disposal behaviors (Peattie, 2010). Several scholars studied sustainable consumption by applying multiple theoretical approaches, theories, and investigating a plethora of factors affecting consumer behavior (e.g., Groening et al., 2018; Concari et al., 2020). Nowadays, literature interest in sustainable fashion consumption is rising. Several studies investigate factors affecting sustainable behavior, like purchase intention (Abrar et al., 2021; Chaturvedi et al., 2020), willingness to pay a premium price (Dodds et al., 2016; Stall-Meadows and Davey, 2013) for sustainable garments, as well as sustainable practices related to garments usage (Whitson-Smith, 2018; Laitala and Klepp, 2016), and disposal (Zhang et al., 2020; Joung and Park-Poaps, 2013). These studies are mainly focused on a single sustainable category (e.g., organic - Gam, 2011) or a single consumption phase (e.g., laundry - Laitala et al., 2012), conversely few studies considered multiple consumption stages simultaneously (e.g., Soyer and Dittrich, 2021).

However, several options to make the fashion industry more sustainable do exist. In addition, sustainable fashion options can belong to the garment choice (i.e., before consumer usage), the garment usage (i.e., during consumer usage), and garment disposal (i.e., after usage when the consumer ceases to use the garment) phase (Dangelico and Pontrandolfo, 2010).

Busalim et al. (2022) published a systematic literature review on sustainable fashion purchase behaviors. However, this study considers articles published till 2019 and is focused on methodologies and theories used and the evolution of the research over time. Other literature reviews concerning sustainable fashion have recently developed. Nevertheless, these reviews deal with a single aspect of sustainable fashion, such as consumer laundry practices (Klint et al., 2022), humans' perceptions of recycled textiles and circular fashion services (Wagner and Heinzl, 2020), collaborative fashion consumption (Jain et al., 2022), clothing recycling and reusing patterns (Xie et al., 2021). Conversely, a holistic approach analysis of sustainable fashion consumption (i.e., considering the phases of clothing purchase, use, and disposal together) is rare.

To the best of our knowledge, only one study systematically reviews sustainable fashion matters considering the life cycle of consumption (Vesterinen and Syrjälä, 2022). Nevertheless, a systemic approach is critical to fully understanding sustainable consumption (Ellen McArthur Foundation, 2017; Peattie, 2010). A holistic analysis of the determinants of consumer behaviour

toward the multiple alternatives to make, use, and dispose of fashion products sustainably available is missing.

For the above-mentioned reasons, and considering the critical role of consumers in the shift toward sustainable consumption, this paper proposes to systematically review sustainable fashion literature to fill the research gaps (e.g., Page et al., 2021). The following research question drives the paper:

*Which factors influence sustainable consumer behavior in each of the consumption phases (i.e., purchase, use, and disposal)?*

The paper provides a picture of the motives that favor or discourage the adoption of sustainable behaviors, defines several future research directions, and it can be useful in developing marketing strategies. The structure of the paper is as follows. Section 2 presents the methodology. Section 3 presents the results reported according to the three consumption stages. Section 4 presents the conclusions, implications, and future research directions.

## **2 Methodology**

To address the research question systematic literature review was conducted (Page et al., 2021). (1) Sustainability, (2) consumer behavior, and (3) the fashion industry are the three main domains from which relevant keywords to build the research query were identified. The keywords determined were mixed in a research algorithm using Boolean operators. Then the obtained research query was launched on 31st December 2022 in Scopus and Web of Science databases to search for relevant articles. Only articles published in peer-review journals and written in English were included. First, 536 articles from Scopus and 349 articles from Web of Science were found. After removing 291 duplicates, the starting sample was composed of 594 articles. The following inclusion criteria were considered in the article screening: (1) focus on the consumer perspective, studying behaviors and/or their determinants, (2) focus on sustainability, in terms of product characteristics and/or sustainable behaviors, and (3) focus on the fashion industry<sup>1</sup>. First, the article's titles and abstracts were analyzed, leading to the exclusion of 292 papers. Second, articles' full texts screening led to excluding other 86 papers. A final sample of 216 articles is considered for the review.

---

<sup>1</sup> Articles dealing with shoes, accessories, and cosmetics were not included.

From the obtained sample, data relating to various aspects (e.g., sample characteristics, product studied, consumption phase, determinants of behaviors) were extrapolated.

### **3 Findings**

Concerning the sample characteristics, the articles were published between 1997 and 2022. Since 2016 a significant increase in the number of studies can be noticed. Papers have been published in 79 different journals. The studies involve consumers from 47 different countries. Countries with more studies are the USA, China, and Europe. In the early 2000s, studies mainly focused on consumers from North America and Europe. Since 2015, a significant increase in studies on Asian consumers has been reported. Most studies applied a quantitative research approach, while qualitative or mixed methods are less used.

Results are classified according to the product life cycle perspective, (1) garment choice (i.e., before consumer usage), (2) garment usage (i.e., during consumer usage), (3) ceasing to use the garment (i.e., after consumer usage) (Dangelico and Pontrandolfo, 2010).

#### ***3.1 Factors affecting sustainable garment choice***

Within the selected sample, more than half of the articles analyze the phase of choosing a sustainable clothing product. Among these, both qualitative and quantitative methods are used.

The selected articles have analyzed consumers' choice of products belonging to six categories of sustainable garments: (1) recycled (apparel, wastes, generic material), (2) second-hand, (3) organic (crop, livestock, generic fibers), (4) bio-based, (5) slow fashion, and (6) generic sustainable garments.

Most of the studies investigated consumers' purchase intention (PI), while fewer focused on willingness to pay (WTP) and actual purchase behavior (PB).

A total of 95 distinct factors able to influence consumers' product choice behavior were identified. These factors are classified into three macro-categories, named (1) Consumers, (2) Marketing and Purchase, and (3) Social context, according to the classification proposed by Bangsa and Schlegelmilch (2020). These categories respectively concern the personal sphere of the consumer (e.g., attitude, values, feelings), the product attributes and the marketing strategy used

by the company (e.g., attributes, price, advertising, CSR), and the factors of external influence (e.g., social influence, celebrities, online communities).

Factors belonging to the Consumers category were divided into four subcategories.

1. *Values* - Here factors ascribable to the values categories defined by Schwartz (1992) are reported. The analysis shows that values related to openness to change (e.g., need for variety), to self-transcendence (e.g., altruism), and hedonism (e.g., consumption hedonism) have a positive effect on consumer PI, WTP, and PB toward several sustainable product options. Mixed results emerged for self-enhancement (e.g., authority and status) and conservation (e.g., frugality) values. Studies found both positive and negative effects on consumers' sustainable product choice behaviors.
2. *Environment* - Here factors related to consumer environmental beliefs are reported. Most of those factors were found to have a positive influence on sustainable product choice behavior (e.g., attitude, environmental concern, past experience with sustainable garments). Mixed results were found concerning consumers' perceived effectiveness and knowledge of both environment and sustainable garments. Here, although most studies have found a positive effect of these variables some have found negative effects. Further consumers who are used to adopting sustainable consumer behaviors have higher intention to purchase and pay a premium price, as well as a higher actual purchase of sustainable garments.
3. *Control* - Here factors concerning the consumers' capabilities to perform the behavior are reported. Perceived behavioral control is the most commonly used factor, some studies introduce other factors ascribable to this subcategory (e.g., perception of availability). The effect of these factors on sustainable consumer behavior was found to be positive for several product categories except for organic garments for which mixed results emerge.
4. *Fashion* - Here factors related to the importance consumers attribute to the fashion industry and the fashion garments in their lives are reported. Factors belonging to this category (e.g., fashion interest) were studied only for a restricted set of sustainable garments, particularly for slow-fashion garments. The effects on sustainable

garment choices are mainly positive, except for some cases in which no significant effects are found.

Factors belonging to the Marketing category were divided into two sub categories.

1. *Product* - Here factors related to product features (e.g., quality) and consumers' perception associated with the product (e.g., perceived risk) are reported. Results show that factors related to product features positively impact consumer choice behaviors toward several sustainable garment categories. Concerning consumers' perception, the review revealed that perceived risk and skepticism have a negative effect on sustainable garment purchase behavior.
2. *Marketing and sustainability strategies* - Here factors related to the firm's marketing and sustainability strategies are reported. Here factors related to the firm's marketing and sustainability strategies are reported. Results show that factors linked to promotion (e.g., visual and verbal nudges), sustainability firms' efforts (e.g., corporate social responsibility), and store attributes (e.g., efficient customer service) have a positive effect on consumer purchase behavior toward several sustainable garment categories.

Factors belonging to the Social context category were divided into two sub categories.

1. *Non-digital specific* - Here factors related to the social forces able to influence consumer behavior (e.g., social norms) are reported. Results show the positive impact of those factors on consumer purchase behavior toward several sustainable garment categories. However, mixed results are found concerning slow fashion and organic garments categories, with some scholars reporting no significant effect of those factors on purchase choices.
2. *Digital specific* - Here factors related to electronic consumers' interactions (e.g., social media influence) able to influence purchasing behavior are reported. The effect of those factors on consumers' purchase behavior was found to be positive across several sustainable garments categories.

Furthermore, several studies have investigated consumer behavior through a qualitative approach, mainly focusing on generic sustainable garments. Four main barriers to sustainable garments purchase emerged from the review.

1. *Price* - Sustainable garments are perceived as more expensive compared to unsustainable alternatives, and several consumers judge those products as not affordable in terms of price.
2. *Skepticism* - Consumers might have low trust in firms' sustainability declarations due to a lack of transparency and misleading language used in product descriptions and environmental declarations.
3. *Knowledge* - Consumers' lack of knowledge of sustainable garments might cause negative product perceptions and efforts in identifying them.
4. *Availability* - Consumers' perception of the low availability of sustainable garments might be associated with difficulty in finding the product.

Concerning factors motivating sustainable fashion consumption, the review shows three main factors playing a critical role in consumers' decision-making process. Affordable prices, high quality (e.g., high comfort clothing), and captivating aesthetics (i.e., fashionable style) favor consumers' choices toward sustainable garments. In addition, results show that sustainable product attributes have secondary importance in consumers' purchasing choices. Recent studies demonstrated the effectiveness of digital tools (e.g., social media) in spreading sustainable fashion knowledge and practices among consumers.

### **3.2 Factors affecting sustainable use of garment**

Concerning sustainable garment usage, it can be possible to distinguish between personal and collaborative fashion usage.

Personal fashion use refers to clothing maintenance and care. Sustainable practices of garments usage are linked to product life cycle extension strategies like continuing to wear garments, repairing defects, and careful laundry. Barriers toward the adoption of those activities are lack of knowledge on how to carry out them, low quality of garments that causes shorter use and lower maintenance, and social pressure to update and change outfits regularly to not incur negative perceptions like being dirty or out of fashion. Conversely, motivators toward sustainable usage practices concern the high quality of the garments, emotional attachment, and the accessibility of services such as repair and laundry services and style consultancy.

Collaborative fashion usage refers to sharing clothing among users and having access to garments instead of owning them, e.g., through renting.

Factors reducing consumers' willingness to participate in collaborative forms of clothing usage are the reduction in consumers' perceived ability to express themselves derived from not owning the garment, lower comfort and lower quality of garments, limited availability, and scarce flexibility of the rental period. Drivers to collaborative fashion use are the sense of belonging in a community perceived, having access to exclusive clothing items, the purpose of adopting more sustainable consumption choices by extending the product life cycle and reducing new purchases.

### ***3.3 Factors affecting sustainable disposal of garment***

Garment disposal refers to the cease of using the garment by the consumer (e.g., the consumer considers it obsolete and does not wear it anymore). Several disposal options do exist, such as donating to charity and recycling.

Barriers toward sustainable disposal are the low quality of garments, serious damages, and specific clothing items (i.e., underwear and socks). Generally, clothing with those characteristics is thrown away unsustainably. Further, the perceived lack of knowledge of recycling services and how to perform sustainable disposal are other barriers to sustainable behaviors.

Conversely, high-quality, expensive, and famous brand garments as well as mono-material composition and modular clothing favor consumers' sustainable disposal practices.

## **4 Conclusions**

This systematic review analyzed the sustainable fashion consumption phenomenon by analyzing 216 articles. The output is a picture of the factors affecting sustainable consumer behaviors among the three consumption stages.

Consumers value mainly the style, quality, and comfort of garments. Marketers should ensure they offer garments with these characteristics to favor sustainable consumption and extend clothing usage. Providing clear information about environmental product features and promoting sustainable ways to use and dispose of clothing is critical to increasing consumer knowledge of sustainable consumption behavior, thus reducing perceived skepticism. Collaborative consumption is a critical sustainable consumption alternative firms should make

efforts to foster accessibility to this service. Nowadays, digital tools (e.g., metaverse simulation) adoption for promoting sustainable behaviors is increasingly widespread in business-to-consumer and consumer-to-consumer relationships and deserves further investigation.

This review highlights several avenues for future research. Since most articles focused on generic sustainable garments and contrasting results are reported for different sustainable categories (e.g., organic vs recycled garments), future studies could compare garments with distinct sustainable attributes. Articles on garments made with new-generation materials (e.g., bio-based) are rare; hence, scholars should further investigate consumer behavior towards those products. The lack of knowledge and availability of sustainable products and services are strong barriers to the diffusion of sustainable consumption practices. Scholars should deepen the analysis of factors able to help consumers in overcoming those barriers. Several strategies to use and dispose of clothing sustainably do exist. Scholars should further analyze influencing factors of consumer adoption behaviors toward these options, such as product type, trust in suppliers, and service accessibility.

Concerning study limitations, only the Scopus and Web of Science databases were analyzed while other relevant articles outside these databases could be missed. Furthermore, this review does not include articles focused on shoes or accessories, relevant findings could be missed. This study is conducted from the consumer perspective: future research could integrate the results with the company perspective.

## Reconstruction of Models. Models of Reconstruction.

---

Pietro Brunazzi

Department DASTU  
Politecnico di Milano  
Piazza Leonardo da Vinci, 32 20133 Milano

### Abstract

The traditional concept of heritage, which focuses mainly on physical, architectural and urban aspects, no longer allows adequate conservation strategies. New approaches need to integrate notions of the socio-economic context and sustainable development as well as factors related to social and cultural representations and intangible heritage. Reconstruction is the activity of building again something that has been damaged, bringing it into the state it was before; nevertheless, deeper studies, focused on what reconstruction is, show how it doesn't only describe a project but it also sums an attitude of mind in the face of lack of form, defined by scientific, ideological and political strategies, economic interests, aesthetic demands

The controversial topic must be led out of fixed patterns of thought, as it has ceased to be simply the continuous representation of an image, instead shifting the paradigm towards a new construction of history. The ever-present idea and practice of re-presenting again what is missing must be seen in the new perspective of "re-construction", stressing the attention on the prefix "re-", linked to the possibility of repetition of actions, in same or opposite way, moving expected results from precise copy to broader quote of invention. The basic principle of any cognitive structure is repetition. If intended as the action of performing again something that already occurred, it allows the formation in the subconscious of an image in which users can recognise specific values. Reconstruction, in the action of building again and filling gaps, supports the desire for continuity of a constructed memory that is also part of contemporary cultural self-construction. The concept of reconstruction weaves relationships concerning ontological, ethical and pragmatic aspects. Reconstruction tackles the dichotomy between complete form and ruins, a condition in which architecture, although reduced to minimum formal terms, still manages to exist through an image that constantly lies in collective memory. It opens questions on the ratio between original contents and replicas and on its social and political legitimacy and investigates building techniques involved and the innovation impressed on the remains by the rehabilitation project.

This contribution aims to clarify how a reconstructive approach to heritage intervention can play, in multiple fields, a significant role in the transmission of memory and value, and also to broaden the spectrum of investigation onto various reconstructive models, which provide the theoretical basis for a subsequent practical approach for the heritage.

**Paper type** – Academic Research Paper

## 1 Considerations on a new approach to reconstruction

*«Since the pre-Roman period, a fortified settlement has existed on the hill where Carcassonne now stands. In its present form it is an outstanding example of a medieval fortified town, with its massive defences encircling the castle and the surrounding buildings, its streets and its fine Gothic cathedral. Carcassonne is also of exceptional importance because of the lengthy restoration campaign undertaken by Viollet-le-Duc, one of the founders of the modern science of conservation<sup>1</sup>.»*

The dossier accompanying the 1996 candidature of the “*Ville historique fortifiée de Carcassonne*” for UNESCO World Heritage Site highlighted not only the importance of the Fortified City of Carcassonne, as an example of a fortified medieval citadel whose defence system was founded on a fortified structure dating back to the late antique period, but also the role of Viollet-le-Duc and the restoration works he undertook in the XIX century, were remarked of fundamental importance. A crucial aspect regarding the inscription of the Carcassonne site was the cultural change that occurred in the early 1990s regarding the concept of authenticity. In particular, the revision by ICOMOS of the perception and definition of the term “authenticity” represented a new opportunity with respect to the inscription of the property, which had been rejected in 1985.

New interest in the concept of authenticity is due to the 1994 Nara Document of Authenticity which, though conceived in the spirit of the Venice Charter, expands the interest and concerns for cultural heritage in contemporary world, mostly elaborating the concept of “authenticity” in ways which accord full respect to the social and cultural values of all societies, in examining those Outstanding Universal Values of cultural properties, which are crucial for the inscription in the World Heritage List. The new vision of the concept of authenticity recognises restoration not as an element of falsification but rather of value. Our ability to understand these values depends, in part, on the degree to which information sources about these values may be understood as credible or truthful. Knowledge

---

<sup>1</sup> <https://whc.unesco.org/en/list/345/>

and understanding of these sources of information, in relation to original and subsequent characteristics of the cultural heritage, and their meaning, is a requisite basis for assessing all aspects of authenticity. From this perspective, the reconstruction project intervenes as a medium for a translation (from latin *traducere*, bringing beyond) and recomposition of an architectural text that would otherwise be indecipherable and unrecognisable. A reconstruction is not a falsification or a forgery or pastiche. It is a ritual that allows the conservation and transmission of local building culture from generation to generation<sup>1</sup>.

The later 2000 Riga Charter<sup>2</sup> states that “the purpose of conservation (and/or reconstruction) is to maintain and reveal the significance of the cultural heritage” (Article 3) and that “in exceptional circumstances, reconstruction of cultural heritage, lost through disaster, whether of natural or human origin, may be acceptable, when the monument concerned has outstanding artistic, symbolic or environmental (whether urban or rural) significance for regional history and cultures” (Article 6). At the beginning of the 21st century, the way is thus set for a project that is the ultimate result of a reconstructive act of thought. In fact, faced with the loss of an architecture that made sense for the existence of an individual man or a community, the only possible act to restart is to attempt to put the form back in its place: in its original spirit, in its design, in its volume, in its essence.

## **2 When and where does reconstruction occur? Architecture in ruin**

The valorisation of architectural heritage must be aware of the possibility of ruin, seen as extreme moment in architecture life-cycle. The work of architecture can be seen as a moment of balance, meticulously planned and designed by the hand of the architect, in which the weight and load-bearing power of matter and the action of the forces of nature, which act and respond on that matter, are equivalent. Ruins occur when the original form fails due to natural events, such as calamitous disasters and the effects of the inexorable flow of time, to events derived from the voluntary and aggressive action of man or his negligence, in the case of abandonment. As a result, the architectural landscape faces a multitude of wandering forms, waiting to find sedimentation, recognition and narrative. Within this framework of ensuring the identification, protection and transmission to

<sup>2</sup> [https://www.iccom.org/sites/default/files/publications/2020-05/convern8\\_07\\_rigacharter\\_ing.pdf](https://www.iccom.org/sites/default/files/publications/2020-05/convern8_07_rigacharter_ing.pdf)

future generations of the cultural heritage, architecture proposes an intervention on the built heritage when its state of preservation impairs its complete understanding through a reconstruction project.

The reconstruction project does not foresee an a priori result; rather, based on a case-by-case situation, it moves from the recomposition of a few fragments up to reconstruction *à l'identique*, based on the study of each case and looking forward to the result that best suits the need for management and transmission of the knowledge and value inherent in the built form. Archaeological and built heritage is a worldwide shared asset, hence the need for each legislation to guarantee its preservation. In some instances, we face genuine problems of culture, which is why it is essential to create a correct perception of the value of specific sites, starting with the sites themselves. By reconstructing lost, disappeared or even incomplete buildings, architects measure themselves against a very particular aspect of the relationship between old and new. Reflecting on the ruins involves formulating a thought about what has passed and a category of the existing: that of the rest, which poses the urgency of setting up a possible relationship between us and this heritage.

### **3 Memory and models**

The concept of cultural memory concerns the external dimensions of human memory. We tend to imagine memory as a purely internal phenomenon, located in the individual's brain, and thus the subject of cerebral physiology, neurology and psychology, but not of the historical sciences of culture. Yet the contents of this memory, the way it organises them and the length of time it manages to retain something are to a very large extent a matter not of controlling inner capacities, but of external, i.e. social and cultural, framework conditions. It is oriented on the basis of fixed points in the past, despite the fact that the past is not able to preserve itself as such, but rather coagulates into symbolic forms to which memory is attached. Memory thus becomes a cultural factor and, as such, is linked to the transmission of meaning. This transmission can take place within a connective structure that act within the social and temporal dimensions establishing bonds and connections. What binds individuals together is the connective structure of a common knowledge: this structure is based on the one hand on the binding of common rules and values and on the other on the memory of a shared past. Cultural memory is not transmitted by biological

inheritance. It must be kept active culturally, through the succession of generations. This is a problem of cultural mnemonics, i.e. memorisation, reactivation and, indeed, transmission of meaning. Textual coherence involves the production of a reference horizon that goes beyond the inherent fractures.

The didactic and valuable objective of the complete transmission of knowledge cannot be separated from the ability of everyone to comprehend heritage objects. Above all, reconstruction is a transcultural medium. Especially when heritage is in a state of ruin, it is necessary to undertake an operation of restitution of meaning: architecture already exists as a lexicon, the result of shared codifications transmitted over time. Architecture transcends mere form by becoming a model, a prototype resulting from conventions between tradition and the architect, or dictated by the geomorphological configuration of sites, the climate and the technical evolution of building customs. The character of iconic model requires that interventions respect a particular lexicon, a shareable code necessary for transmission of meaning. Architecture expresses itself through languages intended for communication that imply the use of a code between the communicator and its users, between the subjects and society or institutions. Belonging to a lexicon allows its repeatability since adherence to a certain code enables its reuse in different times. Reconstruction then intervenes in the transtemporal dimension of ruins, which can be seen as places of collective memory: in fact, as a vector of memory, ruins actively link the past to the present in view of the future, and their preservation must be understood as a modern phenomenon of maintaining living contact with the cultural works of the past. The canonical notion of heritage thus expands to that of heritage landscape, in which one or more different values can be recognised: aesthetic, historical, social, evolutionary, but also mythical or legendary. Valorisation stems from recognising a principle of symbolic value, which varies according to different national and regional contexts and for which it is difficult to impose mechanistic formulas and standardised procedures. Reconstruction guarantees access to knowledge linked to the form of the heritage, acting on a double temporal register: both at the level of the present where knowledge is linked to the possibility of reading and studying the heritage, and at the level of the future where the maintenance guarantees the transmission of knowledge over time of an architectural form imbued with meaning.

To clarifying the vast panorama of reconstructive possibilities the discussion can identify some intervention models. We can consider as a 'model' any real

object that is taken as a reference, in a more or less direct way, to outline the practices and actions to be taken for the realisation of another object that is the same or has similar characteristics. The term refers to a broad class of hypotheses and complex constructions with which the object of research is represented, through which it is proposed to organise data and knowledge, but also to experiment further, and then interpret, explain, generalise and compare. The choice/preference characterizing each intervention must be sought in the variables of the project (e.g. the state of the ruins, the desire to transmit values, the possibility of intervening on the site, the level of legislative constraint placed on the site considered, ...) with the ultimate intention of bridging the gap between the visible condition of the ruins and the invisible one of the original form. These models propose a diversified approach to each project: depending on the individual case, it may restore an architecture down to its last detail or maintain it in its state of ruin, although additions that clarify its original conformation may be taken into consideration, or it may intervene with a greater degree of invention freedom, depending precisely on the initial state of conservation, and propose new articulations aimed, in each case, at reading the original spatiality of the work.

#### **4 Verona and its reconstructions**

The events related with Verona's architectural and urban system from the beginning of the XX century onwards certainly represent an interesting case study, both in terms of the interventions to protect monuments and city fabric and the debate that accompanied them, led by architects such as Libero Cecchini and intellectuals such as Piero Gazzola.

In 2000 the historic city of Verona was inscribed in the UNESCO WHL, standing out as a city of culture and art, which preserved a remarkable amount of monuments from antiquity and the medieval and Renaissance periods, and represented an outstanding example of a military stronghold. Particularly interesting is the ICOMOS Evaluation Mission dossier, occurred in January 2000, which, speaking of "authenticity" reported:

*«The City of Verona retained its historic fabric completely intact until the 1882 flood and World War II, which caused a large amount of damage. Since then, the city has been subject to restoration and reconstruction, which was done with great care and respecting the historic fabric. At the*

*present time, Verona still displays an exceptional amount of Roman remains, and its Roman origins are also reflected in its street pattern. The particular significance of Verona lies in the continuity of its military use, and the defence system has been well preserved. In the 20th century, the urban fabric has expanded beyond the city walls, but the natural setting of the town is still of outstanding quality, and is fully protected. The historic city of Verona can thus be considered to fulfil the requirements of the test of authenticity.<sup>1</sup>»*

This report recognised the role of city reconstructions in conveying and safeguarding the image and value of the historic city through time; value that, in some cases, is transmitted through reconstructed architecture. Specifically, the reconstructions undertaken in the XX century serve as paradigmatic examples to recognise certain operational models for the project.

Anastylosis: it is the reconstruction of an architectural artefact, in accordance with the canons of architecture with orders, using only its original parts, found on site. Noteworthy is the Arch of the Gavi, located along the ancient Via Postumia, a rare case of an honorary and monumental arch for private use in Roman architecture. It was in fact, built around the middle of the I century to celebrate the *gens Gavia*. During the Renaissance, this was one of the most appreciated of Verona's antiquities, also due to the presence of the signature of a Vitruvius, recalling the famous Roman architect and author of the treatise *De Architectura*. The monument was then described by humanists and antiquarians, reproduced in detail and studied in terms of proportions and decorations, and finally taken up as a model by architects and painters, such as Andrea Palladio, Antonio da Sangallo, Sebastiano Serlio, Michele Sanmicheli, and even Andrea Mantegna. He had a great influence on Veronese art in particular, copying the overall scheme for the construction of portals, altars and chapels in the main churches of Verona. In 1805, during the Napoleonic occupation, the French Army Corps of Engineers decreed and implemented the dismantling of the monument for reasons of military safety and viability: the arch was then carefully surveyed in all its stone elements and decorations so that it could be reconstructed later, it was dismantled and the blocks were finally deposited in the archways of the Arena. At the beginning of the XX century, the inspector of monuments, Antonio Avena proposed its reconstruction and recomposition, encountering heated controversy

---

<sup>1</sup> <https://whc.unesco.org/document/154298>

over the location in which to reconstruct it and the method of restoration. The final project, supervised by the archaeologist Carlo Anti, recomposed the arch using all the original pieces, with a few additions of materials that were in any case treated with hammering to disguise its ancient appearance, but envisaged a new location in a square adjacent to Castelvecchio, a few metres from the original site, respecting the city's evolution that took place between its dismantling and reconstruction.

Pseudo-anastylosis: is so defined because it concerns cases of architecture reconstruction that do not conform to classical orders. It is carried out by anastylosis of a few surviving originals, thus providing for a large presence of pieces of new craft but reintegrated to disguise the ancient appearance. A symbol of this model in the Veronese panorama is the reconstruction of Ponte Pietra. The bridge represents a typical example of the symbiosis of the architectural dimension with the environmental one, because the grafting of a mediaeval structure onto a Roman construction is relevant, to which is added the picturesque effect of its position in the landscape, territory and history. Following its destruction, together with the city's other bridges, on 24 April 1945, superintendent Piero Gazzola could only salvage the few intact debris and arrange the riverbed, postponing reconstruction. The elimination of Ponte Pietra in the aftermath of the wartime destruction or its replacement with a modern artefact would have cost the sacrifice of the character of a vast area and would have compromised the general physiognomy of Verona itself, lacerating its delicate aesthetic texture. To avoid this deplorable result, the problem of recomposing the ancient artefact was tackled, proceeding from what had been saved by anastylosis. Before the project was completed, all the original materials of the bridge were recovered, studied and catalogued. This was followed by the restoration of the few surviving portions: the left bank abutment and parts of the first and second piers on the right bank. The building site, supervised by architect Libero Cecchini, began only in 1957, using the original pieces recovered together with new stone elements extracted from quarries in the Verona area and deliberately aged to disguise the bridge's pre-war appearance, to restore the original urban landscape.

In vitro reconstruction: this model, generally for exhibition/museum purposes, is based on an awareness of the fragility of the artefact, which is no longer capable of guaranteeing the necessary static balance. The reconstruction project envisages the dismantling of the artefact and its new relocation on a host

structure. The latter recomposition can take place within a protected and controlled museum system (e.g. Pergamon Altar moved from its original site in Asia Minor and now placed in display inside Pergamon Museum in Berlin) or can take place externally, using a supporting architectural structure, thus ensuring the continuity of the urban role of architecture. This is the case with the façade of the Church of San Sebastiano, which was relocated on the body of the Church of San Nicolò all'Arena. The bombing of 4 January 1945 destroyed the entire complex of the Church of San Sebastiano, of which only the façade remained standing, which had tilted forward due to the air displacement, with the risk of falling ruinously onto the building in front of it. As an extreme protective solution, the Superintendency gave up on the reconstruction of the Neoclassical church, deciding to dismantle the surviving façade and reuse it to complete the unfinished, Baroque church of San Nicolò: as it was not, where it was not. The work of dismantling and recovering the stone elements took place after a meticulous inspection and survey of the façade. For the times, this was a technically and theoretically extreme project, eschewing any philological criteria of which Piero Gazzola was aware. In fact, the project forced the gable to be doubled and the side openings of the façade to be moved. Nevertheless, the final result guaranteed, similarly to the case of Ponte Pietra, the recomposition of a controlled and designed city architectural environment.

Logical/inventive reconstruction: example of this model is the project for Castelvecchio Museum by Carlo Scarpa, famously regarded as one of the greatest examples of Italian museography in the second half of the 20th century. The restoration of the Scaliger castle took place at a time of heated debate on the reconstruction of the city of Verona and its monumental heritage, which prompted the architect to develop a working method that was exemplary. Castelvecchio was not seriously damaged by war raids, but had been heavily remodelled by two phases of restoration during the Napoleonic era and at the beginning of the 20th century. Starting from the recognition of arbitrary additions, he carried out some necessary demolitions to highlight the original parts by means of special devices such as open windows in the floor or cuts that allow the successive stratifications of the monument to be read. This is flanked by the conception of a unified museum itinerary, at times happily interrupted by excursions to the outside, and completed by an essential and rigorous set-up system that visually connects the works, reaching its high point in the display of the equestrian statue of Cangrande I della Scala. Unprecedented are the

juxtapositions of ancient materials such as stone and wood brought closer to modern ones such as concrete left exposed or sometimes treated with traditional techniques such as bush-hammering, or the revisiting of ancient techniques such as the coloured stucco treatment of some surfaces, interpreted in a modern key. Carlo Scarpa here reconstructs the entire history of Castelvecchio in a single project, certainly applying a greater inventive quotient than the models seen previously.

## 5 Concluding remarks

The case history of monumental architectures reconstructed in whole or in part to put an end to their state of lying in ruins or to their state of un recognisability is generally driven by the desire to restore a monumental architecture, felt as collective heritage, to a corporeal reality without which it would be a pure ghost. These examples are not only theoretical sources of study but are also to be taken as operational models. From the treatment of the few cases cited here, however, emerges a vocation for the trans-disciplinary nature of the heritage reconstruction project: the ethical-social will of reconstruction must necessarily interact with the precepts of monument conservation and the technical-operational needs of the project, with a continuous confrontation between scholars, technicians and the community.

A post-conflict and post-disaster approach to reconstruction became an increasingly important issue after the destruction of cultural heritage sites and monuments. Study, recognition and development of these models within proactive cultural frameworks can address the multi-faceted challenges of reconstruction.

### Abstract

In light of recent disruptive events, it is necessary to expand knowledge on how to improve the resilience of healthcare systems. Recent literature on resilience in healthcare considers intra- and inter-organizational collaboration and cooperation as the winning capability for achieving hospital resilience performance. According to the supply chain information integration literature, both collaboration and cooperation depend on integration factors such as knowledge and information sharing within the organizational functions and across the supply chain partners.

Adopting the perspective of resource-based view, a research model reporting resource-capabilities-resilience performance linkages is proposed. This study divides the information integration capabilities in two dimensions, the internal and the external and regarding resources, it considers the digital and human resources as allowing healthcare organizations to develop integration capabilities and obtain resilience performance. The paper intends to investigate the impact of digital and human resources on resilience performance and, moreover, the mediating role of supply chain information integration capability in the relationship between human and digital resources and resilience

performance is also considered. This study intends to test this model conducting empirical research which will be based on survey data collected from Italian hospitals. Structural equation modelling methods will be used to test the proposed relationships. This study contributes to the supply chain information integration literature investigating the healthcare sector and provides managerial implications for hospital and healthcare supply chain managers to properly leverage resources and capabilities with the aim of obtaining resilience performance.

**Keywords** – Supply Chain Information Integration – Resilience – Healthcare – Digital resources – Human resources

**Paper type** Practical Paper

## 1 Introduction

Recent disruptive events have exposed the healthcare industry to risks and uncertainties that have compromised and severely hampered the overriding objective of providing care for patients, resulting in blockages in the flow of goods and services.

Resiliency is considered an effective way to withstand and recover from major disruptions and mitigate their impact in organizations and supply chain (Achour et al., 2022; Alameddine et al., 2019).

To develop resilience capabilities such as flexibility, agility, visibility and adaptability, healthcare organizations are called to reconfigure and reorganize their resources (Ambulkar et al., 2016). As for the recent pandemic, to control disruptions, hospitals need to reconfigure and acquire both tangible and intangible resources such as remote and digital technologies and human skill-set capacity which include not only technical know-how but also relational behaviours (Alan et al., 2022; Tonetto et al., 2021). These resources enable healthcare organizations to standardise new procedures and tasks redeploying health professionals or creating new roles with specific job description and including unusual healthcare professions in the hospital worker force (Veerapen and McKeown, 2021). All of these initiatives are heavily supported by cross-functional cooperation and coordination activities (Donelli et al., 2022; Sacoor et al., 2020).

In situation of high uncertainty, healthcare organizations are unable to manage complex crisis independently but depend on external network partners to acquire

valuable information, knowledge, and complementary resources, enhancing their ability to respond promptly to patient's needs (Kamalahmadi and Parast, 2016).

For example, collaborative networks in healthcare were established, creating relationship in the form of coalitions, collaborations, consortia, expertise sharing between hospitals to improve the quality and the efficiency of the delivery services (Jiang *et al.*, 202; Mervyn *et al.*, 2019; Hines and Reid, 2021). Furthermore, many countries developed coordination mechanisms at the regional level to distribute available resources and collect information (Winkelmann *et al.*, 2021; Jamal *et al.*, 2019).

In their case study, Spieske *et al.* (2022) found that that several hospitals established boundary-spanning activities such as information sharing and forming of alliances, with the aim of reducing uncertainty and improve supply availability.

In this vein, managing collaboration between the intra- and inter-organizational processes enable healthcare organization to be more likely to withstand and quickly respond to crises or, in other word, to be resilient (Ifiaifel *et al.*, 2021).

Both collaboration and cooperation activities rely on integration factors such as information sharing, cross-functional teams, adequate communication which are concepts discussed in the supply chain information integration (SCII) literature (Poberschnigg *et al.*, 2020; Huo *et al.*, 2016).

While the post-pandemic qualitative research has demonstrated the importance of collaborative practices and the literature acknowledges the importance of inter- and intra-organizational information sharing activities, there have been no attempts to demonstrate the role of information integration for resilience, particularly in the healthcare sector.

Grounded on the resource-based view theory (RBV) this study seeks to better understand the relation between resources, capabilities and resilience. The RBV posits that strategic resources and capabilities can help organizations and their supply chain to achieve better performance, including resilience (Chahal *et al.*, 2020; Aragón-Correa and Sharma, 2003). In particular, in terms of resources, this study focuses both on tangible and intangible resources including digital technologies and human skill-set capacity. The digital technologies include all the interconnected digital applications, electronics, and microstructure technologies which leverage the main baseline technologies of IoT, big data, and cloud computing. Concerning intangible resources referring to skills and competencies,

this study refers to the technical know-how, skills, education, training and team-skills of medical personnel, and expertise of hospital procurement department employees. The RBV posits that, developing an effective and efficient process of combining these resources, hospitals are able to produce capabilities and create value. Among the capabilities, information integration refers to the ability to acquire and share information within the organization and along the supply chain.

Overall, our study intends to enrich the understanding of how the information integration capability could explain the impact of the resources, tangible and intangible, has on hospital resilience.

## **2 Theoretical background and hypotheses**

### ***2.1 Supply chain information integration***

Recent disruptive events have caused organizations to rethink the need for cooperative supply chain partnership and joint improvement of inter-organizational processes. The supply chain integration is a stream of Supply Chain Management research which properly examining collaborative relationship between organizations and external actors (Ralston et al., 2015). If integration is essential to achieve effective and efficient flows of products, services, and decisions, the information integration in supply chain is beneficial to improve performance (Harland et al., 2007). Strategic information sharing within organizational functions and across supply chain partners results in a better management of intra- and inter-organizational processes (Huo et al., 2016). Information integration comprises two key elements: the information sharing and the collaborative planning. Information sharing refers to the exchange of critical information between supply chain members through the IT infrastructure such as telephone, mail, internet (Cai et al., 2010). Effective information sharing significantly enhanced supply chain practices. Collaborative planning complements the information sharing as it refers to collaboration among partners to develop operational and strategic planning (Petersen et al., 2005). As supply chain integration involves inter-organizational and intra-organizational interfaces that facilitate coordination and the effective flows of material, money, decisions, in a similar manner, the supply chain information integration should be divided into external and internal information integration (Zhao et al., 2011). External information integration is concerned with a closer collaboration and information

sharing with customers resulting in strategic insights of market opportunities and expectations and a closer cooperation and information sharing with supply chain members which provide insights for effective planning and process design (Schoenherr and Swink, 2012). In contrast, internal integration refers to the collaborative and information sharing mechanisms implemented between internal functions. Inter-functional communication and collaboration enable the utilization of each function's strengths and competences, highlighting the functional interdependencies (Pagell, 2004). Moreover, the internal information integration improves the recognition, dissemination and application of knowledge and information gathered through external information integration (Koufteros et al., 2010; Flynn et al., 2010). Internal information integration mainly involves data and information system integration through the use of operational data which guarantees synchronized and manageable processes (Zhao et al., 2011).

## **2.2 Supply Chain resilience**

Since the 2000s, supply chain resilience has become a popular topic, but its definitions vary in the literature and surround different conceptualizations influenced by other domains such as engineering, psychology and ecology. In one of the earlier definitions, resilience in SC context was linked only to the reaction/response and recovery phase in order to maintain core operational functions after a disturbance occur (Rice and Caniato, 2003). Drawing from the resilience definition in the ecological field, the literature emphasized not only the ability to withstand the crisis and restore the original state but also added the growth phase which refers to the ability to move into a new, more desirable state after experiencing a disturbance (Christopher and Peck, 2004; Pettit et al., 2010; Ali et al., 2017; Brandon-Jones et al. 2014). The definition for supply chain resilience used in this paper is: *Supply chain's ability to be prepared for unexpected risk events, responding and recovering quickly to potential disruptions to return to its original situation or grow by moving to a new, more desirable state in order to increase customer service, market share and financial performance*" (Hohenstein et al., 2015, p. 108). According to the literature, the supply chain resilience encompasses five dimensions, namely the ability to *anticipate* unforeseen disruptive events, to *adapt* and withstanding disruptions, to *respond* quickly to disruptions, to *recover* from disruptions, returning to steady-state conditions, and

to *learn* from what has been done and anticipate future failures (Ali *et al.*, 2017; Duchek *et al.*, 2020; Lundberg. and Johansson, 2015).

### **2.3 Effects of digital resources on resilience**

Digital resources describe information and communication technologies derived from Industry 4.0 which have been adapted to support healthcare treatments and administrative processes (Marques da Rosa *et al.*, 2021). The digital technologies enable interconnection of processes, services and people, allowing organizations to build resilience capabilities such as visibility and flexibility. Some recent studies state that digital technologies are beneficial to resilient performance in hospitals (Chowdhury *et al.*, 2021; Rusinko, 2020; Zhang and Qi, 2021). It is due to the fact that digital technologies, in the form of applications such as digital platforms, facilitate both supplier and cross-functional relationship management and allow real-time identification of trends in materials, equipment, processes increasing situational awareness and enhancing the hospital ability to anticipate the potential risks and disruptions (Tortorella *et al.*, 2022). Moreover, digital applications facilitate the development of the remote communication with suppliers, in order to address issues in material, equipment, processes and patients, and thus enhance the hospital ability to adapt and respond to disruption (Marques da Rosa *et al.*, 2021).

Hence, we propose:

*H1. Digital resources are positively related to resilience performance.*

### **2.4 Effects of human resources on resilience**

Human capital plays a significant role in building resilience and could determine if organizations and supply chain develop the ability to adapt and to respond to change (McManus *et al.*, 2008). Human resources describe all the skill-set capacity of both medical and administrative personnel, encompassing competences, experience as well as soft skills of teamwork and collaborative behaviour. Several competencies and skills emerge as being important for healthcare organizational performance and resilience in time of adversity (Juvet *et al.*, 2022). In particular, hospitals enhanced the ability to respond by leveraging specific knowledge and experience of medical personnel in managing the emerging pandemic-driven intensive care. For example, teams of specialist nurses

and physicians were created to assist and manage the urgent situation combining technical abilities and leadership (MacKinnon *et al.*, 2022; Ladak *et al.*, 2021). Moreover, competences and experience of dentists and medical researchers revealed their utility in dealing with infection control procedures and, for this reason, these unusual health professions were included in the health worker force, improving the ability to adapt and react on time and efficiently in front of the disruption (Sacoor *et al.*, 2020). Finally, the skills and experience of the procurement department employees allow hospitals to react and respond to the shortage of materials and equipment. They identify alternative source of supply and implemented new procurement initiatives (Spieske *et al.*, 2022).

Therefore, we propose:

*H2. Human resources are positively related to resilience.*

### **2.5 Effects of digital resources on supply chain information integration**

The digital resources implemented in healthcare organizations enable communication and promote different ways of interacting and disseminating health-related information (Tortorella *et al.*, 2022). Digital applications including digital platforms or electronic database with patient real-time information, data sharing systems were considered as means for fostering effective information and communication sharing across the hospital. Therefore, digital technologies contribute to organizational collaboration and have improve internal information integration (Deveraj *et al.*, 2007). In a similar manner, digital technologies referring to supply chain applications enable the management of materials, products, and equipment facilitating inter-organizational communication and collaboration (Harland *et al.*, 2007). Moreover, digital resources are also used to collect data from operational processes in order to share information about supply chain problems and solve them (Huo *et al.*, 2016). Therefore, digital resources can also improve external information integration.

Hence, we propose:

*H3. Digital resources are positively related to (a) internal information integration and to (b) external information integration.*

## **2.6 Effects of human resources on supply chain information integration**

The skill-set capacity of medical and administrative staff also includes the confidence in working in team, collaborative behaviours, communication and trust (Alfalla-Luque et al., 2015). This kind of skill-set can promote high level of information sharing between hospitals functions and enhance internal information integration resulting in both formal coordination mechanisms, such as protocols and guidelines, and informal collaborative relationships among staff members (Ree et al., 2021; Forsgren et al., 2022). Moreover, this relational capacity promotes also the ability to manage supplies, establish cross-hospital partnerships and long term relationship, coordinate the supply network (Lyng et al., 2021; van den Berg et al., 2023). The cross-hospital relationship is not just a matter of redistributing patients, but also leads to the creation of alternative sourcing through the so-called lateral transshipment, which means that hospitals create shared central warehouses for most medical products (Aldrighetti et al., 2022).

Therefore, we propose:

*H4. Human resources are positively related to (a) internal information integration and to (b) external information integration.*

## **2.7 Effects of supply chain information integration on resilience**

In the wake of a crisis, like pandemic, the collaboration among supply chain partners is critical for building resilience, facilitating decision-making process and information sharing (Dubey et al., 2019; Senna et al., 2021). Under complexity, information sharing on supply chain risk reduce the impact of disruption, improve response time and build new opportunities for improving products and services (Ambulkar et al. 2015; Kamalahmadi and Parast, 2016). Collaboration and information sharing are, often, two of the most commonly cited elements of supply chain resilience and represent valuable strategies for improving resilience and in particular the organizational readiness (Ali et al., 2017; Scala and Lindsay, 2020). Building an integrated information system within healthcare organizations enable improved situational awareness of operational processes, visibility of operations, information sharing about different processes (Austin et al., 2022; Rubbio et al., 2019). In this vein, all functions can allocate resources appropriately and have clear knowledge of inventory levels and patient demands. Moreover,

recognizing the interdependence between organizational functions as well as between supply chain actors is an integration factor which is related to resilience as it quickens communication, introduce agility into process of solving problems affecting organizations and the supply chain (Poberschnigg et.al., 2020).

Therefore, we propose:

*H5. Resilience is related to external (a) and internal (b) information integration.*

### **2.8 Mediating effect of supply chain information integration**

Finally, this study argues that supply chain information integration, either internal or external, mediates the impact of digital and human resources on hospital resilience. Digital resources enable healthcare organizations to develop both external information integration, impacting on information processing capability and decision-making ability, and internal information integration strengthening the synergistic benefits and improving the management of information flow. In similar manner, human resources which include both technical and specific know-how and collaborative behaviours linked to teamwork, trust and communication enable and strengthen horizontal relationship among functional departments and guarantee the accuracy of supply information sharing. Internal and external information integration based on digital and human resources allow healthcare organizations to quickly adapt and respond to interruptions improving resilience performance. Accordingly, we propose:

*H6a. Internal information integration mediates the relationship between digital and human resources and hospital resilience.*

*H6b. External information integration mediates the relationship between digital and human resources and hospital resilience.*

According to RBV, internal and external information integration represent organizational capabilities, and their development requires support from digital and human resources (Grant, 1991). Hence, we propose the research model as shown in Figure 1:

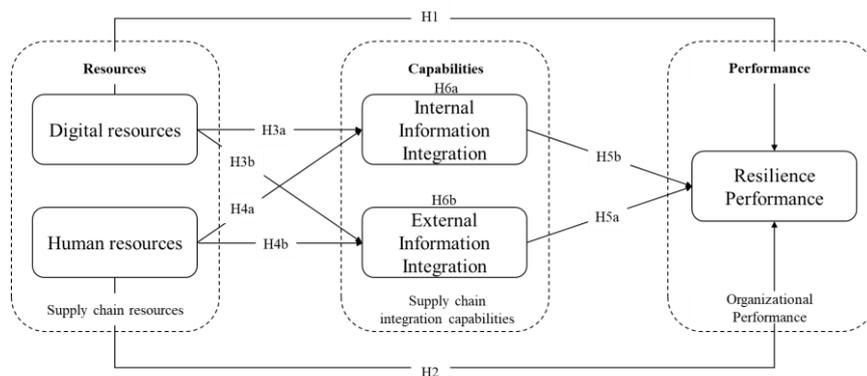

Figure 1 Proposed model

### 3 Research methodology

#### 3.1 Data collection

To test the research model, we intend to conduct an online survey of an Italian sample of hospitals. We intend to focus on this country because it was one of the most affected by pandemic and we can test our model on the basis of a severe disruption as was Covid-19 pandemic. We intend to identify the potential respondents inside hospital among physicians, managers and employees. We intend to develop, pre-test and refine the survey in collaboration with experts in supply chain integration.

#### 3.2 Measures

The survey will contain multi-item scales developed by prior management and information system research. We will assess the psychometric properties of scales, namely reliability, convergent validity, discriminant validity by conducting the following analysis using SPSS 28: composite reliability (CR), Cronbach's alpha (CA), and average variance extracted (AVE) and, finally, the confirmatory factor analysis (CFA).

### 4 Results

To test the research hypotheses of this study, we intend to employ PLS-SEM method which is particularly indicated when researchers include scales that previous works have validated, when the size of the sample is relatively small or,

finally, when the models are very complex (Hair et al., 2013). In PLS-SEM, the study uses the software tool SmartPLS 3.2.3 to treat information.

## **5 Implications and conclusion**

This study intends to offer significant contributions to healthcare management researchers in advancing the current comprehension of hospital resilience. Grounded in the RBV, this study establishes a resources-capabilities-resilience framework in supply chain information integration setting. This study classifies the supply chain information integration into two dimensions: internal and external information integration. This is due to the fact that developing internal and external information integration simultaneously allows organizations to achieve efficiency and service at the same time. Internal information integration enables organizations to provide better products and services to patients through high level of communication and coordination between functions. Moreover, internal information integration also enables the absorption and application of knowledge attained through external information integration processes. In a similar vein, external information integration reduces external uncertainties and wastes increasing operational efficiency. In addition, sharing information with patients should help identify their needs improving satisfaction level. The RBV theory suggests that both tangible and intangible resources should be leveraged and bundled to build valuable capabilities and in this study digital technologies and human skill-set resources are identified as having an impact on the development of information integration capability.

Finally, this study offers insights for hospital managers and healthcare supply chain managers in understanding the role of information integration on resilience performance. First of all, the information integration, which implies the building of integrated database so that different functions can be linked together and healthcare organizations can share information with supply chain partners, is improved by digital technologies and for this reason, healthcare managers should understand the relative importance of digital resources and should acknowledge the need to develop related technical abilities. Moreover, considering that collaborative behaviours are a prerequisite for fostering the willingness to engage in sensitive information sharing, healthcare managers should understand the relative importance of the skill-set capacity of human resources in developing

high levels of communication and coordination not only between different functions but also between partners within the supply chain.

## **Abstract**

In 2015, member countries of the United Nations developed 17 Sustainable Development Goals (SDGs, 2019) that focus on social and environmental issues. To meet the newly introduced requirements, it is crucial to innovate the current system by combining the different dimensions of sustainability, namely social sustainability, economic sustainability, and environmental sustainability. The scientific literature identifies six macro trends, in the area of sustainability, among which the concept of Circular Economy (CE) emerges (Gaudig et al., 2021). To date, CE represents a topic of utmost interest to both the research and business worlds; indeed, CE emphasizes the conscious use of natural resources, promoting their reuse and recycling (Geissdoerfer et al., 2017). In this regard, stakeholders' attention has focused on understanding which are the main facilitators for the adoption and implementation of sustainable business strategies. Recent years have witnessed the emergence and significant growth of a new category of companies: startups. In this regard, the literature points out that this new generation of firms is, at present, the largest producer of radical innovations (Hekker et al., 2007). However, to date, research has mainly focused on the circular approaches adopted by mature firms, while contributions related to startups have been little investigated. The present study aims to focus on the relationship between startups and sustainability, with particular attention to the role of CE on innovative strategies. Indeed, startups, being unstructured business entities, have the opportunity to develop from scratch a new organizational culture that integrates the dimensions of sustainability (Nunes et al., 2022). Startups have the opportunity to build a sustainable business from the beginning by proposing a circular business model or integrating sustainability practices into business operations. The underlying hypothesis is that startups are more open to new ideas because they lack an organizational culture, consequently it is easier to establish sustainable thinking unlike established companies (Pizzi et al., 2021). To achieve this goal, the study was structured in two main phases. First, a review of existing scientific literature was conducted through the methodology of keyword analysis (Fadalla and Amani, 2015). Starting from the results obtained in the literature review phase, the main points to be investigated and then included in the questionnaire were defined. Finally, in the second phase of the study a multiple case study was conducted on a sample of 13 startups.

**Keywords** – Startups, Innovation, Sustainability, Circular Economy, Innovative strategies

**Paper type** – Academic Research Paper

## **1 Introduction**

Nowadays a large number of social and environmental challenges are affecting the whole world, making urgent global changes oriented towards sustainability, as it is expressly stated in the 17 Sustainable Development Goals (SDG) contained in the action plan drawn up by the UN member countries (SDG, 2019). These

efforts require a paradigm shift that implies the need to innovate the current system by considering a domain that combines the social, economic and environmental dimensions of sustainability. As such, sustainability is considered by scholars as a megatrend on a plurality of fronts, i.e., economic, political, technological, and cultural (Mittelstaedt et al., 2014). Organizations of any kind, such as companies, startups, or non-governmental organizations, as economic actors need to align themselves with the emerging sustainability paradigm in order to maintain their competitiveness in a changing marketplace and to contribute positively to the systematic change that is affecting society (Seebode et al., 2012). Within the sustainability megatrend, Gaudig et al. (2021) identifies six distinct megatrends, among which the circular economy (CE) paradigm appears. Since the first industrial revolution, the production system has been based on the so-called linear economy, characterized by the three consecutive phases, namely take, make, and dispose (Rizos et al., 2017). The sustainable alternative to the linear production model is the circular economy, which deviates from the linear model mainly by reusing materials in new products. The concept of CE began to take hold in the middle of the last century, and nowadays it is a topic of considerable interest to the scientific community, industries and policymakers. The CE, specifically, focuses on closing material cycles, aiming at a more conscious use of natural resources, limiting their exploitation and instead promoting resource reuse and recycling (Geissdoerfer et al., 2017). In this regard, one of the major challenges that academics and policymakers are facing is to understand which are the main facilitators of the adoption of business strategies based on sustainability principles for companies, both mature and newly created. In fact, the scientific debate is increasingly tightening around the theme of startups, as they are considered important elements within the innovation system of the CE.

Several scholars (e.g. Hekkert et al., 2007) argue, in fact, that startups stimulate the production of innovation, especially radical innovation, and push other actors, such as incumbent firms, to follow their example by embracing the innovative paradigms they propose. Moreover, startups have the advantage of overcoming one of the main problems that limits the implementation of sustainable practices in already mature businesses: being nascent firms, they are endowed with high flexibility that allows them to adapt to unconventional strategic choices, such as the adoption of principles proper to the CE (Pizzi et al., 2021). However, to date, research has mostly focused on circular approaches adopted by incumbent firms,

while the contributions of startups are still under investigated. For this reason, the present study focuses on the relationship between startups and sustainability, specifically it investigates the role of CE on the innovative strategies of 13 startups. The contributions of this work to existing scientific knowledge are several. Firstly, from a general point of view, this study contributes to the literature on entrepreneurial ecosystems. Secondly, this work underlines the relationships that exist between startups and sustainability, promoting the development of a strategic tool for entrepreneurs. The article is structured as follows: in Section 2, the methodology adopted to conduct the study is presented. Section 3 presents the results of the literature review through keywords analysis, while in Section 4 the results of the multiple case study are shown. Finally, Section 5 provides conclusions, limitations and future research directions.

## **2 Methodology**

The research framework adopted in the present study consists of two main steps. First, a literature review was conducted using the keywords analysis methodology proposed by Fadlalla and Amani (2015). The second step consists of a multiple case study based on the results that emerged from the literature review.

### ***2.1 First phase: keywords analysis***

The research process started with a review of the literature on the subject conducted through the keywords analysis methodology proposed by Fadlalla and Amani (2015). This analysis allowed us to classify the main issues concerning the relationship between startups and sustainability based on the keywords indicated by the authors of the articles in the sample. Specifically, the keywords were categorized based on two parameters, frequency, and persistence, which indicate, respectively, the number of papers in which the word appeared as a keyword and the number of years in which it was used. The result was the classification of the keywords into four broad categories, identified by crossing the dimensions just mentioned and labelled as follows: trendy, emerging/phantom, core and intermittent. The keywords in the trendy quadrant refer to the issues that are of most interest to the scientific community, while those in the core quadrant help to understand the theoretical basis of the topic studied. The emerging/phantom

quadrant, on the other hand, contains the words that appear with low frequency and persistence, while the intermittent ones refer to topics treated with discontinuity. To conduct this analysis, the following query was entered into the Scopus database: TITLE-ABS-KEY ("startup\*") AND TITLE-ABS-KEY (innovation) AND TITLE-ABS-KEY (sustainability), which returned 140 results (as of December 2022). Secondly, articles without authors' keywords or articles on topics not related to startups and sustainability were discarded, resulting in a final sample of 116 papers. Finally, in order to avoid distortions in the calculation of frequency and persistence, the keywords of the sample were standardized by making a series of corrections.

## **2.2 Second phase: multiple case study**

### *2.1.1 Questionnaire development*

The result of the keyword analysis made it possible to define the main points to be investigated through the questionnaire analysis. In particular, the topics that appeared in the trendy and core quadrants were investigated in depth, as they were indicative of an interest on the part of the scientific community. The questionnaire used in this second phase consisted of 4 sections, whose questions were formulated in such a way as to present a list of response options. The first section "Startup profiling" aims to collect general information about the startup (e.g., name, year of foundation, type of startup, turnover). The second section, "Attitudes of startups towards sustainability", aims to assess the degree of interest in sustainability. In detail, this section contained questions to investigate startups' desires for local/national/international programmes/projects supporting sustainability or how startups participated in sustainability initiatives. Section 3, "Adoption of circularity strategies", aims to investigate whether and how the responding startups adopt one or more of the 9 circularity strategies, i.e., reject, rethink, reduce, reuse, repair, refurbish, remanufacture, reuse, recycle and recover. Finally, the fourth section, "Circular Business Model", aims to investigate whether the above-mentioned startups adopt circular business models.

## **3 Keywords analysis results**

Figure 1 summarizes the results from the keywords analysis. The keywords were sorted into the four quadrants by combining the two dimensions of frequency

and persistence. In particular, the two average values of frequency (ADC) and persistence (APC) have been identified, obtained by performing the arithmetic mean of the frequency and persistence values of all the keywords except those with a value equal to 1 and those used as search keys in the string on Scopus (i.e., startup\*, innovation and sustainability,). Frequency or persistence values lower than the average value return low levels of the two dimensions, vice versa high levels. For the purposes of this study, it was considered appropriate to focus the discussion on the topics that appear in the trendy and core quadrants. In this regard, two main aspects of research have been identified: startups characterized by sustainable business models (SBM) and strategic collaborations.

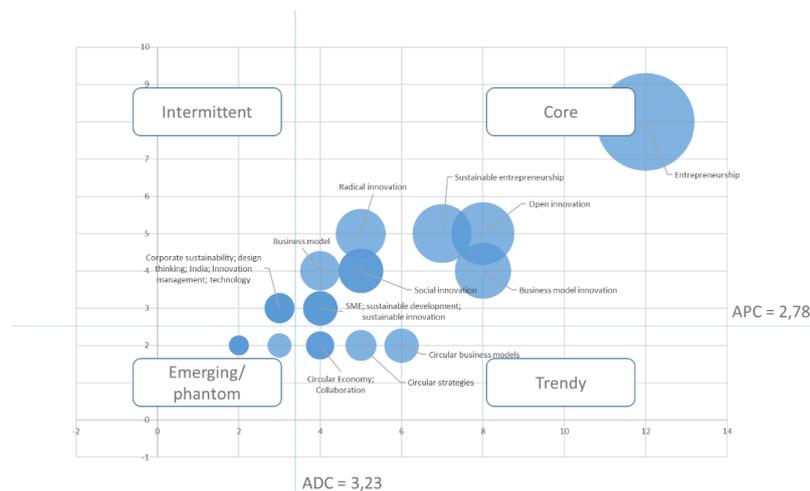

Figure 1 Keywords distribution across quadrants

### 3.1 Startups' SBMs

Business models (BMs) indicate a firm's competitive strategy, how the firm produces its product or offers its service in the marketplace, price, production costs, how it differentiates its value chain from that of other firms, and how it collaborates with other firms. BMs are seen as a key factor in the transition from a linear economy based on end-of-life product waste, to a CE. BM innovation, in fact, offers a potential approach (Henry et al., 2020) to achieve the required change by rethinking the purpose of the enterprise and the logic of value creation (Pieroni et al., 2019). With a view to leading the system to circularity, a transition from a linear economy to a CE, BM innovation is required for the specific purpose

of incorporating CE elements into the current BM. At a general level, we speak of SBM, i.e., BMs that have integrated the dimension of sustainability within the organization. Consequently, it is correct to speak of SBM innovation, which differs from the more traditional BM innovation due to the incorporation of the three components of sustainability, namely environmental, social, and economic sustainability (Boken et al., 2018). Businesses oriented to shift toward the sustainability paradigm must necessarily develop a "sustainable mindset" by integrating business performance measurement with social and environmental, as well as economic, indicators (Stubbs et al., 2008). Moreover, when talking about SBM, it is important to emphasize the concept of value, which includes costs and benefits not only for the company and its customers, but also for the environment and society (Bigliardi and Filippelli, 2021). Since numerous studies recognize the CE as a driver to achieve corporate sustainability goals, the concept of circular BM has recently become popular (e.g., Bardford et al., 2022). Linder and Williander (2017, p.2) formulated one of the first definitions of circular BM by stating that it is "*a business model in which the conceptual logic for value creation is based on utilizing the economic value retained in products after use in the production of new offerings*". More specifically, the literature has identified four ways in which a BM becomes from sustainable to circular, namely through recycling, extension, intensification, and dematerialization of materials and energy in order to reduce the amount of input (Geissdoerfer et al., 2020). Considering circular BMs, to date the literature has focused mainly on the analysis of BMs of incumbent companies, i.e. companies already established in the market, in order to incorporate the dimension of circularity in them (Brendzel-Skowera, 2021). Specifically, innovating the BM to embrace the CE paradigm can be done by implementing different strategies. A company can, in fact, design a totally new BM to replace the existing one, or it can operate a transformation of the current BM or, finally, implement a diversification strategy by acquiring an additional BM to be placed alongside the current one (Bigliardi and Filippelli, 2021). Salvador et al. (2020) highlighted how the size of a firm influences the design and subsequent implementation of CE practices. In fact, according to the authors, firm size can be a barrier to the adoption of circular strategies because a large, market-mature firm has little flexibility and finds it more difficult to innovate its business model. Moving away from "business as usual" is necessary to overcome the current trends in resource use caused by a linear socio-economic system, but the rigidity of structured firms does not always make this transition easy. Conversely, smaller firms such as

startups, being less entrenched in their BMs, are often a source of innovation and can create disruptive changes in their BMs because of their greater flexibility. When comparing the strategies required to implement circular BMs, the results indicate that circular startups tend to embrace CE activities at a higher level than incumbent firms (Veleva et al., 2017).

### **3.2 Strategic collaboration**

Although startups have far greater inventive capacity than well-established companies, whose business is well established, they often have major problems with innovation, finding rigidity in the commercialization of the products resulting from it. One of the main problems that startups have to face is the lack of resources of any kind: financial, human and physical, for this reason it is difficult to bring to market the technological or product innovations made (Khilji et al., 2006). As far as circular strategies are concerned, the adoption of circular practices by innovative startups is subject to the same criticalities, since it is necessary to have resources, infrastructures and knowledge that only in rare cases already belong to the startup, while they are much more likely to be held by a plurality of actors outside the organization. It follows that one way to overcome this limitation is to undertake strategic collaborations with different partners that guarantee the contribution of those complementary capabilities that the startup lacks. In this regard, it is necessary to create a network of relationships that facilitate the implementation of CE practices in the company's business, as well as the marketing of a product made by adopting such practices (Chesbrough, 2003). This inevitably implies an exchange of knowledge and skills between the startup itself and the surrounding environment, made up of the different actors that the startup needs. This tendency to engage in strategic collaborations refers to the paradigm of open innovation (OI), which results as a core keyword. The concept of OI was introduced by Chesbrough (2003) in 2003 to emphasize how the combination of knowledge from inside and outside the organization fosters the production of innovation. Applying the concept of OI to startups, it is possible to frame different types of actors that intervene in the value creation processes, such as incubators, established companies, VC firms, companies operating at different levels of the value chain, research institutions or other startups, with whom it is possible to share resources (Spender et al., 2017; Badiale et al., 2022).

## 4 Analysis and results from the multiple case studies

### 4.1 Sample overview

The startups included in this research are all limited liability companies that operate in different sectors. They all have in common the presence of an innovative idea of product, service, process, technology, organization or business model. An overview of the startups' profile, together with the indication of the interviewees, is proposed in Table 1. For privacy issue we replaced real startups' names with letters.

Table 1 Sample presentation

Startup	Year of establishment	Sector	Interviewees	Number of employees	Annual turnover	Average employees age
A	2021	Packaging	company owner and founder	0	0 – 50.000€	46-50
B	2021	IT consulting	company owner	1-3	100.000 – 500.000€	>50
C	2018	IT consulting	company owner	4-10	500.000-2.000.000€	46-50
D	2020	Food	company owner	1-3	100.000 – 500.000€	20-25
E	2019	Software production	company owner	1-3	50.000-100.000€	41-45
F	2021	Software production	company owner	1-3	0 – 50.000€	>50
G	2021	Biotechnology	founding member	0	0 – 50.000€	46-50
H	2021	Manufacturing	company owner and founder	0	0 – 50.000€	36-40
I	2020	Software production	company owner and founder	1-3	100.000 – 500.000€	41-45
L	2016	Software production	company owner and founder	4-10	100.000 – 500.000€	46-50
M	2015	Manufacturing	administrative officer	4-10	500.000-2.000.000€	>50
N	2020	Marketing consulting	company owner	1-3	100.000 – 500.000€	26-30
O	2015	Manufacturing	employee	>10	> 5.000.000€	>50

#### 4.2 Startup and sustainability with respect to startup size

The exhibition of the survey results focuses on two main directions, in accordance with keywords analysis results, namely the tendency of startups to address the issue of sustainability and the strategic collaborations they engage in. Both issues were studied in relation to the size of the startups investigated. Specifically, although there is no official classification of startups based on their size, for the purpose of this study three categories of startups were identified based on turnover, as shown in Table 2.

Table 2 Startup classification with respect to size

Turnover	Startup category	N. of startups in the sample	Startup
< 50.000€	Micro	4	A,F,G,H
50.000 – 500.000€	Medium	6	B, D, E, I, L, N
>500.000€	Large	3	C, M, O

As previously discussed, sustainability is declined in the three dimensions of social, economic and environmental sustainability. Thus, it was at first found which dimension or dimensions of sustainability the startups investigated are pursuing. Respondents were provided with a definition of the three forms of sustainability so that their response could not lead to misunderstanding. Specifically, by economic sustainability we intend a use of resources in such a way that real incomes are not compromised in the future, allowing subsequent generations equitable access to resources (Markandya and Pearce, 1988). The definition of social sustainability is given by Black (2004, p.34): *"the social dimension of sustainability has to do with the extent to which social values, social identities, social relationships and social institutions are capable of being maintained into the future."* Finally, environmental sustainability refers to the protection of the ecosystem and renewal of natural resources focusing on different types of strategies: reduction of extraction of natural resources, reduction of production of pollutants, reduction of physical degradation of nature (OECD, 2001). Of the 13 startups under investigation, only one stated that it did not pursue any of the three forms of sustainability, while the rest were divided into 3 startups that address the social dimension jointly with the environmental dimension and 9 that address only the environmental dimension. Next, it was asked what ways startups adopt to pursue sustainability goals. It was found that

micro startups favor joining local, regional or national sponsored sustainability support programs (i.e., startups A, F), and using SBM to integrate more circular practices (i.e., startups A, F, G, H). In contrast, larger startups prefer an approach that does not involve a radical revolution of the existing BM (i.e., B, D, O). One possible explanation for this phenomenon is related to the possibility of likening medium and large startups to incumbent companies, which are more financially robust and have a more established market presence than micro startups. Looking at the graph in Figure 2 we notice that large startups are the oldest, founded between 2015 and 2018. Medium startups, on the other hand, were founded between 2016 and 2020, with one exception in 2021. Finally, all micro startups are newly founded, that is, in 2021. The literature concerning Circular BMs (e.g., Bigliardi and Filippelli, 2021; Geissdoerfer et al., 2020) points out that incumbent firms, which are well established in the market, rarely resort to disrupting their current business model to make it circular because of limited organizational flexibility. In contrast, smaller firms such as startups, being very young, do not have a layered structure, thus they can easily change their business model depending on the desired sustainability goals.

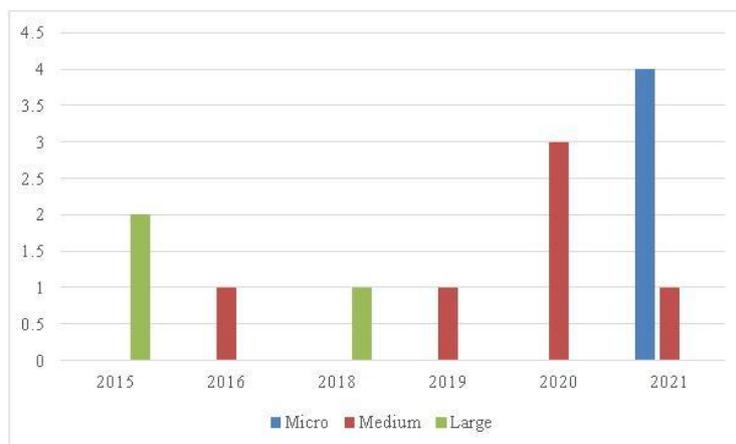

Figure 2 Year of establishment of the startups included in the sample

As for the motivation of startups to embrace sustainability, it was found that the majority of the micro startups (i.e., F, G, H) show reasons related to corporate vision and mission. That is, at the time of creation the founders took care to include sustainable initiatives and practices. In only one case (i.e., A) the motivation lies in corporate social responsibility, i.e., the company while not

obligated decided to adopt processes or use products that would enhance corporate sustainability. Considering, on the other hand, larger startups, in only one case (i.e., C) the motivation is embedded in the corporate vision. In most cases (i.e., B, D, L, M, O), in fact, the company resorted to sustainability practices to fulfil regulatory obligations that required it to meet specific environmental regulations.

Looking specifically at the environmental dimension, the main circular objectives pursued were identified. In this regard, as shown in Figure 3, there is uniformity in the objectives across the three sizes, with the exception of life cycle assessment (pursued by 3 micro startups, i.e. A, F, H) and greenhouse gas reduction (pursued by only one large startup, i.e. C). Specifically, life cycle assessment (LCA) helps to understand the impact generated toward the environment by products, services, economic systems, or production chains. It implies that this practice is implemented by firms producing tangible products, which would explain why few startups in the sample selected this objective: most do not make physical products but operate in the field of IT services.

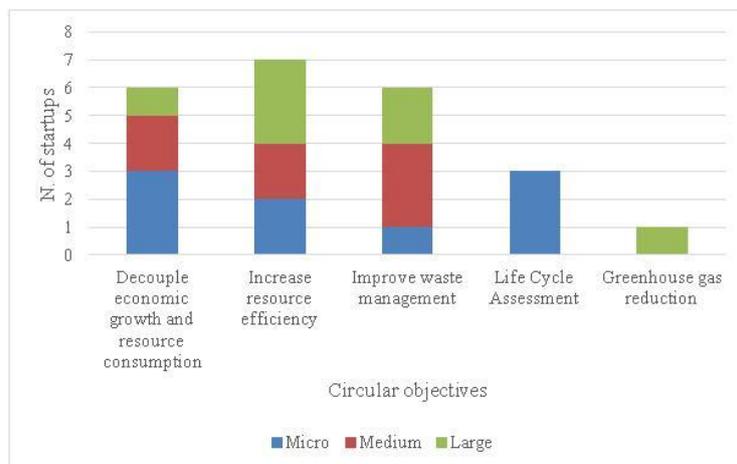

Figure 3 Startups' circular objectives

Another interesting theme concerns the sample startups' adoption of circular strategies. Specifically, the respondents were asked to identify which of the circular strategies identified by Potting et al. (2017) (i.e., Refuse, Rethink, Reduce, Reuse, Repair, Refurbish, Remanufacture, Repurpose, Recycle, Recover) have been adopted.

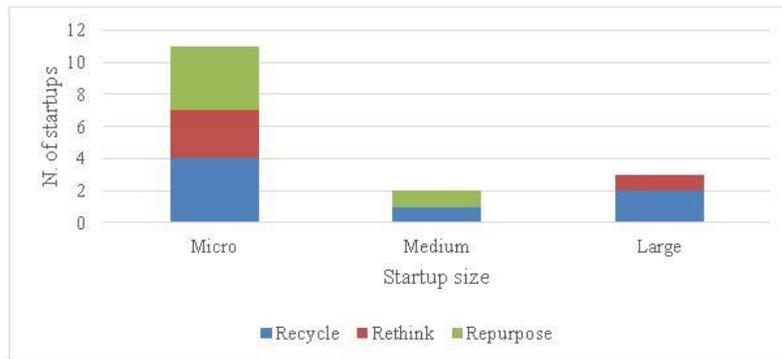

Figure 4 Startups' circular strategies

As is shown in Figure 4, there are three strategies adopted by the startups in the sample, namely recycle, repurpose, and rethink. Notably, there is a marked difference between micro and medium-large startups. The latter appear disinclined to implement circular strategies and, in most cases (i.e., D, M, O), focus only on recycling, in accordance with the goal of improving waste management. Micro startups, on the other hand, show a propensity to adopt strategies that can lead the business system to greater circularity. This goes hand in hand with the tendency, typical of the micro startups in the sample, to innovate the business model to include elements of circularity. It is worth specifying that in the sample considered, rethinking practices concern the possibility of creating products sharable among users, repurposing practices aim to maximize the value of resources through product reengineering, and recycling practices concern the possibility of recovering by-products of production systems and reducing the amount of waste. The summary of case study results in relation to the sustainability issues can be seen in Figure 5.

		Micro	Medium	Large
Sustainability dimension	Environmental	F,G,H,	B,D,L	C,M,O,
	Social and environmental	A	I,N	
Mode	Programs that promote sustainability	A,F	D	C,O
	Circular business model innovation	A,F,G,H	N	M
	Circular strategies adoption without modifying BM		B,D	O
Rationale	Corporate social responsibility	A	I,N	M,O
	Legal obligation		B,D,L	
	Corporate vision and mission	F,G,H		C
Circular objectives	Improve waste mgmt	A	B,D,N	M,O
	Increase resource efficiency	F,H	L,N	C,M,O
	Decouple economic growth and resource consumption	F,G,H	L,N	C
	Life Cycle Assessment	A,F,H		
	Greenhouse gas reduction			C
Circular strategies	Recycle	A,F,G,H	D	M,O
	Rethink	A,F,H		C
	Repurpose	A,E,G,H	N	

Figure 5 Summary of case study results with respect to sustainability issue

Last, the issue of collaboration regarding the adoption of sustainable practices was studied. All micro startups in the sample resorted only to using internal company resources to develop circular-oriented innovations, while all large startups resorted only to collaboration with external partners (see Figure 6).

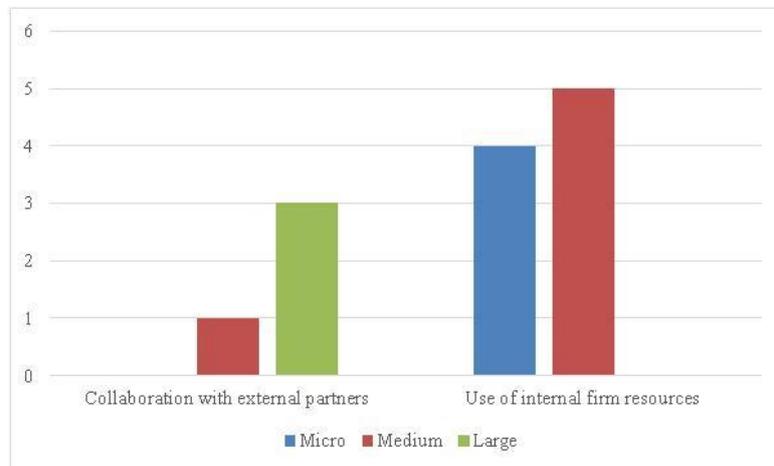

Figure 6 Startups' strategic collaborations

In this regard, it can be inferred that larger startups are more likely to resort to the OI paradigm, theorized by Chesbrough in 2003, according to which the use of external ideas, knowledge and skills in conjunction with internal ones fosters the production of innovation within the company. Accordingly, this is done through strategic collaborations with players outside the company, e.g., customers, suppliers, universities, research centers, competitors, etc. Looking at the large startups, Figure 7 summarizes the external collaborations conducted and their duration over time.

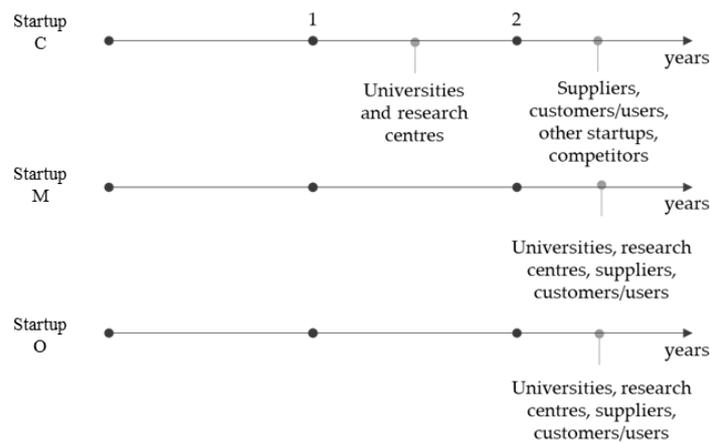

Figure 7 Large startups' collaboration partners and duration

In terms of the collaborations objectives, all three startups agree with the need to acquire missing knowledge, speed up growth and subsequent achievement of the breakeven point, and gain access to new markets.

## **5 Conclusions**

Over the past decade, the number of startups has grown significantly, contributing positively to regional and national development by increasing productivity, encouraging innovation and bringing new products or services to the market. Since the year 2015 when the United Nations drew up a list of SDGs to be achieved by 2030, the scientific literature has increasingly focused on a specific area of study concerning startups, namely the promotion of sustainability in startup businesses. The reason lies in the fact that startups, being yet unstructured business entities, have the opportunity to develop a new organisational culture integrating sustainability dimensions from scratch. Incumbent companies, having a more rigid structure, experience greater difficulty in pursuing environmental, economic and social sustainability objectives that require profound changes to the corporate organisational structure. Startups can realise a sustainable business from the very beginning, by proposing a circular business model, or to integrate sustainability practices into the company's operations. The underlying hypothesis is the fact that new business ventures are more open to new ideas because they lack an organisational culture, consequently it is easier to establish sustainable thinking unlike well-established companies.

In this regard, our paper aims to understand the approach towards sustainability of a sample of startups that are not specifically sustainable, i.e. that do not meet the definition of sustainable startups. A multiple case study was carried out on 13 startups following a survey. The issues investigated were identified through a literature study carried out by means of a keyword analysis. The approach proposed by Fadlalla and Amani (2015) was adopted and allowed the identification of hot research themes on the topic of sustainability in startups. Specifically, SBMs and strategic collaborations emerged as the topics of most interest in the literature. In order to carry out the multiple case study, the startups were divided on the basis of their size into micro, medium and large. The micro startups are characterised by varied sustainability goals and massively adopt circularity strategies such as recycle, rethink, and repurpose. The adoption of

sustainable practices is mainly through BM innovation, and in only two cases through specific sustainability promotion programmes. The motivation for adopting a sustainable approach is inherent in a corporate vision that incorporates sustainable thinking. As far as medium-sized startups are concerned, they have circular goals related to more efficient waste management, more efficient use of resources and decoupling of economic growth and resource consumption. The adoption of sustainable practices occurs in different ways, without one prevailing over the others, whether through BM innovation, sustainability promotion programmes, or the adoption of strategies that do not involve a change in the business model. The main reasons are related to legal obligations and corporate social responsibility. Finally, large startups have varied circular objectives, as in the case of micro startups, and the main strategies adopted involve recycling and rethinking. The rationale is linked to corporate social responsibility and corporate vision, while the methods are as varied as in the case of medium-sized startups.

Considering the results obtained, future research can be envisaged to complete the picture found. Firstly, since the sample consists of only 13 startups, it would be appropriate to carry out a further study considering a larger number of business entities to accompany the qualitative analyses presented in this paper with quantitative analyses. Furthermore, the sample investigated does not belong to a specific industry, so it would be interesting to repeat the study by selecting an industry, or by comparing several industries to assess any differences. Finally, the concept of strategic collaborations emerged from the literature review, consequently, a further advancement of the research could include the analysis of the collaborations implemented by startups in order to adopt a more sustainable approach.

### Abstract

In international markets, territoriality increasingly represents a decisive success factor for companies, particularly Italian ones, which, thanks to their intellectual capital, manage to be competitive in the era of globalisation in which we find ourselves, despite strong competition at world level. In fact, with particular reference to industrial companies, Italy has managed to make the concept of 'Made in Italy' perceived as a guarantee of quality and luxury throughout the world, creating a brand under which all Italian companies are recognised.

The reputation of the Italian manufacturing company is, in fact, known worldwide and is a hallmark of creativity and quality.

This paper aims to investigate the propensity of Italian SMEs to self-finance and invest in research, development, and innovation.

The research is conducted by analysing the findings of a company case study. The results for the three-year period 2019-2021 of a medium-sized Italian company belonging to the manufacturing sector were analysed to examine how a medium-sized family business can implement a growth project through the predominant use of internal financial resources.

The results show how, through self-financing, the company was able to increase its value and market share, especially abroad. This was done by investing heavily in innovation and research, despite the economic crisis resulting from the Covid-19 pandemic.

**Keywords** – Made in Italy, Self-financing, SMEs, Intellectual capital.

**Paper type** – Practical Paper

## 1 Introduction

The purpose of this paper is to analyse the importance of internal sources of finance within the growth strategies of Italian small and medium-sized enterprises and how internal sources have been used in investments aimed at strengthening the value of 'Made in Italy'.

It is, therefore, a company strategy: to focus on made in Italy and, at the same time, a strategic choice of a financial nature: to focus on internal sources.

The 'made in Italy' label is recognised worldwide as a feature that gives an intrinsic value to any product on which this wording is indicated.

Italian companies, from the few large to medium and small, with particular reference to industrial and manufacturing companies, have succeeded in creating a globally recognised perception of luxury and product quality.

The management of small and medium-sized Italian companies, which are often family-run, use the history of their family and territory to create a bond with the consumer through the transmission of cultural values, responsibility, and authenticity by emphasising the concept of 'Made in Italy' (Del Baldo, 2012). The creation of these bonds makes 'Made in Italy' a true national brand, representing all products made in Italy and to which it gives an added value, perceived as such throughout the world. In turn, the application of this brand gives the product an added value, other things being equal, compared to the same good produced in other countries of the world (Cappelli, D'ascenzo et al., 2017).

It is necessary to pay attention to the intangible components that have allowed Italian companies to penetrate foreign markets and achieve very high competitiveness at the top end of the market, exploiting market differentiation and targeting strategies (Galeotti and Garzella 2013). Indeed, Italian products are associated abroad with the idea of luxury and 'premium' products, thanks to the Italian style that sets them apart. In the collective imagination, Italy is recognised for its millennia of history, culture, and traditions, which are reflected in the style and quality of products made in Italy. In fact, the manufacturing sector is one of the driving forces of the Italian economy, with an increase in production since the crisis of 2008 until 2019, the last year taken into account due to the economic crisis, resulting from the COVID-19 pandemic, which exploded in 2020. However, by 2021 Italian manufacturing had already regained its pre-pandemic levels (Confindustria Report for 2021), performing better than Germany and France, even though these two countries had experienced a smaller drop in production at

critical times in 2020. This testifies to the fact that the manufacturing sector is a driving force for the Italian economy, even thanks to exports, which returned to an even higher level in 2021 than in 2019.

The manufacturing sector is mainly composed of small and micro enterprises that employ more than half of the workforce in the sector. Regarding this industrial sector in particular, Italy has a strongly positive image abroad, built up over the years and stemming from the history and culture, design, creativity, tourism, and lifestyle that only belong to Italy (Cappelli, D'Ascenzo et al., 2017).

In fact, also thanks to the phenomenon of globalisation, Italy and its companies have succeeded in establishing themselves as exporters of premium goods, recognised as such, and thus generating in consumers in foreign countries such as the United States, China, Russia, and the United Arab Emirates a very high willingness to pay for goods bearing the 'Made in Italy' label.

The status of premium products is universally recognised due to the relationship that companies have with the territory and the resulting value they create for stakeholders (Festa et al, 2020; Del Baldo, 2012).

This universally recognised value is also, and above all, created by small and medium-sized manufacturing companies, often family-run, which invest heavily in the region and in innovation to improve production standards.

The aim of this paper is to analyse how these investments generate value, especially for foreign consumers, and with which sources of financing the needs generated by these investments are covered.

## **2 Analysis of the literature and regulatory context**

It is demonstrated in the literature how the strength of Italian companies, and therefore of 'Made in Italy' in general, is based on entrepreneurial skills, business networks and intellectual capital (Schiuma and Lerro, 2008; Demartini and Del Baldo, 2015). In fact, 'Made in Italy' products are distinguished by characteristics that are both material, such as raw materials, production techniques, quality, and precision in the assembly of the products; and immaterial, such as the context and working methods with which they are made, the link with the territory of origin and the history behind the producing companies (Festa et al., 2020).

The affirmation of 'Made in Italy' as a premium brand is certainly due to the ability of the large successful companies operating in the food sector, such as

Ferrero, Barilla, Lavazza; fashion, from Ferragamo to Gucci; and automotive, such as Ferrari, Lamborghini, and Maserati.

However, the true essence of 'Made in Italy', representing the craftsmanship of the products, the relationship with the territory and the Italian lifestyle that is constantly sought after abroad is perfectly expressed by small and medium-sized Italian companies. This type of company, especially when exporting its production, relies on the craftsmanship and quality that comes from Italian origin. In fact, most Italian companies do not operate in sectors where economies of scale or scientific excellence are critical success factors. Often, as in the case study at hand, the pillars of success are production technology, access to certain exclusive raw materials, or the brand. This happens more in sectors where the success of Italian SMEs abroad is very strong, such as food, fashion, and furniture, the so-called '3Fs'.

The territory has become an instrument of competition, acting as a repository of localised knowledge, one thinks of certain areas related to the production of leather goods or cars, and consequently becoming a guarantee of product quality.

In fact, the reputation of 'Made in Italy' is linked not only to human factors, such as design and creativity, but also to territorial factors, e.g., the leather goods industry in Tuscany, the eyewear industry in Veneto or the automotive industry in Emilia-Romagna.

This added value can be found in the intellectual capital of Italian companies that have been able to build and enhance a very positive image thanks to their relationships with the territory, their employees, and the individual knowledge of individuals, which is a key element for the success of SMEs (Paoloni et al., 2020; Camuffo et al., 2007)

The surplus value recognised for goods produced in Italy has led over the years to continuous and repeated attempts at counterfeiting in many sectors, from food to fashion and consumer goods. In fact, global trade in trademark-infringing products in Italy exceeds €24.3 billion in the pre-pandemic period (2018, OECD data). Imports of counterfeit products into Italy have also reached a significant level, amounting to €9 billion, representing over 2% of total imports into Italy.

Relocation strategies, implemented by companies in order to lower labour costs and tax burdens, have also meant that more and more parts of the production process are carried out in countries other than Italy, where only the last, or some phases of the production process take place.

Empirical proof of the above is the phenomenon of 'Italian sounding', i.e., the tendency to recall distinctive Italian elements, such as the colours of the flag, names, places, or typical expressions that suggest a provenance with the country but have no connection with Italy.

The Italian regulatory framework on the protection of origin marking is confusing and unorganised. The supranational source regulating indications of origin is the Madrid Agreement of 1981, which prohibits the affixing of false or misleading indications of origin on products. The 2004 Finance Act made it an offence to import, export and market products bearing false or misleading indications of source or origin. Under the law, it is also an offence to use signs that may lead the consumer to believe that the product has Italian origin. However, this risk is only averted in Italy, as the ban on the use of such distinctive product signs only applies on the Italian market and to a certain extent on the European market, generating the aforementioned phenomenon of 'Italian sounding'.

The reference legislation on the origin of products is identified at European level in the European Union Customs Code, established by Regulation (EU) No 952/2013 of the European Parliament and of the Council of 9 October 2013.

The regulations identify two types of origin: preferential and non-preferential. The first, preferential origin, has very stringent requirements since its recognition confers customs benefits on the products.

Non-preferential origin, on the other hand, is recognised when products are wholly manufactured in one country or, if two or more countries are involved in the manufacture of a product, origin is obtained where the goods have undergone their last, substantial, economically justified working or processing in a company specially equipped for that purpose, resulting in the manufacture of a new product or representing a major stage of manufacture.

In fact, there is a tension of opposing interests in this area: on the one hand, large companies that adopt strategies to delocalise production, demand more flexibility on the use of the label 'Made in Italy'; on the other hand, small and micro artisan companies, through trade associations, have always demanded a stricter discipline to enhance the craftsmanship of their products, their link with the territory and reduce the number of goods offered on the market that can have the label 'Made in Italy' (Temperini et al., 2016).

As mentioned above, the economic crisis resulting from the Covid-19 pandemic was a major shock for Italian companies, especially the manufacturing

sector, in 2020. However, the recovery was excellent, returning production to pre-crisis levels in 2022.

This was made possible not only by the business and household assistance policies adopted by the government, but also by the ability of entrepreneurs to react to the crisis and reinvest in the business, sometimes sacrificing their own remuneration. In particular, small and medium-sized enterprises, which make up the Italian entrepreneurial fabric, were able to cope with the sudden shock that interrupted the economic and financial cycle, generating liquidity crises. Especially the most indebted companies, although in financial equilibrium, found it more difficult to find additional resources and guarantees for new financing. In fact, the issue of the undercapitalisation of Italian companies, especially small and medium-sized, often family-run businesses, and the massive recourse to bank credit has characterised the Italian economic-financial context for years (source: Bank of Italy).

The topic of sources of financing for SMEs in Italy has been extensively discussed in the doctrine (Block et al., 2018; Irwin et al. 2010; Paoloni et al. 2019; Tutino and Paoloni, 2012).

In general, companies are born with a financial need: their economic/financial cycle sees costs placed before revenues, and in particular costs attributable to investments in durable goods necessary to start production (Bianchi M.T., 2022; Bianchi C., 1998; Capaldo, 2013).

The sources of funding identified in doctrine are generally:

- Equity.
- Debt.
- Hybrid financing, such as equity loans or subordinated loans.
- Self-financing.

Self-financing is a form of covering needs, which, however, does not entail an injection of new liquidity into the company. In fact, it only involves the retention of monetary resources generated by operations (Bianchi, 2022).

Self-financing strategies are often linked to the product life cycle. In fact, in the early stages of the cycle companies tend not to distribute earnings in order to reinvest them in product development, in the maturity phase the dividend policy will certainly be freer (Yusra et al. 2019).

In addition to the above, a rising interest rate scenario is characterising the market and increasing the cost of money for households and businesses.

In light of this, it is evident how the use of internal financing sources, typically found in retained earnings, becomes vital for the economic and financial equilibrium of the company.

Self-financing is generated by the renunciation of the distribution of earnings, or part of them, by the shareholders, to which must be added all costs that do not have a monetary manifestation (depreciation, amortisation, provisions, and write-downs net of the use of funds) (Capaldo, 2013). Self-financing is, in itself, an index of company health as it indicates the propensity of shareholders to capitalise the company and strengthen its capital structure by reinvesting their profit. Indeed, for years the regulatory system has sought through measures such as the 'ACE' (Aid to Economic Growth) and, following the Covid-19 pandemic, the 'Super ACE' for the year 2021, to strengthen the capital structure of companies, especially small and medium-sized ones. Therefore, waiving shareholders' remuneration in order to ensure business continuity and enable the company to make further investments is also socially responsible behaviour from an ethical point of view.

It is evident that from an accounting point of view, with particular reference to the portion of undistributed earnings, self-financing represents an internal source of financing within the company and is comparable to equity capital, therefore, it needs to be adequately remunerated. In fact, the uses must all be capital deployments that in the future will have to generate surplus income for the company, creating value for the stakeholders and also for the shareholders.

It is, however, clear that companies cannot practise overly restrictive dividend policies, especially those with widespread share ownership, as they would discourage investors and potential investors from subscribing to new capital. Therefore, it is necessary to balance these two shareholder interests, that of corporate growth and that of immediate equity returns (Bianchi, 2022).

### **3 Methodology / Value**

The research is conducted by means of a qualitative methodology: the direct analysis of a single case study aimed at analysing the value creation and internationalisation strategy of an Italian SME through the observation and study of its business model and the structure of its capital sources.

The structure of funding sources was studied, with particular reference to the relationship between external and internal sources.

Starting from the information contained in the financial statements prepared in ordinary form, pursuant to Articles 2423 et seq. of the Civil Code, consisting of:

- Balance Sheet.
- Profit and Loss Account.
- Cash flow statement.
- Notes to the accounts.
- Management Report.

An analysis of the corporate strategies implemented in the three-year period 2019 - 2021 was carried out by analysing the quantitative and qualitative relationship between sources and uses of capital.

The company, which voluntarily provided the data for the study, is a medium-sized family business. It was founded in 1992 in the province of Latina, in lower Lazio, and in just a few years established itself as a major player in the national market for composite sinks. In the twenty years since its foundation, it has become a leader in the Italian market for composite sinks, competing with international giants such as Franke, Corian, and Shock. Since 2008, the group has been expanding in size by attacking new markets, first in China with the Shanghai branch, and then expanding in Europe, opening branches in the UK, Poland and Germany.

The company has in fact decided in 2020 to also launch the production of a new bathroom furniture product line with a structured investment project that aims to double its production capacity by 2024.

<b>Personnel and Fixed Assets</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>
Personnel costs	4.948.704	5.042.479	7.314.102
number of employees	142	152	202
Fixed Assets	12.862.301	26.073.804	28.252.694

In fact, as can be seen from the graph, personnel expenses increased by 48 % (employment increased from 142 to 202 between 2019 and 2021) consistent with the increase in fixed assets, which was 120 % from 2019 to 2021.

In 2021, the company made new investments totalling EUR 3.7 million, of which about EUR 780.000 was in research and development and about EUR 490.000 in other intangible assets.

<b>Net Financial Position (global)</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>
Cash and equivalents	(43.590)	(2.495.222)	(3.247.901)
Financial debt - bank (short term)	2.815.538	590.332	2.316.789
Other financial debt (short term)	9.652	4.592	154.031
Short-term share of financing	1.031.609	397.228	952.427
Financial credit (short term)	(285.010)	(93.652)	
<b>NFP (short term)</b>	<b>3.528.199</b>	<b>(1.596.722)</b>	<b>175.346</b>
Other debt (long term)			364.375
Long-term share of financing	5.259.106	8.177.377	7.270.400
<b>NFP (long term)</b>	<b>5.259.106</b>	<b>8.177.377</b>	<b>7.634.775</b>
<b>NFP</b>	<b>8.787.305</b>	<b>6.580.655</b>	<b>7.810.121</b>

The company's financial position shows an excellent ability to create value for shareholders, in fact, the ROE (considering net income, post-tax) is 38% in 2019, 15% in 2020 and 18% in 2021. The sharp decrease in return on equity is only due to the increase in net assets from 2019 to 2020 due to the increase in revaluation reserves made as a result of special laws to deal with the Covid-19 pandemic crisis. In fact, net earnings grew exponentially from 1.02 million in 2019 to 3.87 million in 2021.

<b>Capital sources and uses</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>
External sources (Debt)	9.115.905	9.169.529	11.058.022
Internal sources (Equity)	7.436.550	22.427.765	25.804.480
Leverage (D/E)	01,2258	00,4088	00,4285

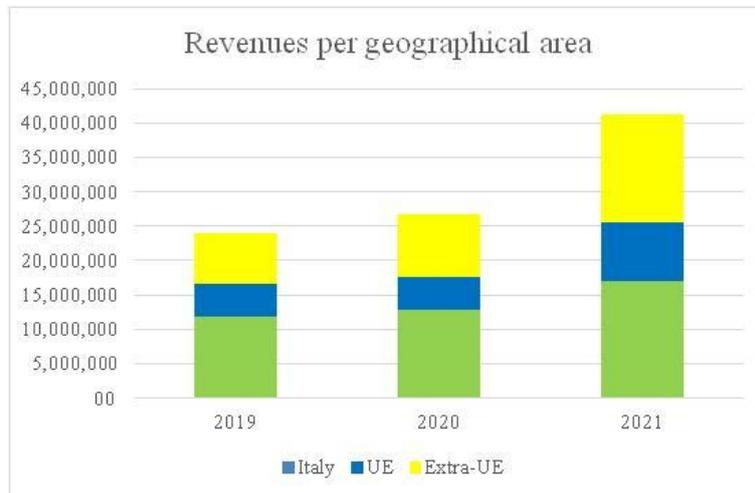

The company, despite huge investments that doubled its fixed assets in the three-year period and, therefore, generated a significant financing requirement, kept its exposure to external lenders constant in absolute terms, significantly reducing leverage from 1.22 in 2019 to 0.43 in 2022, making itself even less financially dependent on external lenders.

<b>Allocation of earnings</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>
Net earnings of the year	2.030.438	2.857.032	3.876.712
Dividends paid	00	00	00
Legal reserve	101.522	142.852	193.836
Extraordinary reserve	1.928.916	2.714.180	3.682.876
Retained earnings	2.030.438	2.857.032	3.876.712
Percentage of earnings retained	100%	100%	100%

In fact, an analysis of the company's financial statements shows an important level of self-financing: it did not distribute the earning for the 2019, 2020 and 2021 financial years. This strategy was necessary to support the development and growth process that the company is facing, as well as to strengthen its capital base to face the economic situation, which, however, has not negatively affected the company's results. The high amount of non-cash costs, due to the significant fixed assets in the balance sheet, and the 100 % earning retention rate ensured an important source to be used in investments and hiring of resources.

<b>P&amp;L</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>
Total revenues	24.063.341	27.454.873	42.864.060
External costs	(16.035.682)	(16.655.937)	(27.331.632)
<b>Value added</b>	<b>8.027.659</b>	<b>10.798.936</b>	<b>15.532.428</b>
Personnel costs	(4.948.704)	(5.042.479)	(7.314.102)
<b>EBITDA</b>	<b>3.078.955</b>	<b>5.756.457</b>	<b>8.218.326</b>
D&A	(1.302.949)	(1.666.726)	(2.571.425)
<b>EBIT</b>	<b>1.776.006</b>	<b>4.089.731</b>	<b>5.646.901</b>
Financial and non-operating income and expenses	773.030	(170.069)	(140.196)
Depreciation of participations	00	(413.017)	(431.865)
<b>EBT</b>	<b>2.549.036</b>	<b>3.506.645</b>	<b>5.074.840</b>
Income taxes	(518.598)	(649.613)	(1.198.128)
<b>Net Profit</b>	<b>2.030.438</b>	<b>2.857.032</b>	<b>3.876.712</b>

Indeed, the company has seen its revenues grow by almost 70 per cent over the last three years (2019-2021) rising from around 24 million to over 40 million, despite the global economic crisis resulting from the COVID-19 pandemic. This is certainly thanks to the sector to which they belong: household and home care products have not suffered a reduction in consumption, on the contrary, they have seen an increase in demand due to the increased time people have spent at home and the importance that the domestic environment has once again assumed. In the last years the company started to sell its products on its own, and under its own brand, contrary to what it used to do in the past but still keeping corporate clients as well. Is possible to assume that entering the market, especially international, under its own brand name and with the 'Made in Italy' label, has contributed to this increase in sale, even in foreign markets.

Also, however, to the great ability to establish itself abroad, especially in the non-EU market, where it doubled its sales from 2019 to 2021, enjoying great success in the Chinese market. Through its subsidiaries, Chinese and German ones in particular, has practiced very effective marketing policies to increase sales abroad. The company presents itself as the first and unique Italian player in the composite sink industry at the high end of the market.

As demonstrated in literature this surplus value of the products, due to the intangible assets owned by the firm, generate a highest willingness to pay for the goods produced by the firm.

This testifies and corroborates what emerged from the literature study, i.e., the great appeal of Italian products on foreign markets, especially the Chinese one. The company, in fact, has implemented an internationalisation strategy strongly focusing on the link with the territory and on 'Made in Italy'

Proof of this strong link to the territory are the investments in high-tech plant and equipment, the implementation of an ISO 14001 environmental management system (the company is already UNI EN ISO 9001 certified) and the recruitment and training of new employees for the Italian plant.

#### 4 Conclusions and future research

This paper analysed the expansion process of an Italian manufacturing company during the Covid- 19 pandemic and the mix of funding sources used to

finance the expansion. The growth was possible thanks to the strong focus of the brand, identified as made in Italy. So the value created is closely connected to this intangible asset.

In companies with a family shareholding structure, this problem of the trade-off between earning retention and shareholder satisfaction is eliminated, since shareholders and managers, or in any case the decision-makers regarding dividend policy, are identified in the same nucleus of persons. In the case of this study, it is possible to observe how the use of internal sources was correctly utilised in order to increase the profitability of the company, both in relation to the operational area and the overall company, thereby increasing its value.

The entrepreneur's renunciation of his own remuneration in the short term created value for the company, which through a virtuous circle increased its revenues and earnings, generating an increase in equity value.

It is therefore clear that the use of internal sources, in particular retained earnings, was decisive in order not to incur additional costs for financial charges and not to have to repay the capital at predefined maturities.

The waiver of earnings by the entrepreneur was a highly ethical behaviour for the company and the territory, guaranteeing jobs directly, through new hires, and indirectly through plant expansion works.

In addition, the company that strengthens its capital structure, invests in innovation and environmental sustainability, and carries out research and development and staff training make itself more financeable by the banking system (Bianchi and Ricco, 2022).

The present investigation has the limitation of having been carried out with a manual approach on a single case study from the quantitative and qualitative information.

It can present the starting point for subsequent studies in the area of sustainability of the company's operations and ESG criteria. In fact, the company does not provide any information beyond the mandatory information in terms of the environmental and social impact of its operations.

## **The Observatory for the Management of the UNESCO Site of Sassi of Matera: Cognitive Autopoiesis and Communities of Knowledge**

---

Angela Colonna

Department of European and Mediterranean Cultures.  
Architecture, Environment and Cultural Heritages  
University of Basilicata  
Campus Matera, 20 Lanera st.  
75100 Matera (MT), Italy

### **Abstract**

The UNESCO Chair on "Mediterranean Cultural Landscapes and Communities of Knowledge", University of Basilicata, research and experiment among others the concept of "Communities of Knowledge" inside the UNESCO site of the Sassi of Matera, contributing to the creation of the Permanent Observatory for the Management of the UNESCO site. The Management Plan (MP) for the UNESCO site of the Sassi was elaborated from a participatory process developed around the concept of "Community of Knowledge". Inside the MP, the strategical regeneration of the testimonial value and use of the UNESCO site - conceived as a cultural landscape of sustainability and harmony between human settlements and nature-, is to understand and operationalize the power of knowledge for the valorization of the Sassi's world heritage, make it also a Mediterranean laboratory and a model too. The Observatory was conceived to work as a laboratory of sustainable development, declined on the topic of valorization of a territory, understood as a universal cultural heritage. The entire design process of the UNESCO Site Management Plan was interpreted as 'process of processes' with methodological and operational value. An analogue approach, principles and procedures will contribute to the creation of the Observatory. With the idea of 'process of processes', attention is drawn to the different logical levels to which actions belong, from attention to the object of investigation and project, to attention to the process itself. This attention develops effective cognitive and awareness processes to implement responsible and participative strategies for the heritage management, conceived as 'common'. The Sassi Observatory project also proposes an autopoietic organization, embracing through its strategies, tools and methods, the way life develops and evolves, i.e., learning from the process itself. Lastly, concerning the actualization of the UNESCO site's values, inside the Observatory, the dynamic process of Sassi's identity building- interpreted as a complex relationship between place, community and universal value- has been read through the concepts of "Community of knowledge" and "Generative narration of the landscape."

**Paper type** – Academic Research Paper

## 1 Introduction

The Sassi Observatory is a tool envisaged by the Management Plan (MP) of the UNESCO site of "The Sassi and the Park of the Rupestrian Churches of Matera" and constitutes the management structure for the implementation of the Plan. The MP was drafted by Angela Colonna and Domenico Fiore, for the five-year period 2014-2019, twenty years after the Sassi were inscribed on the World Heritage List, in 1993. The MP was approved by the Matera Municipality in 2015.

Among the Observatory's objectives are two main tasks. The first task is to facilitate dialogue and collaboration between the public institutions responsible for the site, in order to harmonize their actions and activities, and orient them to the philosophy and strategy of the MP. The second task is the engagement of the population in the site management policies as a strategic action for the enhancement of cultural identity and awareness. Community engagement and dialogue between public institutions and stakeholders responsible for the UNESCO site are the cornerstones for the management of a site such as the Sassi, which is a part of the city, a part of the territory and, in essence, a cultural landscape. In both functions, dialogue is crucial, and the exchange and sharing of knowledge is the basis for building communities of knowledge.

The drafting process of the Management Plan developed along a path that began in 2011. In 2013, an intense participatory phase was carried out through a cycle of Symposia, interpreted as a creative, integrative and participatory environment for the shared construction of the MP; finally, the MP, scheduled for the five-year period 2014-2019, was drafted. The MP systematized contents collected, experiences of inter-institutional collaboration and community participation (envisioned as 'knowledge bearers'), the working procedures used, and the methodological in-depth study. The structure of the MP itself is the result of the synthesis of the contributions of all the phases of the pathway. Moreover, the path that led to the definition of the Plan also constituted the experimentation for the definition of the process and method. To date, the MP has not yet been implemented, nor the Observatory, which is the instrument for

implementing the Plan, has been established. But some actions have been taken to urge public institutions to establish the Observatory. These actions were planned and implemented by the UNESCO Chair in 'Mediterranean Cultural Landscapes and Communities of Knowledge', established at the University of Basilicata in 2016, with A. Colonna as Chair Holder. The UNESCO Chair has among its objectives the facilitation of the launch of the Permanent Observatory for the management of the Sassi UNESCO site (Colonna 2018). The UNESCO Chair has worked both by designing the structure of the Sassi Observatory and developing its operational methodologies (The Observatory project has been developed by A. Colonna and D. Fiore in 2021), and by facilitating a bottom-up participation process aimed at experimenting with the realization of a self-managed core of the Observatory (*Participatory Document of Intent for the Observatory of the Sassi UNESCO Site*, drafted in 2019, for a bottom-up experimentation preparatory to the creation of the Observatory, conceived as a 'Community Foundation'). In these activities, a number of specificities have been introduced that are an expression of the UNESCO Chair's competences and that constitute the core of its research: the experimentation of "Communities of Knowledge" and "Generative Narrative of the Landscape" concepts. These are two specific and interconnected functions, clearly identified in the executive project of the Sassi Observatory proposed by the UNESCO Chair. "Community of Knowledge" and "Generative Narrative of the Landscape" constitute two intertwined strategies to develop within the Observatory the process of actualizing the values of the UNESCO site (Colonna 2020): a path of dynamic construction of the identity of the Sassi has been realized, an expression of the relationship between the place, the community, and the universal heritage.

## **2 Community engagement and 'knowledge bearer'**

The MP for the Sassi UNESCO site was defined around the principle of participation and was based on the idea of a 'community of knowledge'. (Colonna 2019) The entire design process of the MP revolves around the idea of the Plan as a process. Thus, already the path set in motion for MP drafting becomes the first experimentation concerning principles, procedures and tools for implementing the MP. In this path, the Symposia were conceived as workshops to facilitate discussion, comparison and the development of creative and shared ideas among citizens and public institutions. The cycle of Symposia, with which the

participatory process was launched, was also the occasion for experimenting a format with continuity over time, for the implementation of the MP. Thus, the workshop form had been selected; tools and methods of process facilitation had been implemented. The innovative idea experienced in the Symposia was to give back to everyone the responsibility of being a 'knowledge bearer', a competence that shifts the focus from the 'stakeholder' perspective and changes the way of contributing. The 'knowledge bearer' is a figure defined more on contributing, while the 'stakeholder' is centered more on receiving. The figure of the 'bearer of knowledge', which stands out in the Sassi MP, is a novelty precisely because it is an alternative to the 'bearer of interest', a figure that is more generally used in concerted planning processes and in the MIC-Italian Ministry of Culture Guidelines for the MPs of UNESCO Sites and for local tourism systems. With 'knowledge bearers' comes the emphasis on 'knowledge' because this is not only the primary wealth of the contemporary world, but also one of the places of solidarity between people. In contemporary times, a transformation is emerging in relation to the idea of identity. One of the possibilities is that identity will increasingly become the expression of a social bonds based on exchanges of knowledge, mutual listening and appreciation of individuals. Therefore, if today it is on knowledge that the wealth of nations and businesses is based, it is necessary to focus on a better management of knowledge, a strategic skill for the development of a knowledge society that is realized through the contribution of all. The ethics of collective intelligence is based on the model of cooperative learning where access to knowledge is conceived as access to the knowledge of all, and where the exchange of knowledge becomes a new form of social bonds, as each human being is a source of knowledge for others. Collective intelligence is not the fusion of individual intelligences into an indistinct synthesis, rather it realizes precisely the full expression and valorization of individuals and their mutual enhancement. The principle is that no one knows everything, but everyone knows something and everyone can be enriched by the knowledge of others. This awareness emphasizes the interdependence between people and the value of cultural diversity and knowledge heritages. In order to stimulate the enrichment of individual cultural landscapes, it is necessary to invest in tools and methods to facilitate effective communication and spatial representation of each other's and groups' knowledge. To this end, a work of translation into schemes and structured maps can be particularly effective so that everyone can recognise themselves and can find their own knowledge paths. An operational tool, which

still offers much to explore and experiment with, is 'knowledge trees' by Michel Authier and Pierre Lévy. (Authier and Lévy, 2000) This is a tool for the dynamic management of the competences of individuals and groups, in which it is social interaction that is brought into play in a systemic sense through co-constructions of 'knowledge trees'. In this sense, knowledge is not only the primary wealth of the contemporary world, but also becomes one of the places of solidarity between men. The reciprocal multiplication of intelligences can not only be the key to economic success, but can also be one of the ways to the renewal of democracy: a society that is 'intelligent everywhere' will always be more effective than one that is only intelligently governed. The idea of knowledge bearers' is central to the MP and its implementation process, because it is the basis on which to imagine the evolution of the Matera community towards a 'community of knowledge'. Facilitating the process of evolution of the Matera community as a Community of Knowledge is one of the experimentation objectives of the Permanent Observatory.

### **3 Logical levels and autopoiesis**

Just as the entire design process of the UNESCO Site MP revolved around the idea of the Plan as a process of processes, and each activity was also an experimentation of the method, in the same way the same principle and approach is proposed in the realization of the Observatory. (Colonna and Fiore 2012) In the idea of process of processes, the focus is on the different logical levels to which the actions belong, from attention to the object of investigation and design to the process itself. (Watzlawick, Weakland and Fisch, 1974) Such attention develops effective cognitive and awareness processes to implement responsible and participative strategies for the management of the common heritage. An autopoietic organization is proposed for the Sassi Observatory, which makes its own, declining it in strategies, tools and method, the way life develops and evolves, i.e., learning from the same process. Living systems are cognitive systems, and life as a process is a process of cognition. The theoretical reference of the model derives from the discoveries made by Humberto Maturana in the 1970s, concerning the organization of living beings (investigating the nervous system, with parallel conclusions on the cognitive system), conceived as living systems that have a 'circular organization'; living beings have a closed causal circular process at the core of their basic organization. This process allows

evolutionary change, which consists of changing the way in which circularity is realized, never losing the very characteristic of circular organization. Furthermore, Maturana hypothesized that the nervous system is not only self-organizing, but continually referring to itself. On these premises, Humberto Maturana and Francisco Varela coined the term 'autopoiesis' to develop a model representing the way living systems, mind and cognition function. Research has developed from Varela's 'neuropsychology' to cognitive neuroscience studies, adding further verification and detail to that model. (Maturana and Varela, 2001) It is the way we know, learning to learn, continually redefining the balance within the circular process, and, by evolving, reorganize that circularity in an ever-new way, along a process by logical steps. In fact, the Observatory project proposed by the UNESCO Chair envisages its realization as a modular organization, with a cluster structure of modules, which makes it possible, through continuous monitoring, to make revisions and improvements *in itinere*, to develop learnings that are applied in the definition of subsequent modules, to have greater control of sustainability and to practice it widely, to effectively apply criteria of sobriety, replicability and implementation. Thus, a path made up of progressive activation of actions-implementing the Observatory's structure horizontally and flexibly, according to feasibility conditions and assessing the opportunities at any time along the way always with an overall perspective and strategic vision - makes it possible to progressively reach new levels of complexity over time, while still functioning as an organic whole at every stage of development. The overall functioning responds to the principle of 'circular organization', in which each element acts on the next, and the ring acts retroactively on the process ('retroactive ring' of the autopoietic model), to stay the course, continually correcting the trajectory *in itinere*. This operating structure of the Observatory is in line with the emergence, in this phase of epistemological change, of procedural wisdom in place of the rationality of technical solutions, just as the need for the intertwining of specialized disciplinary knowledge and widespread, multiple knowledge practices emerges. From these also derived a new positioning of the interweaving of knowledge and doing, the role of practices, the continuous monitoring, the modular structure of project interventions (as laboratory modules), within a strategic overall framework.

#### **4 A Mediterranean model laboratory**

The MP of the Matera UNESCO site not only directs actions for a sustainable management, but also support a management that can become a model laboratory of sustainability, helping to spread the culture of sustainable development and to accelerate the transition to what in the MP is defined as the 'ecological paradigm'. The relevance of this change inside the MP can be seen in the MP Synthetic Map which, by grasping the relationships between the cognitive elements and the planning indications, is conceived as crucial tool to navigate within the Management Plan and the Action Plan; it had been also a working tool during the drafting process of the MP document, shading light on the complex relationships and connections between the different elements, levels and orders of discourse (Management Plan, Annex, 2014). Making the Sassi a Mediterranean model laboratory for sustainability is the MP's objective. In fact, the model that the Plan wants to realize is that of the 'Mediterranean Rupestrian Ecosystem', as the rehabilitation of the historical model and its actualization. The MP embraces the idea of drawing on the strength of the traditional model of the Sassi to nourish the new ecological paradigm, updating that archaic Mediterranean model and experimenting in Matera a laboratory of environmental and social sustainability for humanity. Matera's civilization is a successful experiment, that has worked for millennia, of appropriate use of scarce resources and ingenuity in landscape creation. The local solution is the creation of a functioning model with which global challenges and urgencies are addressed, and which concerns also energy and the sustainable use of resources (including water). This challenges the way of interpreting man's relationship in and with nature; a paradigm that has remained unchanged over a very long time, coinciding with the history of rural civilization. In that same millennial time, the model has been continuously refined, until it fell into disuse, along with the abandonment of the settlement, with the displacement of the Sassi in the 1950s. The strategy for the regeneration of the testimonial and use value of the UNESCO site -conceived as a landscape of sustainability and harmony between human settlement and nature-, is to use the power of knowledge and care for the valorization of the Sassi's World Heritage, and to make it a model Mediterranean laboratory. The cultural model expressed by the Sassi ceases to function when the paradigm changes, i.e., when the approach to the global issue of resource use changes. With the advent of the contemporary age, the paradigm of the 'limit', the very idea of man as part of

nature and subject to its rhythms and rules, is replaced by the paradigm of unlimited 'progress' in which man dominates an adverse nature. This has brought to a stop to long-lasting process of refining the model in the continuity of the criteria that had produced it and its landscape; this had led to the misunderstanding and loss of meaning of the site for its community. The community-driven and integrated management of environmental resources and space disappears and led to degradation of the whole system. In the 1950s, the Sassi were branded as 'national disgrace' and evacuated because of the interruption of the link with its community which had disabled and distorted the system and subtracted its meaning, leading to the collapse of that age-old ecological model. Today, in order to address the urgent environmental problem, there is a widespread consciousness regarding the need for an 'ecological transition'; issues of sustainable development, containment of the environmental footprint, use of renewable energy, and sobriety are posited as priorities. This new paradigm is the one within which the strategy of the Plan and its implementation through the Sassi Observatory is placed.

## **5 Conclusions**

The Observatory for the management of the Sassi UNESCO site, therefore, had been designed to operate as a laboratory of sustainability and co-creation of a Mediterranean model for the experimentation of sustainable development, declined through the issue of the valorization of a territory as a universal cultural heritage. Knowledge is the strategic resource for the epistemological revolution to be achieved. But it is a knowledge that must be associated with the growth of self-awareness, a knowledge as a widespread resource, a tool for the existence of communities; knowledge as practices of coexistence with the planet Earth that hosts us. In this sense, knowledge can structure a new form of community and the construction of identity processes: a 'community of knowledge'. The valorization of knowledge as an autopoietic process has inspired the operating structure of the Sassi Observatory and of the entire MP system, conceived as a process that in turn activates processes. The autopoietic process of knowledge is the very expression of the way life is organized and functions. The foundation of the MP and the Observatory one these understandings constitute an orientation towards sustainability, it is also an incentive for a sustainable approach to address the radical change necessary for human evolution.

### **Abstract**

Collaboration with external innovation drivers is one of the opportunities that companies, especially if belonging to more traditional sectors, can seize to embark on a twofold path oriented towards both a sustainable horizon and a Digital Transformation goal. This is the case of the Palescandolo Lavorazioni Siderurgiche, which works in the traditional sector of shipbuilding, in particular, providing steel beams and sub-assemblies to shipbuilders of the

calibre of Fincantieri. In this context, the company developed a project (METROPOLIS) in partnership with the Department of Industrial Engineering of the University of Naples Federico II in order to exploit the potentiality of Digital Transformation to improve efficiency and reduce environmental impact. Once described the production system of the company and the main steps of the project, the aim of this paper is to show how the implementation of a Digitalization Plan represents a fundamental premise in order to allow the development of optimization-oriented approaches for operations management and the collection of data related to the environmental impact, making the latter become a new aspect that can guide decision-makers. In particular, we will analyse the opportunity provided by a DSS solution in managing objectives oriented on one side on efficiency and on the other side on sustainability, letting emerge the need for multicriteria approaches able to capture and drive the complexity of systems in which these objectives conflict.

**Paper type** – Practical Paper

## 1 Introduction

The primary goal of the European Green Deal is to arrest the climate crisis reaching net zero greenhouse gas emissions in the EU by 2050 (Haines & Scheelbeek, 2020). Among the multiple related effects, the deal seeks to protect the citizens' health from environment-related risks and repercussions (Eu, 2019) through the implementation of effective policies in various sectors that have a significant impact on global emissions, such as the energy, housing, transport, food, industry, and healthcare sector (Haines et al., 2009). At the same time, while Digital Transformation (DT) has become vital for the stable growth of companies and represents one of the strategies to increase product quality and make production processes more efficient (Duraivelu, 2022; Tortorella & Fettermann, 2018), technological advances are enabling more efficient use of resources and waste reducing, opening the way to new sustainable developments also from an environmental point of view (Li, Dai, & Cui 2020; de Sousa Jabbour et al., 2018; Ghobakhloo, 2020).

Along the path linking DT and environmental impact, one of the main pillars is represented by new industrial policies able to support product and process transformations toward the use of more sustainable technologies. Indeed, social and regulatory dynamics are exacerbating the enacting of policies that press companies to make them embark on a path oriented towards a sustainable

horizon (Para-Gonzalez & Mascaraque-Ramirez, 2020; Caniëls, Gehrsitz & Semeijn, 2013).

However, the potentiality of these interventions is strictly related to the company's specific industrial sector, size, and position. In this regard, the most traditional sectors seem to have a lower digitalization trend due to reasons related to limitations in the infrastructure upgrade and technology availability (Alexandrova & Poddubnaya, 2021). One of these sectors is undoubtedly represented by the shipbuilding sector, in which the current industrial practices are still linked to traditional approaches (Kolić, Fafandjel & Zamarin, 2012, Centobelli et al. 2023). This misaligned evolution of the sector that reduces the boost to innovation depends on different factors: the oligopolistic characteristics of the market with very high entry barriers, the complexity of the final products and its supply chain, the high degree of customisation, the wide presence of labour-intensive operations (Gourdon & Steidl, 2019; Sánchez-Sotano et al., 2020).

In this context, we describe the experience of *Palescandolo Lavorazioni Siderurgiche* (PLS), one of the leading Italian suppliers of Fincantieri, the world largest cruise shipbuilding group (BRS, 2022). The company operates in the metal carpentry field, producing welded beams and sub-assemblies used for the building of cruise ships and ferries. Due to the absence of any form of production standardization, the production organization is very traditional with a very basic degree of digitalization. In this context, the company developed a project (METROPOLIS) in partnership with the *Department of Industrial Engineering* (DII) of the *University of Naples Federico II*, in order to exploit the potentiality of DT to improve the efficiency and to reduce the environmental impact. The project was developed in the framework of an Italian institutional program sponsored by the Economic Development Ministry (MISE) to promote innovative projects able to support Small and Medium Enterprises in process transformations.

The description of the projects and of the preliminary obtained results is interesting from many point of views. Its implementation has been highlighting the challenging aspects related to the introduction of form of DT within a very traditional sector. In addition, it allowed to show what are the practical difficulties in combining the attention toward the sustainability of the processes with the need to assure level of service as high as possible to respond to the pressing requirements of the market.

The remainder of the paper is organised as follows. In Section 2, we describe the characteristics of the productive context of PLS and the critical problems related to the logistic and production organization. Then, in Section 3, we describe the objective of the project and its main steps. Section 4 presents the characteristics of the DT introduced. Finally, in Section 5 the relationship between digitalization and evaluation performance is explored, and in Section 6 we close the paper with some conclusions.

## **2 The PLS production system**

PLS is one of the leading Italian suppliers of Fincantieri, the world's largest cruise shipbuilding group (BRS, 2022) and it operates in the metal carpentry field, producing welded beams and sub-assemblies used in shipbuilding for the building of cruise ships and ferries. Production is Make to Order, in the sense that, on the basis of the specific ship to be produced, Fincantieri provides the list of items that PLS has to supply. Items are grouped into batches, and each of them is characterized by a due date within which the batch should be completed and delivered to a final destination.

Each item is defined on the basis of a specific and unique technical drawing to be respected and has to be delivered according to a deadline. To have a picture of the technical and operational complexity of the process, just consider that the input materials of the PLS are principally represented by steel slabs that can reach 18 meters in length and exceed 3 meters in width; while the components (Part Number – PN) of the beams (obtained by the cutting of the slabs) may vary from few centimetres to some meters of length and/or width. Annually, the PLS produces about 15000 final items, starting from about 1000 steel slabs.

On the basis of the morphological and physical characteristics, items can be grouped into 5 different classes or families. After the cutting of the input steels, the production cycles of each PN generally involves the routing through various production cells where labour-intensive operations are performed with the support of dedicated machines. Figure 1 shows the layout of the production plant with the indication of 13 cells of production (from 3 to 15) and four storage areas (1, 2, 16, 17).

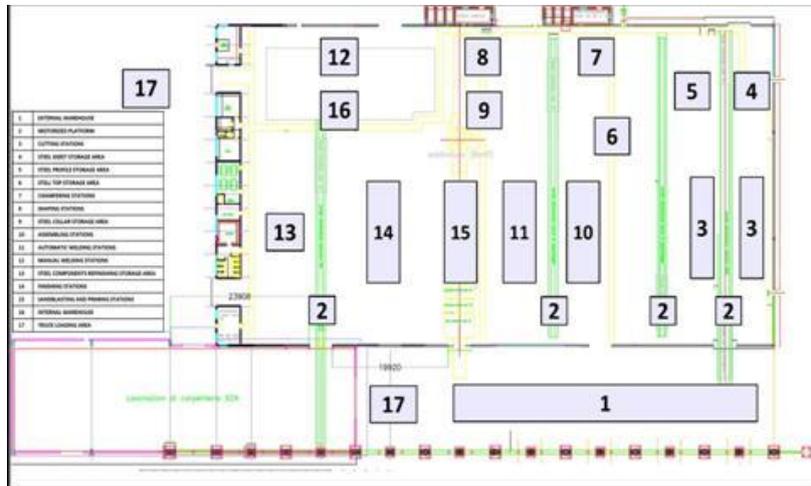

Figure 1 – Layout of the PLS production plant

The core of the production process is the cutting operation (cell 3) which is fed by the so-called nesting generation process, which consists of the definition of cutting schemes of the input materials to generate the required components followed by the consequent cut of the slabs. Once the cutting operation is executed, each PN follows different *operations routing* (the typology and sequence of operations) on the base of the PN characteristics. Finally, in the assembly phase all the PNs are collected and assembled so that the item can be stored in an output area (cell 1 or 16).

The described process presents various critical aspects. First of all, each family of items is characterized by different routing sequences, as shown in Figure 2. Consequently, the production process presents a low level of efficiency with long waiting times for single PNs at each cell due to the difficulties in coordinating the operations planning.

This aspect is typical of a Job Shop production scheme which is considered one of the hardest production contexts to be managed (Chaudhry et al. 2016). In the specific context, the difficulties are exacerbated by further determinants: the lack of a tracking system able to monitor the production progress, and the time consumption for the cell to cell handling operations due to the need of using special machines such as overhead cranes. Therefore, a significant percentage of the available time for production is lost to detect the actual position of PNs in the plant. In this regard, Figure 3 shows at each cell, the percentage of the actual processing time in relation to the total available time.

Another indicator which underlines the significant inefficiency of the whole production system is the level of service in terms of ability to satisfy the due dates indicated by the customer. Analysing a sample of produced items started in a time window of 6 months, over a total number of 6709, 4583 items, corresponding to 68,3%, were completed after the due date, with an average delay of 21 days and maximum delays over three months.

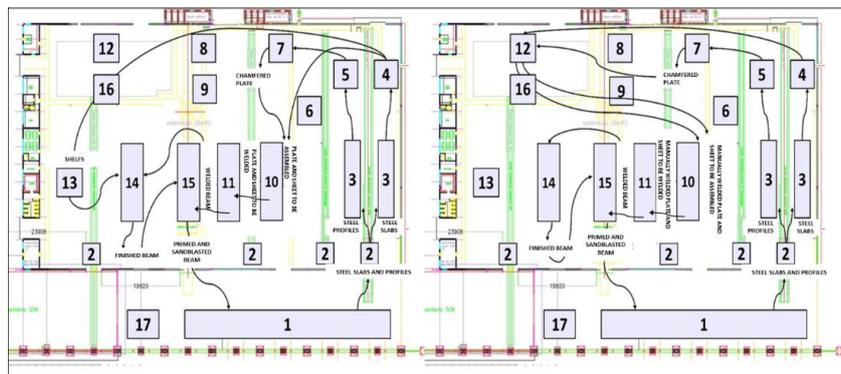

Figure 2 – Example of different production routing

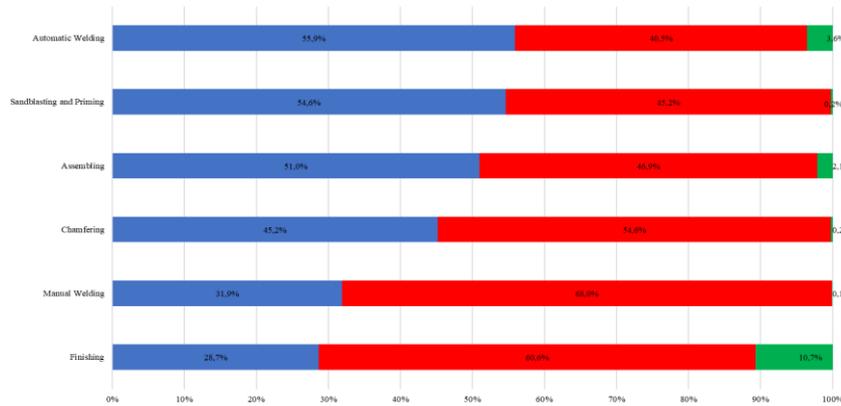

Figure 3 – Processing time (blue), waiting times (red), handling times (green)

Analysing the current production and logistic system, various critical aspects may be identified: the inappropriateness of the physical and information flows tracking system; the lack of a framework to monitor and to evaluate system's performance, especially in terms of sustainability; the absence of optimization-oriented approaches for operations management. More precisely, the current information tracking system is based on the application of paper labels which are

updated, duplicated, and printed at each production cell. Therefore, the system is susceptible to many kinds of errors, such as incorrectness and/or delay in the provision of information. Then, the data recording mechanism does not allow the company to monitor the production progress in real-time, making it impossible to intervene promptly to resolve any delays or operational problems and compromising the management of subsequent production planning.

Concerning the environmental impact, PLS currently does not collect any direct data related to waste production and energy consumption. Therefore, there is no evaluation about the sustainability of the production processes.

### **3 The METROPOLIS Project**

Starting from the described organization of the production and logistic system, the PLS opted for developing the Metropolis project in partnership with the *Department of Industrial Engineering (DII)* of the *University of Naples Federico II*, in order to improve the efficiency of the whole production system. The project adheres to the field of the "*Smart factory*" concerning technological solutions for the optimization of production processes and industrial automation, the integrated management of networked logistics, the use of advanced Information and Communication Technologies (ICT) for the virtualization of transformation processes and systems for the enhancement of people in factories (MISE, 2018), in line with the *National Strategy of Smart Specialization* related to the "evolutionary and adaptive production systems for customized production".

The duration of the project was 36 months and is articulated on 11 different *Realization Objectives* (RO), split into two categories the *Industrial Research* (i.e., planned research or critical investigations aimed at acquiring new knowledge and skills to be used to develop new products, processes or services or to make a significant improvement to existing ones) and the *Experimental Development* (i.e., the acquisition, combination, structuring, and use of existing scientific, technological, commercial and other knowledge and capabilities to develop new or improved products, processes or services).

The project aimed to implement a radical change in the production and logistics system on the basis of three main pillars. The first pillar was represented by the design and development of a Digitalization Plan in order to monitor and, consequently, manage in real-time the production processes, integrating it into the pre-existent ERP. The second pillar consisted of the definition of a set of KPIs

(Key Performance Indicators) able to describe the different dimensions of the production environment: specific attention was paid to identifying appropriate KPIs to describe and predict the level of service, also considering the expected trend of growth in demand. The third pillar is constituted by the role assumed by the sustainability objectives in the re-organization of the production process in a context of medium and long term.

The practical output of the project was the design and the implementation of a *Decision Support System* (DSS) able to offer decisional alternatives in the production planning and control in order to combine classical efficiency targets with environmental impact aspects.

Now the project is living in the final phase of experimentation of the adopted solutions. In the following the first results obtained during its realization are described.

#### **4 The Digitalization Plan**

The design and the implementation of a Digitalization Plan (DP) represented a necessary premise for the innovation of the production and the logistic system. The main objectives were (a) the design of a Data Warehouse Management (DWM) architecture in order to extract, transform and load data provided by external sources logically distributed along the production processes, (b) the elaboration and selection of appropriate subsets of data to allow the definition of models able to support decisions about the operations planning, (c) the calculation of a set of KPIs in order to monitor and evaluate the production and environmental performances. In practice, the data transmission and collection system, the connection tools between operators and the information system, and the desk and mobile interfaces (dedicated to the individual workstations) were defined.

The architecture is based on a LAN and a Wi-Fi network for the connection to various desks and mobile devices and a server rack where data extracted from different sources are stored. In order to collect data in real time, a network of sensors, based on different technologies, was installed. The main innovation is represented by the labeling procedure, which is performed as each PN is produced while information (position, processing times, waiting times) are automatically updated through infrared technologies.

The implementation of the DP, now completed, has been permitting the collection of a huge amount of data which are currently used to evaluate the performance.

## **5 The environmental impact evaluation**

Data collection, performed thanks to the implementation of the DP, has permitted a first analysis of the environmental impact of the production processes. To this aim, a methodology based on the *Life Cycle Analysis* (LCA) was applied. In particular, starting from the raw material inputs (steel slabs and profiles) and considering the entire production process, including the delivery phase, the material and energy consumption was evaluated and converted to CO<sub>2</sub>e (carbon dioxide equivalent). Figure 4 shows the contribution of each production/logistic operation to the environmental impact in terms of CO<sub>2</sub> equivalent production.

The cutting operation is particularly critical as two of the most impacting contributions according to the considered categories (*Damage to human health*, *Damage to ecosystems*, and *Damage to resource availability*) are the oxygen utilized during the cutting process and the steel production of the input material. For this reason, reducing the cutting operations would have a significant positive environmental impact.

Considering that the cutting operation is the initial process that provides the PNs, so crucially conditioning the production performances, it is fundamental to define appropriate methodologies able to appropriately manage this operation. This is the core of the DSS that has been developed to drive appropriate production planning decisions.

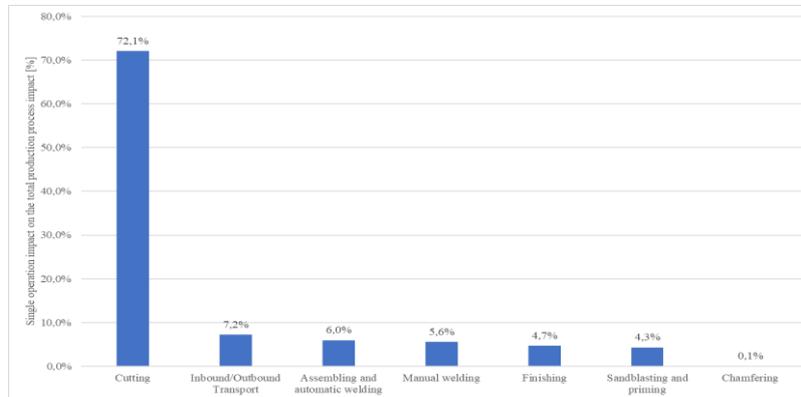

Figure 4 – Distribution of CO2 production over the production/logistic operations

## 6 Efficiency vs. sustainability: the opportunity provided by a DSS solution

As illustrated above, the cutting operation has a crucial role in the described production for two main reasons: it is responsible for the prevalent percentage of CO<sub>2</sub>e; it affects the production progress by determining the release times of each PN included in the items. Therefore, an efficient management of this process is fundamental in order to improve the desired system performance.

The cutting or nesting optimization, in general, arises in the presence of a set of bins of a given capacity that have to be partitioned according to a set of objects of given dimensions to be produced (Kellerer, Pferschy, & Pisinger, 2004). In our case, bins are rectangles of a given length and width that have to be cut according to the bi-dimensional characteristics (occupation, shape) of the PNs in the lists of the items. In order to have an idea of the problem, Figure 5 shows an example of the output of a nesting procedure which highlights the complexity of the decision problem.

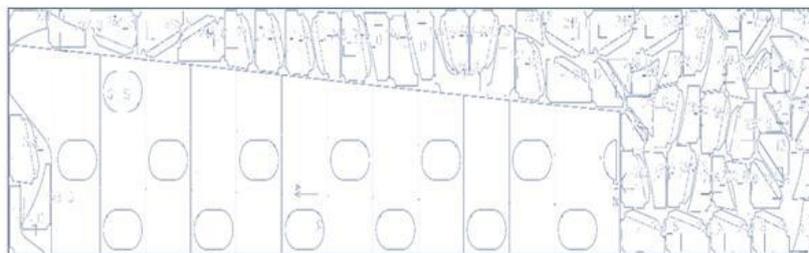

Figure 5 – An example of nesting output

Especially in this bi-dimensional version and in relation to the huge number of PNs to be produced and variety of their morphological dimensions and shapes, it is a very hard optimization problem (Cacchiani et al., 2022) whose solution requires the use of specific heuristic algorithms. Currently, the nesting decision is performed empirically on the basis of the experience of the employees and without the support of any optimization tool.

However, the criteria used to determine the nesting can be different in dependence on the adopted objectives. In the case of steel waste minimization, for instance, PNs should be chosen on the basis of their occupancy and shapes but independently on their belonging batch and, consequently, of its due date. This option may produce good results in terms of sustainability as it reduces energy consumption and material wastes due to the minimization of used steel slabs; however, it can negatively affect the level of service as it leads to an increment of the required time to obtain all the components of the same batch. On the other hand, if nesting rules are adopted in order to give priority to PNs belonging to the same batch, this has positive effects on the logistic performance, but it may increase the environmental impact.

These two conflicting objectives point out that, in some cases, sustainability objectives are not in line with efficiency targets. For this reason, a DSS was proposed in order to drive decision makers in this context. The fundamental elements of the DSS are: (a) a heuristic algorithm able to perform the nesting procedure defining, as objective function, a trade-off between sustainability objectives and the level of services; (b) a set of dispatching rules to be locally applied at the level of single production cell to foster production progress. The first results obtained in testing the DSS show the ability of the system to drive the decision maker.

## **7 Conclusions**

The shipbuilding industry is one of the industrial sectors where logistic and production operations are still based on traditional procedures. The introduction of digital practices, in this context, generally requires huge investments and long-term pervasive organizational restructuring programs. One way to overcome the limited boost to innovation due to the peculiarity of the context is represented by collaboration with external innovation drivers, such as academic institutions. In this paper, we described the first results obtained thanks to the implementation

of a project financed in the framework of the Italian Strategy of Smart Specialization. The project may represent an example of fruitful cooperation between a medium enterprise belonging to a traditional industrial sector and academic institutions.

The aim of the project was to promote innovation through radical transformations of the logistics and production operations thanks to a pervasive DT, which should represent a premise for a continuous improvement of production and sustainability performances.

The description of the results provided during the implementation of the project highlights the general complexity of the needed interventions and the potentialities offered by a profound digitalization transformation. However, we stressed how the DT represents a necessary but not sufficient condition to obtain significant performance improvements. To this aim, it is necessary to introduce appropriate supports based on advanced methodologies able to capture and drive the complexity of the system. In particular, we showed, as usual in practice but superficially underlined in theory, that efficiency objectives and sustainability issues may be in conflict. Then, in order to take into account both aspects, multicriteria approaches should be adopted.

### **Abstract**

In the last decades, a broad scientific debate - which involves the fields of engineering, psychology and ecology among the others - has been developed on the concept of resilience. The broadness of the debate highlights the need to define new models for the management and development of cities and territories in a holistic perspective. Many models and tools developed to improve the resilience of cities converge in recognizing the fundamental role of stakeholder engagement in developing more resilient communities. However, initiatives launched by local, regional, national, and international governments and organizations often fail to involve urban stakeholders, who are the first to suffer the risks of living in fragile systems. In the study, by using a systematic literature analysis protocol, the authors explore the domain of urban resilience initiatives, with a particular focus on resilience dimensions and goals, addressed threats, involved stakeholders, and employed stakeholder engagement practices. The content analysis conducted on 57

initiatives has highlighted the centrality of water management as one of the main objectives in urban resilience initiatives. The analysis showed that the initiatives are mainly designed to manage chronic stresses. Additionally, the results highlight that local governments, citizens and public and private companies constitute the main involved stakeholders, whereas workshops and interviews represent the most adopted stakeholder engagement practices.

From a theoretical point of view, the research contributes to enriching the state of the art on the concept of resilience by collecting knowledge about real-world initiatives. Furthermore, the paper presents some policy implications: it contributes to creating structured knowledge about urban resilience initiatives with a focus on stakeholder engagement so as to inspire and support policymakers interested in increasing stakeholder participation.

**Paper type** – Academic Research Paper

## 1 Introduction

In the last decades, a broad scientific debate - which involves the fields of engineering, psychology and ecology among the others - has been developed on the concept of resilience (Meerow & Stults, 2016; Zeng et al., 2022). The broadness of the debate highlights the need to define new models for the management and development of cities and territories in a holistic perspective. Urban systems, complex by their nature (Meerow et al., 2016), are increasingly exposed to stressors such as climate change, natural disasters, resource scarcity, environmental degradation and geopolitical crises, which threaten the entire urban ecosystem. These factors and their epiphenomena contribute to making the urban system fragile. That makes the development of strategies oriented towards preparation, absorption, transformation, change, and recovery in relation to shocks (Figueiredo et al., 2018) and the definition of tools capable of directing urban policies towards an increase in resilience necessary and urgent (Béné et al., 2012), as mentioned in 2030 Agenda (United Nations, 2015). In particular, SDG11 "Make Cities and Human Settlements Inclusive, Safe, Resilient And Sustainable" (United Nations, 2015) highlights the need to pay greater attention to urban planning and governance.

Resilience improvement strategies and processes can trigger new forms of urban governance (Duit et al., 2010; Schwanen, 2016), based on a multi-stakeholder participatory approach. Stakeholder participation is widely

recognized as a key element in the effectiveness of urban resilience initiatives. In particular, stakeholder engagement is the first step towards building self-reliant urban realities, equipped with systems of democratic participation in decision-making and able to proactively respond to acute shocks and chronic environmental, social and/or economic stresses (Baravikova et al., 2021; Kapucu et al., 2021).

Several programs and frameworks have been developed to guide political decision-makers in the implementation of interventions aimed at improving the level of resilience of cities (Béné et al., 2012). Despite the use of heterogeneous and not always overlapping dimensions, indicators and approaches, local, national and international political agendas and resilience frameworks converge in recognizing the importance of stakeholder engagement. For example, The City Resilience Index (ARUP, 2014), developed by Arup and supported by The Rockefeller Foundation, is a framework structured on four dimensions (namely, Health and wellbeing, Economy and society, Infrastructure and Environment, Leadership and strategy), 12 goals and 52 indicators to measure the resilience and provide a holistic representation of urban resilience. Three of 12 goals are aimed at assessing aspects related to stakeholder participation, public involvement in decision-making processes and partnership among urban actors. The Resilience Maturity Model (Hernantes et al., 2019), developed as part of the Smart Mature Resilience project, one of the most important European projects on urban resilience, provides indications of initiatives implemented at the urban level to increase resilience along four dimensions, namely Leadership and Governance, Preparedness, Infrastructure and Resources, Cooperation. Great importance is devoted to stakeholders, to the point of prescribing their involvement in relation to the urban resilience maturity level. Therefore, it becomes crucial to adopt multistakeholder engagement approaches to implement transformative processes geared towards urban resilience.

The objective of the paper is to investigate the domain of urban resilience, starting from real-world initiatives, with a focus on stakeholders and stakeholder engagement. To this end, a systematic review of case studies reported in extant literature is carried out. After briefly introducing the concepts of urban resilience and stakeholder engagement, the authors identify a set of real-world resilience initiatives. For each initiative, the geographical area, the stakeholders involved, the engagement practices adopted and the addressed threats (e.g. stormwater mismanagement, earthquakes) are inductively identified. Additionally each

initiative is deductively characterized by adopting dimensions and goals provided by the City Resilience Framework (ARUP, 2014), one of the globally most known and implemented urban resilience frameworks.

From a theoretical point of view, the research contributes to enriching the state of the art on the concept of resilience by collecting knowledge about real-world initiatives. Additionally, the paper presents some policy implications. By providing a synthesis and classification of the main case studies, the paper contributes to creating knowledge about the main characteristics of the initiatives carried out on a global scale that may inspire and support policy makers interested to increase the urban resilience.

The paper is structured as follows. Section 2 presents the concepts of resilience and stakeholder engagement, which will guide the definition of the research questions. Section 3 presents the research protocol used by the authors to address the research questions. Section 4 presents and discusses the research results. Finally, implications and future research avenues are briefly discussed in the Conclusions.

## **2 Research Background and Rationale**

In the Section we present the research background and the study rationale.

### ***2.1 Resilience and city resilience initiatives***

Urban resilience is the ability of a city to respond, adapt, and transform in the face of external threats. Threats range from natural disasters such as floods, earthquakes, and hurricanes, to human-made events such as public health crises, and terrorist attacks. Building urban resilience is crucial as cities become more populated and interconnected, and the risks associated with urban systems failure become more significant (ARUP, 2014; Meerow & Stults, 2016).

Resilience in the urban context has evolved from its initial conceptualization as engineering resilience, i.e. the property of a system to return to a previous equilibrium state after a disturbance. Today, resilience is understood as a multidimensional concept that includes ecological and socio-ecological perspectives (Meerow et al., 2016). Ecological resilience recognizes the multiple states of equilibrium in an ecosystem and the need to adapt to changing conditions. Socio-ecological resilience focuses on the adaptive capacity of social

and economic systems, while recognizing the need to transform and restructure them to cope with future shocks and stresses (Folke, 2006).

Urban resilience requires a coordinated effort among various stakeholders, including city governments, private sector actors, and local communities. It involves a range of activities, such as disaster preparedness planning, infrastructure investments, and community engagement. Building urban resilience is not only essential for mitigating the impacts of shocks and stresses, but can also provide benefits in terms of increased economic competitiveness, improved social equity, and enhanced environmental sustainability (Hernantes et al., 2019; Schwanen, 2016; Zeng et al., 2022).

In order to increase the resilience of urban systems over time, various public and private actors have launched initiatives, programmes, and policy agendas. Indeed, urban resilience initiatives represent a heterogeneous group of actions characterized by different objectives (e.g. planning, implementation, education) and affect very different urban contexts. Nevertheless, some policy and strategic frameworks tend to standardise the objectives and approaches of urban resilience initiatives. The Resilience Maturity Model, for instance, proposes a set of resilience initiatives structured to accompany urban realities in their path towards social-ecological resilience (Hernantes et al., 2019). The need to structure initiatives and structure them within frameworks addresses the demand to create global networks to foster awareness of resilience issues, dialogue and learning between cities, and longitudinal and vertical comparison of urban resilience performance.

## **2.2 Stakeholder engagement and city resilience**

The term stakeholder refers to 'any group or individual who can affect or is affected by the achievement of the organization's objectives' (Freeman, 1984). Stakeholder engagement typically refers to a set of actions or initiatives undertaken by an organization to involve its stakeholders in various activities, ranging from decision-making processes to educational campaigns (Greenwood, 2007).

It is evident that urban actors constitute stakeholders of any urban resilience initiative: they not only benefit from the effects achieved by effective resilience initiatives, but also, and above all, suffer from the effects of failed resilience policies and strategies. The promoters of any urban resilience initiative cannot exempt themselves from strategically identifying and considering their

stakeholders, especially in a complex and delicate system such as the urban one (Hernantes et al., 2019). Placing urban stakeholders at the center of the processes that characterize resilience initiatives has proven to be a central aspect in determining the effectiveness of such initiatives (Petrescu et al., 2016).

Most of the frameworks geared towards urban resilience exceptional importance to stakeholder engagement (Chen et al., 2022; Gosain et al., 2022; Hernantes et al., 2019). As mentioned in the Introduction, many international projects aimed at promoting urban resilience include stakeholder engagement or neighbouring concepts (e.g. public participation), among their objectives. In some the level of resilience achieved is assessed based on urban stakeholders reached by city-level initiatives (Hernantes et al., 2019).

### **2.3 Research objectives and questions**

The aim of the research is the exploration of urban resilience initiatives by identifying addressed threats, impacted dimensions, pursued goals, involved stakeholders, and employed stakeholder engagement practices. Therefore, starting from the assumptions presented so far, the following research objectives and questions were defined:

Research Meta objective: explore the domain of urban resilience improvement initiatives.

*RQ-1: What are the addressed threats, the impacted dimensions and the pursued goals of urban resilience initiatives globally conducted so far?*

*RQ-2: What urban stakeholders are currently involved in urban resilience initiatives?*

*RQ 3: What engagement practices are currently adopted in urban resilience initiatives?*

RQ-1 aims to provide a structured representation of conducted urban resilience initiatives: as anticipated in previous Sections, resilience is a nuanced concept often associated to different meanings (Meerow et al., 2016). RQ-1 is formulated to investigate how resilience is meant in heterogeneous geographical and cultural contexts so as to confirm or enrich the conceptualisations provided by extant literature. RQ-2 was formulated to develop a taxonomy of stakeholders involved in urban resilience initiatives. Stakeholder involvement within resilience initiatives is widely advocated, especially when the resilience initiative is generated with a top-down approach, i.e. an institution acts as the main promoter and organizer of

the initiative (Petrescu et al., 2016). RQ-3 aims to identify the practices effectively used to involve urban stakeholders: governments, decision-makers and in general promoters of urban resilience initiatives may adopt a plethora of tools, including technological ones. If the success of an urban resilience initiative largely depends on stakeholder engagement, it is evident that the choice of the right engagement practice is central in determining its overall efficacy.

### **3 Materials and Methods**

To address the research questions introduced in the previous Section, the authors developed a systematic literature review protocol aimed at identifying urban resilience initiatives conducted on a global scale. The methodology known as systematic literature review is a research approach used to explore a specific topic by examining extant knowledge (Tranfield et al., 2003). Originally designed for medical research to ensure consistency and uniformity in evaluating medical treatments (Boell & Cecez-Kecmanovic, 2015), this methodology has now been applied in various fields such as management (Tranfield et al., 2003), policy making and urban planning (Meerow et al., 2016). A systematic literature review enables the collection, assessment, and correlation of evidence from prior publications. This approach distinguishes itself from other review methods as it avoids biased analyses due to limited or irregular coverage of existing evidence. The systematic literature review is valued for its replicability, transparency, objectivity, and rigor (Boell & Cecez-Kecmanovic, 2015). The research pipeline used in this work was informed by (Xiao & Watson, 2019) and is depicted in Figure 1.

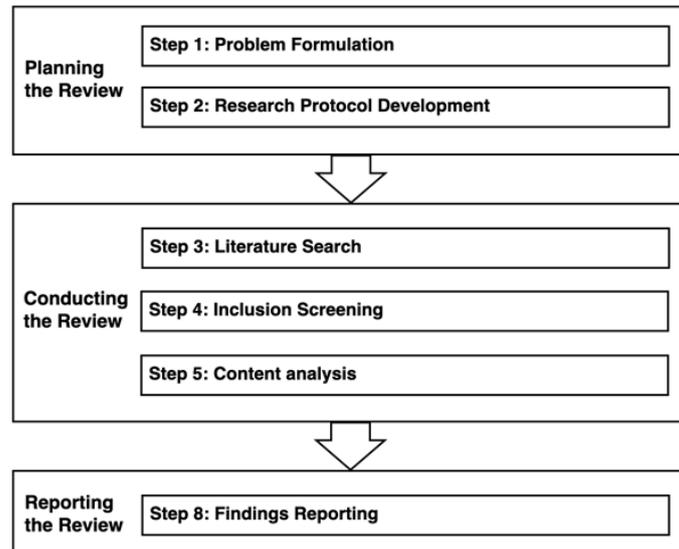

Figure 1: Research pipeline, derived by (Xiao & Watson, 2019).

The authors therefore designed a query aimed at collecting knowledge useful to address the formulated research questions. The following query was launched on SCOPUS scientific database (Burnham, 2006) in March 2023:

*TITLE-ABS-KEY ((policy OR practice OR initiative) AND (stakeholder) AND (resilien\*) AND (urban OR city) AND "case study")*

In the first instance, the query returned a raw dataset to which inclusion criteria were applied, leveraging on the structured information provided by the database (e.g. document type, language). The filters applied are shown in Table 1.

Table 1: Inclusion criteria selected in the SCOPUS environment.

Variable	Inclusion criteria
Publication stage	Final
Document type	Journal article
Language	English

Following the application of the filters, the authors identified 108 scientific papers potentially relevant to the study. At this point, two of the authors read the abstracts and proceeded to exclude from the knowledge base those papers that were not useful for research purposes (e.g. not containing real-world initiatives).

This phase was conducted in parallel and blind between the two authors, who converged on a final dataset containing the 29 articles reported in Table 2.

The identified articles were read in their entirety to identify the urban resilience initiatives mentioned. Within the same document, it was indeed often possible to find information pertaining to different initiatives, distinguished for example by being set in different cities or having different purposes. Ultimately, the dataset subject of the analyses presented in this paper consists of a set of 57 urban resilience initiatives. In order to find useful information to address the research questions, the dataset obtained was subjected to inductive-deductive content analysis.

Content analysis is a methodological tool for textual data analysis, aimed at identifying manifest and/or latent meanings within texts, widely used for the analysis of business and management literature (Gaur & Kumar, 2018). In the study, to address RQ-1, the authors inductively identified the types of threats that the initiatives aspired to address. In parallel, again in the context of RQ-1, the authors used the dimensions and objectives of the City Resilience Framework (ARUP, 2014) to characterise the identified initiatives. The City Resilience Framework is one of the major frameworks for urban resilience and is composed of four dimensions (namely Health and wellbeing, Economy and society,

Infrastructure and Environment, Leadership and strategy) which group 12 goals (see Table 3).

Table 3: Dimensions and goals composing the City Resilience Index, adapted from (ARUP, 2014)

Dimension	<b>Health and well-being</b>
Goal	<p>1. Minimal human vulnerability The key to achieving a standard of living beyond mere survival is to minimize human vulnerabilities. Meeting basic needs such as food, water, sanitation, energy, and shelter is necessary to reach a basic level of wellbeing that can help individuals deal with unforeseen circumstances.</p>
	<p>2. Diverse livelihoods &amp; employment Citizens need diverse livelihood opportunities and support mechanisms to respond proactively to changing conditions in their city while maintaining their wellbeing. Access to finance, skills training, and business support allows individuals to pursue various options to meet their basic needs and accumulate personal savings for their long-term development and survival during crises.</p>
	<p>3. Effective safeguards to human health &amp; life Health systems are crucial for preventing illnesses and controlling disease spread on a daily basis, as well as protecting the population during emergencies. They include a range of practices and infrastructure that maintain public health and treat both chronic and acute health problems.</p>
Dimension	<b>Economy and society</b>
Goal	<p>4. Collective identity &amp; mutual support Active communities that are properly supported by city governments and interconnected with each other play a key role in creating a city with a strong identity and culture from the bottom up. This fosters trust and support between individuals, communities, and the government, allowing them to face unforeseen circumstances together without resorting to civil unrest or violence.</p>
	<p>5. Comprehensive security &amp; rule of law A transparent and ethical justice system is crucial for reducing and preventing crime and corruption in a city, as well as promoting citizenship and maintaining order during times of stress. Well-planned and resourced law enforcement also supports peaceful recovery and ensures a healthy population by reducing crime-related injuries, fatalities, and stress.</p>
	<p>6. Sustainable economy A strong economic system is crucial for sustaining the investment that a city needs to maintain its infrastructure and support its communities. It allows for the creation of contingency funds that both the private and public sectors can use to respond to emergencies and unforeseen events. This enables cities to adapt to changing economic conditions and pursue long-term prosperity.</p>

Dimension	<b>Infrastructure and environment</b>
Goal	<p>7. Reduced exposure &amp; fragility Conserving environmental assets is crucial for preserving the natural protection that ecosystems provide to cities, such as coastal wetlands and upstream woodlands. Proper design and construction of infrastructure, including day-to-day structures and specific defences like flood barriers, is necessary for effective protection against severe conditions and preventing injury, damage, or loss.</p>
	<p>8. Effective provision of critical services Effective management of ecosystems and infrastructure is essential for maintaining their quality and performance. During times of stress, some of these services become crucial for urban functioning. Well-maintained systems can better handle abnormal demand and continue functioning. Good management practices enhance knowledge of system components, allowing for faster restoration of disrupted services by infrastructure managers.</p>
	<p>9. Reliable mobility &amp; communications Reliable communications and mobility support daily connectivity between people and services, as well as fostering a positive environment for daily living and working. Additionally, they enable rapid mass evacuation and widespread communication during emergencies.</p>
Dimension	<b>Leadership and strategy</b>
Goal	<p>10. Effective leadership &amp; management Effective leadership is crucial in promoting trust, unity, and a shared understanding of a city's direction. A committed city government that makes decisions based on evidence empowers a city to thrive and respond to unexpected events.</p>
	<p>11. Empowered stakeholders The provision of early warnings and access to education, information, and knowledge empowers individuals and communities, making them invaluable assets to a city during unexpected events. This enables them to take appropriate decisions and be better positioned to act, learn, and adapt.</p>
	<p>12. Integrated development planning Development plans and land use regulations help cities coordinate and control urban development and guide future investments. They ensure alignment of individual projects, address uncertainty, and create a framework for dealing with multidisciplinary issues.</p>

Additionally, in order to answer RQ-2 and RQ-3 for each initiatives the authors inductively collected data about the involved stakeholder (e.g. NGOs, citizenship, local government) and the adopted engagement practice (e.g. public events, workshops, online platforms).

## 4 Results

The results largely contributed to addressing the research questions. In the present Section, results are presented and discussed: first, the identified knowledge base is introduced from a time and geography point of view; then, in order to address RQ-1, the results about threats, impacted resilience dimensions and pursued goals are provided; finally, with reference to RQ-2 and RQ-3, the profile of the involved stakeholders and the employed engagement practices are presented.

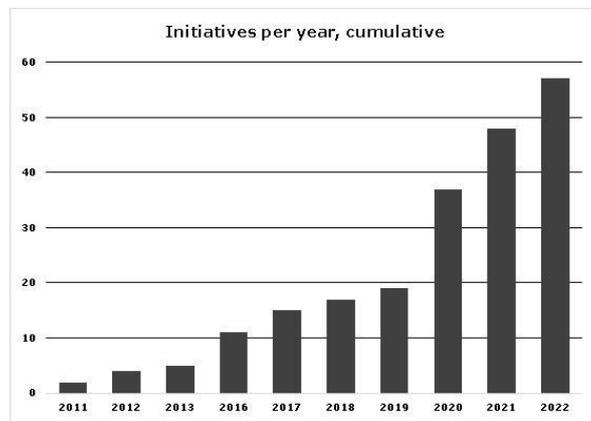

Figure 2: Number of initiatives included in the knowledge base per year, cumulated.

The identified knowledge base contains 57 initiatives, spanning a time period from 2011 to 2022 (Figure 1). Although the concepts of resilience and stakeholder may date back to earlier times (Freeman, 1984; Holling, 1973), no initiatives prior to 2011 were identified in the analysed literature. The trend in the time pattern of initiatives is increasing, with a surge in the last three years (2020-2022). This surge could be caused by the resilience challenges emerged during and following the Covid-19 pandemic crisis, a crisis also mentioned in some of the work identified (e.g. (Huynh et al., 2022)).

Geographically, the initiatives contained in the knowledge base are worldwide distributed, with a particular concentration in Europe. France, United Kingdom and Germany are the main settings for the identified initiatives, whereas developing countries are poorly represented within the knowledge base. Figure 2 shows that most initiatives have coastal and riverine towns and cities as their setting: most initiatives indeed deals with water management.

Figure 3: Localization of the identified initiatives.

#### 4.1 Urban resilience initiatives: threats, dimensions and goals

The identified initiatives address threats related to different dimensions. In particular, a large part of the initiatives is aimed at preventing, coping with, adapting, or transforming the urban environment in relation to the threat posed by floods. Great attention also seems to be devoted to the threats posed by urban heat and the loss of biodiversity. In general, 72.6% of the initiatives included in the knowledge base address environmental threats (namely floods, urban heat, loss of biodiversity, stormwater mismanagement, water scarcity, sea level rise, air pollution, poor solid waste management, earthquakes, hurricanes, marine pollution, soil pollution, fires). Such a result contributes to demonstrating how the concept of resilience, although understood as multidimensional, is very much associated with the environmental sphere.

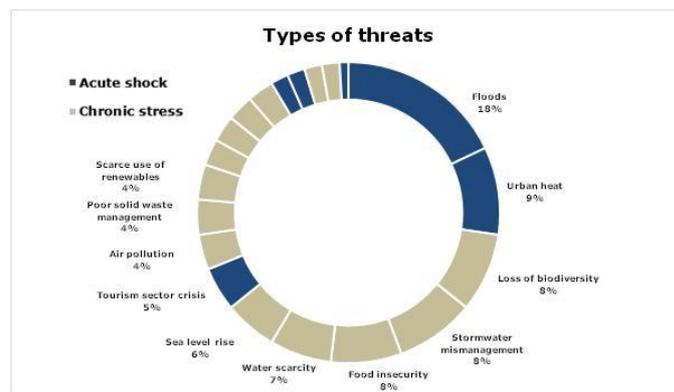

Figure 4: Pie chart representing the types of threats addressed by the selected initiatives and their frequency (percentage).

The identified threats can also be categorized based on the time of onset. Acute shocks refer to destructive and sharp events capable of causing significant damage in a very short time (e.g. earthquakes or hurricanes), while chronic stresses refer to threats that afflict the urban fabric constantly or cyclically over time (e.g. housing problems or public transport issues). From this point of view, the analyzed initiatives mainly deal with chronic stresses (63.2%). That suggests, limited to the knowledge base domain, an understanding of resilience that integrates long-term issues, so overcoming a conceptualization focused on coping (typically associated with acute shocks).

Water, one of main natural capital resources, is detected in 38.7% of the initiatives. The problem of environmental disasters caused by water can be traced back both to the effects of climate change and to the lack of planning for land management, protection and maintenance interventions, and prudent management of water resources (Olmstead, 2014). Therefore, it is considered as fundamental to establish plans aimed at an optimization and more rational management of water resources, also in function of the increase in world population (United Nations, 2015).

As described in Section 3, the initiatives were classified according to the dimensions and goals of the City Resilience Framework (ARUP, 2014). 42% of the initiatives is aimed at impacting the 'Leadership and strategy' dimension. With reference to the goals, 'Effective leadership & management' is the most pursued one, accounting for 18% of the initiatives, followed by 'Integrated development planning' (14%) and 'Empowered stakeholders' (11%). These values point to a trend towards inclusive governance involving government, business and civil society. Local governments are particularly engaged in the implementation of hazard monitoring and risk assessment processes as well as action planning to deal with slow and fast-onset events.

The low values pertaining the goals 'Reliable mobility & communications' (1%), 'Effective safeguards to human health & life' (1%) and 'Comprehensive security & rule of law' (2%) suggest an underrepresentation, within the knowledge base, of initiatives acting in the areas of transport, health and public safety.

Figure 5: Resilience dimensions, as defined in (ARUP, 2014) targeted by the identified initiatives, frequency.

#### 4.2 Stakeholders and stakeholder engagement

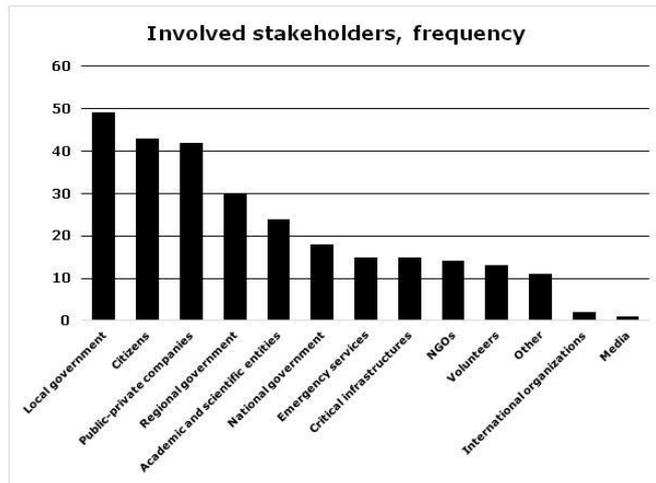

Figure 6: Stakeholders involved in the analysed initiatives and their frequency.

The analysis of the stakeholders involved revealed a significant presence of local governments (86%), citizens (75%) and public and private companies (74%), while central governments are present in only 32% of initiatives. It should be noted that the frequency of involvement of institutional stakeholders (local, regional and national governments) is positively correlated with the proximity of the institution to the territory. It suggests that resilience initiatives are generally promoted by local authorities that play an important role both in terms of

knowledge of the area and in raising awareness among other stakeholders. Nevertheless, a greater presence of the central governments, which could exercise a role of coordination and connection between various actors acting at local level, would be decisive for a more effective and coordinated use of the deployed economic resources.

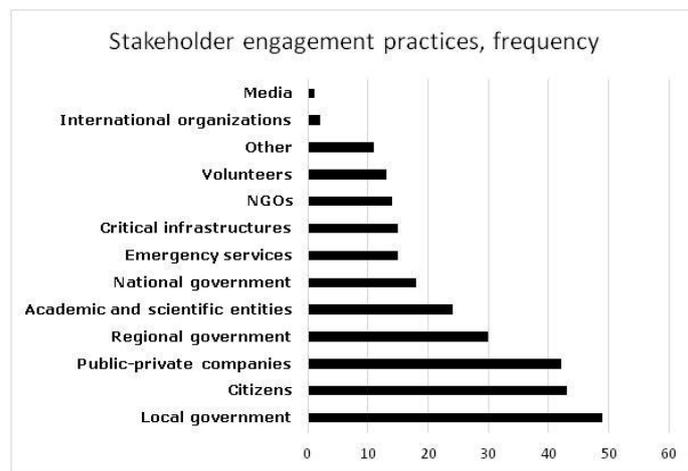

Figure 7: Stakeholder engagement practices adopted within the identified initiatives.

With regard to the stakeholder engagement practices, there is a widespread prevalence of community offline engagement tools, such as public events, interviews, and workshops. As shown in Figure 7, urban resilience initiatives are tentatively approaching the use of engagement practices that leverage new technologies. It is not surprising that these aspects have been highlighted by institutional stakeholders who advocate for the use of technological tools to make urban resilience initiatives more effective, attractive and recognizable (Adade & de Vries, 2023).

## 5 Conclusions

In the paper, a systematic literature analysis is adopted to explore the initiatives deployed to increase the resilience level of urban systems.

The study provides a map of interventions, so contributing to understand engagement dynamics underlying urban resilience initiatives. Results show that most initiatives are aimed at countering natural disasters or events that affect the environment. In particular, the frequency of events such as flooding, urban heat

and loss of biodiversity confirms that climate change is at the center of the international debate. An element of notable relevance is the conspicuous presence of initiatives aimed at water management both in terms of related disasters and scarcity, phenomena that can be attributed both to the effects of climate change and to the mismanagement of one of the most relevant natural resources. Such an aspect leads to reflections on the need to incentivize the planning of interventions for the management, protection and maintenance of the territory, as well as the prudent management of all resources, also based on the global demographic growth. The analysis highlights a significant presence of local governments among the involved stakeholders, so testifying the fact that initiatives are urged with a top-down approach. Local government plays a significant role both in risk assessment and in raising awareness of initiatives involving organizations, citizens and associations. A greater central government presence would favor the cooperation of international organizations and an effective and efficient use of economic resources.

In the study, the City Resilience Framework was used as a tool to rank the goals of the initiatives implemented, highlighting a trend, especially on the part of local governments, towards inclusive and participatory governance. Cities need new governance approaches that are inclusive, collaborative, reflective and with a long-term vision (Elmqvist et al., 2019; Webb et al., 2018). Governance rearrangements could facilitate the emergence of 'bottom-up' initiatives and give voice to citizens' needs so as to enhance the initiatives that deal with social aspects and stimulate planning processes to prevent disasters.

Future research directions involve the assessment of the discriminating factors in the choice of stakeholder engagement practices within urban resilience initiatives. Factors to be potentially investigated include available resources, expected outputs and the type of targeted stakeholder.

The study is not without limitations. Firstly, despite the development of a systematic literature analysis protocol aimed at answering the formulated research questions, it is not possible to ensure the inclusion of all papers relevant to the research. Furthermore, despite the fact that the content analysis phase was handled with a deductive approach which adopted the City Resilience Framework dimensions and goals as a priori set themes, it cannot be excluded that the results are susceptible to the sensitivity of the researchers involved.

## Communicating Circular Economy: Implications of Habermas's Theory of Communicative Action in the Public Sector

---

Elisabetta Pozzetto

Statistics "Bruno de Finetti"  
University of Trieste  
Piazzale Europa, 1 Trieste (Italy)

### Abstract

The study applies Habermas' Theory of Communicative Action (TCA) to expand research on public sector communication about the Circular Economy (CE).

Theory guides the analysis of a case study of an Italian region ranked among the most advanced in terms of CE legislation. A qualitative study was conducted, with in-depth interviews with officials, communicators and information workers. The research is based on a narrative enquiry approach and uses guidelines to increase methodological accuracy.

The study is relevant from theoretical and practical perspectives. The conceptualisation of CE communication can provide analytical leverage and guide the operationalisation of social change programmes required by the CE paradigm, suggesting the benefits of incorporating the concept of interaction to promote circularity principles. From a practical point of view, the study identifies limitations and enabling factors of the current communication model and generates a set of indications that policymakers and communication/information professionals can use.

The study lies at the intersection between communication and CE and fills a gap in the literature, particularly in the public sector.

**Keywords** - Communication, Circular economy, public sector, Habermas's theory of communicative action, qualitative research

**Paper type** - Academic Research Paper

## 1 Introduction

Although the literature on the Circular Economy (CE) has been growing in recent years, the debate around its theoretical delimitation is still ongoing, affecting the effectiveness of its communication process.

Much of the research has also so far focused on investigating the implementation of the CE in the private sector, neglecting the public sector, which instead has both a tangible impact as it purchases, consumes and disposes of resources and services and, above all, serves as a role model for social and economic actors.

This study uses Habermas' Theory of Communicative Action (TCA) as an analytical framework to evaluate the state of communication of the CE by the public sector.

As the CE is a concept on which there is still no unambiguous definition, applying a theoretical framework that sees its core in communicative rationality, i.e. a form of reason oriented towards social interaction and the process of mutual understanding and negotiation of meaning, seems the most suitable.

On the one hand, communicative rationality provides a model for understanding the mechanisms of involvement and information sharing; on the other hand, Habermas' theoretical framework on language allows for guiding the exploration of the intent and purpose of communication in the public environment for the promotion of circularity.

It is possible to apply TCA in different ways in the context of communication and CE research. For instance, one can use the theory to study the communication dynamics between stakeholders, such as businesses, authorities and citizens, in promoting CE.

Furthermore, one can use TCA to develop effective communication strategies to promote CE by creating spaces for dialogue and participation to engage different stakeholders.

Finally, the theory of communicative action emphasises the importance of the active participation of citizens in the public sphere, which can foster the construction of a widespread consensus and the monitoring of public agency actions. In this sense, communicative action can foster a relationship of trust between the public body and citizens, promoting a culture of sustainability based on concrete actions and reinforcing the 'brand' of a public body understood as a capital of good reputation and reliability.

As a starting point, the study defines the concept of communication in the public sector and that of the CE.

The growing academic literature has proposed many definitions of CE (Geissdoerfer et al., 2017; Murray et al., 2015; Korhonen et al., 2018), and up to now, it has 114 different versions (Kirchherr et al., 2017). Still, in this paper, we refer to the most comprehensive and widely used one, developed by the Ellen MacArthur Foundation: "An industrial system that is restorative or regenerative by intention and design [that] replaces the end-of-life concept with restoration, shifts towards the use of renewable energy, eliminates the use of toxic chemicals, which impairs reuse and aims for the elimination of waste through the superior design of materials, products, systems, and within this, business models" (EMF, 2013, p.7).

This study aims to analyse the communication model of CE in the public sector from the perspective of Habermas' communication concept. In order to achieve this, the research adopts a qualitative approach with exploratory purposes, carried out through the collection of secondary data published in institutional sources and primary data obtained through in-depth interviews. In particular, the results of the research applied to the Lombardia Region, indicated by previous reports (CER, Energy&Strategy Group Politecnico, 2021) as the most advanced among Italian Regions in terms of CE legislation, are presented here as the first phase of a broader multi-case study.

After an overview of the main concepts of Habermas' theoretical system, this article will describe the context of the application, pointing out that the regional aspects of CE are still little studied, although they are a crucial dimension of the CE. In a later section, the paper will analyse the communicative components of the case study in light of the theoretical concepts. The rest of the paper will present the methodological approach adopted, a section with the main results of the in-depth interviews. Finally, results will present theoretical and practical implications, with an insight into the enabling factors, the research's limitations, and future perspectives on implementation.

## **2 Public Communication**

This paper lies at the intersection of research in public communication and studies on implementing CE practices.

Theoretically, if understood as opposed to 'private' communication, public communication would be addressed to a more or less wide audience; thus, all mass communication would fall within the meaning of public communication.

In the literature, narrower meanings, which present both divergences and points of contact, have therefore come together: political, social, institutional, and general interest communication relating to the public sphere and communication relating to public administrations (Gadotti, 1993; Grandi, 2001; Rolando, 1995, 2001, 2004; Mancini, 2015; Rovinetti 2000, 2005, 2007; Faccioli, 2000; Nieto, 2006; Mele et al., 2011).

In this study, public communication refers to public administrations and authorities (La Spina, 2007, p. 2).

Often in the literature, the definition of communication by a public administration overlaps with that of 'institutional communication', even though the latter, on the one hand, is also referable to non-profit organisations, associations, and companies that are not public bodies and, on the other hand, the objective - to disseminate identity - does not exhaust the communication purposes of a public administration.

This study focuses on the communication activities of public administrations, particularly those organised on the initiative of regional administrations. The literature identified three types of communication within public administrations: internal, external - addressed to individuals and associated citizens -and external communication - addressed to the mass media (Faccioli, 2000). This research considers external communication.

According to Mancini (2015), who in turn borrowed Luhmann's (1984) model, it makes no sense to distinguish between communication and information, as communication always implies an informational activity, and this, in turn, requires a correct understanding, hence the creation of an effective channel between sender and receiver, so that it is decoded and used according to the sender's intentions. (Mancini, 2015, p. 100).

## ***2.1 Communication of Circular Economy***

Numerous studies have highlighted the importance of communication for disseminating the CE (Hunka et al., 2021; Vehmas et al., 2020; Sawe et al., 2021). In Europe, the New Action Plan for the CE (2020), compared to the one adopted in 2015, has placed more emphasis on the importance of information and has

challenged the private sector and the responsibility of national and local institutions to implement communication policies.

The Plan emphasises, in addition to ecodesign and sustainable design, the empowerment of consumers, who must be provided with reliable and relevant product information to make more sustainable choices. At the Italian level, the 'National Strategy for the Circular Economy' (Ministry of Ecological Transition, 2022) identifies actions, objectives and measures for defining institutional policies to ensure the transition to a CE. The Plan, starting from the conviction that the development of CE must concern both the improvement of production efficiency and the change of consumption models, identifies the need to intervene in consumer behaviour: to this end, it indicates the need for the development of a national environmental education and communication plan, locally declined, which, starting from compulsory schools and reaching families, contributes to forming a generation of critical, aware and informed citizens. Among the indicators for monitoring and evaluating circularity, the Strategy indicates communication campaigns on CE.

### **3 Analysis of communication from the perspective of the Theory of Communicative Action (TCA)**

#### ***3.1 Introduction aspects***

In order to analyse the external communication of the Regions applied to CE, this study deemed valid to adopt the perspective of TCA. Since its elaboration in 1981, TCA has proved to be fundamental for contributing to philosophy and social theory. Subsequently, numerous interdisciplinary studies have also drawn on its theoretical basis.

It has been used both in general, as a moral framework for organisational and public relations communication (Burkhart, 2007) and to analyse the characteristics of the ideal discourse in communication and evaluate participative communication (Jacobson and Storey, 2004), and in applied terms also in the corporate field (Herda and Messerschmitt, 1991), e.g. in the field of marketing methods (van Toledo, 1986) and brand management (Kernstock and Brexendorf, 2009).

Habermas's TCA perspective (1997) is applied here to analyse the relationship between the public body offering information and the external stakeholders receiving this information about CE principles, processes and initiatives.

In order to understand the nature, effectiveness and complexity of communicative action, it is necessary to indicate the framework in which it takes place. For this purpose, it is the category of the world itself that needs to be clarified. Habermas takes up the one elaborated by Popper (1979), who distinguished the objective world of facts, the social world of norms and the subjective world of individual experience. These three meanings, which correspond to the dimensions of culture, society and person, constitute Habermas's different but communicating levels of explicitness of communicative action in the contemporary age. The three dimensions occur against the backdrop of common sense, the culturally handed down background knowledge (Habermas, 1997, p. 725), constituting the life-world or vital world. Communication, the subject of the present study, is interpreted as coordinating the subjective and intersubjective worlds through dialogue and the sharing of meanings. The concept of the vital world thus becomes related to processes of understanding. Those who act communicatively integrate the three concepts of the world into a system and give, as intended, an interpretative framework that forms the background to the negotiation process to reach an understanding of a common meaning. Thus, communicative acting occurs within a vital world behind the communication participants. Based on this assumption, the consequences of the processes of social rationalisation and progressive reification of relations between people become manifest. Two strategies conflict: the 'system' and the 'vital world'.

Habermas identifies the reification of communicative relations as the cause of the 'colonisation' of the vital world typical in capitalist societies: the colonisation by the system over the vital world produces social pathologies. The reification occurs when subsystems of the Economy and state intervene with monetary and bureaucratic means in the symbolic reproduction of the life world.

Habermas expressly defines the 'green problems' as developments that blatantly undermine the organic foundations of the vital world and drastically bring to consciousness severe limits of the deprivation of basic aesthetic needs and sensibilities. The attack of large-scale industry on ecological balances, the scarcity of non-regenerative natural treasures and demographic developments present industrialised societies with major problems. Nevertheless, these

challenges are abstract and require technical and economical solutions that must again be planned globally and implemented with administrative instruments (Habermas, 1997, p. 1075).

In the particular area of public communication, understood here as issued by a public administration, it is also interesting to consider the concept of communicative rationality. The concept considers communication as the foundation of society and that human reason develops through communication.

In this case, it is a type of reasoning which aims to reach consensus through dialogue, a form of rationality oriented towards social interaction and the sharing of meanings. In other words, communication is a process that involves participants discussing 'validity claims' in order to achieve mutual understanding and reach a consensus. In the Habermas view, communication is a process in which each participant avoids egocentric calculations of success and control and engages in acts of understanding, continually negotiating over meaning to reach a common definition of reality.

Communicative action applies to a background and three validity claims: truth, correctness and sincerity or authenticity. In addition, there is an underlying, necessary claim: comprehensibility.

The philosopher then distinguishes communicative rationality from other forms of reasoning, such as instrumental rationality, based on the logic of calculation and power. Instrumental rationality seeks to achieve a result or objective using the available resources without considering the consequences for society or the environment.

Therefore, it is possible to escape the reifying rationalisation through communicative reason and not stifle the living world.

Analysing in the dynamics of public communication the presence and role of instrumental reason and communicative reason, the presence or absence of a disjunction between the system and the vital world, thus allows us to understand whether the transformation of communicative action into controlled interactions and the initiation of pathologies of the vital world is taking place.

### ***3.2 Applying the TCA perspective to the Regions' external institutional communication on CE***

Habermas' concept of TCA can be useful in understanding how external communication by a public institution can become a tool to promote the CE.

The CE is a complex paradigm which requires major behavioural changes and whose economic and social benefits are only sometimes immediately extruded (Korhonen et al., 2018; Daae et al., 2018; Bertassini et al., 2021). Communicative rationality is a tool to promote the CE, as it is a process based on finding consensus and cooperation between different actors. External communication of a public authority can play an important role in promoting the CE by sharing information on policies, programmes and initiatives.

A further concept from TCA regards the consideration of language as a central tool in constructing the social world and creating meaning. This idea is important in conceptually grounding the analysis of public agency communication that we propose here. Habermas (1997) argues that language has two main functions, the representative and the communicative.

The representational function refers to the way humans use language to describe reality and to give a representation of the world. Therefore, language's communicative function refers to language's ability to create consensus and facilitate cooperation between people. Habermas (1997) argues that communication occurs when participants in a linguistic interaction engage in mutual understanding and negotiation of meaning.

Furthermore, Habermas distinguishes between two types of language: action-oriented and life-oriented.

When analysing websites, press releases and other initiatives by a region, it is important to consider how language represents reality and creates meaning and facilitates cooperation and mutual understanding between participants in a language interaction. In particular, it is important to assess the type of language used, whether action-oriented or life-world-oriented, and whether or not the use of language contributes to consensus-building and facilitation of cooperation.

Life-world-oriented language refers to those discourses that aim to achieve intersubjective consensus based on mutual understanding and dialogue. On the other hand, system-oriented language refers to discourses that aim to achieve a specific goal, such as persuasion or political influence. In this case, language has an instrumental use; it serves to achieve a concrete result.

In CE, an example of life-oriented language could be a debate between experts to share knowledge and define shared solutions. On the other hand, an example of system-oriented language could be a press release that tries to convince the public of an authority's commitment to the CE without providing clear and verifiable information on their substantial impact.

An example of system-oriented language concerning the CE is the use of technical and bureaucratic terms that may need to be revised for the general public to understand and focus more on the economic and regulatory aspects of the CE. In addition, system-oriented language might emphasise mainly the institutional and legal aspects of the CE, without considering the involvement of stakeholders, such as citizens and businesses, in creating a culture of reuse and sustainability.

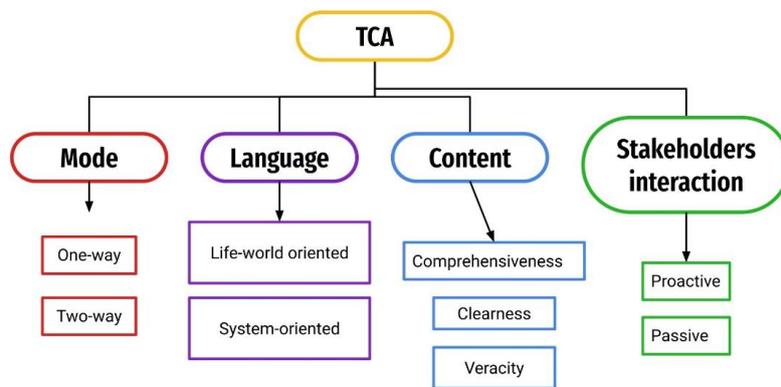

Figure 1. Personal adaptation from the TCA model

## 4 Application context and methodology

### 4.1 Application context: Regional administrations

In general, regional aspects of CE are still little studied (Dagilienė et al., 2021; Henrysson and Nuur, 2021; Scarpellini et al., 2019). The debate on how cities and regions should adopt CE strategies is ongoing (Sanchez Levoso et al., 2020). However, the literature agrees that regional issues are a key dimension of CE (Silvestri et al., 2020), and regions and their political institutions play a crucial role.

The Italian Regions are a significant example of how public policies can influence the adoption of CE practices. The Italian Constitution assigns them important competencies in various fields, including the environment and economic development. In particular, many Italian Regions have launched initiatives to promote the circular Economy, such as supporting enterprises that adopt circular business models, organising events to raise awareness among citizens and enterprises on the importance of the circular Economy, and promoting research and innovation projects. The Ministry for the Environment,

Land and Sea - General Department for Sustainable Development, through Sogesid, has monitored the Italian Regions also from the point of view of EC regulations with the project CReAMO PA - Competences and Networks for Environmental Integration and Improvement of PA Organisations, and by re-elaborating data from the Circular economy report drawn up by the Energy & Group of Strategy Politecnico di Milano (CER, 2021, p.116) has divided the regional administrations into three groups (Figure 2): "expectant", "work in progress" and under strengthening.

The "expectant" Regions have yet to create legislation that is capable of spanning various sectors; the "work in progress" Regions are in the phase of transition and of greater affirmation of CE principles within their legislation; regions "under strengthening" are those where CE principles are more pervasive and explore various sectors.

LAW'S PERVASIVENESS	EXPECTANT	WORK IN PROGRESS	UNDER STRENGTHENING
HIGH	Sardegna	Campania, Emilia-Romagna, Lazio, Sicilia, Liguria	Lombardia, Toscana, Veneto, Trentino Alto Adige, Valle d'Aosta, Friuli Venezia Giulia, Piemonte
MEDIUM	Abruzzo, Umbria	Marche	
LOW	Basilicata, Puglia, Molise, Calabria

#### 4.2 Methodology

From a methodological point of view, the present study was based on qualitative research with exploratory purposes, carried out through the collection of secondary data published on institutional sources and primary data obtained through in-depth interviews. In particular, the results deriving from the research applied to the Lombardia Region are presented here as the first phase of a broader multi-case study.<sup>1</sup>

<sup>1</sup>Later in the research, all the regions involved in the CReAMO PA project will be analysed to cover the whole country.

#### 4.2.1 Data collection

The criteria for selecting interviewees were role, i.e. covering administrative functions related to implementing circular economy initiatives, and operational relevance in communication processes. The study identified the first core of interviewees from the contact persons for the CE indicated as speakers at the conferences of the CRelAMO PA project by the regions themselves; from this initial group through a snowball sampling process (Noy, 2008), which envisaged the indication by each interviewee of other relevant potential interview candidates, 15 officials and managers were interviewed. Before the interviews, some pre-screening questions were administered to exclude irrelevant participants. The final group of 11 interviewees (Fig. 3) was formed when the materials began to show repetitive patterns, suggesting a saturation state. At this stage, documents were collected from public administration officials and available public sources as secondary data to provide a holistic understanding of the context. Using the Patton (2002) approach of the 'general interview guide', interviews were conducted by video conference or telephone between March and April 2023 and recorded with the participant's consent. The language used was Italian and the transcripts were then translated into English. They lasted between approximately 30 and 90 minutes each. Each respondent was assigned codes to refer to for quotes (e.g. A, B, C): this ensured anonymity.

SECTOR	SUBJECTS	FORMAT
Environment	1	Virtual conference
Economic development	2	Virtual conference
Sport	1	Phone interview
Foundation (subsidiary of Region)	1	Phone interview
Communication	4	Virtual conference, phone interview
Press office	1	Phone interview
Agriculture	1	Virtual conference
Total	11	

Figure 3. Personal elaboration

In order to answer the research question of what form of communication is adopted by the regions to disseminate CE, an inductive approach based on narrative enquiry was adopted (Pentland, 1999). The study considers it the most appropriate research method because it allows the collection of information from ordered sequences and the construction through the narratives of key interviewees of a coherent picture by identifying the mechanisms of content emergence, agenda setting, choice of channels and language.

#### *4.2.2 Data Analysis*

The process of analysis used is a thematic narrative, organised in five stages: 1) organisation and preparation of documentation, 2) emergence of a general sense of information, 3) coding process, 4) categorisation 5) interpretation.

The first phase started with transcribing the audio files, partly manually and partly through the sonix.ai software. All transcripts were reviewed manually to eliminate errors and non-narrative lines, such as random conversations. In the second phase, the narratives were re-read and recurring words and main ideas were highlighted.

In the next step, the data were coded manually. At the end of the coding of the first transcript, a code list was constructed; in subsequent transcripts, the codes from the list, when applicable, were extracted; conversely, new ones were created to be added to the main list. A final 43 codes were identified.

In the fourth stage, following the guidelines of Reissman (2008), the categories condensing the themes were identified. For this study, the codes were collected in two categories, the second of which was divided into five subcategories. The last step was the attribution of meaning to the data.

## **5 Results**

In total, the data analysis identified 137 quotations and 43 codes. The codes were condensed into two main groups: respondents' perceptions and the communication model. The second category, i.e. the communication model, was subdivided into subcategories referring to applying the TCA (Mode, Language, Content, Stakeholder interaction, Transparency). Both categories made it possible to identify barriers and implementing factors for CE communication. Some quotations are given in Tables 6, 7, 8, and 9.

## **5.1 Barriers Limiting the Effectiveness of CE Communication**

### *5.1.1 Confusion Sustainability/circularity*

The interviewees mostly reported a personal definition of circular Economy that brings the concept under the broader category of 'sustainability', particularly limiting its application to the environment and waste management. Of the three dimensions - environmental, economic and social - almost only the first two seem relevant. This aspect reflects the great regulatory and financial commitment that the public authorities have deployed to create and spread circularity chains in the business fabric and to act with a significant quantitative impact on reducing landfill; on the other hand, however, it also reveals vast unexplored space to act on the dissemination of models that are inclusive of all the components of circularity.

### *5.1.2 Perceived lack of appeal of the CE concept*

In addition to an objective quantitative scarcity of news (press releases, videos, social media posts) dedicated by the information component to the CE detected in the secondary data, the interviewees negatively perceive the topic's attractive potential. Some interviewees highlighted its elitist, 'niche' character, which contradicts the consideration of a rather informed and aware public and the belief that the target audience of young people is receptive and curious.

### *5.1.3 Attention Capture Time/Topic Complexity Ratio*

According to a good number of communicators and information workers, the topic is difficult to understand at a time when the average person today is willing to hold their attention. The public's habituation to slogans borrowed from marketing and commercial communication, examples of greenwashing, has further deprived society of charge of the topic. Only some are willing to spend the cognitive energy and time to understand the paradigm shift and the disruptive effects of the CE. One interviewee stated: 'The discourse on CE is a subject on which there is a need for time and willingness to pay attention on the part of the recipient: you cannot get into it by dint of slogans. There is a need for opportunities to meet to make people understand that certain issues have dignity and value and that they cannot be slipped away in an advertising slogan' (F). This aspect is consistent with the TCA.

#### *5.1.4 Technical Culture in PA Management*

There is a prevailing opinion among communicators and informants that many important circular economy initiatives do not emerge in the storytelling of the public administration because the core of the actions and initiatives is the responsibility of every technical Department, which are attentive to the concretisation of results but do not consider the communication aspect as incisive for public policy purposes.

#### *5.1.5 Lack of early communication activation*

Technicians only sometimes activate communication experts in the preliminary stages of discussion tables and projects. This lack hampers the emergence of important content, the definition of clear communication objectives and targets, and a careful form of 'life-oriented' language.

Very virtuous cases have emerged in the case study - for example, the communication model applied by the Fondazione Lombardia per l'Ambiente, which was set up by the Region as a meeting point between the political and scientific worlds and whose mission is precise 'science for policy' - or communication campaigns on specific topics - the fight against food waste - where activation was immediate and very fruitful, but the situation is not generalised.

### **5.2 Enabling factors**

#### *5.2.1 Focus on CE*

An organisational structure dedicated solely to dealing with the CE, acting as a collector and coordinator of all policies, and creating a dedicated management unit in the organisation chart represents a strong communication implementation factor. In the case study analysed, the establishment of a CE Observatory and an organisational unit dealing exclusively with CE, separate from the one dedicated to 'Sustainability', expresses a desire to mark the difference and show the uniqueness of the circular model. We are strongly aware that we should aim to promote all its dimensions.

#### *5.2.2 Measurement and Evaluation*

There is a clear awareness that measuring communication actions is fundamental, all the more so for public authority. While this is a well-established

practice on the part of the communication structures that manage social media, the rest of the interviewees point out that there still needs to be more committed to this, albeit very important, aspect.

### 5.2.3 Target Segmentation

One of the major challenges that communicators have identified as necessary to get the circular message across is a policy that dares to identify precise, verticalised targets. Among those deemed strategic for disseminating circularity are young people, who are already curious about the concept and considered 'ambassadors' to their families and environments. This factor is consistent with the National Strategy for the CE and the Environmental Education and Communication Plan.

### 5.2.4 Emotional Message

There is no doubt on the part of both officials and information workers that resorting to normative messages or appealing to emergencies to produce behavioural changes required by the circular model on businesses and citizens is ineffective and, indeed, very often counterproductive. Experimentation with communication campaigns that have resorted to emotional messages, albeit based on in-depth information and quantitative scientific studies, has yielded good results in engagement.

### 5.2.5 Interaction with Stakeholders in Attendance

Consistent with the theory of communicative action, strong stakeholder involvement in both the policy-making and communication phases is one of the most enabling factors. Many interviewees emphasised that the organisation of in-person events, participation in trade fairs, and public presentations are valuable ways of cultivating dialogue and reaping the benefits of two-way communication.

Table 6: Barriers limiting the effectiveness of CE communication – first category – Opinion

Fusion of CE in the sustainability concept	"I consider CE as one of the pillars of sustainability" (A) "During the 'Sustainability Forum' wide space is for CE issues" (B) "The Region (...) has equipped itself with the tool of the Sustainability protocol to create an important community around the topic, with a focus also on the CE" (G)
Environment predominance	"CE is one of the engines that must be started to achieve sustainability, first of all environmental, but also social" (A)

Economic predominance	"Towards a CE in response to new economic and energy needs" (A)
CE model in the making	"The world of CE is still a reality in the making, often to be created" (A) "Start-ups with circular models are catching on, but we are still at the very beginning" (A)
Limited CE concept	"It is the theme that deals with prevention and reuse and what we consider waste, which becomes second raw material ... It is associated with the concept of waste, in which there is everything" (B) "For me, CE means making the most of waste and, above all, trying not to produce it and to re-introducing it into a production cycle in an economically sustainable way and on a large scale" (C) "I have in mind a virtuous process that allows a 360-degree look at everything related to the environment, and that can benefit citizens. I tend to link it to activities of the Environment Department" (H)
Regulatory contradictions Complexity	"There are often contradictions between recycling and reuse" (G) "CE issue needs time and willingness to pay attention: one cannot enter into it by force of slogans. There is a need for opportunities to meet in order to make people understand that certain topics have dignity and value and that they cannot be slipped away in an advertising slogan" (F)
Time/Attentiveness	"Culture is done not by slogans but by devoting time and energy, by paying attention to those who ask you to account for your initiatives, why you participate in a UE project that implies a certain kind of use of public resources" (F) "Slogans dominate the world of environmental communication and are not interested in understanding who is on the other side, what they think, what they have understood, and how they can react" (F)
Technocratic culture	"Very technical departments, with a high number of engineering professionals, lack communication skills" (B) "Our utmost concern as technicians is to communicate to institutional bodies, e.g. the Ministry" (C)
Communication delegated	"We have communicated the circular supply chain call to the companies together with Unioncamere, which has concretely taken care of disseminating the information" (A) "The technical table "Plastic" of the CE Observatory relied heavily on the communication aspect of the European project structure" (C) "We made the call for the reuse centers known to the municipalities and those financed were obliged to publicise the initiative. We relied on the communication of the municipalities because it was more incisive at the local level" (C)

<p>Delay in Involvement Communication</p>	<p>"I know it exists, but I have never attended a CE Observatory" (B)          "There is a bit of a lag in the involvement of the communication sector from the early design stages of public policies, in general" (B)          "When an initiative is born with the early involvement of the communication sector, it always takes on a clearer identity. Conversely, it remains vague; you struggle to make an impact (B)          "On the communication of the ReCycling project we are we are only at the beginning" (H)          "Communication involvement depends on the topic we are dealing with. We should certainly be present right from the embryonic part of the projects, and for example, we should follow all the stages of the CE Observatory, but there, for example, we are present a little bit on the side. On other topics such as the Sustainability Forum, on the other hand, we are involved from the earliest stages" (I)</p>
<p>What matters is the doing</p>	<p>"In my opinion, communication has taken a bit of a back seat. It was certainly disseminated among those who put the lines into practice, but it was limited to that" (C)          "The technical component of the administration is concerned with involving stakeholders, making policies concrete, but then the whole part that is to disseminate all this work is missing" (C)</p>
<p>Elitist-niche concept</p>	<p>"Often, many actions and experiences are very elitist. For example, at the Ecomondo trade fair, I attended a talk by large luxury brands about the recovering service. A commendable initiative of commitment to circularity, but how many people can afford it? Perhaps these are examples that tend to make 'culture', but in my opinion, CE actions must be more within reach of the citizen, and there must also be a real relevance and economic return in supporting them on the part of the public sector" (C)          "It seems that the circular economy is still perceived as being quite remote from the citizens, a very niche thing" (M)</p>
<p>Poor newsworthiness</p>	<p>"In a year of news published on the Lombardy News website, there is a very low percentage of news on the circular economy, perhaps 1 per cent. The editor asks very little about it" (M)</p>
<p>Unattractive concept</p>	<p>"It is not a theme considered particularly attractive" (B)          "There is no strong demand for information as on other topics" (B)          "These are still issues that do not warm the heart" (C)          "In my experience, it is not a topic of strong appeal, and there is little engagement" (M)</p>

Table 7: Enabling effectiveness factors – first category – Opinion

<p>CE as a distinct concept from sustainability</p>	<p>"We have two organisational units, one dealing with sustainability and one with CE" (B)          "The CE is one of the communication focuses on which we have decided to keep a spotlight at all times" (F)</p>
<p>Extension of the concept</p>	<p>"The CE Observatory follows two sectors in particular, waste and energy. The waste component has thematic tables on plastics, aggregates, steelworks and foundry slag, sludge, food, and non-recoverable waste. We plan to activate one on textiles soon" (C)          "On the one hand, the Region has indeed focused essentially on minimal landfilling, but I think it is a path that has begun and aims to achieve all the 'R's of the circular model one step at a time. It takes time, but the first steps have already been taken" (E)</p>
<p>Early involvement communication</p>	<p>"The National Waste Plan provides to reduce food waste. Among the actions identified are communication campaigns, which were considered important in the study's results commissioned by the university and in other literature. Our structure is technical, and we asked for collaboration with the communication staff of the Environment Department and the General Department" (D)          "Communication is part of the project, not an optional aspect, precisely because the aim of the Foundation is the transfer of knowledge" (E)</p>
<p>The propensity for communicative innovation</p>	<p>"There are not many situations in which the campaigns go off the track of the institutional standard, but on this aspect, the Presidency of the Region has good attention and willingness to set out on new paths" (B)          "We need to get to work on the site because there is much information, but it is scattered here and there and often difficult to find: we now have the idea of creating a page where we can collect all the prevention actions, correlating them with the results of studies, campaigns, and also 'showcase' what has been done not only by us as a Region but also by organisations and associations". (D)          "We are developing a digital storytelling platform that will also be open to stakeholders where communication campaigns can be shared. We want to tell how they are created and upload the data" (G)          "Region is trying to innovate a lot on the communication side, which from an overall point of view is already good" (I)</p>
<p>Emotional mood</p>	<p>"In promoting certain circularity actions, it becomes important to use emotional messages" (B)          "The campaign against food waste played on the concept of 'loving' and therefore not throwing something away" (B)          "The concept of a love affair with food is an emotional communication choice; the choice of influencers was also" (G)          "We made an emotional video that followed the volunteers of an association on a typical day both to promote activities but also to make people understand how we have important impacts against waste" (G)</p>

Cross-sectoral vision	<p>"The CE Observatory is a table for comparing and sharing objectives with all players in the area" (A)</p> <p>"The CE Observatory is organised in coordination tables" (A)</p> <p>"We are not the only directorate dealing with CE because it is an issue that needs to be addressed in the round" (C)</p> <p>"For us, the CE is a cross-cutting policy in respect of which we have activated an initial communication and awareness-raising work concerning the campaign against food waste" (G)</p>
Sharing with stakeholders	<p>"The CE Observatory defines the expected results of the joint construction process of regional environmental and climate policies and strategies" (A)</p> <p>"Institutions, organisations, and experts are invited to the tables of CE Observatory" (A)</p> <p>"Collaborative agreement with universities to promote CE transition based on reconditioning and recycling of existing materials and products, extending their life cycle as far as possible and minimising waste" (A)</p> <p>"Close cooperation with companies and stakeholders in the waste management chain and with citizens. Obviously, there is no good waste collection without the cooperation of citizens" (B)</p> <p>"To share policy choices on CE, an Observatory has existed for years, bringing together regional leaders and stakeholders" (B)</p> <p>"We interface with actors who then put CE policies into practice, so certainly trade associations, consortia, environmental and consumer associations, and then it is very important that there are researchers at the tables, so we involve the universities" (C)</p> <p>"When we set up the thematic tables on CE, we launched an initial expression of interest through the Region's channels and so interesting parties were able to apply to participate" (C)</p> <p>"At the steelworks slag table, a precise proposal came from the trade associations to find common guidelines for disposal" (C)</p> <p>"We are very open to proposals that come to us from operators, and we never set out to do anything at all" (C)</p> <p>"The councilor for the Environment in the legislature that has just ended strongly wanted a CE Observatory, and in the table against food waste, all the actors involved (non-profit organisations, research organisations, environmental associations, representatives of the large-scale retail trade) participate, with whom all actions have been shared, including the communication campaign" (D)</p> <p>"In the table against food waste, we created a sub-table communication and in addition to suggesting the most important contents, many actors, such as non-profit organisations, expressed their willingness to make themselves known, and the communication campaign took this into account" (D)</p> <p>"The Region has an active table on regional policies 'Development Pact' at which various stakeholders sit, almost all the association acronyms, in which we have created a sub-table dedicated to communication to identify and share joint communication lines, which could act as a sounding board for regional activities but also deserving ones coming from the territory" (G)</p>

Time-tested involvement	<p>"Communication towards the stakeholder is the driving force behind all our actions". (I)</p> <p>"Regione Lombardia has been investing in CE and sustainability issues for years now" (A)</p> <p>"The call for CE supply chains is now a tried and tested instrument" (A)</p> <p>"For several years, the region has developed separate collection and re-use policies, such that it has excellent indicators even compared to European best practices in this area" (B)</p> <p>"In the 20 years that I have been dealing with waste in Regione Lombardia, in many respects, the approach has changed enormously" (C)</p>
Proudness and awareness of results	<p>"Around forty companies participated in the call for CE supply chains with very interesting initiatives" (A)</p> <p>"Last year, in 2022, 50 percent of the funding dedicated to the CE by the Region went to the Economic Development Department."</p> <p>"The investment of Lombardia's entrepreneurs in green is a given compared to other areas of the country" (B)</p> <p>"We are the second largest directorate (Environment) for investments in communication in Regione Lombardia: this is because we believe that environmental issues as a whole and the effects of the CE are the times not of the future but of today" (I)</p>

Table 8: Barriers limiting effectiveness-2nd category - Communication method

Language- System oriented	<p>"Public administration is aseptic, it tells in a detached way. There is a problem with the public communication of emotions: yet there would be issues that could be profitably dealt with using an emotional mode and this would touch the interlocutor better" (B)</p>
Mode - One way	<p>"We have communicated the calls to companies through the Region's website and the dedicated section Sustainability in Lombardia" (A)</p> <p>"In general, in Regione Lombardia, we are not used to thinking of communication as listening, which is fundamental" (B)</p> <p>"The work of the technical tables is published on the sustainable development online platform. This section is not always updated in real-time, but we try to keep up with it. Perhaps the platform does not give an organic view of the work of the CE Observatory" (C)</p>
Transparency low	<p>"As a citizen as well as an official, I think there is still some effort to be made" (B)</p> <p>"On data that are a systematic source of difficulties in public management we do what the law prescribes, no more. In short, we keep silent profiles on certain topics" (B)</p> <p>"The world of environmental communication is dominated by slogans and is not interested in understanding who is on the other side, what they think, what they have understood and how they can react" (F)</p>

Discourse - System-oriented	<p>"We need a policy that says about the CE more clearly: look we are doing this and this and this, public money is being put here and taken away there because this choice serves us all better. I am communicating a choice that is an attribution of value" (F)</p> <p>"Remove the compulsion to announce politics that the media world feeds tremendously" (F)</p> <p>"Information should be useful but sometimes there is a quota of somewhat empty press releases. But for 85 percent, they are all of the substance' (M)</p> <p>"Sustainability, CE, environment are words emptied of meaning by marketing communication" (F)</p>
-----------------------------	--

Table 9: Enabling effectiveness factors - 2nd category - Communication method

Mode - Two-way	<p>"The Sustainability Forum was an opportunity to disseminate initiatives and is open to all" (A)</p> <p>"The two-way interlocution is honestly sporadic and occasional, but there is a plan to move in that direction precisely because the topic of CE is not so attractive in itself" (B)</p> <p>"Our relationship with our stakeholders is not one of supplier-customer as much as a partnership, and even in communication, we try to set it up as one of participation and inclusion" (E)</p> <p>"We know that the most genuine dynamic of education is the one-to-one relationship, and it is a sowing that is worthwhile regardless of the numbers it can bring" (F)</p> <p>"Organising in-presence events such as the Environmental Education Fair or the Rimini Meeting is crucial because they always have the dimension of listening and meeting the target audience of our communication actions" (F)</p> <p>"The influencer we involved also relies heavily on relationships with her followers, which she translates into in-attendance moments where she often meets her audience: she has managed to engage with a large audience on the issue of waste and has fuelled a lively discussion"(G)</p> <p>"We planned a public presentation event during the Sustainability Forum where the moderator engaged the audience to participate" (G)</p> <p>"The communication of the ReCycling project will not so much be through social media as through the organisation of events in the various partner territories: we try to create a network of public administrations that already have reuse centers, stakeholders, associations and to organise events where young people can participate together with a wider public that may be interested in bringing their bike and exchange it" (H)</p>
----------------	--

Language - Life world oriented	<p>"On the Waste Plan, which among other things provides policy guidelines for waste prevention, reuse, and recovery, a so-called 'pop-up booklet' has been produced, which is intended to be a simplification of data and information" (B)</p> <p>"I have a personal aversion to institutional and formal language" (B)</p> <p>"Political and scientific worlds are two very different worlds in terms of language, and the added value of the Foundation is precisely to work on academic, specific topics and make them understandable and communicable" (E)</p> <p>"We try to bring the scientific content to as accessible a formula as possible, without distorting it, without trivializing it" (F)</p> <p>"Language is relative to the medium and the target and is continuously modulated" (G)</p> <p>"I personally, when I write a news story, I aim to make anyone understand any topic, even very technical and vertical ones" (M)</p>
Transparency	<p>"An easily searchable database for citizens on all waste facilities in Lombardia, with geo-referenced maps, will soon be online (B)</p> <p>"If we are the project promoter, we usually make the data open access, but if we are commissioned, we only communicate the general data, and the decision on the complete data remains with the client" (E)</p> <p>"Since working with the Foundation, I have worked on re-designing the site to access content more easily and more immediately."</p>
Content-based on veracity	<p>"The Foundation is the place where policy and academia physically meet, and the mission is 'science for policy, the process by which information is transferred from the scientific community or individual researchers to policymakers, to produce evidence-informed policies" (E)</p> <p>"For the reduction of food waste, a study was commissioned to Università Cattolica in collaboration with the Fondazione Lombardia per l'Ambiente, which has expressed an environmental, social, and economic assessment of the benefits of waste reduction" (D)</p> <p>"The study carried out by Cattolica, 'Virtuous networks against food waste', showed how important it is to intervene also on communication to citizens to reduce waste at household level" (D)</p> <p>"Almost all areas of environmental communication are inflated, many concepts are empty words, or totems of commercial communication permeated with greenwashing: we need to restore scientific rigor to what we disseminate" (F)</p>
Content clearness	<p>"We have always used content with positivity-focused messages" (D)</p> <p>"For how many years have we been fed messages of catastrophism? We have become addicted to bad news, and they have no effect" (F)</p> <p>"The campaign created engagement because it succeeded in touching common points, moving away from the logic of the decalogue, which was there, but empathising with the suggestion of everyday domestic tricks" (G)</p> <p>"Emergency communication is very dangerous, and we realised this with Covid. You have to know how to manage it; otherwise, it does more harm than good" (M)</p>

Stakeholders interaction- knowledge transfer	<p>"Foundation acts as a bridge between politics and science to enable knowledge transfer" (E)</p> <p>"We work on a practical level with schools, with teachers and pupils, going into classrooms, organising events or training courses, and developing teaching tools that we offer free of charge, and the topic of the circular economy is one of the most in-depth and developed for schools" (E)</p>
Stakeholders interaction-training	<p>"Tying in with the theme of communication, we develop tools on the topic of the circular economy for schools of all levels" (E)</p> <p>"We activate a mix of communication, education, and training to spread environmental and circular economy culture" (F)</p>
Channels	<p>"The chosen channel for the campaign against food waste was exclusively social media because everyone is now communicating this way, and we asked four influencers with different personal follower bases to participate" (D)</p> <p>"The first channel we use for CE news is digital, website, and social networks (Facebook, Youtube, and LinkedIn). The second channel is the editorial one and the latest tool we are making available free of charge to schools and citizens are dedicated to the circular economy and are called 'The world is a wheel'" (F)</p> <p>"We use video a lot because we also operate in the big attention market where the real challenge is an irrelevance, and therefore, we look for an issue like the circular economy to deserve the attention and consideration it deserves" (F)</p> <p>"Instagram is our main channel, but we also use LinkedIn to narrate the communication operation. In the case of the campaign against food waste, we also used posters in the main railway stations during Christmas' (G)</p>
Target segmentation	<p>"The target group of the campaign against food waste was exclusively citizens" (D)</p> <p>"The information level of the average citizen on circularity issues from our observatory is quite at a good level" (E)</p> <p>"The topic is one that young people can get involved with" (E)</p> <p>"One of the big challenges is to study and understand the target audience well, whom we are talking to, to identify them and 'lose' time in studying, getting to know the people we are addressing" (F)</p> <p>"Last year, we stayed on broad targets for the food waste campaign, but this year we are developing a campaign on a specific target, in particular middle schools, because during the working table meetings, we were very emphatic about the educational objective, so we are now verticalising on schools" (G)</p> <p>"We need to focus on target groups. Focusing on children is the right way to go: they are future decision-makers and potential educators in their families and environments. They are ambassadors" (G)</p>

## 6 Discussion

The results suggest that the organisational structure and the public authority's communication model influence how information and content related to the CE are transferred externally. A model derived from the qualitative analysis summarising the main enabling factors is proposed in Figure 10.

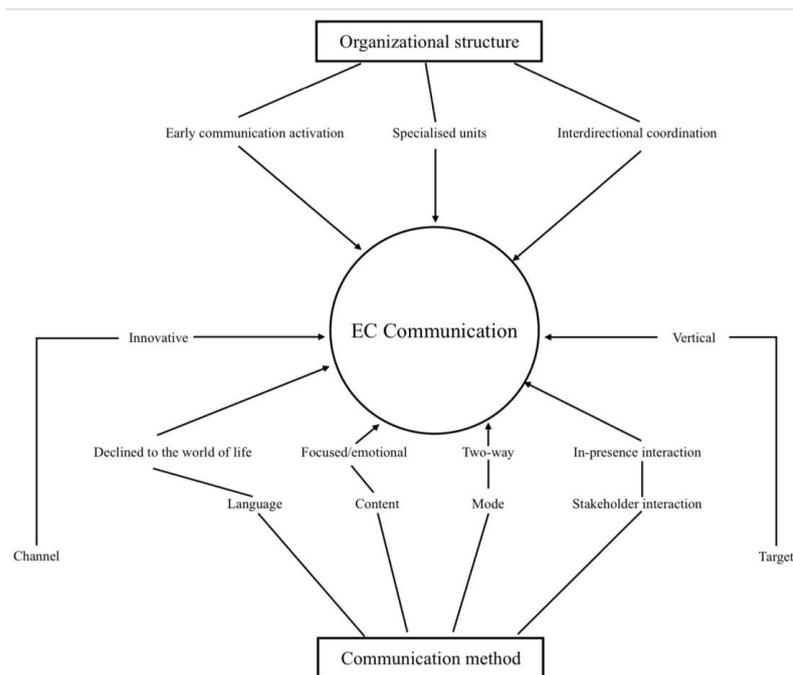

Figure 10. Enabling factors CE Communication: insights from qualitative analysis.

## 7 Conclusions

The study presents the research results applied to the Lombardia Region as the first phase of a larger multi-case study examining representative regions throughout Italy. However, this research has many limitations, which can represent a starting point for investigating the topic in greater depth. Future studies could analyse the differences between public communication strategies and those adopted by the private sector and include the view of stakeholders.

### Abstract

In this study, we focus on the modeling of the judicial system through a suite of System Dynamics. More specifically, employing a participatory modeling approach (GMB – Group Model Building) based on the System Thinking methodology, we have developed Causal Loop Diagrams, which we have then transformed into quantitative models through the modeling and simulation methodology known as System dynamics. The System Dynamics approach allows the development of context and scenario analysis aimed at identifying bottlenecks and high-leverage strategies for improving the judicial system's performance. We carried out 50 interviews and 200 hours of participatory observation in shadowing the human resources working within the Italian courts, and the present paper relates to our main findings.

**Keywords** – Judicial System, Public Management, System Thinking, Organizational Behavior, Innovation Studies.

**Paper type** – Academic Research Paper

## **1 Introduction**

In Italy, no structural reforms have been carried out in the organization of the work of judges. However, with the approval of the National Recovery and Resilience Plan (PNRR), the Italian Ministry of Justice has committed to the European Commission to achieve specific targets, with particular reference to the reduction of the disposition time (DT) and of over-three-year civil judicial backlog, following the principle of a reasonable duration of the trial. The objectives of the Project *"Next Generation UPP: New collaborative schemes between Universities and Courts to improve the efficiency and performance of the judicial system in North-West Italy"* represent a major organizational challenge.

In this context, it appears clear how the reduction of the judicial backlog of cases in first-instance or second-instance Courts is a critical aspect that demands immediate attention from Policy Makers to guarantee efficient work of the involved judicial organizations and thus also reflecting in an effective result in terms of the reduction of the average disposition (processing) time of each judicial case and hence in terms of the general "lead time" offered to citizens. Each Court thus has the problem of guaranteeing a proper lead time in working out each case (either first instance or second instance appeals), hence minimizing its Clearance Rate (meaning the rate at which courts can process and finalize their backlog of cases)

## **2 The Modernization of public organizations and the New Public Management (NPM)**

In the 1990s, the same innovative logic guided, with the adaptations required by the specificities of individual countries, the administrative reform programs launched first in the United Kingdom, then in the USA and northern European countries, in Germany, and finally, in recent years, also in France and Italy. The public sector modernization process started in the context of the financial crisis and was mainly driven by the need to reduce the costs of public administration and services.

However, the awareness that cost containment was a focus also accompanied by a crucial objective: improving the quality of public administrations' services.

The issues of the quality of public services and the central role of the customer, as a strategic resource for assessing the correspondence of the services provided

to the actual needs perceived by the users, thus assumed considerable importance.

A new organizational culture emerged oriented above all to disengage the public administration from the characterizing legalistic-formal vision for adopting a management logic based on achieving the result.

This global dimension process was denominated New Public Management (NPM), highlighting the conjunction between the public character of organizations and the business inspiration of management techniques. At the basis of NPM is Ronald Reagan's famous ideological statement was posed: "*Government is not the solution to our problem, the government is the problem.*"

The NPM is an approach mainly focused on transforming public management to facilitate more effective measurability and evaluation of performance for the final objective of reducing public spending. This new conception introduces tools, principles, and dynamics of private management.

The effort is, therefore, to implement the modernization of the State and its institutions by basing it on methods and techniques typical of the organizational and management sciences, however, considering the peculiarities of the public macrostructure oriented towards pursuing public scopes.

The fundamental principles of this new theoretical approach are generally traced back to the decentralization of functions and authority from the State to local government centers, to the introduction of competitive logic in the production and management of public services, to the privatization of public companies, and to a greater orientation to the result.

In this basic perspective, the work by D. Osborne and T. Gaebler, "*Reinventing Government. How the Entrepreneurial Spirit is Transforming the Public Sector*", constitutes the starting point: the inspiring idea of this perspective contrasts with the Weberian model and focuses on the results that could be achieved if public managers were allowed to operate with a flexible approach driven by missions rather than rules that pursue results by meeting the needs of the customer, not the bureaucracy<sup>1</sup>. As noted by Hague and Harrop, the NPM marks the shift from public-sector administration to public-sector management:

---

<sup>1</sup> Osborne and Gaebler's "*Reinventing Government*" outlines ten principles that authorities should adopt to foster their effectiveness: a) promote competition between service providers; b) empower citizens by pushing control out of the bureaucracy into the community; c) measure performance, focusing not on inputs but on outcomes; d) be driven by goals, not rules and regulations; e) redefine clients as customers and offer them choices – between schools, between training programs, between housing options; f) prevent problems before they emerge, rather than offering services afterward; g) earn money rather than simply spend it; h) decentralize authority and embrace participatory

*"...The significance of this, in turn, is the break it represents with Weber's view that the job of a bureaucrat is simply to apply fixed rules to cases. For its supporters, NPM is public administration for the twenty-first century; Weber's model is dismissed as history. Public administration has been displaced by public management".*

Therefore, the modernization of the public administration becomes of fundamental importance since an efficient administration and tangible progress in the services provided to the community and businesses directly influence a country's economic development. In essence, it is a matter of redesigning the administrative structure of the State, improving its product, eliminating useless procedures, simplifying the necessary ones, and reducing responsibilities and burdens.

## **2.1 From New Public Management to System Governance**

New analytical perspectives began to emerge between the end of the 90s and the beginning of the new century, which opened under the sign of public policies conditioned by the need to contain public sector expenditure and rationalize the costs of public institutions (Borgonovi *et al.*, 2017). In the context of the international economic crisis and the subsequent austerity policies, some critical issues of the New Public Management were starting to be highlighted. Among these, the debate focused on the tendency of the NPM to propose a mechanistic model, unable to highlight the managerial and decision-making specificities of public administration. The main limitation of the NPM lies in wanting to transfer the logic of the world of private companies to the public sector in an almost automatic and uncritical way<sup>1</sup>.

Secondly, the rationale for founding the NPM would not be *a priori* applicable to all public services provided by public administrations. In fact, for some of these, it was easier to transfer tools and dynamics of the private sector<sup>2</sup>. In contrast, for

---

*management; i) prefer market mechanisms to bureaucratic ones; j) catalyze all sectors – public, private and voluntary – into solving community problems.*

<sup>1</sup> *Among the further limitations of the NPM, there is also the tendency to underestimate ethics, fairness, and democratic principles, neglecting the specificities of the public administration understood as a subject that provides public services, in the implementation of the interests of the community. The emphasis is also placed on the further propensity of the NPM to lose sight of the inter-organizational and relational perspectives within public institutions, neglecting the cultural, socio-political, and managerial differences of the different local contexts.*

<sup>2</sup> *For example, telecommunication, public transport, and distribution of water and electricity, etc.*

other more complex and articulated sectors, this was only partially successful, or it was not possible<sup>1</sup>.

Therefore, in recent years, the NPM has gone through a new phase, namely that of implementing its theories, generally united by the focus on the characteristics of the internal and external environment, and preparatory to changing the face of the public administration.

This is System Governance or Public Governance, which is based on the policies of globalization and European integration, aimed at constructing new relational models, both at an institutional and governmental level, to guide public policies toward pursuing common and shared goals.

More specifically, public agencies are required to adopt governance policies that, considering the variables that influence the social, economic, and administrative system of a given reality, can create value for the community, ensuring that every action is carried out in compliance with the principles of economy and efficiency. Public operators must therefore ensure the quality of each initiative and encourage customers' cooperation in satisfying the community's needs (Bracci *et al.*, 2019).

The governance wave was therefore born as a response to the weakening of the State<sup>2</sup> and intends to represent a new technique for taking care of the common interest through the coordination and involvement of all stakeholders in the process of redistribution of decision-making power. In fact, regarding the tools used to realize this redistribution, self-organization is favored by implementing reticular and horizontal organizational structures characterized by collaborative rather than hierarchical relationships. These structures are based on maximum informality and the search for the engagement of all stakeholders in elaborating and implementing decisions (Ansell and Torfing, 2021).

In this sense, we understand how the accountability of public operators towards the community assumes an increasingly important role, following the criteria of participation, efficiency, and transparency in the management of public financial resources and in the activities and results the public administration achieves. The accountability-governance combination is, in fact, synonymous with a radical change that has affected the public sector, that is, the transition from a model of authority based on the rigid, formal, and hierarchical distribution of

---

<sup>1</sup> Health and education systems are the best-known cases.

<sup>2</sup> Precisely, the centralized nation-state model is unable to develop a differentiated solution for the variegated needs of the reference communities.

powers and responsibilities to a governance approach inspired by the principle of subsidiarity which envisages a distribution that is flexible and susceptible to change as economic, social, technical conditions or political priorities change.

### **3 Organizational efficiency of the judicial system and the trajectories of innovation processes**

This analysis focuses on the functioning and organization of one of the main branches of public administration, the judicial system. In the last 20 years, many studies in *Institutional economics* have emphasized the pivotal role played by well-functioning judiciaries in fostering multiple economic activities, as judicial institutions are responsible for the concrete enforcement of the legal framework. Indeed, in a context of uncertainty and incomplete contracts, a well-organized and then high-performative judicial system cuts down transaction costs and opportunistic behaviors by acting as a deterrent against economic agents' deviations from previously signed contracts (Marciano *et al.*, 2019).

The multi-faceted nature of judicial performance is generally – and accordingly to the European Commission for the Efficiency of Justice (CEPEJ) - captured in terms of the efficiency of the justice system by two indicators, the *Disposition Time (DT)* and the *Clearance Rate (CR)*.

The *Disposition Time (DT)* indicates the estimated time needed to resolve litigious cases (in days) in a specific year and court/country and is usually computed as the number of unresolved cases divided by the number of resolved cases at the end of a year, multiplied by 365 days:

$$Disposition\ Time = \frac{Pending\ cases\ at\ the\ end\ of\ a\ period}{Resolved\ cases\ in\ a\ period} \times 365$$

Instead, the *Clearance Rate (CR)* is calculated as the ratio of the number of resolved cases to incoming cases in a specific year and court/country, multiplied by 100:

$$Clearance\ Rate = \frac{Resolved\ cases\ in\ a\ period}{Incoming\ cases\ in\ a\ period} \times 100$$

When the CR is about 100% or higher, the judicial system can resolve at least as many cases as those come in; conversely, a CR below 100% indicates that the courts are not keeping up with their incoming caseload.

Once scholars in *Institutional economics* have made clear the significant impact of judicial performance on the economic growth of a country, supporting with robust empirical evidence the importance of efficient courts in ensuring the effectiveness of a legal framework oriented to enhance economic outcomes, it becomes necessary to investigate what are the determinants and organizational principles that favor the proper functioning of judicial systems.

In this regard, at the end of the 1980s, M. Crozier, analyzing the essential data of the evolution of modern organizations, enucleates four crucial elements in the new logic. First, the ability to continuously innovate the product or service, the technique, and the relationship with the customer makes it possible to achieve success. To acquire and maintain this order of capabilities, it is necessary to manage resources differently, specifically human resources, by implementing forms of organization capable of freeing the autonomy and creative spirit of personnel in the search for flexible and innovative solutions.

Therefore, Crozier strongly supports organizational models inspired by the principles of Total Quality Management, which entails the circle of continuous improvement in the activities carried out day by day so that the search for an ever-higher quality model is uniformly widespread in the social space of the organization and well rooted in its culture. In this perspective, technical innovation and new ideas on services require both the initiative of potential innovators and a more fertile, open environment capable of receiving, communicating, and elaborating. The good or service has a better chance of success only if the user is considered a resource and his/her suggestion and learning skills are appropriately valued. There is no effective service without communication skills on both sides.

According to this logical approach, it is crucial to involve all operators at any level in the search for solutions and in the proposal of innovations is essential. These have to be placed in the conditions to develop their cognitive and relational qualities to the maximum, through training courses and the development of cooperation tools, up to the acquisition of autonomous managerial skills, functional to a balanced and integrated system growth.

The literature in *Innovation Studies* agrees that the centralization of decision-making processes within a rigid and top-down hierarchy, with a high level of

bureaucratization, risks stifling the development of innovative ideas (Amabile, 1988; Amabile *et al.*, 1996; Deci *et al.*, 1989; Gagné and Deci, 2005; Verzelloni, 2020). Therefore, the ability to innovate, if meant as one of the main determinants of the success of an organization, necessarily requires the coexistence of a series of factors that allow both its development and sustainability (Crozier, 1963; Crozier and Friedberg, 1977; Verzelloni, 2020):

- Internal specialization;
- Structural flexibility;
- Autonomy of the organizational actors, who retain a margin of maneuver and the possibility of experimentation;
- Availability of resources;
- Existence of an incentive system, including informal ones;
- Opening to the external environment;
- Effectiveness of internal and external communication and existence of adequate horizontal, top-down, and bottom-up cooperation and connection tools;
- Simplicity of the organizational structure and simplification of rules and regulations
- Presence of participatory leadership, which enhances individual skills and encourages intra- and extra-organizational learning processes and continuous training courses;
- Organizational culture to support creativity, innovation, and dissemination of ideas.

If the ability to innovate plays a fundamental role in the proper functioning of an organization, even judicial systems should have adequate innovation paths that allow the development of ideas and functional solutions for improving performance in terms of efficiency and quality of services provided to end users.

### **3.1 Digitization of the public sector**

The high technology of services represents the primary source of innovation in the economy and society. The principles of transparency and simplification that increasingly characterize administrative action today materialize through telematic channels.

This explains the massive trend toward digitization of all administrative tasks, including the workflow of the judicial system. Indeed, a modern administration

needs to use information and communication technologies. The digital transition allows, on the one hand, the speeding up of procedures by operators and in relations with citizens; on the other, it is an indispensable prerequisite of the criterion of transparency, connected to the profiles of legality and anti-corruption, which are instrumental to the pursuit of efficiency of public agencies.

Among the primary purposes that the public administration seeks to achieve, therefore, also includes the adoption of technological and information models such as to be able to guarantee e-Government services to the community by implementing new technologies and reducing costs and times for providing services to final users.

#### **4 The Italian Judicial System Organization**

In Italy, no structural reforms have been adopted to organize the judges' work. However, with the approval of the National Recovery and Resilience Plan (PNRR), the Italian Ministry of Justice has committed to the European Commission to achieve specific targets concerning the reduction of the disposition time (DT) and over three-year civil judicial backlog following the principle of a reasonable duration of the trial.

Any reflection of an organizational-institutional nature, especially if oriented towards the innovation of the structures and rules of the judicial sector, should start from the observation that the Italian judicial system is, at least in part, a loosely coupled system: it is a complex organizational system in which interdependencies, behavioral rules and logics of action are characterized in a significantly different way from bureaucratic-hierarchical systems. A loosely coupled system is an organization characterized by a plurality of organizational units, which tend to be autonomous, with low technological and hierarchical interdependence.

In this sense, the Italian courts are - although similar in structure and partly in terms of material and human resources - each like an island in itself. The rules and practices of daily operations are very diversified, just as - from a micro-organizational perspective - the judges who create them are professionals assisted by the constitutional guarantees of independence and autonomy. This peculiar position produces its negative effects when it resolves itself into the claim of self-referential organizational solipsism. The system at the macro-

structure level does not have well-defined hierarchical links and is characterized by low interdependence.

It is both a centralized and localized system: the decision-making process is planned at the center, but then everything must be managed and re-evaluated at the local level under the responsibility of operators who, if not by chance, have no managerial training and experience. The division of tasks at the center of a strictly functional type (for example, between the Ministry of Justice and the Ministry of Finance or between general directorates of the same ministry) is such as to induce behavior in "watertight compartments" which in parallel are directly reflected on the territory lacking any intermediate level of government.

From the central governance perspective, the system is diarchic in the sense that by constitutional provision, the administration of justice is the responsibility of both the Ministry of Justice and the Superior Council of the Judiciary (CSM)<sup>1</sup>.

The former is responsible for managing human, instrumental, and technological resources for judicial activity, while the latter is responsible for governing, that is, managing and organizing the judges work and their leadership. The linear distinction outlined by the Constitution regarding the division of competencies between the two institutions increasingly shows its limits when tested by the facts and by the evolution of the respective spheres of action of the two institutions. On the one hand, the interventions to reorganize the Ministry's services, IT and organizational innovation projects have increasingly shown the need for support by the judges, the local judicial management, and the CSM. Likewise, in the CSM, the centrality of the government of the judiciary of the correct and efficient management of ministerial resources and of the projects on which the (few) resources are allocated is increasingly felt.

The effectiveness of the judicial action, the ability of the judicial offices to be active subjects of the development of the individual territories entrusted to their care, and therefore credible institutions, the possibility, in a nutshell, of rendering a just justice in adequate times are systematically dependent on ministerial policies. The segmentation and parceling out of responsibilities between the periphery and the center and, in the center, between the CSM and the Ministry have worse consequences when considering other factors: a) the coexistence within the system of a bureaucratic component (administrative officials) and a professional one (judges), each of which expresses its cultural background,

---

<sup>1</sup> *Articles 105 and 110 of the Italian Constitution.*

operates according to distinct professional and behavioral paths and responds to differentiated (formal and substantive) rules; b) the fact that the professional body of judges is organized according to constitutional directives of independence and autonomy which outline wide discretionary margins in the organization of their work with inevitable (also, but not only) negative repercussions concerning the needs of the homogeneous organization of services and standardization of procedures.

Both components (the judicial and the administrative one) are still not inclined towards a synergistic managerial approach (although with a very different gradient, as administrative managers today operate and are then evaluated by the Ministry of Justice in a certainly more stringent way on the results and the expenditure budget management). Above all, the professional component has for too long discounted a generalist conception of the function for which, for example, the judge, especially if he/she has been in service for many years, is considered (or self-certifies) competent to deal with any type of managerial and non-legal issue.

At the central level, there is no doubt that it is necessary to rethink the national judicial system's governance methods. We need civic courage, political will, and institutional seriousness to move towards a new and more modern judicial organization (Sciacca *et al.*, 2013).

## **5 Methodology**

The public administration as an organisation can be regarded as an 'open system', that is as a mechanism composed of variables that interact and condition each other, characterising the structure and thus determining the quality of outputs. Moreover, the variables interact with the environmental context in which the public administration is embedded (hence the 'open system'), and thus react in relation to the inputs that enter the system and the outputs that the system produces (possibly to adapt its behaviour, in the case of adaptive systems). Some constituent elements of fundamental importance for such a system (that is, the building blocks of the administrative system) are certainly to be found among the following: human resources, organisational structure, operations/procedures, technology, regulatory constraints. The effectiveness of an organisation depends on the degree to which its variables are consistent with the objectives for which

that organisation was designed, as well as in the ability of that organisation to cope with major external disturbances (organisational resilience).

We can thus affirm that a Public Administration is a complex system, dynamic in nature due to its capability (or even inability) to adapt to a varying context.

To describe such a systemic nature of a public administration, we will make use of the Systems Thinking and System Dynamics approach, the first one being a thinking approach where we can find several tools for describing (qualitatively) the complex structure of a system as well as its potential (still qualitative) behaviour over time; the latter, being the quantitative counterpart of the first one, particularly apt at describing a system's structure and then simulate its behaviour over time as well as its reaction to specific input (i.e.: policies).

In a first instance, we will use one of the qualitative Systems Thinking tools, causal loop diagrams (CLDs) to describe how the technological innovation in terms of "digital readiness" of a court can help reduce the backlog of cases by increasing the overall productivity of all the staff in a court (hence reducing DT and increasing CR). We will also show how innovation will support and speed-up such a technological transition and how innovation can be further sustained thanks to an institutional context (Ministry and CSM) that is capable of favouring the diffusion of such innovation.

By borrowing the concept of the general "workrate" from the project management sector, we can see how the typical "clearance rate" of Courts is indeed equivalent to such a PM workrate.

$$\text{Workrate} = \text{Tasks To Do (tasks)} / \text{Avg Task Processing Time (time\_unit)}$$

Or

$$\text{Workrate} = \text{Workforce (ppl)} * \text{Productivity (tasks/time\_unit*ppl)}$$

Borrowing a Stock & Flow diagram representing a general process for tasks development from the System Dynamics literature on Project Management, we have the structure shown in the next figure.

Which, if we substitute "cases" to "tasks", becomes:

$$\text{Avg. Workrate (cases/time\_unit)} = \text{Number of cases in the backlog (cases)} / \text{Avg. Disposition time (time\_unit)}$$

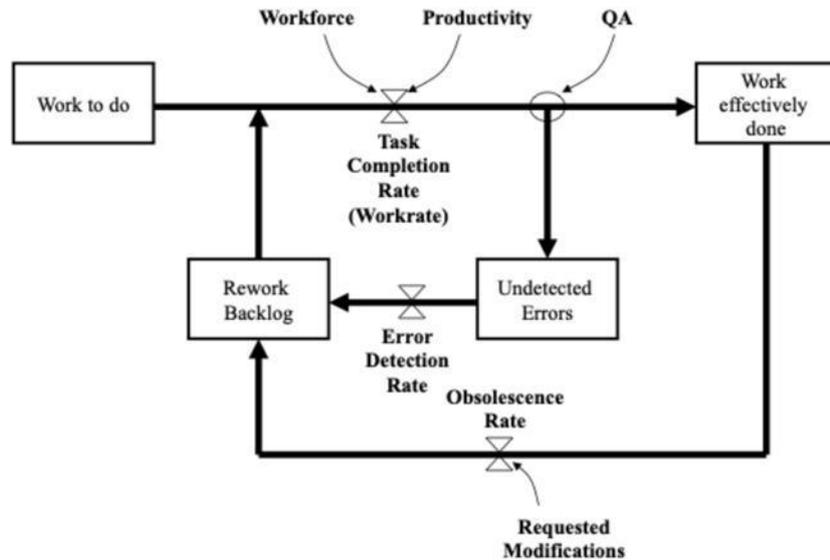

But also:

$$\text{Actual Workrate (cases/time\_unit)} = \text{Available Workforce (ppl)} * \text{Avg. Productivity (cases/time\_unit*ppl)}$$

Where:

Task Completion Rate → Clearance Rate

## Work To Do → Cases in the Backlog

Source: Lyneis et al. (2001)

Even though these models have been contextualised mostly in the field of project management, they represent the basic stock & flow structures to depict development processes, that is those processes meant to carry out work, hence including working out judicial cases, from their opening to their final closure (with potential reworks in-between).

It is worth noticing how not only the availability of (proper) staff influences the Clearance Rate but also Skills & Experience (meaning the competences owned by such resources) as well as Quality of Work, which all contribute to the capability to carry out the tasks still to be done (and those that in the meanwhile are piling up in the backlog due to new cases being filed to the court).

Technological Innovation can be considered as part of the available resources with an acceleration effect on the capability to carry out tasks more efficiently, hence contributing to the effectiveness of the organization which can become more capable to respond to its "users".

Also Innovation at the level of the Organization can solve several efficiency issues by making sure that there is always the right resource in the right place.

Additionally, the dialogue between Courts (under the coordination of CSM, the Higher Magistracy Council) and the Ministry of Justice tend to make policies to be followed much unclear for Courts, who tend then to manage problems on their own without leveraging on the knowledge acquired by the whole systems (hence leveraging on best practices and avoiding worst practices)

## **6 The proposed model**

Our analysis starts from the consideration of an existing Backlog of cases that the Court is not able to manage according to a required/desired Service Level (Desired/Required Disposition Time?). As the backlog increases, the President of the Court will realize more and more that there's a need to increase the capability of the court to manage such a backlog according to an acceptable timing. This means increasing the court's equivalent work-rate (which we can assume is the Clearance Rate?), that can be achieved either by increasing the available human resources (which we are not considering in this CLD) and/or by increasing the staff productivity, for example through technological support, aimed at easing work and speeding up average tasks duration. Increasing the technical support here implies augmenting (over time) the digital readiness of the organization.

The Digital Readiness of Courts is impacted by several organizational aspects that we have tried to capture in the CLD represented in the following Figure.

As the Backlog increases, the avg time allocated to study new digital solutions will decrease, hence decreasing over time the stock of digital readiness of the court. This in turn will decrease the clearance rate, thus augmenting again the backlog. But reinforcing loop R1 can also be read in a positive way since as the DR increases, CR increases, backlog will decrease and so there will be more time to study additional DR solutions, hence over time increasing again DR.

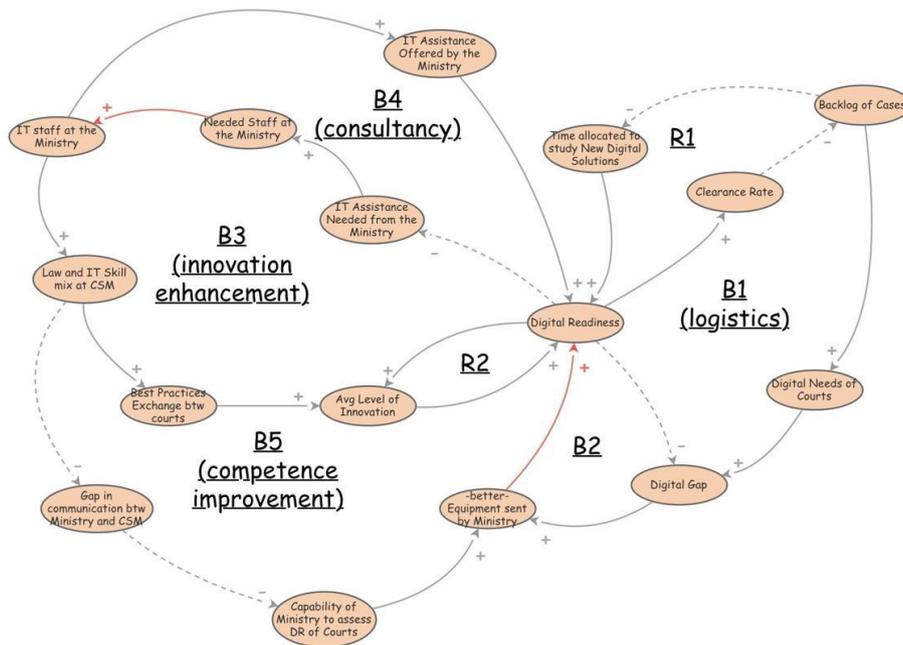

So Digital Readiness of the Court can be increased over time thanks to actions put in motion by the Head of the Court in order to innovate but it can increase also thanks to the overall average level of innovation of the other courts (reinforcing loop R2), in a process of best practice exchange. This process however can be slow if the starting number of Digital Ready courts is low.

Also, as the backlog increases, the court will start to perceive that they have higher digital needs, which will in turn express a higher amount of orders of digital equipment/solutions sent to the Ministry. Assuming the latter is capable of assess effectively the digital needs of courts, it will in will send new equipment

which, over time (red arrow means a delay acting), will increase digital readiness (Question: what about Knowledge?), hence in the long run decreasing the backlog again (Balancing Loop B1).

On the other hand, increasing DR implies a decrease in the gap and hence a decrease in the equipment sent by the Ministry which, over time, will imply a decrease again of the DR through its depreciation. (Balancing Loop B2).

When the DR is not good, the Courts will require Assistance from the Ministry, which will then have to find the necessary staff to cope with incoming requests. Once the needed staff will have been found, this in turn will imply an increase in the Skill Mix at the 7th Commission inside CSM. which will then make it possible to better exchange best practices at local and national level among the courts willing to innovate.

This will increase the average level of innovation, contributing in turn to increase the DR of the court (balancing loop B3 - Innovation Enhancement).

In turn, a higher amount of IT staff at the ministry will imply a better IT assistance offered by the Ministry, hence an increase in DR (balancing loop B4 - consultancy cycle).

On the other hand, when the law and IT skill mix at CSM is good, this will help reduce the communication issues that exist between Ministry and CSM, thus favouring the capability at the Ministry to effectively assess the DR needs of courts, hence transferring better equipment to the courts, ultimately increasing its DR...! (balancing loop B5, competence improvement).

## 7 Conclusions

The Judicial Systems is a complex System that needs to be analysed through tools capable of improving the understanding of its dynamics as connected to its organizational structure, both at local (Courts) and at national level (Ministry of Justice, Higher Magistracy Council, etc.)

Complex organizational systems can be analysed qualitatively through Systems Thinking (Armenia, 2019), modelled thanks to the Smart Model-based Governance approach (Armenia et al., 2018; Armenia et al., 2019) and simulated by means of System Dynamics models.

The Digital readiness of courts passes through an innovation process that can be sustained through the institution of a more effective (thanks to IT competences) operational unit at CSM aiming at a better cross-fertilization at national level of local innovations.

### Abstract

The European Union has been advocating for Gender Equality Plans in academic and research organisations since 2015, recognising them as a criterion for eligibility in Horizon Europe calls for research and innovation. The European Commission defines GEPs as a set of commitments and actions that aim to promote gender equality in an organisation through a process of structural change. Italian universities are now required to adopt GEPs in compliance with Decree No. 2/2019 and EU-COM No.152/2020. While most Italian universities have implemented their first GEPs, studies on their implementation and content are still limited. This study aims to explore the state of GEPs in Italian universities by analysing the extent of information disclosure in terms of actions planned. Special attention has been devoted to the area of work-life balance and organisational culture. Our study has found that universities are acknowledging the significance of promoting work-life balance and providing family care assistance. However, universities have not planned enough measures to address workplace well-being and mitigate threats to diversity and inclusion.

**Keywords** – Gender equality plan, diversity, gender gap, universities, empirical research

**Paper type** – Academic Research Paper

## 1 Background and theoretical framework

Across the world, emerging evidence has highlighted the persistence of gender inequalities in academia (European Commission, 2021; Górska et al., 2020). In this sector, the under-representation of women in senior academic positions, such as professors and university rectors, is the most visible manifestation of a gender gap (Van den Brink, and Benschop, 2012; Clavero and Galligan, 2021; Teelken et al., 2021), but it only represents the tip of the iceberg. In fact, the matter involves a broad category of subjects including students and technical-administrative staff (Barros et al., 2018; Oppi et al., 2021). Thus, it means that gender inequality in higher education affects the whole population of women both in the professional education careers and the labor area (European Commission, 2021a). Furthermore, the Covid-19 pandemic exacerbated pre-existing inequalities (UNCTAD, 2020; European Union, 2021). Scholars have demonstrated that women in higher education (such as teaching staff, technical-administrative staff, students, etc.) have been disproportionately affected by pandemic-related changes (Górska et al., 2021; Boncori, 2020; Guy and Arthur, 2020).

In response to this context, many international and European institutions have released guidelines, directives and recommendations aimed at promoting Gender Equality (GE) at different levels of society, both in the private and public sector. On this matter, the 2030 Agenda for Sustainable Development includes a specific goal called “gender equality” (SDG5) as one of its 17 goals, and it underlines the need to encourage interventions to accelerate progress, including the promotion of laws, policies, budgets and institutions that advance gender equality (UN 2015).

To promote a transformative and effective change towards GE, the European Union has been recommending and actively supporting the implementation of the Gender Equality Plan (GEP) in academic and research organisations (Council of the EU, 2015; EIGE, 2016): a set of commitments and actions that aim to promote gender equality through a process of structural change. A further step in that direction was taken in 2021. With the launch of Horizon Europe (HE) — the key funding program for research and innovation — a new eligibility criterion was

introduced to strengthen gender equality as a priority: organisations applying for HE funds are required to have a GEP in place.

In the literature on gender issues in academic institutions, GEP has been criticised as an ineffective policy instrument because the change process, required to implement it, faces resistance in different forms with different sources: lack of financial and human resources, and the burden of time (Bencivenga et al., 2017). Also, universities may decide on GEP measures for reasons which have little to do with a commitment to justice and equality: with a view to remaining competitive on the global market (Tzanakou and Pearce, 2019); or because they are legally obliged to do so (Ikävalko and Kantola 2017) to obtain funds, such as in the case of the HE programs. However, GEPs are also recognised as an essential means of creating GE awareness and serving to promote cultural change (Ovseiko et al., 2017; Barros et al., 2018; Clavero and Galligan, 2021; Barnard et al., 2016).

Despite a growing interest in gender issues in academia, little research has been done on GEP implementation and strategic actions identified to overcome gender inequalities (Clavero and Galligan, 2021). Given its recent mandatory introduction, more empirical research is needed to better understand how institutions have adopted this instrument. Therefore, this article aims to fill the gap exploring the content of GEPs in Italian public universities by responding to the following research question:

(RQ1) What thematic areas and key actions are included in the GEPs to identify and address gender inequalities and bias in academia?

## **2 Methodology**

To achieve our goal, we have focused on Italian public universities and, following a qualitative research approach (Krippendorff, 2018), a content analysis on published GEPs was adopted. Italian academia is a particularly suitable context to examine gender issues. According to the last Global Gender Gap Report (WEF, 2022), in terms of economic participation and opportunities, Italy ranks 110 out of 146 states, behind several developing countries. Even though women outnumber men among graduate students, a marked inequality persists at the upper levels of the academic career (Baldarelli et al., 2016; Istat, 2019; European Commission, 2021). Furthermore, gender segregation persists: horizontal, regarding choice of education, as women are underrepresented in STEM disciplines, and vertical, with regard to women's involvement in the governance and top positions of higher

education organisations as they represent a minority in both cases (Barone, 2011; Roberto et al., 2020; Morana and Sagramora, 2021; European Commission, 2021, 2021a).

Specifically, the study analyses 52 Italian public universities to examine the content of GEPs that have been drafted and published on the institutions' websites. Content analysis appears particularly suitable for this study, because starting from a more complex text — such as GEPs — the coding enabled us to study the objectives and actions implemented by universities to tackle gender inequalities in their institutions. Moreover, in the last few decades, this technique has been increasingly applied to investigate gender issues (Polzer et al., 2021; Neuendorf, 2011), also in higher education (Oppi et al., 2021).

The method allows us to explore the types of objectives pursued and actions implemented in each strategic area included in their GEP. It should be mentioned that a preliminary analysis involved creating a database containing all the actions indicated by the universities, arranged in five thematic areas (Chamocho et al., in press). By doing so we decided to focus the content analysis on the first area, "Work-life balance and organisational culture", because, compared to other strategic areas, it is certainly targeted more frequently in terms of actions proposed by universities to tackle the gender issues in academia. During the content analysis of the first area, three coding levels were recognised. First, starting from the raw materials — which represent the set of actions listed in the thematic area — in a simple descriptive phrase, we have identified the labels of actions planned (sub-categories). Second, finding connections between the labels' actions, we have defined the categories by collecting actions based on their main purpose. Third, by following a logical progression, dimensions were identified, which has allowed us to analyse the planned actions from an all-round perspective.

### **3 Findings**

On a sample of 58 universities, 89.65% of universities have published a GEP, while only 10.35% have not published the document. Therefore, the final sample consists of 18 large universities, 15 medium universities, 10 mega universities, 6 small universities, and 3 polytechnics. However, only 52 GEPs out of 58 have been analysed due to a lack of data and compliance with the GEP guidelines published by the Conference of Italian University Rectors (CRUI).

Findings show that Italian universities are implementing eight primary types of initiatives aimed at addressing the issues related to the area of work-life balance and organisational culture. The categories, as shown in table 1, aim to promote well-being in the workplace, encourage work-life balance, aid with family care, foster an environment of equity and diversity, strive for gender balance, implement gender equality plans, address threats to diversity and inclusion and provide student assistance.

The first category, "workplace well-being", encompasses initiatives that focus on: meeting the training and development needs of employees returning to work after a leave of absence, as well as enhancing the overall human resource development of the organisation; addressing work-related stress and developing strategies for its management; and providing specialised units offering psychological support and well-being services to the university's community. To ensure a smooth transition for employees who take leave due to parenting or illness, various actions can be taken, such as providing access to mentors who can offer support and guidance after returning from parental leave or for other reasons. Other actions include offering training to inform employees of legal provisions and possibilities related to parental leave, providing support to employees returning to work after leave (e.g., maternity, parental leave, illness) to maintain their career progression and developing guidelines for parental and maternity leave procedures to ensure consistency and a smooth process across the organisation. Instead, to promote well-being and tackle work-related stress in the workplace, several actions can be taken, such as setting up a counselling desk to offer support and guidance to technical personnel, administrators and teachers who may be at risk of work-related stress. Other actions include implementing procedures to identify critical areas that generate stress and finding solutions to overcome these stressors, conducting ongoing assessments of technostress levels caused by technology use, and sharing these findings with relevant stakeholders. Finally, to promote mental well-being, universities have planned actions that involve setting up specialised units or offices within the organisation to provide psychological support and counselling services to employees and implementing an internal organisational listening strategy, which involves creating mechanisms for employees to share their feedback, concerns and suggestions with management, and actions devoted to creating a positive and supportive work environment that promotes mental health and well-being.

The second category, "work-life balance", includes establishing policies and procedures that enable employees to work flexibly and remotely, as well as creating guidelines to ensure that work-related activities and events are scheduled with consideration for employees' personal lives and responsibilities. This can help employees balance their work and personal lives more effectively, reduce commuting time and costs and improve overall job satisfaction. Some examples of this action may include: setting up remote work policies and guidelines that outline expectations, best practices and tools for remote workers; providing employees with the necessary equipment and technology to work from home or other remote locations; offering flexible schedules that allow employees to work outside of traditional office hours or adjust their hours to accommodate personal needs, developing a "family-friendly" calendar that takes into account major holidays, school schedules and other important events that may affect employees' availability; providing training to managers and supervisors on how to plan meetings and work activities in a way that accommodates employees' personal needs and priorities; and encouraging open communication between employees and management to help identify scheduling conflicts and find solutions that work for everyone.

The third category, named "family care assistance", refers to the provision of facilities and programs to support employees with children, such as on-site child care services or access to summer camps, and involves making changes to the physical spaces and structures within universities to promote gender equality and inclusivity. Some of these actions are the creation of on-site child care, baby rooms, pink parks and summer camps, as well as the provision of vouchers for babysitting services and systems for holiday management able to balance work and family schedules.

The category of "equity and diversity culture" includes actions devoted to communicating, training, building and promoting a culture of diversity and inclusion. The actions to promote gender equality include publishing and disseminating information materials to reduce gender prejudices and stereotypes, organising meetings, conferences and seminars to highlight the social and economic role of women, providing training and awareness-raising activities on gender issues for technical-administrative staff, formulating and implementing guidelines for gender-inclusive language, strengthening the organisational unit dedicated to equal opportunities and identifying reference figures and structures for gender equality.

The category of "gender balance" regards integrating gender balance into universities' activities, processes and planning and involves a comprehensive approach to ensure that gender equality and inclusivity are considered in all aspects of university operations. To achieve this goal, it's necessary to take several actions, including presenting, publishing and disseminating the University Gender Report, which should include visual representations and be shared with both academic bodies and external audiences. Additionally, gender-disaggregated data should be collected and analysed to prepare the gender budget, and a systematic data collection process should be implemented for the Gender Budget. The Gender Report's results should be integrated into the university's strategic planning cycle, and the progress made should be periodically monitored and evaluated to assess its impacts.

To promote the category of "gender equality plan" in the university, it is essential to integrate it into the institution's overall strategy. This involves drafting and presenting an annual gender report to the academic community, organising information sessions about the GEP to increase awareness and establishing a dedicated GEP team responsible for monitoring data and tracking the progress of the planned actions.

The category of "threat to diversity and inclusion" refers to the anxiety and negative feelings that individuals from underrepresented groups can experience when they perceive that they are being judged based on a negative stereotype associated with their group. This can lead to reduced performance and motivation, which can reinforce the stereotype and contribute to a lack of diversity and inclusion in each setting. To avoid these issues, universities planned actions devoted to providing training to faculty and staff on ways to recognise and address stereotype threats, as well as implementing policies that promote inclusive practices such as avoiding biased language and creating a welcoming and supportive environment, and implementing an "alias career", which allows transgender professors, administrative staff and students to use a name and/or gender identity that is more comfortable and reflective of their gender identity, without having to legally change their name or gender marker.

Finally, the category "student care assistance" encompasses initiatives aimed at providing financial, social and educational support for students throughout their academic journey. Specifically, the following proposals have been developed to support students who are parents or caregivers: conduct an evaluation of tax and benefit regulations and propose a reduction in enrolment fees for students who

are parents under 25 years old; recognise and provide equivalency for students who are also caregivers, treating them as both students and workers; provide the same facilities and support for students who assist children, parents or relatives as those provided for working students; allow working students and students with children to access dedicated study plans, flexible class and exam schedules, and dedicated tutors; implement actions to facilitate the reconciliation of parenthood and studying; and ensure access to distance learning and other didactic activities for students who are caregivers or on maternity leave.

Table 1: exploring work-life balance and organisational culture initiatives in Italian universities.

Examples	Sub-categories Actions devoted to	Categories	Dimensions
<p>providing access to mentors who can offer guidance and support; offering training on the legal rights and benefits associated with parental leave; facilitating a smooth transition back to work through tailored support programs, such as flexible schedules or reduced workloads; and creating guidelines for parental and maternity leave procedures to ensure clear and fair processes are in place.</p>	<p>post-leave (return to work) training needs and human resource development</p>	<p>Workplace well-being</p>	<p>Policies and Training</p>
<p>creation of a counselling desk to provide support to technical, administrative and teaching staff on work-related stress risks; implementation of procedures to identify critical areas that generate work stress; identification of solutions to overcome such critical areas that generate work stress; ongoing assessment and communication of the level of technostress.</p>	<p>overcome work-related stress and how to manage it</p>	<p>Workplace well-being</p>	<p>Policies and Communication</p>

<p>establishment of departments/positions/roles dedicated to psychological support; implementation of an internal strategy to actively listen to the needs of the organisation; measures designed to improve the mental well-being of the organisation.</p>	<p>establish units of psychological support and wellbeing service</p>	<p>Workplace well-being</p>	<p>Policies</p>
<p>reviewing and categorising tasks that can be conducted through remote means; implementation and standardisation of guidelines for smart working and telecommuting.</p>	<p>implementing and regulating work flexibility through smart and remote working</p>	<p>Work-life balance</p>	<p>Policies</p>
<p>avoid scheduling meetings during times when employees need to attend to personal or family commitments, such as school drop-offs or pickups, doctor's appointments, or religious observances; allow employees to prioritise and block off specific time slots during the day for personal or family-related activities, such as exercise, childcare or meal preparation; encourage managers to communicate with their team members about their availability and personal/family responsibilities when planning team meetings or events</p>	<p>the preparation of guidelines for planning meetings, work activities and teaching life consistent with private life (family-friendly calendar)</p>	<p>Work-life balance</p>	<p>Policies and Communication</p>
<p>on-demand babysitting services; provision of baby rooms and parks; arrangements with private organisations to operate nursery schools, kindergartens and summer camps; mailing vouchers for babysitting services; definition of contributions to provide access to nursery schools.</p>	<p>childcare, nursery programs and summer camps</p>	<p>Family care assistance</p>	<p>Policies</p>

<p>agreements with home services and assistance organisations to support non-self-sufficient individuals; expansion of care infrastructure at the university; agreements with alternative recreational spaces to provide additional support, creation of assistance services and spaces for individuals with disabilities, young children and other dependents; adaptation of university structures to ensure gender inclusivity</p>	<p>structural transformation to achieve gender equality in universities spaces</p>	<p>Family care assistance</p>	<p>Policies</p>
<p>implementation of a holiday management software; conducting regular surveys to identify the needs of employees for better work-life balance, aligning the Positive Action Plan (PAP) based on the analysis of the previous year's final balance to improve work-life balance.</p>	<p>implement Staff Holiday Booking System and services to reconcile workload with private life</p>	<p>Family care assistance</p>	<p>Policies</p>
<p>publication and dissemination of information materials aimed at reducing gender prejudices and stereotypes; giving greater visibility to women in institutional and scientific communications; organising meetings and conferences dedicated to promoting the social and economic role of women; hosting seminars to raise awareness and promote support for parenting and shared care.</p>	<p>communicate diversity and inclusion</p>	<p>Equity and diversity culture</p>	<p>Communication</p>
<p>incorporating a workshop or seminar on the topic of female entrepreneurship and gender equality within the annual Start-up Day initiative; conducting training and awareness-raising activities on gender issues for technical and administrative staff; organising training courses for the university population on topics such as equal opportunities, stereotypes and gender-based violence; providing individual mentoring for female staff members.</p>	<p>training in diversity and inclusion</p>	<p>Equity and diversity culture</p>	<p>Training</p>

<p>formulating and implementing guidelines for gender-inclusive language; strengthening the organisational unit dedicated to equal opportunities; identifying reference figures and structures in the field of gender equality; introducing monitoring tools to ensure gender balance; enhancing gender diversity and promoting the inclusion and well-being of male and female students; removing barriers to recruitment, retention and career advancement to promote equal opportunities.</p>	<p>building and promoting a culture of diversity and inclusion</p>	<p>Equity and diversity culture</p>	<p>Policies</p>
<p>presentation, publication and dissemination of the University Gender Report through graphic editing and sharing with academic bodies both internally and externally; collection and analysis of gender-disaggregated data for the preparation of the gender budget; systematic data collection for gender budgeting; integration of gender report results into the university's strategic planning; periodic monitoring of the results achieved through the gender report cycle; evaluation of the impacts produced by the gender report cycle.</p>	<p>integrating Gender Balance into universities activities, processes and planning</p>	<p>Gender Balance</p>	<p>Policies, Training and Communication</p>
<p>integrating the Gender Equality Plan (GEP) into the university's overall strategy; drafting and presenting the Gender Report on an annual basis to the academic community; organising information days to raise awareness of the GEP among the academic community; establishing a GEP Team responsible for monitoring data and the progress of the planned actions.</p>	<p>integrating Gender Equality Plan into universities activities, processes and planning</p>	<p>Gender Equality Plan</p>	<p>Policies, Training and Communication</p>
<p>training actions to combat stereotypes and prejudices; overcome gender stereotypes; promote awareness of gender equality.</p>	<p>addressing stereotype threats to diversity and inclusion by training</p>	<p>Threat to Diversity and Inclusion</p>	<p>Training</p>

evaluation of the modification of the tax and benefits regulation; proposal to reduce enrolment fees for students who are parents within the age of 25 years old; proposal for recognition/equivalence of students/caregivers as student/workers; proposal for the adoption of the same facilities provided for working students for students who provide assistance to children, parents, relatives; enabling working students and students with children to access dedicated study plans and class/exam organisation, also granting them access to ad-hoc tutors; actions aimed at facilitating the reconciliation between parenthood and study; guaranteeing didactic activities in distance learning to students who are caregivers or on maternity leave.	promoting student careers with economic, social and didactic support	Student care assistance	Policies

#### 4 Conclusions

Our analysis contributes to the literature debate on gender issues through an in-depth analysis of the areas and actions included in GEPs aimed at promoting GE, with a specific focus on academia as a field requiring further study (Clavero, Galligan, 2021). We would like to offer a reflection for policymakers and university managers on the adoption of this novel means of fostering organisational change towards gender equity, and on the need to promote this process by investing resources and developing awareness at different institutional levels. Institutional stakeholders should develop and implement targeted actions areas which are most critical and most neglected, where a glaring gender gap is undeniable. Particularly, our study aimed to explore the measures that universities planned to

adopt to address issues related to work-life balance and organisational culture. Findings show that universities are increasingly recognising the importance of creating a supportive and inclusive work environment that values work-life balance and promotes gender equality. This can involve implementing initiatives such as work well-being programs, family care assistance, equity and diversity culture and student care assistance.

Based on the number of actions planned and disclosed in the GEPs, the categories of work-life balance, family care assistance and equity and diversity culture are the areas in which universities are more involved and committed. To promote work-life balance and family care assistance, universities mainly planned policy actions with the aim of creating set rules and procedures able to drive universities operations consistently with its values and goals; to improve equity and diversity culture, universities are strongly investing in training and communication. Instead, the categories in which universities seem to have planned fewer actions are those related to workplace well-being and overcoming threats to diversity and inclusion. It seems that the importance of workers' and students' mental health, and pre-and post-leave, are issues still undervalued by universities. Moreover, it seems that universities are still understanding which paths and plans in terms of training and policies to implement to address stereotype threats to diversity and inclusion. Finally, regarding the categories of Gender Balance and GEP, most universities seem to have planned policies, training and communication activities devoted to integrating these documents into universities' activities, processes and planning.

This research has certain limitations. First, the analysis focused on the actions proposed only in the first thematic area, while future research should consider what kind of actions were proposed in other strategic areas to combat specific gender inequalities. Second, the study observed the actions planned without focusing on the target population, whether students, teaching staff, technical-administrative staff, etc.; a more in-depth analysis should be conducted in this sense. Third, the present investigation observed the gender equality plans in their first versions in the Italian context; future longitudinal studies will enable us to better understand the evolution of this process and observe the changes over time.

### Abstract

Can FinTech companies close the gender gap in access to financial services? In order to answer this question, the present research in the first part analyzes the literature that has been expressed on the diffusion of FinTech platforms and their approach to an inclusive financial system aimed at supporting and sustainable development of companies with greater difficulties in accessing credit, including women's businesses. The research is inspired by a study by the Bank of Italy on the analysis of FinTech platforms operating in the world and in Italy and then analyzes the specific data of a FinTech platform, through direct contact. The example of the research is the absence of comparable official data, while the originality of the work lies precisely in the desire to draw scientific attention to a well-known topic, but still little explored in terms of data and literature.

**Keywords** – FinTech, woman entrepreneurship, female, sustainability, inclusion

**Paper type** – Practical Paper

### 1 Introduction

Can FinTech companies close the gender gap in access to financial services? In the era of digital innovation, accelerated by the Covid-19 pandemic, innovative finance, better known as FinTech, is the protagonist of this new historical period. The pandemic has also encouraged and accelerated a process of change where technology and digitalization together with sustainability have been identified as

key factors of this revolution in the various sectors and in particular in the financial sector, which can no longer be limited only to the study of risk and return.

Regardless of gender, alternative credit access channels play a crucial role in encouraging inclusion in the broadest sense of the term, resulting in true sustainable finance. We are talking, therefore, about sustainable and technologically advanced finance. Companies operating in the FinTech sector represent the frontier of development of corporate finance and the traditional one aimed at reducing the environmental cost and guaranteeing greater value in terms of sustainability of the financial sector. The FinTech industry is ideally placed to take a prominent role on the global stage and positively influence the choices of the economic and financial system, in order to ensure that sustainability becomes increasingly mainstream in finance and the real economy. FinTech companies' intrinsic use of big data, artificial intelligence and real-time business and stakeholder information makes the industry a perfect model for implementing environmentally friendly and socially sustainable practices.

The financial services sector is currently undergoing a major transformation, with digitalization and sustainability as the driving force behind a new and more complex but at the same time sustainable process. While both concepts, digitalization and sustainability, have been studied in recent years independently of each other, the intersection between FinTech and sustainability has so far attracted only limited research, although the sector is becoming increasingly relevant as the financial system is an important element to enable a maintenance and growth of the global economy. In recent years, technological finance aimed at ensuring greater inclusion and, more specifically, sustainable finance has gained greater importance at company, national and supranational level. The union of techno-sustainable finance can represent one of the main levers to alleviate the impact of different factors that nowadays affect the various socio-environmental changes. It is worth remembering that the financial system, in general, has an essential function within the economy, it represents the nexus of the real economy. Traditionally the financial system provides a whole range of payment, investment and financing services. These essential functions of the financial system, in addition to sustainability, have been rethought and questioned in recent years, especially in the years marked by the pandemic, where digitization has represented one of the main engines of the financial system, digitizing products and processes.

A new sector therefore that of FinTech that is characterized by the undisputed combination of technology and finance, areas in which the presence of women is still at rather low levels, but what leaves even more perplexed is the deep gap between female and male entrepreneurs when it comes to raising funds for their companies and especially in the establishment of new entrepreneurial activities . This gap has been further accentuated during the pandemic, which has seen women engaged in the sectors most affected by the crisis and who have sometimes been forced to make drastic choices that have led to the closure of many companies. A situation that paints a potential social tragedy that accentuates and confirms an economic and financial gender gap.

A reason, therefore, for FinTech to be defined as a revolution of financial inclusion achieved through sustainable technology.

The document is structured as follows:

1. after a literature review, aimed at providing an overview of the definition of FinTech, we then move on to a systematic review of the existing literature in the field of financial technology integrated with the concept of financial inclusion. The SCOPUS database was used for the literature analysis;
2. the second part dedicated to research methodology introduces the case study of a specific platform operating in the FinTech sector;
3. The third part summarizes them ain findings.

## **2 Literature review**

The review of the literature has shown that the issue of women's financial inclusion through FinTech is still a little addressed issue. Using the search terms "FinTech" and "Female" or "woman entrepreneurship" the research produced only 24 papers. Extending the search to the terms "FinTech" and "Inclusion" and limiting it to the areas "Economics, Econometrics and Finance" and "Business, Management and Accounting" identified 219 articles. Using the search terms "FinTech and Sustainability" the research produced an additional 138 documents; this certainly means that although it is a fairly attentive issue from a general point of view, the specificity of how FinTech can contribute to reducing the financial gender gap does not yet appear to be studied significantly. In addition, in general on the topic of FinTech and financial inclusion, the analysis of the literature has also shown that the topic has received attention only recently since most of the

articles are from the last five years. This is also an indication that the topic is becoming topical.

The prevailing literature concerns the market, historically identified as the main market, but it has been found that the activity of FinTech platforms of Chinese origin have recorded a strong contraction since 2018. The main cause behind the collapse of the Chinese market is to be found in the introduction, in that year, of a very strict regulatory regime, in particular in terms of capital requirements and registration requirements for FinTech operators, whose main purpose was to combat the high fraud rates that characterized the Chinese market itself (Ding et al., 2021; Cornelli et al., 2020).

To understand what this revolution of sustainable technology represents, it is good to start from the definition of FinTech.

The term "FinTech" is short for "FinTech". The literature identifies the introduction of the term in the early 1990s by former Citicorp chairman John Reed. According to this very first quote, FinTech identifies innovative financial solutions and is often used to identify start-ups that develop such solutions. The literature has recently revised this definition in more detail, identifying mainly with this terminology start-ups that offer solutions characterized by the application of IT systems in the field of financial services: payments, investments and financing.

Specifically, we talk about FinTech-Fin startups and FinTech-Tech ones: the first are those who focus on one or more financial services and try to optimize them through the use of digital tools, the second have a diametrically opposite process as they start from the development of a specific technology that is then applied to the financial sector.

According to the Financial Stability Board's definition, the term FinTech defines innovations in financial services made possible by technology, resulting in new business models, applications, processes or products with a decisive effect on financial markets, institutions or the provision of financial services (Financial Stability Board, 2017). In addition to lending operations, analyzed for the purpose of this research, and equity and debt crowdfunding transactions, the term FinTech applies to numerous other activities, including digital payments, insurance (Insurtech), supervision and regulation and open banking.

Often, however, FinTech companies are focused on a single service, but touch all sectors of finance: from payments to loans, from insurance (InsurTech) to banking and asset management, up to the use of technological tools to support

compliance procedures, compliance, compliance with rules, regulations, laws and reporting.

In recent years, the growing importance of FinTech has had a substantial impact on the banking sector as modern technological innovations, ranging from robotics to Artificial Intelligence (Hassani et al., 2020; Colom et al., 2010) and Machine Learning, are revolutionizing the traditional banking channel. This undoubtedly implies for the banking system an increase in digital investments such as to be able to respond to the growing and diversified financial needs and above all to be able to cope with competition from non-bank operators or even new banks specifically structured to make the most of technology. However, the introduction of new technologies by the banking system faces higher start-up costs in order to achieve them, but their marginal costs tend to be reduced to zero when economic pressure in terms of demand increases (Liao et. Al, 2020). The literature (Stulz, 2019) in particular tends to highlight how FinTech companies tend to offer cheaper and tailor-made banking products for both individuals and businesses and this undoubtedly represents a threat to the activity of traditional banks or could, on the other hand, represent an opportunity for the banking system if technological finance is considered as complementary and not alternative to traditional channels. Suffice it to say that, although the FinTech sector is rapidly evolving in the field of payment services, it is still struggling to grow, in terms of economic margins, in the field of other traditional banking services.

Of course, the relationship between FinTech and the banking sector is still evolving and under scrutiny by regulators, academics and technicians. However, the need for the banking sector to invest in digital technologies and to adapt quickly and comprehensively to the modern digital age should not be underestimated, but above all to meet the rapidly evolving consumer behaviors and to grasp the needs of those markets and customers that have long been outside the financial system. Some authors (Salampasis and Mention, 2018) argue that, many disadvantaged people in society are left out of the traditional financial market, thus creating inequality and information asymmetry (Bongomin & Ntayi, 2020). They also argue that the emergence of FinTech is closing the gap of those individuals and businesses that previously did not have access to the traditional banking channel, thereby creating greater equity and social and economic growth (Dawei et al., 2018).

Online services and products offer a lot of information to customers that could not have access without the use of digital services (Gomber et al., 2017, Gomber et al., 2018). Some authors (Sapovadia, 2018) believe that digital financial inclusion is different from traditional banking in that it allows access to customers without having to request historical documentation or detailed information as the use of artificial intelligence and big data allows to have an information set of data both known, as easily available from public sources, but also alternative data not common to the traditional banking system, such as purchase history, online behavior pattern, online transactions, etc. The use of artificial intelligence helps overcome the main problem of traditional financial inclusion (Gomber et al., 2017); Through machine learning and artificial intelligence it is possible to analyze and collect data from the web or current accounts to measure the solvency even of small companies and perhaps previously rejected by banks.

Let's not forget that the growth and development of an organization of any type and size strongly depends on financial inclusion, therefore digital financial inclusion is becoming increasingly central to the debate on how to ensure equal treatment even for those at the lowest levels of the pyramid so that they become financially active parties (Peric, 2015). Some authors believe (Salampasis and Mention, 2018; Bill & Melinda Gates Foundation, 2019; Wang and He, 2020), that financial inclusion is increasing thanks to the use of technological finance which, in addition to offering customers financial services at even more sustainable costs than traditional channels (Gomber et al., 2017), reaches users who are underserved or even excluded from traditional financial channels (Alameda, 2020).

It becomes easy to understand that the financial system becomes among the most important for pursuing social sustainability objectives. According to the latest Observatory of the Politecnico of Milan on FinTech and Insurtech, the financial sector ranks third (out of 11) after those of University and Education and Crops in terms of social sustainability, while otherwise consumers believe that the financial system cannot contribute to environmental sustainability. The tema is certainly to be paid attention at the level of literature, given that the eradication of poverty, which is achieved with financial inclusion and climate change are at the top of the agendas of the United States, the EU and are presented as among the most important of the 17 sustainable goals of the UN.

Entrepreneurial development is highly dependent on government support and financial resources (Ojiaku et al., 2018) and the financial inclusion of women entrepreneurs has attracted much attention, particularly for the significant impact

it has on each country's economy in terms of job creation and subsequent economic growth (Nguse et al., 2022; Malik et al., 2022). Typically, female entrepreneurs start their businesses with their own funds or with the help of family members and are often required to provide collateral to obtain bank loans (Mulili, 2020) and/or to pay different economic conditions than male entrepreneurs. Better access to financial services can improve people's employment outcomes, wealth accumulation and willingness to undertake new initiatives (Guiso et al. 2004, Guiso et al. 2021; Brown et al. 2019; C'elierier and Matray, 2019), but despite this, women remain unbanked or underbanked compared to men (Demirgu, c-Kunt et al., 2017; Guiso and Zaccaria, 2021; ke, 2021). Financial inclusion, therefore, promotes entrepreneurship and helps the female community (Fareed et al., 2017; Koloma, 2021) and new FinTech or FinTech can improve financial inclusion and close the gender gap in access to financial services (Demirgu, c-Kunt et al., 2018; Breza et al., 2020).

The literature analyzed highlights, therefore, that technological finance improves financial inclusion which in turn stimulates female entrepreneurship, moreover, the current state of research defines financial inclusion as a mediator in various reports, some authors (Demir et al., 2022; Chinoda and Mashamba, 2021) have argued that financial inclusion facilitates financial innovation and the link with growth and economic progress.

The use of new technologies and the use of non-traditional data allows FinTech companies to offer new products at lower costs and, at the same time, could stimulate incumbents to adapt to these new offers (Buchak et al., 2018; Philippon, 2019; 2020; Thakor, 2020), thus ensuring financial inclusion and therefore sustainable finance. However, the growing rise of the FinTech industry places a focus on the sustainable use of this service, some people are skeptical about using FinTech due to the presence of risks (Rathi, 2016). Some challenges relate to data availability and quality, accountability requirements to implement AI technology (Sundblad, 2018; Harkut and Kasat, 2019).

Some authors say that although FinTech industries develop rapidly, there is still a shortage of literacy in the sector (Shim & Shim, 2016).

### **3 Approach**

The Occasional Paper number 702 of June 2022 of the Bank of Italy entitled "FinTech lending and financing platforms in the world and in Italy" analyzed

FinTech lending and funding platforms (capital and 1 bonds) in the world and in Italy. In particular, the study defines platforms as facilitators that connect applicants for funding with investors (individual or institutional) who intend to grant them. In addition, the same platforms can, with the necessary authorizations, be loan providers. The study found, and excluding China, that the platform market in the world has grown in recent years, reaching a transaction volume of 113 billion dollars in 2020. The same trend in terms of growth can also be seen in Italy where the granting of loans to companies and the sale of invoices increased.

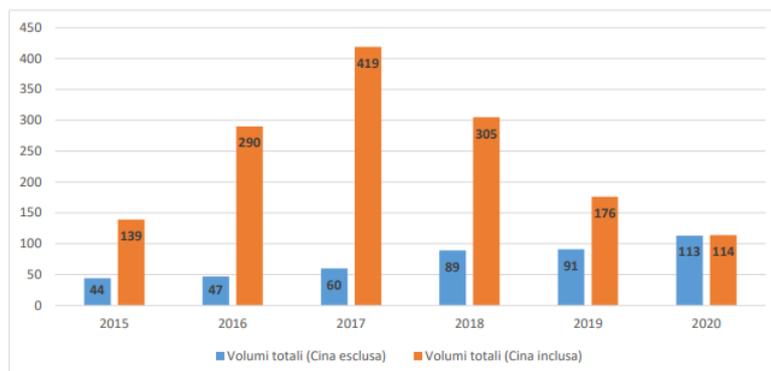

The work reports the limitations of the study, also found during the drafting of this paper, as the data concerning the platforms are not easily available and updated and above all are often not consistent between the different sources. Starting from the information, used by the study to circumscribe the perimeter of the identified platforms, through the latest 2020 update of the report prepared by the Cambridge Centre for Alternative Finance (CAAF) (Ziegler et al, 2021) for international data and the Politecnico of Milan for Italian data, reported below in its main information, one of the three platforms included in the Occasional paper on access to credit for SMEs was then analyzed through direct contact.

### **3.1. The trend of the platforms in the world and in Italy**

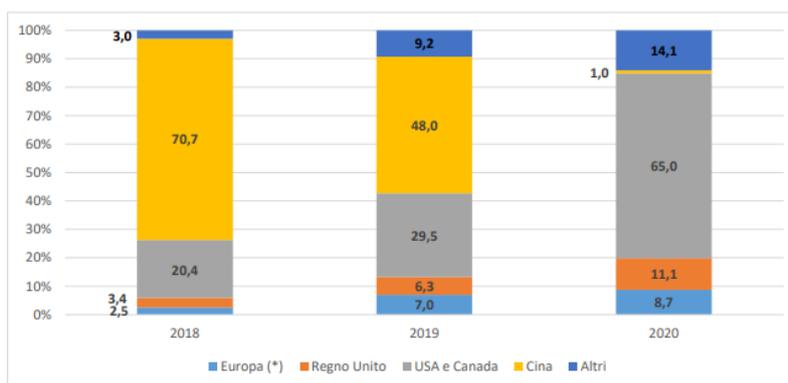

The Occasional Paper notes that transactions made through FinTech platforms have grown significantly in recent years, albeit with heterogeneous dynamics both at the level of jurisdiction and business models. Globally, in the second half of the last decade, platform activity increased until 2017, peaking at \$419 billion, and subsequently contracting to \$114 billion in 2020 (Figure 1). The trend mainly reflects what happened in China, historically the main market. By contrast, platform activity in other countries continued to grow; the outbreak of the Covid-19 pandemic does not seem to have had a significant impact (figure 2).

*Fig. 2 – Market shares of FinTech platforms by geographical area (annual transactions, percentage values)*

(\*) Europe is considered in its geographical sense and countries that are not part of the European Union are also included. The United Kingdom is considered to be a stand-alone.

Source: figure taken from the Bank of Italy's Occasional Paper, no. 712, June 2022 – FinTech lending and funding platforms in the world and in Italy – source used by CAAF

Taking as a reference only the segment of loans, also the subject of this work, the Occasional paper highlights that it is precisely the segment of loans, in its broadest definition, that has recorded the greatest volume of growth (about 84 billion in 2019 and 100 in 2020) and also in terms of growth rates (figure 3).

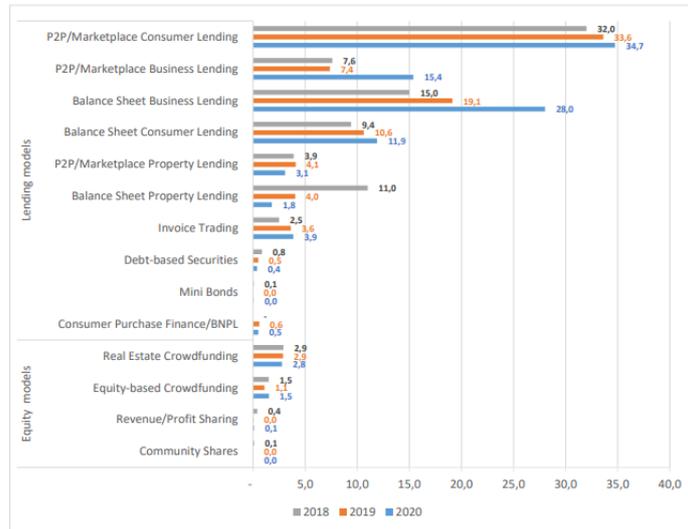

Fig. 3 – Transactions on FinTech platforms by activity and business model (excluding China, billions of dollars)

Source: figure taken from the Bank of Italy's Occasional Paper, no. 712, June 2022 – FinTech lending and funding platforms in the world and in Italy – source used by CAAF

The Occasional paper then analyzes the FinTech platform market in Europe which shows that the market has experienced a high increase in recent years: the value of annual transactions increased from 1.5 billion dollars in 2013 to 22.6 in 2020 (figure 4). The study highlights in particular how the United Kingdom is the largest player in terms of total transaction value.

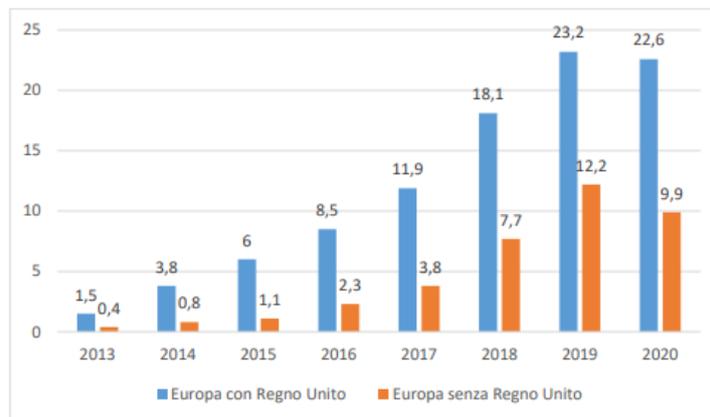

Fig. 4 – Transactions on FinTech platforms in Europe (billion dollars)

Source: figure taken from the Bank of Italy's Occasional Paper, no. 712, June 2022 – FinTech lending and funding platforms in the world and in Italy – source used by CAAF

As for as Italy is concerned, the Occasional Paper highlights how the Italian market has also grown in recent years. Addition, the study confirms that in Italy, even more than in the main European countries, the activity of the platforms is mainly directed towards loans, while capital investments represent a smaller share (figure 5). In the case of Italy, the loans mainly concern companies and invoice trading (Figure 6).

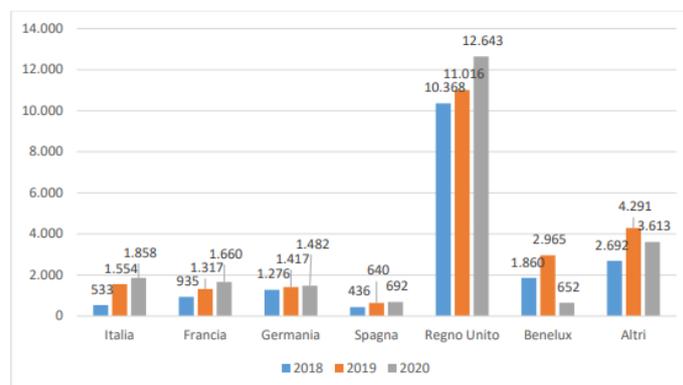

Fig. 5 – Transactions on FinTech platforms in European countries (million dollars)

(\*) The non-investment category collects donations, the financing of activities in exchange for products or non-monetary awards (reward-based crowdfunding) and other forms of subsidized financing to micro enterprises (crowd-led microfinance).

Source: figure taken from the Bank of Italy's Occasional Paper, no. 712, June 2022 – FinTech lending and funding platforms in the world and in Italy – source used by CAAF

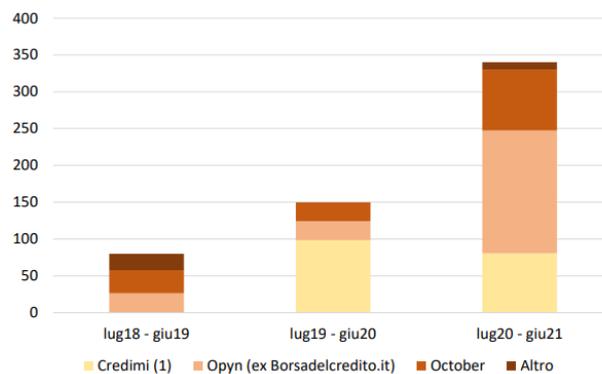

The Occasional paper, to analyze the Italian FinTech market, used data taken from the publications on alternative finance of the Politecnico of Milan (Italian Report on CrowdInvesting and Alternative finance for SMEs in Italy 2017a-2021a e 2018b-2021b), information and data collected through direct contacts with platforms or from the internet. The reference period is not the calendar year, but the twelve months ending in June; The most up-to-date data refer to the period July 2020-June 2021. The study distinguishes that financing can take place through the granting of a loan (social lending and invoice trading) or through the subscription of capital or minibonds (equity and debt crowdfunding). In general, the study defines platforms as facilitators that connect individuals or companies seeking funding and investors who intend to grant it (marketplace platforms).

A fundamental aspect to consider is that for equity crowdfunding since 2012 a dedicated legislation has been introduced in Italy, merged into the Consolidated Law on Finance, the lending activity is not subject to a specific legal framework, therefore, the activity of the loan platforms is freely exercisable, but must be carried out in such a way as not to violate the reserves of activities regarding the collection of savings, provision of credit to the public, provision of payment services and credit mediation. If the platform operator intends to participate in the provision of loans (balance sheet platforms) or independently manage the payment flows connected with the operation of the platform, it must be equipped with the necessary authorizations in accordance with the UPC (e.g. respectively as a financial intermediary pursuant to art. 106 TUB, as a payment institution or EMI). More often, platforms make use of the collaboration of authorized parties to carry out confidential activities and are limited to providing ancillary services and creating contacts with other companies in the credit chain, such as those assessing the creditworthiness of customers or securitizing loans; if among the lenders there are intermediaries authorized to grant loans, the activity of the platforms could, , be configured as credit mediation (art. 128-sexies TUB) and require registration in a list kept by the Body of Agents and Mediators (OAM), subject to possession of the requisites prescribed by law.

In Italy, many active platforms are authorized to operate as payment institutions (IP) or agents of Community payment institutions and EMIs; others have entered into cooperation agreements with Italian or EU payment service providers.

The Occasional paper found that as of June 2021, 28 digital platforms were active: 22 for business financing (of which 14 specialize in real estate) and 6 for

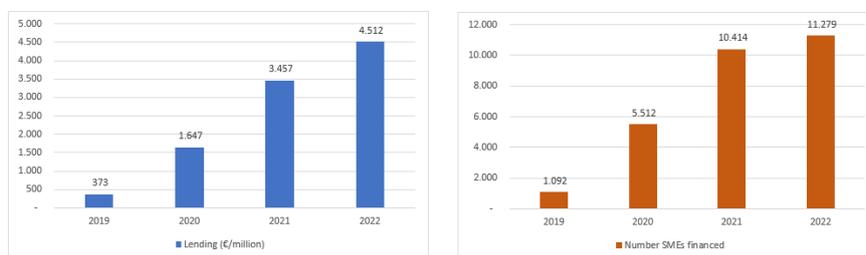

household financing. Reporting only the data of interest for this paper, it is highlighted that the market for loans to non-real estate companies and households is highly concentrated. Loans to non-real estate companies are still contained, but rapidly expanding: they increased from 80 million disbursed between July 2018 and June 2019, to 150 in the following 12 months, reaching 340 in the last period ending in June 2021. Almost all of the funding is provided by three platforms: Credimi, which collects only from institutional investors, Oryn, and October (figure 7).

*Fig. 7 – Loans to non-real estate companies (annual flows, million euro)*

*Source: figure taken from the Bank of Italy's Occasional Paper, no. 712, June 2022 – FinTech lending and funding platforms in the world and in Italy – source used by CAAF*

Finally, the most recent public data of the Italian FinTech association are reported and relating to the growing volume of loans granted to the number of SMEs in the period 2019-2022 (figure 8). In 2022, over 4.5 billion euros were disbursed to Italian SMEs, for a total of 9.9 billion euros in the period 2019-2022.

### **3.2 The case study**

This paper, in order to respond to the research demand, aims to analyze a FinTech platform operating in Italy and grown in recent years with the aim of expanding the financial inclusion of SMEs.

The press review of "Il sole 24 ore" of March 16, 2023, reports as the winner and in the Diversity & Inclusion category of the Fintech Awards 2023, the FinTech platform Opyn, one of the realities also cited by the Bank of Italy study and case study of this work.

The information described below was acquired through direct contact with the corporate structure of the platform. Opyn describes itself as a human FinTech which, through its technology, offers fast and digital financial services, on the one hand, to companies in order to facilitate their access to credit, and on the other, by simplifying the work of financial institutions. Opyn is a reality with three souls: Fin + tech + human.

Founded in 2012 (figure 9), it is now one of the main marketplace lending for SMEs operating in Italy, having opened this channel of access to credit for companies for the first time in Italy. It is supervised and authorized by the Bank of Italy and Consob to play the role of mediator between supply and demand, between companies and lenders. Finally, in 2022 it expanded its offer with the launch of a new short-term installment loan dedicated to B2B both online and in physical stores.

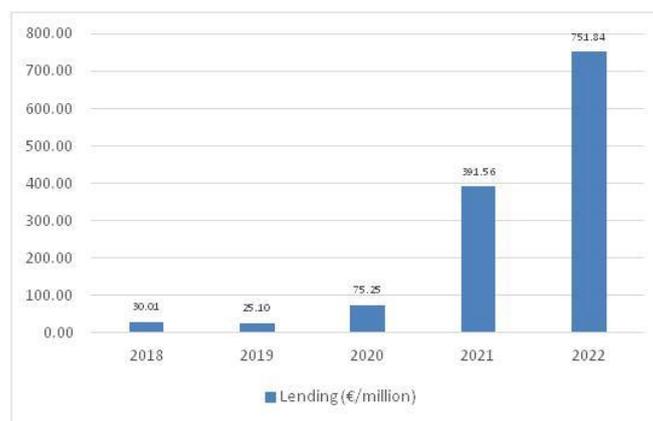

Opyn is a brand managed by a corporate group, whose holding company is Business Innovation Lab Spa, which controls 100% of two other companies: Mo.Net Spa and ART SGR Spa. Mo.Net is the group company authorized to carry out payment services related to money loans. ART SGR is authorized to manage alternative investment funds reserved for professional investors. These funds lend money through the Opyn platform.

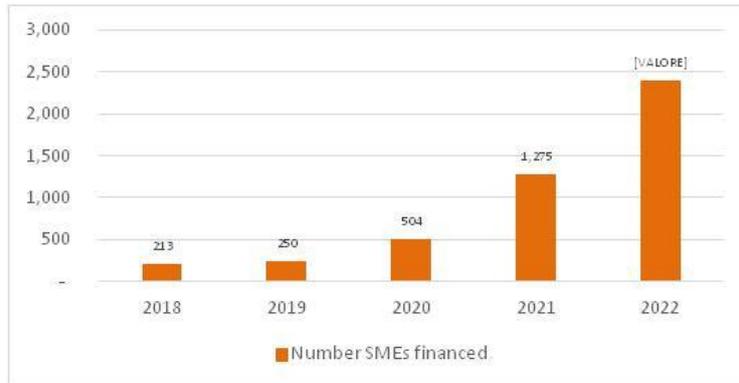

*Fig. 9 – Milestones*  
 Source: Opyn Sustainability Report 2021

Through its processes and technology, Opyn aims to be a sustainable reality and above all aimed at ensuring greater financial inclusion. The platform has developed a specific algorithm that allows you to look at new and more effective data with the aim of making those realities that were previously excluded access to credit.

In particular, going to analyze the data of the period 2018-2022, it is clear how Opyn responds perfectly to that growth trend that has characterized the world of FinTech. Growth confirmed also in the pandemic and post-pandemic period (Figure 10, Figure 11).

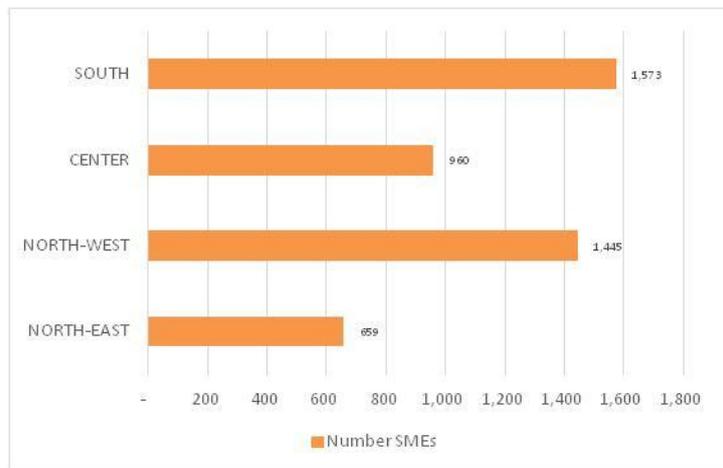

*Fig. 10 – Lending (EUR/million)*  
 Source: Data provided by Opyn. Graphical representation of our processing

*Fig. 11 – Number SMEs*

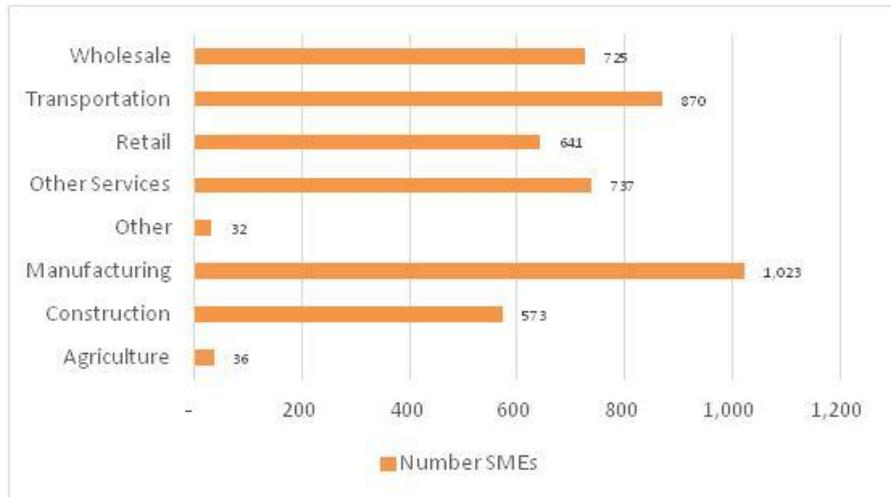

*Source: Data provided by Opy. Graphical representation of our processing*

As can be seen from the data and documentation acquired, financial inclusion is a goal for Opy, evaluating entrepreneurs for their bankability, without any bias related to geographical origin and sector (Figure 12, Figure 13).

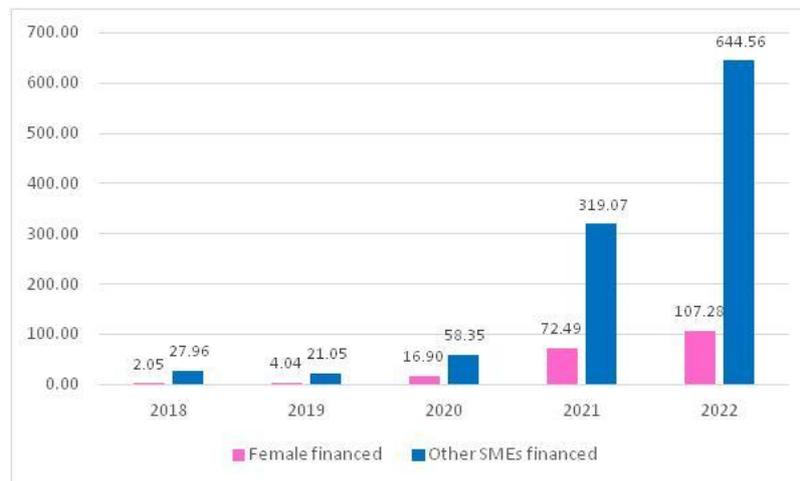

*Fig. 12 – Geographical distribution of the enterprises financed*

*Source: Data provided by Opy. Graphical representation of our processing*

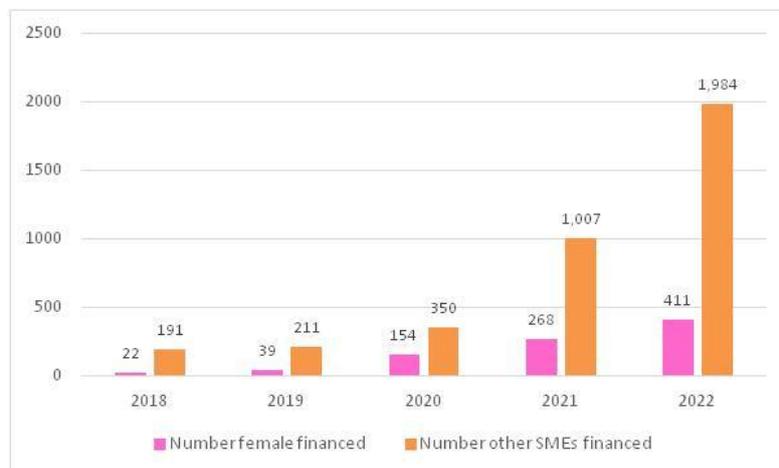

*Fig. 13 – Sectoral distribution of the enterprises financed*  
 Source: Data provided by Olyn. Graphical representation of our processing

Going to analyze the information, it is possible to affirm that the growth trend is also confirmed with regard to women-owned companies, whose greatest increase in terms of numbers and values is also confirmed in the pandemic and post-pandemic period (figure 14, figure 15)

*Fig. 14 – Women's enterprises financed vs. the rest of enterprises (EUR/million)*

#### **4 Conclusions**

Women in general still face significant hurdles when it comes to accessing the credit needed to build and expand their business.

Financial inclusion is one of the main tools to reduce gender inequality in the economic system and to achieve one of the Sustainable Development Goals. In fact, it is clear that gender equality also passes through economic independence and how for this it is essential a greater and more qualified participation of women in the economic system and therefore in the entrepreneurial fabric.

As regards access to finance, women's businesses being smaller and specialized in less productive sectors are less attractive to investors, moreover, companies run by women are perceived as riskier for a cultural issue. The result is that applications for funding from women entrepreneurs are often not accepted and when they are, compared to men, women find themselves paying higher interest and having to accept more stringent conditions and so most of the time women mainly use personal or family resources. This confirms what emerges from the analysis conducted by our study, namely that women's applications for funding are minor and therefore it is possible to affirm that: women do not ask or in any case ask in a limited way, credit to the financial system compared to the total of companies. As analyzed and demonstrated by the case study, the entry into the economic and financial system of technologically innovative financial platforms, FinTech, contributes to the financial inclusion of women's businesses. It is

therefore possible to assume that, albeit in small numbers, women-owned companies that access these new channels obtain positive responses in terms of access to credit. The case we analyzed, shows that the operation of this platform has increased by about 88% in terms of the number of companies financed between 2021 and 2022 and that the number of companies owned by women has also increased by about 53% between 2021 and 2022.

So do platforms help close the gender gap in access to financial services? There is no doubt that FinTech companies are contributing, giving a crucial boost through digital financing and alternative channels, to access to credit for subjects not easily served by the traditional financial system, thus ensuring greater participation and inclusion in the financial market and guaranteeing the sustainability that is obtained only when the economic, environmental and social dimensions interact.

The limit of the research is that the data on SMEs that turn to FinTech platforms are still few and more generally there are no data available with which to carry out comparative analysis at national and international level and therefore one of the indications of this work is precisely to bring to attention the need to start collecting disaggregated data, by gender, with specification by activity, by size, by location, in the financial sector, agreeing at international level also on a common definition of female enterprise.

Certainly, a greater availability of gender-disaggregated data is the first step to measure the gender gap in terms of financial inclusion that is actually recorded in the various countries and to understand how to address this gap more effectively also through the continuous comparison between traditional channels and innovative channels of access to credit.

Another limitation of the analysis conducted on the surveys on FinTech platforms dedicated to lending is that the platforms are still few and even if the theme appears attentive it is certainly still contained in the results.

Therefore, the originality of this work lies in drawing attention precisely to the lack of information and regulation on the subject of FinTech platforms, an information gap to be filled by drawing the attention of the authorities for greater regulation and the financial system to develop effective policies to attract and support companies with greater difficulties, as well as to start collecting and making public gender-disaggregated data on the their customers.

### Abstract

This research investigates the impact of smart city projects and initiatives on public value. A narrative literature review is performed, which leads to the proposed framework of measurement and evaluation. The model represents a useful information system to better understand the complexity of the process studied, to support policy-makers in defining winning strategies, and to make them accountable, ensuring public value creation and urban resilience. The study is preliminary, but provides broad insights for further research and application.

**Keywords** – Public value, Smart cities, Urban resilience, Integrated framework.

**Paper type** – Academic Research Paper

## 1 Introduction

Public value creation is the institutional purpose of public sector organizations (Moore, 1995; Meynhardt, 2009) and is defined as the production of what is good for and positively valued by the public (Moore, 1995; Benington and Moore, 2011). Thus, for public entities, the concept of value assumes not only an economic but also a social meaning, depending on the abilities of public managers (Moore, 1995).

In the complex process of creating public value, a key role is played by cities, which should become smarter and more resilient places. Adopting a holistic perspective, a city can become smart realizing investments on urban innovation (Nam and Pardo, 2011), that should create public value (Meijer, 2015; Neumann et al., 2019) and improve urban resilience (Zhu et al., 2009).

Once the development paths, aimed at minimizing resource consumption and maximizing the outputs, have been clearly defined, the greatest criticality arises from the complexity in measuring and assessing the effects of smart city projects and initiatives on the public value. To this end, this study seeks to answer the following research question (RQ):

*RQ: How and to what extent do smart city projects and initiatives contribute to the overall creation of public value generating benefits for the city and its stakeholders?*

In order to answer this RQ, a narrative literature review was primarily carried out. The scientific literature on the analyzed field is multidisciplinary as it regards different bodies of knowledge ranging from public management, government and public policy to urban studies. The study reviewed journals and books, contained in Google Scholar and mostly published in English after 1995, the year in which Moore's theory was developed. The most relevant concepts were identified through a forward snowballing approach (Wohlin, 2014) and a new measurement and evaluation framework is proposed.

The study has potential practical implications because: (i) it can provide a useful tool to monitor and improve the performance of projects, guiding public managers in their decision-making processes; (ii) it can also enable citizens to acquire information, ensuring highest levels of participation and accountability.

The remainder of the study is structured as follows: Section 2 discusses the main theoretical concepts related to public value, smart cities and their role in the process of creating public value and increasing urban resilience; Section 3

proposes and discusses the measurement and evaluation framework; Section 4 presents general conclusions, implications and insights for further research.

## **2 Theoretical background**

### **2.1 Public value theory**

Recently, the public sector and its functions within the socioeconomic system were radically transformed to overcome the bureaucratic approach and the widespread inefficiencies (Borgonovi, 2004). In response to current challenges (i.e., the recovery of public accounts, the effectiveness of the adopted policies, the quality and efficiency of the provided services, the autonomy of managers, transparency, accountability, etc.) many scholars oriented their research efforts on a new approach, which goes beyond New Public Management and focuses on public value (e.g., Moore, 1995, 2000, 2005, 2013, 2014; Boyte, 2005; Stoker, 2006; Bozeman, 2002, 2007; Kettl, 2008; Alford and Hughes, 2008; Osborne, 2010a, 2010b; Talbot, 2010; Kalambokidis, 2014), both from a theoretical and practical perspective (Shearer and Williams, 2011; Van der Wal et al., 2015; Bryson et al., 2014; 2017).

The institutional purpose of public organizations is the creation of public value (Moore, 1995; Meynhardt, 2009). Since this concept is broad and complex, the literature does not yet provide a clear and shared definition of public value (Bryson et al., 2017; Panagiotopoulos et al., 2019; Hartley et al., 2017). According to Moore's perspective, it can be defined as the production of what is good for and positively valued by a community (see also Alford and O'Flynn 2009; Meynhardt, 2009; Benington and Moore, 2011). While for businesses the concept of value is mainly related to the economic dimension, for public entities it also takes on a social meaning, expressed by the perceived utility and level of community well-being (Moore, 1995; Bracci et al., 2019). Moreover, the creation of public value represents the main aim of public managers, depending on the ability to realize and coordinate three fundamental conditions, the so-called "strategic triangle" (Moore, 1995): (i) achieving substantial valuable results for all stakeholders; (ii) adopting sustainable and feasible initiatives; (iii) obtaining legitimacy and support. This approach focuses on governments, which are the explorers charged by society to seek public value, and suggests that public

managers need specific organizational-relational abilities to generate value (Moore, 1995).

The government certainly plays a key role as a producer and a guarantor of public value (Benington, 2011), but it is not the only actor involved (Peters and Pierre, 1998). Public managers need to adopt collaborative approaches (Meijer and Bolívar, 2016) also with non-profit organizations, businesses, media, citizens, and other institutions (Bryson et al., 2014).

Designing a process of public value creation without adequately measuring, assessing and communicating the achieved results is not possible. However, identifying what exactly should be measured and evaluated is not easy. Moore (1995, 2005) emphasized specific parameters which could serve to measure and evaluate public value, such as efficiency, effectiveness, accountability, fairness, and justice. Similarly, many authors argued that the parameters of public value are: quality, efficiency and effectiveness of public services, and aspirations of societies, referring to democracy, transparency, participation, trust, legitimacy, integrity, equal opportunities, and social inclusion (Kelly et al., 2002; Cole and Parston, 2006; Meynhardt, 2009; Ju et al., 2019; Twizeyimana and Andersson, 2019).

In the light of this, the definition of public value could include measures of input, process, output, and outcome (Moore, 1995, 2005; Bozeman, 2007; Meynhardt, 2009), but currently, there is no single bottom line (Kalambokidis, 2014). According to Moore (2013, 2014), public value accounting can be used to prove valuation, which is based on a broad aggregation of costs and benefits. Bozeman (2002, 2007) and Talbot (2010) support the use of a range of criteria to determine how much public value has been created or destroyed, but the emphasis on public value also encouraged the focus on profitability and reliability of public investments (Fisher, 2014), as in the case of smart and resilient city projects and initiatives.

## ***2.2 The smart city toward public value and urban resilience***

Cities are called to promptly solve several problems and face challenges, such as overcrowding, degradation, pollution, traffic, social inequality, crime, economic and health crises, natural disasters (Kabir et al., 2018; Kummitha and Crutzen, 2017). Taking advantage from the current context (e.g., the rapid spread of technologies, the growing sensitivity to environmental protection, the disruption of traditional cultural practices, etc.) (Estevez et al., 2016), there is a strong

opportunity to transform cities into smarter and more resilient places (Chourabi et al., 2012; Albino et al., 2015).

In fact, a smartly planned city must be also resilient (Bansal et al., 2017), i.e., able to absorb, adapt, and convert external pressures while ensuring urban safety in case of crises, hazards or disasters (Rus et al., 2018). However, there is no unanimity regarding what a smart city is and what should be done to get a city smart (Hollands, 2020; Meijer and Bolívar, 2016; Mora et al., 2019a). The scientific literature on smart cities can be considered twofold: a research trend focused on technologies, and another one adopting a human-centered, people-driven, holistic perspective, where technologies are exclusively instrumental in addressing local development needs (Mora et al., 2019a). The latter notion implies a multidimensional vision of smart cities, that involves six dimensions, i.e., economy, mobility, environment, people, living, and governance (Giffinger et al., 2007). A city is smart when investments (e.g., in human and social capital, traditional and modern infrastructure, etc.) boosts sustainable economic growth and high quality of life, with a appropriate management of natural resources, through participatory governance (Caragliu et al., 2011). Based on Nam and Pardo (2011) and other similar contributions (e.g., Camboim et al., 2019; Caragliu and Del Bo, 2019; Lee et al., 2014; Manville et al., 2014; Appio et al., 2019; Barrutia et al., 2022), the smart city represents urban innovation, which refers to new ideas, practices, and projects.

The outcomes of smart city projects have been discussed in a number of ways in the literature. Some scholars argue the expected benefits without considering public value (see Komninos et al., 2021; Gil-Garcia et al., 2021; Barba-Sánchez et al., 2019). Mora et al. (2019b) identified the outcomes of smart city activities in four benchmark cities. Although they did not specifically address public value, the results outlined can be summarized as the pursuit of three forms of public value: efficiency (cost savings), effectiveness (service improvement), and social challenge (sustainability, social inclusion). Meijer and Bolívar (2016) do not define the concept of public value, but they regard it as the outcome of smart city governance. According to Castelnovo et al. (2016), public value is defined in terms of direct short-terms effects and long-terms impacts of the projects implemented. The combined creation of both economic and social value is highlighted by Dameri and Benevolo (2016). Neumann et al. (2019), while acknowledging the vagueness of the concept of public value, state that it can refer to several

dimensions, including service quality, integrity, equal opportunity, and citizen involvement.

Under this umbrella, where a smart city is shaped by urban innovation projects aimed at public value creation, the city government becomes the leader of the city transformation process (see e.g., Giffinger et al., 2007; Meijer and Bolívar, 2016; Ojo et al., 2015; Esposito et al., 2021). Nevertheless, this process can be difficult to lead, and it may fail in different ways (Nam and Pardo, 2011; Ruhlandt, 2018). For instance, may lack innovative ideas and leadership (Nam and Pardo, 2011), select the wrong partners or mismanage relationships (Crosby et al., 2017), be driven by self-interest (Cabral et al., 2019), and have insufficient skills (Neumann et al., 2019). This represents a problem, as cities may invest in innovation projects, incurring economic and social costs, without realizing the expected benefits (Ruhlandt, 2018). For these reasons, the public value created by smart city initiatives so far has been questioned by several authors (see e.g., Kummitha, 2018; Komninou et al., 2021). While the ability of local governments is typically seen as crucial to explaining public value (Bryson et al., 2017; Cabral et al., 2019; Janowski et al., 2018), there is no systematic knowledge about how the implementation of a smart city strategy actually affects the public value creation dynamics of a city and the urban resilience. In this study, a new theoretical framework is proposed to fill this gap.

### **3 A new integrated framework**

The performed narrative analysis identifies different concepts which represent the theoretical foundations of the proposed framework, described as follows.

#### ***3.1 Strategic areas of action***

A city can become smart through the realization of investments going on urban innovation projects, which must be technically feasible and financially sustainable (Nam and Pardo, 2011). An innovation project can be understood as an intentional effort to develop new solutions that increase public value (Meijer, 2015; Van Winden and van den Buuse, 2017; De Vries et al., 2016; Neumann et al., 2019) and urban resilience (Zhu et al., 2009). These may vary in a wide range of ways that could have an impact on the public value (e.g., ends pursued, technological content, stakeholders involved, investment volume and funding, etc.) (Barrutia et al., 2022).

The framework concentrates on the approaches discussed in previous studies that are related to the main purpose of the projects and categorizes them into six *strategic areas of action* of the city, which recall the classification proposed by Giffinger and colleagues (Giffinger et al., 2007; Giffinger-Gudrun, 2010) (*Table 1*).

Table 1

<b>Smart economy</b>	<b>Smart mobility</b>	<b>Smart environment</b>
<ul style="list-style-type: none"> <li>- Innovative spirit</li> <li>- Entrepreneurship</li> <li>- Economic image &amp; trademarks</li> <li>- Productivity</li> <li>- Flexibility of labour market</li> <li>- International embeddedness</li> <li>- Ability to transform</li> </ul>	<ul style="list-style-type: none"> <li>- Local accessibility</li> <li>- (Inter-)national accessibility</li> <li>- Availability of ICT-infrastructure</li> <li>- Sustainable, innovative and safe transport systems</li> </ul>	<ul style="list-style-type: none"> <li>- Lack of pollution of natural conditions</li> <li>- Pollution</li> <li>- Environmental protection</li> <li>- Sustainable resource management</li> </ul>
<b>Smart people</b>	<b>Smart governance</b>	<b>Smart living</b>

### 3.2 Evaluation levels

The need to meet the growing needs of citizens, given limited resources, requires public entities to account and monitor the performance of their actions (Pollitt and Bouckaert, 2000). In this study, the ability to generate public value from innovation projects, framed within the different cities' *strategic areas of action*, is assessed at three different *evaluation levels*, which define the processes for improving strategic, managerial, and organizational performance (Borgonovi, 2004).

More specifically, the *strategic level* includes the solutions that public administration wants to provide for issues of collective well-being. At this level, the assessment of performance is very complex, due to the multidimensionality of the effects produced by projects and the number of actors involved.

The *managerial level* involves the translation of strategic guidelines into operational lines of action, and combines instances of correct business conduct, rational use of resources, and efficiency of action.

At least, the *organizational level* concerns the evaluation of results produced by a combination of human (i.e., the level of knowledge, skills, abilities, and growth potential of the human resources), organizational (i.e., level of innovativeness of practices, behaviors, procedures, and process, able to adapt to changes in the external environment), and systemic-relational (i.e., the relations established with stakeholders, citizen's engagements) factors (Borgonovi, 2004; Cepiku, 2018).

### **3.3 Evaluation dimensions and type of KPIs**

Based on the different smart city outcomes in terms of public value, recalled in the previous literature (Meijer and Bolívar, 2016; Castelnovo et al., 2016; Dameri and Benevolo, 2016; Neumann et al., 2019; Mora et al., 2019b), the following dimensions were identified to assess the impact of innovative projects on public value:

1. *Effectiveness of intervention*, which aims to measure the outcomes and/or the long-term impacts of the project. Usually includes the broader goals that initiatives pursue (e.g., economic growth and employment, social inclusion and well-being, reduction of pollution, etc.);
2. *Quality of intervention*, intended to measure the satisfaction of citizens/end beneficiaries of the project implemented;
3. *Economic sustainability*, which aims to assess the efficiency in the use of economic resources and making wise investments;
4. *Organizational grow and innovation*, intended to assess different aspects, like the degree of technological innovation of projects, use of change management techniques and process reorganization/reengineering, creation of partnership, level of skills and know-how of actors involved, citizens' engagement, etc.

For instance, street lighting projects can reduce energy consumption and contribute to sustainability (*effectiveness of intervention*), improve the experience and the satisfaction of drivers and pedestrians (*quality of intervention*), reduce public lighting costs (*economic sustainability*), use innovative technologies and be

implemented in partnership with other parties (*organizational grow and innovation*).

The proposed framework links the evaluation dimensions (1) and (2) to the strategic level, while dimension (3) is related to the managerial level and dimension (4) to the organizational level.

In turn, each evaluation dimension must be synthesized by a specific set of *key performance indicators*, which should be S.M.A.R.T. (Specific, Measurable, Achievable, Realistic, Time-based) (Shahin et al., 2007) and represents the drivers for minimizing costs and maximizing benefits (Moore, 1995).

Assumed that the concept of public value takes on both economic and social meaning, and depends on the specific skills and capabilities of public managers (Moore, 1995), the measures lead to three forms of public value: (i) social, (ii) economic, (iii) intellectual.

The overall public value generated by the innovative projects in the smart city is then represented by a synthetic measure, that represents a careful weighing of all variables under consideration (see *Figure 1*).

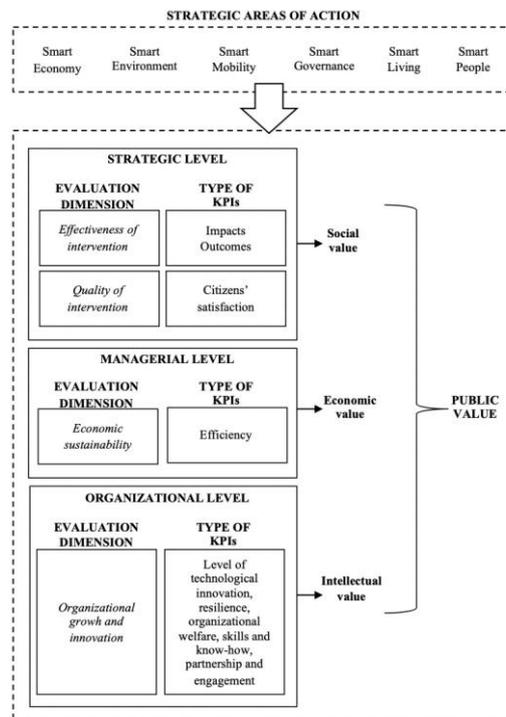

Figure 1 (Source: Self own)

## **4 Conclusions and implications**

Public value is generated if public entities are able to optimize available resources by directing them toward organizational welfare (internal perspective) and the satisfaction of community needs (external perspective). The implementation of smart city projects and initiatives represents a mandatory choice to create value, providing stability and urban resilience. According to this perspective, public entities must be evaluated based on their ability to create value. To these ends, the proposed framework allows for clearly and timely measuring and evaluating the achieved results.

From a theoretical point of view, this study provides a deeper understanding of the relationship between the dynamics of public value creation and the smart city context, giving also evidence of how the types of projects and initiatives and the decisions taken by public managers can differentially affect public value. The dynamics underlying this process are heterogeneous and complex and require knowledge advances and adequate interpretation.

From a managerial point of view, the framework provides public managers with valuable information on how to guide their decision-making processes and manage the implementation of smart city projects and initiatives. The study highlights that public managers cannot rely exclusively on the alleged "intrinsic" positive features of projects, but rather must concretely measure and evaluate their performances, supporting appropriate investment decisions. Focusing on public needs satisfaction, economic balances and organizational well-being represents the best mix to ensure a positive impact on public value. From a citizens' perspective, the proposed framework can facilitate instead the judgment on urban performance and support accountability mechanisms.

### ***4.1 Limitations and further research***

The development of smart cities is an ongoing phenomenon which occurs differently based on the territorial setting. The proposed framework assumes that smart city projects and initiatives are framed in a specific area of action. Actually, projects and initiatives are generally transversal, having multiple purposes at the same time, resulting difficult to be categorized. In addition, determining exactly which elements should be measured to evaluate the effectiveness of a choice, the efficiency of a process, and organizational capacity requires further research efforts.

In fact, since the study is preliminary, it provides insights for further research developments, referable to: (i) the definition of specific KPIs for each evaluation dimension;; (ii) the determination of the relative importance (weight) of the KPIs, by applying MCDM method; (iii) the framework validation through its testing on real cases.

### Abstract

Innovation represents a key factor for sustainable growth and long-term success. However, despite most firms recognize its importance, only few of them are equipped and prepared to innovate. Previous studies have shown that various characteristics of the board, such as networks, behaviors, gender, and composition, influence a firm's decision to innovate. Even though recent transformations like the digital one and the Covid-19 pandemic emphasized the need for including directors with digital expertise to understand new technologies that affect business decisions, this role is still underexplored. Our study addresses this gap in the literature by exploring the impact of the digital expertise of the board on corporate innovation. Using data from 2527 U.S. listed large firms, our preliminary results show that the presence of at least one director with digital expertise significantly increases the likelihood that firms implement high-quality innovation strategies. The study sheds light on how specific professional expertise of directors matters for firms that decide to innovate and adds new evidence to the role of corporate governance in high quality innovation activities.

**Keywords** - innovation, digital expertise, board of directors, corporate strategy

## 1 Introduction

Innovation is vital for the growth and long-term success of modern business. Specifically, corporate innovation is today commonly considered a sustainable strategy for achieving superior performance (Kuratko *et al.*, 2014) and value creation (O’Cass and Sok, 2013). A recent survey of over 5000 board members from around the world revealed that firms focused on long-term results tend to consider more the innovation strategies (Cheng and Groysberg, 2018). However, according to BCG (2021), despite most of the firms believes that innovation is a priority, only 20% of global businesses are ready and equipped to innovate. Extant literature shows that a variety of board’s characteristics influence the decision to innovate (e.g., Grün et al., 2016; Arzubiaga *et al.*, 2018; Chang and Wu, 2021; Valenti and Horner, 2020). For instance, boards can proactively recommend a CEO change to increase the firm’s innovativeness (Grün et al., 2016). The study by Arzubiaga *et al.* (2018) finds that boards provide valuable knowledge to increase the innovation of small and medium family businesses. In addition, Valenti and Horne (2020) report that boards provide strategic contributions and valuable advice to the firms in term of innovation. Also, Chang and Wu (2021) show that the board connectedness enhances firm patenting activities. Nowadays, with the advent of recent transformations like the Covid-19 pandemic and the digitalization, firms need more than ever “board of directors who are digitally competent and understand the new technologies that are impacting business decisions” (David and Farzan, 2021, pp. 5-6). We therefore contend that the digital experience must be considered when determining the composition of the board.

Even though previous studies on innovation management investigated a variety of board’s characteristics like their networks (Chang and Wu, 2021; Wincent *et al.*, 2009), their behaviors (Robeson and O’Connor, 2013), their gender (Wu *et al.*, 2021), and their composition (Chen *et al.*, 2022), we lack detailed insights into how directors with digital expertise direct the innovation strategies. For example, firms with different classes of directors tend to develop more new product lines and plans, according to Chen *et al.* (2022). Furthermore, while Wu *et al.* (2021) study the role of chief technology officers in association with the firm’s patent application and with the quality of innovation, they limit their analysis to female executive representation.

In this study, we address this gap in the literature by exploring the impact of digital expertise of the board on corporate innovation. Specifically, we investigate this professional background through boards may affect innovation. We begin our analysis by gathering information from the proxy statements (DEF 14) published on SEC EDGAR including current and past employment of the board. A digital expertise is identified if specific digital-related keywords are included in these board's documents. We finally aggregate these directors' characteristics to construct a measure of digital expertise of the board. In addition, we follow Chemmanur *et al.* (2014) to measure corporate innovation through on patent-based metrics. In particular, we use the pattern of forward citations to define the firm's innovative activity in a year (e.g., Griliches, 1987; Ganglmair et al., 2021). As a result, we construct a database that includes patents, financial, and board information of 2527 U.S. listed large firms.

We then perform a panel data analysis following Maddala (1987) and find that the presence of at least one director with digital expertise significantly increases the likelihood that firms implement high quality innovation strategies. Our findings add to the literature on dynamic managerial capabilities and innovation management in the following ways. First, our study sheds light on the question of how specific professional expertise of the directors matter for all the firms deciding to innovate. Specifically, firms with digital boards may enhance corporate innovation and therefore strengthen their long-term competitiveness. Past research show that the boards provide strategic contributions to the firm (Chatterjee and Wernerfelt, 1991; Golden and Zajac, 2001; Gordon *et al.*, 2000; Valenti and Horner, 2020). Our study adds new supportive evidence that the inclusion of directors able to understand the new technological trends that are impacting business decisions are crucial for corporate innovation. Second, our study provide evidence on the board's configuration to assess the role of corporate governance on corporate innovation activities (e.g., Chen *et al.*, 2015; Cumming and Leung, 2021; Sariol and Abebe, 2017). Furthermore, the results may also be explained by the upper echelons theory which suggests that determined board of directors' characteristics have a direct impact on corporate strategy (e.g., Greiner and Bhambri, 1989; Hambrick and Mason, 1984; Haynes and Hillman, 2010; Herrmann and Nadkarni, 2014; Wu *et al.*, 2021). While most of the upper echelons' research examines the demography, composition, and other characteristics such as the educational background among directors, this study

introduces a new variable of professional background that serves as a mechanism to explain why firms decide to change their strategy by innovating.

## **2 Theory and hypotheses**

We begin our theorizing by reviewing prior research on the antecedents of innovation and by establishing the baseline linkage between board's characteristics and innovation. We then build on these arguments to conceive how board of directors with digital expertise shapes whether observing firms activate innovative strategies. As we will describe, our prediction regarding the effect of the board expertise builds upon research on the dynamic managerial capabilities, suggesting that specific competencies are essential to help firms redeploying and reconfiguring their resource base to sustain a competitive advantage through value-creating strategies (i.e., innovation).

### **2.1 The executives' influence on innovation**

A number of past studies have indicated that individual characteristics and experience represent a relevant antecedent of corporate innovation (e.g., Attah-Boakye *et al.*, 2020; Balkin *et al.*, 2000; Elenkov *et al.*, 2005; Hoffman and Hegarty, 1993; Prasad and Junni, 2016; Zhang *et al.*, 2017). For instance, the functional expertise of top management explains the influence on different innovation decisions like product-market and administrative (Hoffman and Hegarty, 1993). Similarly, the product-market and administrative innovations have been studied in association with specific strategic leadership dynamics (Elenkov *et al.*, 2005). Liu *et al.* (2020) focused on executives with financial backgrounds to demonstrate that they tend to undertake less innovation within the firm; rather, they opt for quick short-term return of financial investments. Also, the cross-country research conducted by Attah-Boakye *et al.* (2020) found that gender representation of the board positively impacts on corporate innovation. The surveys administered by Colder (2000) revealed that senior executives develop more new products in international markets when the knowledge is spread across the organization.

Limited research focused on the relationship between board members and innovation suggested that the diversity in scope of the board (i.e., gender and age) results in higher-quality patents (Cumming and Leung, 2021). The main assertion in the study of Chen *et al.* (2022) is that board structures made up of

different classes of directors are more inclined to increase the number of new trademark and of product-related patents developed.

Consistent with the expectation that CEO characteristics shape corporate strategies, scholars have largely examined the impact of CEOs on innovation. In the computer software industry, the long-tenured CEOs, CEOs with technical education, and CEOs with broad functional background increase the level of innovative exploitative activities rather than explorative (Tabesh *et al.*, 2019). CEOs have generally great power to influence the innovation decisions if their compensation system is based on short-term and long-term indicators (Makri *et al.*, 2006). In fact, this category of CEOs reinforces the invention resonance (i.e., number of citations) and the science harvesting (i.e., number of references in the firm's own patent applications to scientific papers). In a similar vein, in high-technology industries it has been shown that the CEO's short-term and long-term compensations are related to the firm's ability to innovate (Balkin *et al.*, 2000). Instead, the presence of high dispersion in executive pay fosters the negative effects on firm's innovative performance (Amore and Failla, 2020). On the one hand, risk-taking and explorative CEOs represent effective predictors of innovation quantity, quality, and novelty, according to Makri and Scandura (2010). On the other hand, Prasad and Junni (2016) found that transformational and transactional CEOs can both support the organizational innovation. Similarly, Marwaha *et al.* (2005) surveyed more than 9,300 global business leaders and found that, according to 33% of technology executive, the exploitative activities represent a key driver of growth than the explorative ones. Sariol and Abebe (2017) illustrated the existence of a positive and significant relationship between CEO power and organizational innovation activities; they in fact found that powerful CEOs encourage the introduction of new products. At the same time, cognitive and personal traits have been associated with the CEOs in relation to innovation outcomes. For instance, Zhang *et al.* (2017) provided support that humility and narcissism of the CEO are interactively associated with the innovative culture and the innovative performance. The executive hubris has been studied by Tang *et al.* (2015) who demonstrated that it is positively affected by the firm innovation. Likewise, Galasso and Simcoe (2011) reported that the CEO overconfidence is positively associated with innovation.

Hence, although recent studies demonstrate that corporate directors recognize the need to innovate to stay ahead (Cheng and Groysberg, 2018), on balance the innovation benefits associated with the CEO characteristics outweigh those

resulting from the board's ones so far. Our study addresses this gap by exploring new horizons on the influence that board of directors have on innovation strategies.

## **2.2 The role of professional experience of the board: dynamic managerial capabilities' perspective**

The dynamic managerial capabilities perspective is an influential theoretical framework for understanding how executives develop specific skills and experience to sustain the firm's competitive advantage (Åberg and Torchia, 2020; Adner and Helfat, 2003; Augier and Teece, 2009; Helfat and Martin, 2015; Kor and Mesko, 2013). The three core underpinnings of dynamic managerial capabilities are managerial cognition, managerial social capital, and managerial human capital (Adner and Helfat, 2003). The managerial cognition is associated with beliefs and mental modes that managers develop over time; the managerial social capital is based on the development of their network relationships; the managerial human capital represents the base of knowledge and competencies that managers develop through their prior experience, training, and education (Helfat and Martin, 2015). We focus on the managerial human capital capturing the role of specific professional backgrounds of the board of directors with the aim to understand how certain experience influence the firm's decisions to innovate.

Previous research has largely neglected the role of the board of directors in innovation strategies. For instance, Veltrop *et al.* (2017) provided evidence on the presence of board financial expertise on the directors' social status and influence within the board. In addition, past board experience in environmental sustainability has been studied in association with the firms' ethical behavior (Homroy and Slechten, 2019). The need to develop board expertise to be aligned with the firm risks is examined by Schnatterly *et al.* (2021) who suggested that such alignment results in an improved performance. Accounting, legal, political, and corporate media experience in the board have been investigated by Masud *et al.* (2019) in association with the corporate corruption disclosure. Directors with increasing level of scientific expertise are better able to generate value from research and development investments, according to Cumming and Leung (2021). Finally, despite the study of Wu *et al.* (2021) recently considered the role of chief technology officers in association with the firm's patent application and with the quality of innovation, they limit their analysis to female executive representation.

Building on the dynamic managerial perspective, we suggest that specific resources are useful for the innovation context (Eisenhardt and Martin, 2000; Winter, 2003). We also reason that innovation represents a high degree of change and uncertainty requiring that specific competencies need to be developed to encourage the innovation process (Lee and Kelley, 2008; Makri and Scandura, 2010; Prasad and Junni, 2016). We form this expectation as prior research has pointed to the importance of board expertise “to foster and initiate innovative ideas and strategies” when innovation is central to the firm’s survival (Valenti and Horner, 2020, p. 17). Especially, since directors with digital expertise have enough flexibility to address rapid environmental transformations (Lewis, 2020) and because they are particularly confident with new technologies, we believe that when firms appoint at least one director with digital expertise, it will influence the firm’s decision to direct more innovation activities. It could be especially true under circumstances of environmental transformations like technological changes when firms are committed to adopt innovation strategies to survive. Thus, there is a need for firms to develop this specific expertise to entirely capture value from innovative changes. The arguments above lead us to predict board of directors with digital expertise will increase the likelihood that firms innovate more. Therefore,

*Hypothesis (H1). A positive relationship exists between the presence of at least one director with digital expertise in the board and the corporate innovation.*

### **3 Data and method**

#### **3.1 Sample**

We studied corporate innovation by 2527 US listed and large firms during 2005–2019. We compiled our data from multiple sources. Data on the digital expertise of the board were automatically collected by using the RStudio software from DEF 14A proxy statements published on SEC EDGAR and were later manually checked via LinkedIn and corporate websites. Financial data came from the Compustat database and board data came from the BoardEx database. Our corporate innovation measurement was based on the number of forward patents’ citations gathered from the United States Patent and Trademark Office (USPTO) by using Orbis Intellectual Property.

### **3.2 Dependent variable: corporate innovation**

In line with previous research (Chang and Wu, 2021; Moon *et al.*, 2022; Wu *et al.*, 2021), we collected patent data to generate a measure of corporate innovation since firms spending more on R&D receive more patents (Griliches *et al.*, 1986). We consider the number of forward citations received by all patents in a given year from 2005 to 2019 to capture the quality and influence of innovation; we then use the natural logarithm of each measure to mitigate bias introduced by outliers. We gathered data from the USPTO, the federal agency for granting U.S. patents and registering trademarks.

### **3.3 Independent variable: digital expertise of the board**

We compiled an original database on the creation of digital expertise of the board among 2527 US firms. We refer to the DEF 14A proxy statements published on SEC EDGAR for the identification of specific sentences indicative of the directors' digital experience. By using RStudio, we first downloaded these DEF 14A documents containing common keywords included *chief technology officer*, *chief technical officer*, *chief information officer*, *chief information security officer*, *chief information technology officer*, *technology*, *digital*, *online*, *mobile*, *software*, *e-commerce*. We then manually checked every sentence contained in the RStudio output to be consistent, and we triangulated board information about each firm using a variety of online sources (e.g., LinkedIn profiles and corporate websites) to confirm the directors' digital experience. For each of the firms from 2005, we searched whether each director has held a digital position at least once in his/her professional career. Our independent variable was measured by the lagged percentage of directors with digital expertise on the total directors (Whitler *et al.*, 2018).

### **3.4 Controls**

Since availability of resources may influence the likelihood that a firm invest in innovation, we controlled for the log-transformed *firm slack*, measured as the ratio between current assets of the firm and its current liabilities in the prior year. We used the lagged measured of total assets to control for the *firm size* (log-transformed). We then measured the *firm age* as difference between the year of reference and the incorporation date, in addition to the *firm performance*

measured as the return on assets (lagged). We used the ratio between debt and equity to account for the *firm leverage*. These firm-level variables are gathered from the Compustat database.

To control for the total number of directors within the firm in the year of reference, we included the *board size* variable gaining information from BoardEx. The same database has been used to collect data on the *share of independent directors*, measured as the ration between total number of independent directors on total number of directors in the reference year (lagged).

We finally use the factor variable related to the *year* in which each firm is observed.

#### **4 Preliminary results and Discussion**

The digital era has brought about significant changes in the business world, forcing firms to adopt innovative strategies to remain competitive. As such, disruptive transformations like the digital one represents a crucial aspect to consider for corporate strategy. The ability to navigate complex and rapidly evolving scenarios is critical for firms aiming at leveraging on innovation and at achieving sustainable growth. In this context, the board plays a crucial role in shaping the strategic direction of the firms and in ensuring that they remain competitive in the digital landscape.

In this study, we conducted a panel data analysis and preliminary results show that the effect of digital expertise of the board on quality of corporate innovation is positive and significant, exhibiting that the presence of directors with digital expertise encourages firms to consider innovation as a top strategic challenge. To check for robustness, we measure the lagged percentage of digital executives on the total number of directors as independent variable, and the preliminary outcomes support our previous results.

There are several reasons why board of directors with digital expertise can positively impact the quality of innovation. In recent years the role of digital expertise within the board has become increasingly sought-after and the digital knowledge is increasingly integrated into every aspect of the business. Thanks to these types of expertise, the board of directors can provide valuable insights into emerging technologies to drive innovation. Moreover, board of directors with digital expertise can help to foster a culture of innovation within the firm. In fact, they can provide guidance on how to craft an environment that encourages

creativity, experimentation, and risk-taking, which are essential for successful and high-quality innovation.

## **Sustainability in Family Firms: A Structured Literature Review**

---

Veronica Procacci

Università La Sapienza  
Facoltà di Economia  
Via Del Castro Laurenziano, 9 – 00161 Roma

### **Abstract**

The family firm is a type of firm in which family owners “exercise substantial influence on the firm's affairs”.

Family businesses dominate the economic landscape. According to the latest statistics from the Family Firm Institute, family firms account for two thirds of all businesses around the world, generate around 70-90 percent of annual global GDP, and create 50-80 percent of jobs in the majority of countries worldwide.

Sustainability practices are critical for family firms, as they relate directly to the continuity of the business and relationships with important stakeholders, such as members of the local community. nevertheless, not all family firms wish to adopt sustainability practices.

The purpose of this paper is to identify and analyse the main areas of research related to sustainability practices in family firms.

The study proposed here is part of an ongoing research project in the field of family business studies and is also part of a broader interdisciplinary investigation.

In order to identify the topics dealt with and the investigation methods used, a structured literature review (SLR) was carried out. Specifically, 87 international contributions on the selected SCOPUS database were analysed.

This paper stems from the need to provide an overview of varied literature on the topic in order to understand the different approaches to sustainability that family businesses have. The literature review shows that the gaps in knowledge about family businesses' (FF) approach to socially responsible initiatives persist. FFs present unique perspectives on socially responsible behaviour, as they recognise an undoubted priority to actions related to emotions and goals such as reputation, identity, image and environmental performance.

**Keywords** – Family firms, sustainability, Corporate social responsibility

**Paper type** - Literature review, Academic Research Paper

## 1 Introduction

A family business is a type of enterprise in which family owners 'exercise substantial influence over the business' (Gómez-Mejía, Cruz, Berrone, & De Castro, 2011).

Family firms involve both SMEs and large companies and dominate the international business landscape. According to statistics from the Family Firm Institute, family firms account for two-thirds of all businesses worldwide, generate around 70-90% of annual global GDP and create 50-80% of jobs in most countries around the world (Family Firm Institute, 2017).

Although the importance of family businesses is even greater in Europe (Botero et al., 2015), they contribute significantly to the growth of the economies of South and East Asia, Latin America and Africa (Tharawat Magazine, 2014).

Their economic impact is clear from their great long-term stability and from their high level of commitment to the community in which they operate. The families of FFs demonstrate the responsibility they feel as business owners, as the firms represent their family values.

Similarly, there is a growing focus by companies of all sizes on sustainability and thus socially responsible actions.

In fact, investments in sustainability practices worldwide are steadily increasing and have reached USD 600 billion (Paul, 2019).

Studies indicate that sustainable development can be a source of success and innovation that is profitable for companies (Broccardo et al., 2019) and that companies with sustainability practices have a competitive superiority over others that do not have them (Adomako et al., 2019).

In particular, internal sustainability practices (pollution prevention and green supply chain management) help companies reduce environmental costs and risks, thus leading to wealth creation.

External sustainability practices (green product development), on the other hand, enable companies to meet the expectations of external stakeholders, including customers, suppliers, NGOs, regulators and communities, thereby enhancing the legitimacy and reputation of the company (Hart and Milstein, 2003).

Businesses adopt responsible practices not only to build social legitimacy, but also to adapt to the environment in which they operate, which may favour or limit their continued growth (Goll & Rasheed, 2004).

The growing trend of sustainability practices has boosted the need to define how to implement FFs. They are influenced by a number of intrinsic factors, and since the FFs' universe is very heterogeneous, so is their approach to sustainability (Caputo et al., 2017).

Sustainability issues in FF require research because of the importance of such practices and the impact they will have on companies' reputations and profits.

The literature on sustainability is vast and the topics from are numerous. Given the specific characteristics of FF, theoretical support for FF sustainability studies is usually based on five theories: Socio Emotional Wealth (SEW) Theory, Corporate Social Responsibility, Stakeholder Theory, Resource-Based View (RBV) and Stewardship Theory.

The literature review proposed here was conducted with an analysis of studies relating to three key themes: 1. the succession process, 2. social disclosure in family firms 3. correlation between family governance and socially sustainable practices, the predominant theme, 4. sustainable innovation in family firms. The last theme showed little results.

By adopting a structured literature review (SLR) methodology (Massaro et al., 2016; Paoloni and Demartini, 2016; Paoloni et al, 2020), and following the suggestions defined in the protocol, this article attempts to answer the following research questions:

*RQ1. How is research in the literature developing the topic of sustainability in family businesses?*

*RQ2. What are the main foci of analysis in the extant literature?*

*RQ3. What are the possible future research areas?*

The following article is organised as follows. Section 2 describes the research methodology used for the analysis, section 3 presents the results obtained from the study of the SLR. Section 4 discusses the results, while section 5 provides concluding remarks and finally section 6 theoretical and practical implication.

## **2 Research methodology**

In this work, the SLR method was used to analyze the literature on sustainability in family firms, a method already used by Paoloni and Demartini (2016). This type of literature classification is widely used among business economics academics.

In essence, what distinguishes an SLR from an analysis of the conventional literature is that we follow a specific methodology that selects and evaluates the contributions and analyzes and summarizes the data to obtain results with greater transparency, completeness and reproducibility of analysis (Tranfield et al., 2003; Denyer and Tranfield, 2009; Littell et al., 2008).

SLR is used by researchers to map and assess existing intellectual territory to identify

future research needs (Dixon-Woods, 2011, p. 331).

This approach is used as the aim of the following work is to provide an overview of the vast and varied literature on the topic in order to discover under-researched topics and methods, thus nurturing the development of new areas of knowledge and research approaches (Massaro et al., 2016).

The database used by the Authors to extract the information is SCOPUS because it is widely used and the largest available database for the multidisciplinary scientific literature (De Moya-Anegon et al., 2007).

The research was conducted on 12 March 2023. The authors identified specific clear words specifically the Scopus query used was the following: ("family businesses" and "sustainability"). The authors limited the search to 'Paper title', 'Abstract' and 'Keywords' to avoid extracting papers unrelated to the research objective.

This search yielded 165 papers.

Filter by subject area was applied to limit the search to documents related to Business, Management and Accounting and Economics, Econometrics and Finance. Therefore, only articles that reached the last stage of publication and were written in English were examined. Specifically, 87 international contributions were analyzed.

Figure 1 shows the process used to identify the eligible research.

The limited number of contributions related to the topic under study prompted the authors to investigate the existing literature in order to outline possible future research alternatives.

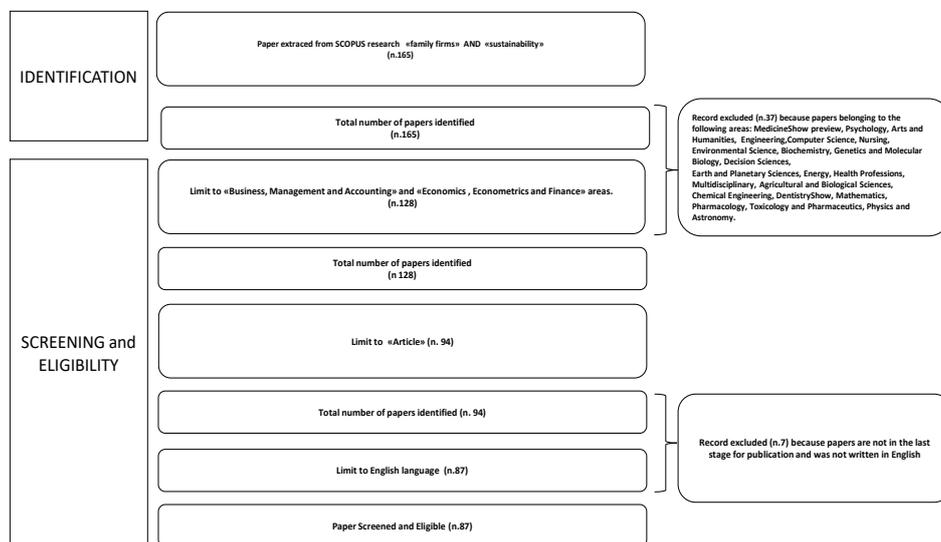

Figure 1. The procedure for selecting the eligible papers

## 2.1 Definition of the analytical framework

About the framework the authors decided to use method as proposed by Paoloni and Demartini (2016).

We made several adjustments to fit categories and their characteristics to our sample and to make them compliant and relevant to our RQs.

This allowed the analytical framework to be defined, which was helpful in distinguishing units of analysis within selected documents as separate items. (Yin, 2014)

After reviewing and classifying the articles in the most consistent way with the research theme and having identified the most consistent classifications referring to the literature and consequently to the adjustments made with the continuation of the work, the taxonomy of the categories emerging from this process are presented list below (analytical framework).

The categories were selected after reading the titles, abstracts and keywords of the articles.

- A - Article focus
  - A1 – Generational succession process
  - A2 – Sustainability reporting in family firms
  - A3 – Correlation between family governance and socially sustainable activities

- A4 – Sustainable innovation in family businesses
- A5 – Other
- B - Research methods
  - B1 – Literature analysis
  - B2 – Qualitative
  - B3 – Quantitative
  - B4 – Mixed Method
- C – Geographical area
  - C1 – Comparative study
  - C2 – America
  - C3 – Europe
  - C4 – Asia
  - C5 – Africa and Oceania

The purpose of the category "article focus" is to identify the specific focus of articles in order to gain insights into which topics are of continuing interest to scholars or otherwise (Paoloni and Demartini, 2016).

They are outlined below:

*A1 Generational succession process:* includes all works dealing with the topic of generational succession in family businesses, in detail the sustainability of family businesses over time and the changes brought about by new generations.

*A2 Sustainability reporting in family firms:* here are included all papers dealing with the topic of sustainable reporting in family businesses and specifically the credibility of these reports compared to those prepared by non-family businesses.

*A3 Correlation between family governance and socially sustainable activities:* includes articles on the correlation between family ownership and the propensity to engage in sustainable business activities.

*A4 Sustainable innovation in family businesses:* includes contributions on innovation in family businesses, in detail analysing the difference in the approach to innovation of family businesses compared to non-family businesses.

*A5 Other:* here are collected all articles that are not related to the previous article focuses. In particular, they are researches concerning specific working conditions not related to gender inequalities.

In relation to the category search method, the authors distinguished the following methodologies:

B1 *Literature analysis:* SLR results dedicated to the review of existing literature.

*B2 Qualitative research*: analysis carried out using case studies, experiments, content analysis, surveys through interviews, focus groups, etc.

*B3 Quantitative analysis*: structured method to collect and analyse data obtained from different sources. It involves the use of statistical, mathematical and computational tools. *B4 Research mix*: including both qualitative and quantitative methodology.

The last classification is related to geographical area. With reference to geographical origin, articles were classified not according to the location of the research but according to the origin of the author.

tarting from the taxonomy quoted by Paoloni and Demartini (2016) a smaller number of geographical areas were considered as follows: C1 Mixed (authors with affiliations from different geographical areas), C2 America (Canada, USA, Brazil, Colombia and Argentine), C3 Europe, Switzerland and UK (Austria, Belgium, Denmark, Iceland, Ireland, Finland, France, Germany, The Netherlands, Norway, Poland, Sweden, Greece, Italy, Portugal, Spain, and Turkey), C4 Asia (China, Japan, Korea, Singapore, India), C5 Africa and Oceania (South Africa, Australia and New Zealand).

### **3 Results**

For each research study, defined as eligible, the authors read the title, abstract and keywords to ensure they were consistent with the research objectives.

#### **3.1 Research focus**

The authors analysed the documents and divided the research studies according to the topics covered. Figure 2 shows the results obtained over the period 1999 to 2023.

The main focus of the researchers was A3, *Correlation between family governance and socially sustainable activities*, with 48 documents out of 87 analysed followed by A1, *Generational succession process*, with 16 documents, than A2 *Sustainability reporting in family firms*, with 6 documents out of 87 related to the topic. 5 documents were categorised in the section A4 *Sustainable innovation in family business*, and finally 12 documents were included in category A5 *Other*, residual category, where we find contributions that could not be included in any of the previous.

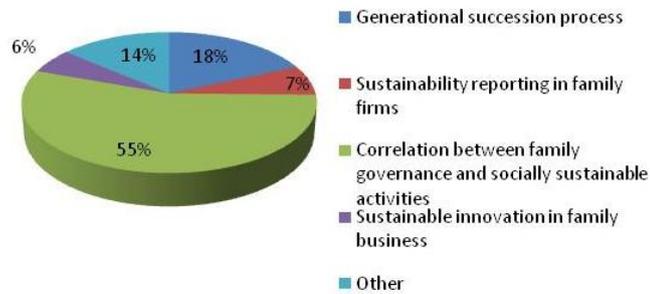

Figure 2. Times series articles focus evolution

### 3.2 Research method

The most commonly used research method was B3 (Quantitative research) with 45 papers out of 87 analysed, followed by B2 (Qualitative research) with 38 papers, B1 (Literature analysis) with 3 papers and finally B4 (Research mix) with 1 paper.

The results explained here are summarised in figure 3.

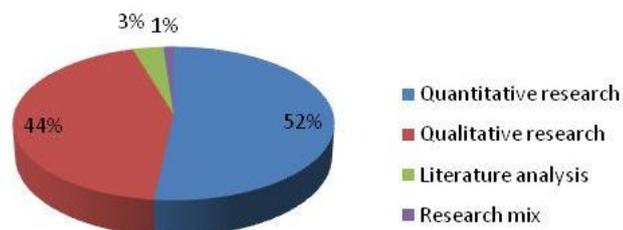

Figure 3. Times series research method evolution

### 3.3 Geographical area of authors' affiliations

Most of the documents analyzed were written by from areas C1 (Mixed) with 32 contributions out of 87, here are enclosed contributions written by authors with affiliations from different geographical areas, followed by C3 (Europe, Switzerland and UK) with 22 papers, than C2 (America) with 18 documents, followed by C4 (Asia) with 11 documents and lastly C5 (Africa and Oceania) with 4 contributions. All results are shown in Figure 4.

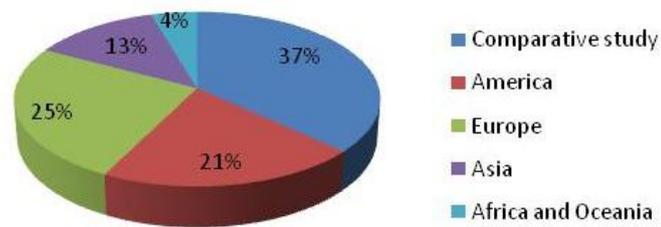

Figure 4. Representation of the geographical area of authors by year of publication

#### 4 Discussion

This section analyses the main contributions with reference to the identified analysis focuses. The aim is to answer research question RQ1, namely how the literature is developing the topic of sustainability in family businesses, and research question RQ2.

The article focus with the highest number of contributions is A3, *Correlation between family governance and socially sustainable activities*, probably because ownership structure is one of the most relevant dimensions to explain differences in environmental performance between firms (Dou, Su, & Wang, 2017; Lamb & Butler, 2016).

A common belief is that the presence of family influence affects the firm's strategic behavior (Chua et al., 1999; De Massis et al., 2021; Xi et al., 2015; Yu et al., 2020), and thus its sustainability practices.

Several literature reviews contain inconsistent and sometimes contradictory findings (e.g. Van Gils, Dibrell, Neubaum, & Craig, 2014) on the relationship between family ownership and environmental practices and performance. The underlying perspective of family business studies is that family businesses behave differently from non-family businesses because owners aim to shape and pursue the vision of the business. Family ownership changes the goals of the firm (Basco, 2017), thus changing the reference point for strategic decisions (Cennamo, Berrone, Cruz, & Gomez-Mejia, 2012), such as environment-related practices (Doluca, Wagner, & Block, 2018; Sharma & Sharma, 2011).

Given the specific characteristics of FF, theoretical support for FF sustainability studies is usually based on five theories: Socio Emotional Wealth (SEW) Theory, Corporate Social Responsibility, Stakeholder Theory, Resource-Based View (RBV) and Stewardship Theory.

Relevant is the contribution of (García-Sánchez et al., 2020), the authors in their analysis of 956 international companies for the period 2006-2014 confirm that family businesses, under difficult environmental conditions, show a greater commitment to CSR and are more likely to direct their CSR activities towards both stakeholder groups in order to preserve their emotional and social endowments. They are likely to avoid any irresponsible behaviour that could damage their family name and make their stakeholders unhappy, which is crucial to bring valuable resources and ensure their survival in difficult times. These findings contribute to the research on CSR in family businesses and respond to the calls of Dyer and Whetten (2006), Berrone et al. (2012) and Cennamo et al. (2012), in particular.

The opposite view is the one presented by Rees and Radionova 2015, the authors in their study found that listed family firms have worse environmental performance than listed non-family firms and argued that family firms are more concerned about their wealth than non-family firms. In particular, the authors hypothesised that family shareholders may impose their interests in the organisation.

The second article focus with a larger number of contributions is A1, Generational succession process, in fact the main reason for the closure of family businesses is the problems in succession preparation (Handler, 1994). Succession is a multi-dimensional process through which leadership shifts from one generation to the next (Sharma et al., 2001). Due to the difficulties in managing the highly complex and emotional process (Matthews et al., 1999), it has been difficult to establish generalizable theories of succession.

A successor's managerial ability could be said to be one of the most critical factors influencing succession. Especially when an incumbent CEO selects a successor, the successor's managerial ability could be an essential criterion. It also significantly affects the company's performance during and after the succession process.

In a study by Kang and Lee (2009), business competence was defined as a complex of skills, knowledge, and behavioral modalities to affect successful succession. As a result, business competence had a positive and significant effect on succession effectiveness. Education and training are crucial factors that form the successor's managerial ability, and the factors could possibly affect succession (Kim & Han, 2017).

On the other hand, the means of succession in a family business are different. Even the succession is not finished after the succession. It means that a long-term plan and the preparation of succession are necessary for a successful succession. The plan is also needed in various areas, and family members and nonfamily members should be included.

A literature review with reference to the succession process within family businesses reveals another theme: with the second/third generation there is an increase in investment in social and environmental initiatives. Mullen 2018, in his contribution, he explains that the underlying reason for this evidence is that when the company passes from one generation to the next, the concern to maintain and further strengthen the relationship with the company increases in importance. Consequently, the company invests more in social and environmental initiatives to strengthen its reputation in the next generation.

In article focus A2 we find contributions addressing the topic of sustainability reporting in family businesses.

Corporate social responsibility (CSR) reporting is defined as the process of communicating the social and environmental actions of organisations to particular interest groups within society and to society at large (Campbell 2004; Gamerschlag et al. 2011; Gray et al. 1987).

The literature on CSR reporting has increased considerably in recent years, in parallel with the development of CSR practices, assuming that this implies that the company is responsible for its actions (Perrini 2005).

Specifically, the contributions we study analyze the credibility of corporate communication in family businesses, compared to non-family businesses, in the context of voluntary sustainability reporting.

Part of the literature argues that family businesses suffer from a credibility disadvantage with regard to their sustainability reporting efforts from the perspective of external stakeholders. This phenomenon is referred to as the 'credibility gap'.

It is defined as stakeholders' lacking of trust in the ability or intention of the reporting company (Dando and Swift 2003). It causes stakeholders to have little confidence in the authenticity of company claims in the report. The voluntary nature of sustainability reporting further reinforces this credibility gap. A company can strategically choose what to disclose about its actual behavior, especially unethical behavior (Wang and Li 2016).

However, this result is in stark contrast to the other part of the literature which argues instead that there is greater trust attributed by external stakeholders to family businesses. This depends to a large extent on the man model (Corbetta & Salvato, 2004) that stakeholders attribute to family businesses and their respective owner families.

According to the agency theoretical perspective, family businesses should have a credibility disadvantage. The family owner possesses privileged information about the company that could be used to opportunistically exploit external stakeholders and deprive minority owners (Morck and Yeung, 2003, Schulze et al., 2001, Young et al., 2008).

Opposed to this view is the stewardship theory, which assumes that individuals are characterised by a more organisationally favourable, collectivistic and intrinsic motivation (Davis, Schoorman, & Donaldson, 1997).

In detail in the work of (Stutz et al., 2022) it emerges that neither family nor non-family businesses suffer from a greater credibility gap when it comes to sustainability reporting as judged by external stakeholders.

However, their extensions of the original study reveal that when family businesses are perceived as such, they have a credibility advantage over non-family businesses. This effect is completely mediated by the perceived benevolence of stakeholders.

Furthermore, the authors show that this credibility advantage translates into positive stakeholder behaviour in the form of increased purchase intentions (for customers) and application intentions (for job seekers).

Undoubtedly, socio-emotional wealth and emotional assets play a key role within family businesses.

In fact (Dominguez et al, 2021) Through empirically conducted analysis of an international sample of companies, they argue that decisions in family businesses are made according to accumulated affective wealth or socio-emotional wealth aimed at maintaining ownership and control of the company and passing it on to future generations.

This decision-making framework leads these companies to make decisions to protect socio-emotional wealth, finding in CSR a sustainable growth strategy that favours the image and reputation of the company and the family. In this sense, the authors believe that these companies will be less prone to greenwashing practices due to the risks it may pose to their image and legacy, opting for a more meaningful coupling between what they do and what they say.

Lastly, article focus A4, *Sustainable innovation in family businesses*, with a rather small number of contributions.

Relevant is the study of Dangelico et al., 2019, in which the authors question what are the differences and commonalities between family and non-family businesses regarding their approach to green Innovation.

The authors point out that the main differences between the two categories of companies concern the antecedents of green innovation, and how it is conceived, whereas green innovation in itself (characteristics, process characteristics, and challenges) and its outcomes are not influenced by the nature of the firm.

In particular, family businesses are mainly driven from the perspective of longer-term benefits (such as quality improvement, better image and reputation, and market share growth) and pressure from internal stakeholders (such as the family and future generations), and this leads them to conceive green innovation primarily as an opportunity. On the other hand, non-family enterprises are driven by short-term benefits (such as maintaining market share and customer demand satisfaction) and the pressure exerted by both Internal and external stakeholders, leading them to see green innovation primarily or initially as a necessity to satisfy external actors.

Innovation has become a critical factor in achieving sustainable growth through energy efficiency improvement and energy intensity efficacy at both the micro and macro levels.

Innovations at the micro (firm) and macro (country) levels support sustainability in the long run by producing more output while causing less natural resource depletion.

The innovation and sustainability link at the micro level exhibits a family-firm (ownership) effect and an innovation-technology impact. (Kao and Huang, 2019) show that technology-related innovations have a primary role in supporting sustainable growth.

On the macro level, (Fagerberg et al., 2010) show a clear correlation between innovation activity and the state of development. The higher the GDP per capita is, the higher the share of companies participating in innovation activities.

Skare et Porada-Rochon 20220, in their study they point out a gap in the literature on the micro level role of family firms in innovation-driven sustainable development. With their contribution they therefore conduct an empirical analysis to fill this gap. This study finds that the family firm effect has an essential impact

on sustainability related to technological innovations. Technological innovations demand significant financial resources for research and development (R&D). Necessary financial resources for R&D investments are less available to family firms. Therefore, countries with a larger share of non-family firms heavily investing in technological innovation will achieve higher sustainability. As this study shows, technological innovation in non-family firms promotes an average increase of 1% percentage point increase in innovation more to family firms. This is the family firm effect. The same family firm effect holds for non-technology-related innovation. Firms' in-house-driven innovation investments in intangible assets such as advertising, market research, and branding (ADV) purchased organizational capital (POC), vocational training (VT), and own-account organizational capital (OOC). Family firms investing in these types of innovations contribute less to sustainability than nonfamily firms. The family firm effect is not as strong as in the case of technological innovation but is still present.

## **5 Conclusions and future perspectives**

The analysis shows that the topics of the correlation between family-type governance and sustainable practices and the succession process in family businesses have become increasingly prevalent in the literature, involving a growing number of research articles, with a consequent increase in the number of interconnected analyses on these topics.

With regard to RQ1 (How is the research in the literature on the topic of sustainability in family businesses developing), this has been a fairly discussed topic since the early 2000s. The last five years have seen a small increase in contributions on the topic.

The increasing media attention on the topic of sustainability and the relevance of family businesses internationally have probably stimulated more studies on the topic.

The literature review shows that the topic of sustainability can be analysed from different perspectives. It is clear that, since the family owner strongly identifies with the business, is motivated to ensure its long-term survival and tends to be embedded in its socio-economic context (Corbetta and Salvato, 2004, Gómez-Mejía et al., 2011, Le Breton-Miller et al., 2011, Zellweger et al., 2013), it will exhibit a distinct management behaviour compared to non-family businesses, and thus also approach sustainability.

Regarding RQ2 (What are the main points of analysis in the existing literature?), the largest number of studies is related to focus A3 (Correlation between family governance and socially sustainable activities) with rather mixed results on the topic. From the results of the present analysis A1 (Generational succession process) is another focus on which numerous researches have dwelt, mainly addressing the increase of investments in social and environmental initiatives with the second and third generation. In particular, it emerges that the reason behind such an increase in sustainable practices can be attributed to the concern of ownership to maintain and strengthen its reputation (Mullen 2018).

Numerous researches have also addressed the issue of the successor's managerial skills in the succession phase, which can be considered one of the most critical factors influencing succession.

Other widely discussed topics, in order of number of contributions, are A2 (sustainability reporting in family businesses) and finally A4 (Sustainable innovation in family businesses), respectively.

With reference to the latest RQ3 research question (what are the possible future research areas?), the literature analysis has generated few contributions on the topic of sustainable innovation in family businesses. It might therefore be interesting to analyse, as an idea for future research, how family businesses raise capital to invest in innovative activities and what sustainable innovations these companies implement, especially by small and medium-sized family businesses.

Finally, an interesting question could be to carry out the same structured analysis of the literature with reference to the theme of internationalization and digitalization, to understand the points of contact between the three themes analyzed (sustainability, internationalisation and digitisation) in the context of family businesses.

## **6 Theoretical and practical implication**

A limitation of this research is the use of a manual approach because it is more convenient and flexible. Moreover, the classification that the authors report involves the introduction of subjective parameters on the evaluation of the results that we have decried. Another limitation of the work is represented by the consultation of only one database (SCOPUS) for the collection of the analysed articles. In the future, it will be possible to use other databases (Google Scholar or JSTOR) and replicate the SLR protocol adopted by this study.

Finally, by performing searches based only on titles, keywords and abstracts, we may have overlooked some relevant information needed to perform a complete classification according to our chosen analytical framework. For instance, in some cases, abstracts do not always provide details on the methodology applied by the authors, if not summary and partial information.

### Abstract

The development and diffusion of digital technologies (especially those supporting communication, collaboration and social networking), along with the pervasive dissemination of powerful and easy-to-use mobile devices, may encourage organisations to implement Smart Working (SW). The previous research suggests that an effective SW implementation is enabled by the availability of a certain set of resources, namely advanced ICT infrastructure and digital technologies, employees' digital skills and acceptance, and a trust-based organizational culture and managerial style. Despite this, the existing studies neither empirically determine the role of enabling resources for an effective SW implementation nor explain the interplay of different SW enablers in the improvement of organization performance. This study investigates through an empirical study the relationship between the SW enabling resources and the organization performance. Furthermore, this study aims at analysing the mediating role of digital leadership on the relationship between the SW enabling resources and organization performance.

**Keywords** – Smart Working, Digital Leadership, organization Performance

**Paper type** – Academic Research Paper

## 1 Introduction

The development and diffusion of digital technologies (especially those supporting communication, collaboration and social networking), along with the pervasive dissemination of powerful and easy-to-use mobile devices, may encourage organisations to implement Smart Working (SW) (Ahuja et al., 2007). In this regard, the necessity caused by the Covid-19 pandemic made the adoption of digital technologies along with the implementation of SW faster and widespread (Baudier et al., 2023). Looking at the post-pandemic world, researchers and practitioners are questioning about the future of SW and whether it will be adopted by companies as an established successful practice. Indeed, an essential part of the “new normal” after the Covid-19 pandemic will be a revision of the working methods (Bonacini et al., 2021) to employ an effective combination of information technologies, computer networks, and mobile devices.

Several studies investigated SW implementation during the pandemic (e.g., Bonacini et al., 2021; Fana et al., 2020; Ipsen et al., 2021). Most of them focused on the identification of benefits, drawbacks as well as implementation drivers. As to the latter aspect, many scholars pointed out a new paradigm shift that “is being driven by extreme changes in approaches to work, work cultures, business architectures, decision making, communications, and collaboration” (Boorsma & Mitchell, 2011, p. 2). Others referred to evolutionary changes in work and management practices that are enabled by technological advances and that foster both organizational agility and new workforce expectations (e.g., Bednar & Welch, 2020; McEwan, 2016). Overall, what emerges from the different contributions are the enabling resources for an effective SW implementation. There is no doubt that a SW successful implementation requires changes in the organizational culture and managerial practices, Information and Communication Technology-based solutions, and specific employees’ characteristics and behaviours, e.g. perception, motivation, flexibility, digital skills and capabilities (Berghaus et al., 2015; Reyt & Wiesenfeld, 2015; Vanajan et al., 2020).

Few studies investigated whether and to what extent SW impacts on organization performance. Some evidence suggests that when implemented, SW not only reduces infrastructure costs but also increases the workforce’s overall productivity (Barrero et al., 2021; Bolisani et al., 2020). Others arrive to opposite results, proving that expected benefits or performance brought by systems including SW are not satisfactory. In other words, introducing SW systems or

building ICT-based infrastructure does not produce performance immediately (Sasidharan et al., 2012).

Only Ko et al. (2021) identify the antecedents of SW appropriation and examine what effects the appropriation of SW has on task performance, whereas Carbonara et al. (2022) conduct an empirical study to investigate whether and under which conditions companies that adopted SW during the Covid-19 pandemic improved their performance. However, as far as we know, no other researchers have explained the interplay of the different enabling resources for SW implementation in the improvement of organization performance. Understanding the impact on performance is important because SW requires companies to invest to acquire tangible and intangible resources, such as technologies, workspaces, HR management systems, competence and training, and such investments should be offset with appropriate benefits. Furthermore, establishing the benefits of SW for the organization will enhance the confidence and commitment of managers in this new paradigm of work (i.e., smart working) and its implementation. Therefore, this study aims at investigating through an empirical study the relationship between the SW enabling resources and the organization performance.

Furthermore, this study argues that the relationship between the SW enabling resources and organization performance is mediated by a well-established digital leadership that is a combination of transformation leadership and digital technologies, i.e., the ability of digital leaders to identify and realize opportunities to create value through the effective, efficient, and acceptable use of digital technologies (Waal et al., 2016). It is widely recognized that SW involves more than just the mere implementation of technological resources, existing studies have addressed the necessity of reskilling human resources, changing organizational culture and management practices, but also adopting a new breed of digital leaders to guide organizations towards an effective implementation of SW, and more, in general, the digital transformation (Guinan et al., 2019; Hensellek, 2020).

Despite the booming interest in digital leadership as a unique capability for implementing SW in companies and dealing with digital transformation, no other studies have empirically explored the impact of SW on organization performance through the establishment of digital leadership. Therefore, to explore these relationships, we developed a conceptual framework based on the resource based view (RBV) theory since it may provide a solid basis for identifying and assessing

the significance of all relevant resources and capabilities to ensure organizational performance. The conceptual framework was empirically tested using structural equation modelling on survey data of 209 employees that experienced SW in different Italian public companies.

## **2 Literature review**

### ***2.1. Smart working enabling resources***

In the last few years, SW is catching a growing attention from both practitioners and academics. Technological issues represented the focus area of prior studies on SW, which mainly explained the effectiveness of SW as a result of ICT developments (Sørensen et al., 2005; Koh et al., 2014). In this perspective, the use of SW refers to the application of new technologies and systems to carry out tasks, thus, ease of using ICT services that make possible SW is required. In other words, employees are more likely to use SW when relevant technologies and systems provide services with greater accessibility and ease of use (Agarwal & Karahanna, 2000; Venkatesh & Davis, 1996). The previous research thus confirmed that SW is enabled by advanced ICT infrastructure and digital technologies (Coenen & Kok, 2014; Corso et al., 2011; Dornelles et al., 2022), although a successful implementation of SW does not refer to the mere use of ICT tools to provide remote work or to the mere digitization of work processes (Bednar & Welch, 2020). An effective SW requires the parallel development of a “digital culture” (Miller, 2011) that presupposes a virtuous, conscious, and critical use of such tools.

Along with technological factors enabling SW, previous research explored the role of employees and organizations’ characteristics as well as of the managerial practices for an effective SW implementation (Chandola et al., 2019; Peretz et al., 2018). Boorsma and Mitchell (2011) state that the term ‘smart working’ has been used to describe an evolutionary change taking place over a number of different dimensions in the world of work. The scholars also highlight that SW requires ‘changes in approaches to work, work cultures, business architectures, premises, decision making, communications, and collaboration’ (2011, p.2). There has been a decline in the importance of place in work activities, greater scope for collaboration, employee autonomy and talent management, and an emphasis on innovation (Hamel & Breen, 2007). Lake (2013) highlights flexibility as a key

feature of new, smart working practices. However, the recent multidisciplinary studies on SW recognize that flexibility and disappearance of place are only one feature of smart working. Empirical and theoretical studies, as well as literature reviews, offer relevant insights to better understand this new approach to organizing work and identify the key drivers for an effective SW implementation (Dahlstrom, 2013; Overbey, 2013; Malik et al., 2016; Birkinshaw et al., 2008; Elsbach & Pratt, 2007; Mann, 2012; Reyt & Wiesenfeld, 2015). The drivers include managerial practices, employees' personalities, organizational structure and policy, work digitization and suitable Information and Communication Technology-based solutions, support and training practices for workers.

The implementation of SW requires adequate management policies with particular attention to the reorganization of work and personnel management (Gastaldi et al., 2014; Rapisarda et al., 2021). It would be necessary for organizations to adopt better and more effective human resource management (HRM) practices, e.g. more inclusive and differentiated approaches to support employees so as to better balance work and private life (Marino & Capone, 2021).

Furthermore, workers must be adequately trained and have the technological resources needed to perform well (Manuti et al., 2020). The survey conducted by Barbieri et al. (2021) on smart working during the pandemic demonstrated that workload and social isolation, perceived organizational support, and commitment to organizational change have affected workers' quality of life and their performance during the pandemic. New practices of HRM needed to be implemented in order to reinforce the workers' engagement when the work methods change, motivate them to adopt proactive behaviors and positive attitudes, and achieve results in line with the expectations of the organization (Decastri et al., 2019).

To sum up, the previous research suggests that an effective SW implementation is enabled by the availability of a certain set of resources and capabilities, namely advanced ICT infrastructure and digital technologies (Corso et al., 2011; Kim et al., 2018); employees' digital skills and acceptance (Sung, 2013); a trust-based organizational culture and managerial style (Vanajan et al., 2020; Iannotta et al., 2020; Mann, 2012). Availability and usage of suitable ICT-based solutions (Technology), an employees' aptitude and skills to SW (People), as well as changes in the organizational culture, new managerial and HRM practices (Culture) are the key enabling factors that contribute to implement an effective SW. However, the existing studies neither empirically determine the role of each

factor in the effective implementation of SW nor explain the interplay of different SW enablers in the improvement of organization performance, which is a research gap that needs to be addressed.

## **2.2. Digital leadership**

In order to fully exploit the opportunities offered by the inclusion of digital technologies into an organization, a true digital transformation process is required, which includes the redesign of the organizational structure, a profound change of the organizational culture, the alignment of business strategy, new capabilities and competences of workers (Oberer & Erkollar, 2018; Wasono & Furinto, 2018; Mihardjo et al., 2019). To achieve this result, a total organizational commitment is required (Miller, 2016), which is driven by an appropriate leadership style (Kohnke, 2017), namely the digital leadership.

Beyond the key characteristics required to transformational leaders, namely interpersonal, technical, & decision-making skills, individual behaviors and personal traits (DeRue & Ashford, 2010; Judge et al., 2001; Santoso et al., 2019), digital leaders must possess a set of capabilities to identify and realize opportunities to create value through the effective, efficient, and acceptable use of digital technologies (De Waal et al., 2016). Despite digital leadership is currently considered a key ability to support companies in advancing the digital transformation process, its role in the effective implementation of SW, which is part of the digital transformation process of organizations, seems to be overlooked by empirical studies in the academic literature.

## **2.3. The Resource based view theory**

The Resource Based View (RBV) theory explains that organisations can achieve sustainable competitive advantage by properly creating bundles of strategic and dissimilar resources and/or capabilities (Barney, 2001). As a matter of fact, RBV is a principal paradigm for theoretically and empirically assessing the relationship between organizational resources and organizational performance, and, therefore, it allows one to understand how firms can improve their performance (Brandon-Jones et al., 2014; Chahal et al., 2020; Gupta et al., 2018; Kraaijenbrink et al., 2010). Given that the main objective of this study is to investigate the relationship between the SW enabling resources and the organization

performance and to explore if the presence of digital leadership can explain the effect of the SW enabling resources on the organization performance, the choice of RBV as a theoretical framework for this study seems appropriate. This is consistent with Wade & Hulland (2004), who argue that RBV not only provides a useful means to assess the strategic value of organizational resources but also lays out a clear association between resources and capabilities as an independent variable and firm performance as a dependent variable.

Even though the RBV theory has been criticized for the lack of clarity in distinguishing the terms resources and capabilities (Kraaijenbrink et al., 2010), the literature uses the term resources referring to any assets owned and controlled by the firm (Amit & Schoemaker, 1993; Aragón-Correa & Sharma, 2003; Barney, 2001), whereas the term capability is used to indicate a bundle of resources or, in other words, the ability to effectively combine and utilise the resources to achieve a desired outcome (Huemer & Wang, 2021; Makadok, 2001; Größler & Grübner, 2006; Amit & Schoemaker, 1993; Schendel, 1994).

The different types of resources fall broadly into three categories (Makadok, 2001): tangible (e.g., technology and physical resources), intangible (e.g., reputation and culture), and human (e.g., employees' skills and know-how). Consistent with this, the SW enabling resources can be categorized as tangible (ICT-based solutions), intangible (organizational culture), and human (employees' mindset and digital skills) resources. Whereas digital leadership is the organizational capability that gives firms the capacity to develop, deploy, assemble, and integrate the SW enabling resources for a desired result, namely the effective implementation of SW with the achievement of better organization performance.

### **3 Research model and hypotheses**

#### ***3.1. Effects of SW enabling resources on the organization performance***

The availability of ICT-based solutions allows smart workers to effectively collaborate, coordinate with each other, and perform their tasks independently by time and place. Advanced technology-based platforms contribute to improve interconnectivity, favoring interactions and enriching the communication among employees within smart working organizations (Larkin 2017; Shah et al., 2017). Studies have also shown the positive effects of digitalization, referring to the

usage of any digital assets, on the organizations' performance (Kuusisto, 2017; Ribeiro-Navarrete et al., 2021). Its benefits are numerous and include automating and optimizing processes to improve productivity, saving costs, streamlining production, and supporting the decision-making process (Parida et al., 2019; Scott et al., 2019). Furthermore, the use of digital technologies enables firms to quickly interact and share in-depth information and knowledge (via digital channels), enhancing knowledge exchange and organizational learning, and boosting innovation (Kamalaldin et al., 2020).

Thus, the following hypothesis is proposed:

*H1. Advanced ICT infrastructure and digital technologies (Technology) positively influence organization performance in SW settings.*

A number of studies grounded on the theory of reasoned action analyzed the importance of mindset or attitudes in guiding individuals towards desired behaviours (Ajzen & Fishbein, 1980; Ajzen, 1991). Attitude or mindset determine the intentions towards a certain behaviour, defining how much effort the individual will exert in order to perform the behaviour. The perceptions of the behaviour's consequences and the value ascribed to those consequences shape the individual mindset and attitude.

Based on the notions and concepts developed by the theory of Reasoned Action, many researchers pointed out that employees' mindsets and attitudes toward the use of new information and communication technologies positively influence employees' intention to use and exploit ICT in the workplace (Agarwal & Karahanna, 2000; Venkatesh & Davis, 1996). Therefore, the positive attitude toward ICT and an ICT mindset of employees will increase the acceptance to adopt a new ICT-based working practice like SW.

Some empirical studies have also revealed that SW is positively viewed especially by those employees who had technological and digital skills (Carbonara & Pellegrino, 2021; Risi & Pronzato, 2021).

Based on the above discussion, the following hypothesis is proposed:

*H2. Employees' mindset and digital skills (People) have a positive impact on the organization performance in SW settings.*

The adoption of SW has implications at the level of organizational structure, individual workforce and managerial practices (Bentley et al., 2016; Johnson et al., 2020), bringing a number of benefits and advantages, but has also revealed some problems. These problems include worker monitoring and control measures, the absence of face-to-face interactions and direct feedback, and depersonalized

approaches to managing work (Alward & Phelps, 2019; Suh & Lee, 2017). At the level of group and organization, scholars have suggested that SW hampers visibility and social interaction, which can affect trust in working teams (Allen et al., 2015; Hafermalz & Riemer, 2021), create a sense of exclusion and perceptions of surveillance (Soga et al., 2020), threats the cohesion in organizations (Bentley et al., 2016). Further, there are negative effects on team working (Jacobs & Padavic, 2015; Zarei et al., 2021; van der Lippe & Lippenyi, 2020). These are manifested in an increased job insecurity (Kolasa et al., 2021), withdrawal behaviors (Stirpe & Z'arraga-Oberty, 2017), and a lack of engagement of employees (Golden et al., 2012), with negative effects on performance. These problems call for changes in the organizational culture and the adoption of new managerial and HRM practices.

Studies on virtual teams suggested that higher levels of individual and team performance are measured for companies with a strong cooperation and collaboration culture, based on trustworthy relationships among employees and between employees and management. Creating sharing goals, establishing and maintaining trust through timely and open responses, as well as by giving feedback (Henttonen & Blomqvist, 2005), monitoring team progress, and enhancing team visibility inside and outside the organization (Malhotra et al., 2007) are solutions to positively influence performance in SW organization.

Furthermore, a common assumption in the studies on SW is that managers should place more emphasis on output controls when dealing with the challenge of not being able to directly monitor the behaviour of employees who adopt smart working (Groen et al., 2018). In other words, the reduced possibility of monitoring employee behavior, characterizing SW settings, should be compensated by an increased emphasis on output controls (Poelmans & Beham, 2008; Martin et al., 2013).

This assumption is in line with control theory, which suggests that when direct monitoring of employees is not possible, output controls will become more important (Eisenhardt, 1985; Ouchi, 1979; Snell, 1992), which means managers will place more emphasis on targets, performance indicators, and outcomes in managing their employees.

We thus propose the following hypothesis:

*H3. A trust-based organizational culture and performance-based managerial practices (Culture) have a positive impact on the organization performance in SW settings.*

### **3.2. The mediating role of digital leadership**

We also believe that the hypothesized associations between SW enabling resources and the organization performance might be contingent on certain organisational conditions.

In light of RBV theory, firms to take full advantage of the resources they control must develop a set of capabilities (Barney, 1991; 2001; Prahalad & Hamel, 1990; Ray et al., 2004). That is, capabilities enable firms to use their resources to increase their performance and gain competitive advantage.

In this study, we argue that digital leadership is an important capability that may affect the effective exploitation of SW enabling resources for increasing organization performance.

In particular, digital leadership is recognized as a key capability that enables an organization to effectively adopt new digital technologies (Nwankpa & Roumani 2016; Ravesteijn & Ongena, 2019). A great part of the recent studies argues that solely possessing a technology is not sufficient for increasing organizational performance and it has been observed that organizations lacking digital leadership capability have failed to exploit the full potential of technologies (Boomer, 2019). Digital leadership prepares companies to adopt and exploit new digital technologies, defining and executing the correct steps to digital transformation (Saldanha, 2019).

Furthermore, the degree of users' acceptance of novel technology influences their performance. Lower is the acceptance and lower is their propensity to use the new technology and, as a consequence, their task performance. According to the Technology Acceptance model, the two primary factors affecting users' attitudes and intention to use new technologies are perceived usefulness and perceived ease of use (Davis, 1989; Agarwal & Karahanna, 2000; Venkatesh & Davis, 1996). Further extensions of the Technology Acceptance model have been proposed to understand which other external factors intertwine with perceived ease of use, usefulness, and attitude toward technology in influencing technology use intention (Reynolds et al., 2020; Venkatesh & Davis, 2000; Venkatesh et al., 2003). Among these other factors, not only the employees' digital skills and competence (Antonietti et al., 2022; Backfisch et al., 2021), but also the leaders' technology readiness and attitude toward technology (Normala et al., 2013; Reynolds et al., 2020) have been proved positively influencing the users' technology acceptance.

Finally, changes in the organizational culture and managerial practices are also required to fully exploit the advantages of new digital technologies and are often considered as enabling framing conditions for digital innovations (Wiesböck & Hess, 2020).

Digital technologies, in fact, can be used to their full extent only in trust-based organizations where information is disclosed among different groups of people and collaboration is promoted (Albu & Flyverbom, 2019). Furthermore, as the availability of data and information increases, employees are well-informed about all processes and demand for self-organization, more empowerment and participation (Carasco-Saul et al. 2015). In this context, managers will not need to apply monitoring mechanisms but have to design new forms of control and employee engagement (Gierlich-Joas et al., 2020). Digital leadership has been conceptualized as a new leadership style that can foster and support these organizational changes, as it empowers employees to better master their daily tasks (Heuman et al., 2015), has a significant effect on work engagement, assures participation, trust and collaboration, thus promoting a more participative culture (Guzmán et al., 2020).

Hence, we propose:

*H4: Digital leadership mediates the relationship between the organization's performance and (a) technology availability, (b) employees' digital skills and capabilities, and (c) a trust-based organizational culture and performance-based managerial practices.*

The hypothesized conceptual model is presented in Figure 1.

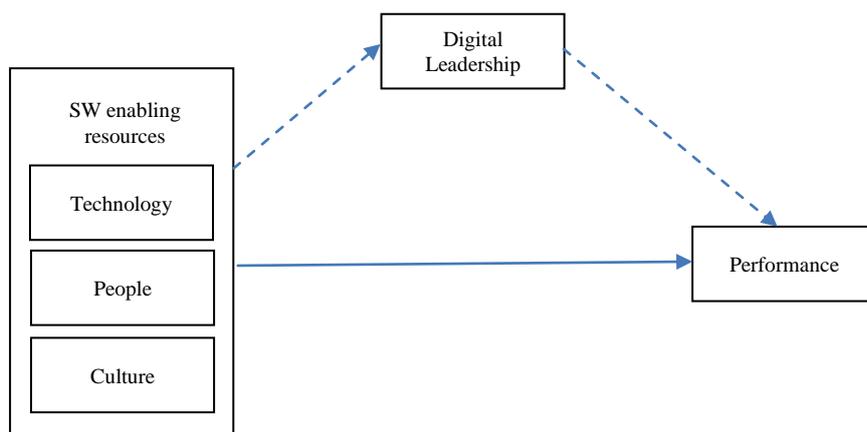

Figure 1. The conceptual model – Dotted line denotes the indirect relationship, digital leadership construct as a mediator.

## 4 Research method

### 4.1. Data collection

To empirically investigate the proposed hypotheses, a survey was conducted on a sample of employees working in Southern Italy public utility companies. 234 people participated in the online survey, and the questionnaires of 209 participants were available for analysis, achieving an 89.3% response rate. Table 1 shows the characteristics of the respondents.

Table 1. Characteristics of the respondents.

<b>Demographic characteristics</b>	<b>Number of respondents</b>	<b>Percentage of respondents</b>
<b>Gender</b>		
Female	87	41.63%
Male	121	57.89%
Not specified	1	0.48%
<b>Years</b>		
26-35	21	10.05%
36-45	54	25.84%
46-55	74	35.41%
>56	60	28.71%
<b>Educational Qualification</b>		
Middle school diploma	4	1.91%
High school diploma	84	40.19%
Bachelor/master's degree	86	41.15%
Postgraduate degree (PhD or Master)	34	16.27%

This study uses a survey-based method to evaluate the assumptions of the research model (Figure 1). In order to structure the questionnaire, several steps and a pre-test were carried out. First, the items for each construct of the research model were defined on the basis of an in-depth review of the existing literature, and all the items were measured by a 5-point Likert scale, with "1" representing "strongly disagree" and "5" representing "strongly agree". The first version of the questionnaire was evaluated and modified by the authors in several discussion sessions to validate the items. In addition, the survey was reviewed by experts to ensure that all questions were clear and accurately represented the topic under investigation. Following the implementation of the suggested improvements, the survey was sent to the participants and they were assured that their personal information would remain confidential. The surveys were returned via email. A

summary of the questionnaire' items for each construct is provided in Appendix A.

#### **4.2. Data analysis**

This study conducted structural model analysis (Ringle et al., 2017) by employing the partial least squares (PLS) method, which has become a standard tool used to validate hypotheses rather than assessing the overall fit of models (Chin & Gopal, 1995). PLS is also appropriate for analysing the model with a single construct, or formative structure construct. In addition, PLS-SEM offers more flexibility by avoiding inadmissible solutions and factor indeterminacy issues (Fornell & Bookstein, 1982). Moreover, PLS-SEM approach is useful for theory development when models are in an explorative stage (Nitzl, 2016). This methodology was also chosen because it is well suited to small sample sizes (Hair et al., 2013) and allows the estimation of complex models with a large number of constructs, indicator variables and structural paths without imposing distributional assumptions on the data (Hair et al., 2019). In this study, we performed preliminary tests on the data sample in order to exclude bias and then the model was analysed following a two-step approach: 1) assessment of the reliability and validity of the measurement model, 2) examination of the structural model (Chin, 2010).

### **5 Results**

We received 209 completed answers by the selected population. According to Cohen (1988) and Hair et al. (2013), the recommended sample size for applying the PLS-SEM analysis to our model, with a minimum R<sup>2</sup> value of 0.10 and a statistical power of 80%, is 137. Therefore, the size of our sample (i.e., 209) is well above the recommendation.

#### **5.1. Preliminary Tests**

We conducted tests to ensure the validity of the data collected. Firstly, the non-response bias was assessed by comparing the difference between the responses from the early and late respondents (Armstrong & Overton, 1977). We found no significant statistical difference ( $p > 0.05$ ) after applying the t-test to the responses of the two sub-samples based on the date of receipt of the

questionnaire (N = 105 and N = 104, respectively), confirming that non-response bias was not a problem in our study. Secondly, we investigated the issue of common method bias since it is common for all research projects that employ a survey-based tool to acquire the data. This bias refers to the fact that the variance is a result of the measurement process rather than the model structure (Podsakoff et al., 2003; Podsakoff & Organ, 1986). We used Harman's single factor to test the presence of CMB. In Harman's single-factor test, the key components were subjected to an exploratory factor analysis in which all indicators were clustered into a single dimension. The Harman test revealed that no one factor explained all of the item variations and that the first factor did not account for the majority of the variance. Thus, common method bias did not appear to be a concern according to the accepted parameters for Harman's single-factor test.

## 5.2. Measurement Model

After validating the responses collected through the questionnaire, we assess the validity of the model both in its individual items and then in its constructs. Table 2 shows the summary of the parameters considered to demonstrate the validity of the proposed model. Considering the items, we investigated their reliability by analyzing the loadings that must be greater than 0.708, since they indicate that the construct explains more than 50 per cent of the indicator's variance according to Hair et al. (2013).

Table 2. Parameters Model Summary.

Construct	Items	Loadings	Composite Reliability (CR)	Cronbach's alpha	Average Variance Extracted (AVE)
<b>Technology</b>	T1	0.764	0.839	0.745	0.567
	T2	0.753			
	T3	0.691			
	T4	0.800			
<b>People</b>	P1	0.685	0.871	0.824	0.577
	P2	0.753			
	P3	0.854			
	P4	0.812			
	P5	0.677			
<b>Culture</b>	C1	0.649	0.904	0.877	0.576
	C2	0.681			
	C3	0.796			

	C4	0.850			
	C5	0.796			
	C6	0.784			
	C7	0.737			
<b>Digital Leadership</b>	DL1	0.810	0.900	0.866	0.600
	DL2	0.762			
	DL3	0.730			
	DL4	0.829			
	DL5	0.770			
	DL6	0.742			
<b>Performance</b>	PER1	0.739	0.905	0.869	0.656
	PER2	0.785			
	PER3	0.844			
	PER4	0.872			
	PER5	0.804			

Considering the constructs, we first tested the internal consistency by checking both Cronbach's alpha and the composite reliability and since they were all above the lower limit of 0.60 the internal consistency was established (Hair et al., 2017). Secondly, we confirmed the discriminant validity using the heterotrait-monotrait ratio (HTMT) ratio which was found to be always less than 0.9 (Hair et al., 2013), as shown in Table 3.

Table 3. Discriminant Validity.

<b>Construct</b>	<b>T</b>	<b>P</b>	<b>C</b>	<b>DL</b>	<b>PER</b>
<b>Technology (T)</b>	-				
<b>People (P)</b>	0.571	-			
<b>Culture (C)</b>	0.702	0.434	-		
<b>Digital Leadership (DL)</b>	0.845	0.331	0.799	-	
<b>Performance (PER)</b>	0.432	0.741	0.519	0.421	-

### 5.3. Structural Model

After confirming the goodness of the model constructed in the measurement model analysis, we carried out the analysis to reveal the relationships between the constructs and finally answer the research questions. Firstly, the findings showed that the model can explain an adequate portion of the variance of the constructs, still confirming the goodness of the proposed model ( $R^2$  for Digital Leadership is 0.634,  $R^2$  for Performance is 0.543). Table 4 reports the results of the PLS structural model analysis.

The results show a positive and significant direct relationship between organizational performance and "people" ( $\beta = 0.645$ ,  $p = 0,000$ ) and "culture" ( $\beta = 0.189$ ,  $p = 0,019$ ). Such findings demonstrate that employees' mindset and digital skills as well as a trust-based organizational culture and performance-based managerial practices have a positive impact on organisational performance in SW settings. Therefore, H2 and H3 are supported.

Conversely, we find that the "technology" has a negative and weakly significant direct effect on the performance ( $\beta = -0.116$ ,  $p = 0,096$ ). This result does not support H1 and can be explained by the specific working conditions in which many workers find themselves, characterized by continuous technological changes, the adoption of new technologies, which are not familiar with, processes not adequately redesigned and digitized, and low technology acceptance.

H4a examined the mediation effect of digital leadership on the relationship between technology and performance. The results revealed that the path from technology to digital leadership ( $\beta = 0.436$ ,  $p = 0.000$ ) was significant and positive, while the path from digital leadership to performance ( $\beta = 0.124$ ,  $p = 0.076$ ) was also significant and positive. The results showed that the indirect effect of technology on performance ( $\beta = 0.054$ ,  $p = 0.080$ ) through digital leadership was significant. Thus, both the direct and indirect effects of technology on performance were significant and positive, which indicated a mediation effect of digital leadership.

H4b examined the mediation effect of digital leadership on the relationship between people and performance. The results revealed that digital leadership did not mediate the relationship between people and performance ( $\beta = -0.011$ ,  $p = 0.114$ ).

Finally, H4c examined the mediation effect of digital leadership on the relationship between culture and performance. The results revealed that the path from culture to digital leadership ( $\beta = 0.500$ ,  $p = 0.000$ ) was significant and positive, while the path from digital leadership to performance ( $\beta = 0.124$ ,  $p = 0.076$ ) was also significant and positive. The results showed that the indirect effect of culture on performance ( $\beta = 0.062$ ,  $p = 0.080$ ) through digital leadership was significant. Thus, both the direct and indirect effects of culture on performance were significant and positive, which indicated a mediation effect of digital leadership.

To sum up, the findings showed that digital leadership can be considered an underlying mechanism that explains the relationship between “Technology” and “Culture” with the organization performance.

Table 4. Structural model summary.

	<b>Path coeff.</b>	<b>Standard deviation</b>	<b>P values</b>
<b>DIRECT EFFECTS</b>			
Technology → Performance	-0.116	0.089	0.096*
People → Performance	0.645	0.058	0.000***
Culture → Performance	0.189	0.091	0.019**
Technology → Digital Leadership	0.436	0.062	0.000***
People → Digital Leadership	-0.088	0.056	0.058*
Culture → Digital Leadership	0.500	0.060	0.000***
Digital Leadership → Performance	0.124	0.086	0.076*
<b>INDIRECT EFFECTS</b>			
Technology → Digital Leadership → Performance	0.054	0.038	0.080*
People → Digital Leadership → Performance	-0.011	0.009	0.114
Culture → Digital Leadership → Performance	0.062	0.044	0.080*

## 6 Conclusion

The Covid-19 pandemic has brought about profound changes in the socio-economic relations of our societies. In this context, the adoption of digital technologies and new working practices has allowed the economic sector to continue its activities and not to collapse due to the health and distance needs caused by the pandemic. In this context, the practice of SW has allowed companies, public administrations, universities and the economies of countries in general not only to continue their activities but also to overcome previous levels of performance. The effective use of this practice needs the resources to implement it in organizations, i.e., technological resources, employee capabilities and skills, and the culture the mindset for adopting new practices in the organization. Moreover, considering the pivotal role of digital technologies, the academic literature point out that digital leadership is a key capability to support companies in advancing the digital transformation process. Thus, the role of digital leadership could have been central to the effective implementation of SW. However, despite the relevance of the resources (i.e., technologies, skills and

culture) and digital capabilities in achieving optimal performance in organizations, their role in the effective implementation of SW has not been investigated in the academic literature, to the best of the authors' knowledge. Aiming to fill this gap, in this study we developed a research model grounded on RBV theory to investigate the relationship between resources and digital leadership with the organization's performance related to the implementation of SW. We tested the hypotheses proposed in the research model and confirmed the pivotal role of resources and digital leadership on organizations' performance. In particular, our findings demonstrate that all the resources had an impact on the organization performance and showed capabilities (i.e., digital leadership) as an explaining mechanism of the success in achieving optimal organization performance when implementing the SW. Therefore, in this regard, firms are likely to increase their performance when implementing SW by adopting specific resources and developing capabilities as digital leadership. Our Hypotheses validate the resource-capability-performance relationship, consistent with other studies (Lu et al., 2010). In particular, our findings demonstrate the important role of digital leadership that can be considered an underlying mechanism that explains the relationship between "technology" and "culture" with the organization performance.

## Managing the Metrics of Academic Publishing: Private Benefit at Public Cost

---

Stuart Macdonald

School of Management  
University of Leicester, UK

### Abstract

The management of academic performance in higher education has become the management of gaming. All actors in academic publication - individual academics, editors, universities, publishers - game to create the metrics that will bring them most personal reward. Much gaming is - like the white lie - considered mild and is scarcely noticed: an author self-citing more than previously; an editor pleased when authors cite more of the journal's own papers; a university congratulating employees for publishing in top journals; authors making the most of their research by spinning one paper into three or four; social and other media coverage emphasising the impact of a group's research, new research collaborations bringing a proliferation of co-authors, each likely to self-cite their paper, and so on.

But this amateur gaming is being overtaken by more sophisticated gaming. It has become normal for authors to cite themselves dozens of times; for editors to coerce authors into citing their journal's papers on pain of rejection; for universities to pay publication bounties well in excess of salaries; and for authorship to be extended to any name that will contribute to a paper's metrics. Journal papers have become formulaic, designed to fit citation requirements rather than to say anything new, or perhaps anything at all in that many are never intended to be read and some are quite unreadable. Vacuous 'water is wet' papers that can be cited just about anywhere in support of just about anything are highly valued. The editors of the *BMJ* and the *Lancet* are as one in declaring that most papers published in medical journals are disgraceful, and that the main task now facing medicine is erasing the rubbish from the record.

The metrics used to measure academic performance do no such thing, in small part because achieving the measures has become an end in itself, and in large part because the metrics, being key to competition, are universally gamed. When no one knows who has written a paper except that it is unlikely to have been any of the paper's listed authors - the situation encountered in many medical journals - this is extreme gaming, as it is when authorship slots are openly sold and bought, or when publishers sell tailoring services to fit papers to the requirements of their own journals. The public good is no longer served by castigating essay mills and predatory publishers when very similar services are provided by the 'legitimate' academic publishing industry. Nor is it served by relying on peer review to maintain standards; referees are reluctant to serve this system and are being replaced by editorial assistants who simply reject what is unlikely to be cited.

**Keywords** – academic publishing, metrics, gaming, peer review

**Paper type** – Academic Research Paper

## 1 Managing the history of academic publishing

Academic publishing is not what it seems, but then it never has been. There has always been a divide between the public face of academic publishing and the hidden underbelly. In recent decades, the divide has become wider and deeper. Some attention may be required.

The fanciful notion that the scientific enlightenment of 17<sup>th</sup> century Europe was built on peer review has come to serve the needs of modern academic publishing, *From these early efforts gradually emerged the process of independent review of scientific reports by acknowledged experts that persists to this day. (Lee et al., 2013, p.3)*

For centuries, editors of scientific journals published whatever took their fancy. No doubt they would occasionally consult friends on the merits of a paper, but often they were pushed for copy and forced to fill their pages with whatever they could get, which was often whatever pleased the rich and powerful:

*I am under the Necessity sometimes of inserting Communications that are not altogether to my Mind, merely because that better cannot be got and also from a desire to keep well with people, who though imperfectly qualified to write are yet good friends to the Magazine (editor of Farmer's Magazine to George Culley, 17 March 1803, Northumberland County Record Office, ZCU/25.*

Progress in the agricultural revolution was fundamental to progress in the industrial revolution of the 18<sup>th</sup> century Britain and agricultural societies throughout the land published transactions filled with recipes for improvement, often much more enthusiastic than informed. The fashion for agricultural improvement consumed the landowning classes – even the king, Farmer George, was hooked - and no peer review on earth prevented the great and the good foisting their nostrums on the world at large:

*... such men as Lord Brougham, who ... makes a boast of his ignorance, and who, in his dotage, pours out such ravings as would not be allowed for*

*a moment from any poor farmer. (Westminster Gazette, 20 October 1949, quoted in Edwards, 1974, facing p.45)*

In three centuries of peer review, suspiciously little evidence has accumulated of peer review leading to the rejection of papers. It may be that peer review was more valued in the theory than in the practice. Robert Maxwell explored the business prospects of academic publishing in the Oxford of the 1950s. He was quick to spot the business opportunity in a peer review system that would guarantee the quality of the publishing product and would cost him, as academic publisher, almost nothing, whether it worked or not. Many of the other costs of academic publishing were in the same attractive category: academics wrote papers for nothing, and they edited journals on the same terms. Even their research was financed by someone else. What was not to like? Maxwell, the war hero, busied himself cultivating Oxford academics, ever amazed at how easily flattered they were. And so unworldly; they really did believe that Maxwell had no ambition beyond helping them provide their thoughts to the world in return for the world's recognition of their brilliance. Academic publishing must have seemed not unlike the fashion business; much as *Vogue* signaled what everyone should be wearing, so academic journals might signal what everyone should be reading and citing.

*... in the boom years after the second world war, entrepreneurs built fortunes by taking publishing out of the hands of scientists and expanding the business on a previously unimaginable scale. And no one was more transformative and ingenious than Robert Maxwell, who turned scientific journals into a spectacular money-making machine that bankrolled his rise in British society. (Buranyi, 2017)*

Robert Maxwell did not survive long enough to witness the explosion in academic publishing that accompanied the sudden expansion of higher education from the 1970s, impelled by the fancy that a country could not compete unless at least half its workforce were graduates. Maxwell's business model - buy copyright cheap from academics who really just wanted to be published - proved sound. He founded Pergamon in 1949, which eventually became Elsevier, the largest of all the academic publishers. Declared unfit to run a public company, Maxwell was ruthless and totally unconcerned with any public value scholarship might have (Barker and Sylvester, 1991).

... the big publishers have rounded up the journals with the highest academic impact factors, in which publication is essential for researchers trying to secure grants and advance their careers. (Monbiot, 2011)

Academic publishing received further impetus from the notion that higher education was an industry rather than a charity and so required appropriate management of its resources, particularly its workforce. Maxwell was very interested in the proper management of the academic workforce.

## **2 Managing the academic workforce**

The business plan of higher education required a new approach to the management of academics. Whatever ambitions might have had to contribute to public knowledge was no basis for running the international businesses that universities aspired to be. There were lessons to be learnt from business schools, rapidly coming to incorporate (and often oust) a good few of the university's traditional disciplines. Their logic was straightforward: employees were not to be trusted, especially to play their part in meeting organizational targets rather than their own. The solution was to measure their performance, enabling those who complied to be rewarded, and those who did not to be punished. Measuring all the output of an academic's endeavour was always going to be a challenge too far, avoided by assessing a single representative aspect - journal publication.

The new computing power of the 1950s allowed those who were so inclined to trace and measure academic citation. For Robert Merton, a proponent of sharing information within a collegiate environment, whether visible or invisible, this meant an ability to match library orders to academic demand, and to follow the flow of intellectual ideas. For Merton's student, Eugene Garfield, the new capacity to find who was citing whom might just realize a private benefit distinct from the public benefit envisaged by Merton. Garfield founded his Institute for Scientific Information (ISI) in 1958 and remained chairman of what is now Clarivate ISI - personally responsible for blighting academic life for decades - until his death in 2019.

Garfield's prescience was remarkable, though his business plan required that two conditions be satisfied. The first was that citations were a reliable measure of academic quality: the more citations of a paper, the better the paper. This is a nonsense, of course. A paper might be cited for all manner of reasons, including

demonstrating how awful it is. But opposition could always be overcome with recourse to that backstop of academic publishing, peer review:

*Even in high IF journals there are some poorly cited papers. But even these poorly cited papers are usually good, professional papers. They went through the sieve of thorough refereeing and editing. (Garfield and Pudovkin, 2015, pp.10-11)*

The second condition was that academics could be persuaded to throw collegiality to the winds and compete fiercely with each other using citation as a measure of their success. Could academics be persuaded? They certainly could, even if it meant accepting citation as a valid measure of quality.

### **3 Managing the game**

The measurement of performance is fundamental to academic life. Performance measures determine career prospects and research funding. More fundamental still is gaming - achieving the measure rather than the performance itself. Gaming, by all players in academic publishing, is now universal and compulsory in that competition will rapidly weed out those who refuse to game. Competition, though, is not in performance or even the measures of performance, but rather in gaming proficiency.

Citation is key to the game and brings together authors, editors, and publishers in common purpose. Authors self-cite shamelessly and bring in co-authors in the sure knowledge that they too will cite themselves and so the paper. The author must submit the sort of papers editors and publishers want. These are papers that contain citation to papers in their own journals, and will also be readily cited themselves. Papers with short titles will attract citation as will papers with a single theme and simple abstract. The less readable a paper, the more it impresses those who are reluctant to read it anyway and the more likely it is to be cited (Wang *et al.*, 2022; Ante, 2022). Papers which eschew the latest research (which is too unconnected to past research to be readily cited) are required, positive, unquestioning papers that can be cited just about anywhere in support of just about anything.

*Every university is pushing publishing so hard that this results in significantly lower quality research in total ... the vast majority of work is derivative, or makes observations that amount to 'this tiny square of the*

*sky is blue ... unlike the sky over there which is blue'. (editor quoted in Karabag and Berggren, 2016)*

The typical academic paper has evolved into an homogenous thing designed to yield the most in terms of metrics with minimum academic effort and minimum content (Kaltenbrunner *et al.*, 2022). The measures of performance quickly come to bear no relationship to actual performance and become a measure of gaming proficiency instead (Fire and Guestrin, 2019). Academic research can be described with no reference at all to content. Measures have replaced content entirely.

*H-index: 29; total citations: 2962 (2505 without self citations); citing articles: 1953 (1852 without self-citations). Average citations per item: 25.18. The most highly cited paper has received 442 citations. From Google Scholar: H-index: 35 (22 since 2012); i-10 index: 88 (53 since 2012), total citations 4377 (2398 since 2012). (academic's job application cited in Wood, 2021, p.13)*

Much citation is actually wrong in any scholarly sense (Simkin and Roychowdhury, 2003, 2005). About a quarter of citations in top journals turn out to be wrong (Smith and Cumberledge, 2020); and authors are unfamiliar with something like half the works they cite (Teplitskiy *et al.*, 2018). And when there is no citation to hand, one can simply be fabricated (Harzing, 2023).

#### **4 Managing academic publishing**

The academic publishing industry could hardly have been more delighted by developments in the measurement of academic quality. As if it were not blessing enough that the market for its product worked for free to make the product, that citation of the product was rapidly becoming a measure of its quality was manna from heaven. In almost literal sense, the industry was printing its own money. Indeed, it was to become one of the largest and most profitable of all industries (Harvie *et al.*, 2013), in the same league as the pharmaceutical and armaments industries – and with a similar reputation. Just how could an industry supposedly bringing knowledge to the world have sunk so low?

An oligopoly of academic publishers – the Big Five – is responsible for over half the world's academic publication. The publishers' customers were once anyone who read academic journals and especially the members of the large libraries that took out subscriptions with academic publishers. The subscription model is no longer dominant, being gradually replaced by a variety of open access systems.

These allow the reader free access to journals (which brings obvious public benefits), the publisher now being paid by the author (which brings less obvious public costs). These arise from acceptance that the author rather than the public is the customer of academic publishing. Academic publishers, never keen on negotiating with powerful subscribers and waiting years for their money, are delighted to be paid up front, especially as this allows them to relate the customer's requirements to their own. Editors and publishers are as interested as authors in papers that will be much cited and so contribute substantially to the impact factors (JIF) of their journals (Ashkanasy, 2007). As a universal measure of journal quality, the JIF is as inadequate as the citation metric on which it is based. For instance, the JIF of the *British Journal of Medicine* is above 30, that of the *Lancet* over 60.<sup>1</sup> This compares with an impact factor of 6 for *Research Policy* and 3 for *Human Relations*, both top journals in the social sciences, and just 0.1 for *Notes and Queries*, a prominent publication in the arts. The higher a journal's impact factor, the more its papers will be cited (regardless of quality) and the more it will attract submissions to be cited and boost the JIF. The higher the JIF, the more academic publishers can increase their article processing charges (APC), though it is a mystery how the cost of publishing a journal can be affected by alterations in a JIF.

'Legitimate' academic publishers have come to resemble the predatory variant. Predatory publishers are also customer-driven, publishing whatever the author wants quickly and generally without the inconvenience of peer review, for a fee very much lower than the APC of the legitimate industry. Predatory publishers serve a market of academics many of whom cannot publish elsewhere and must still acquire quantitative measures performance to satisfy their employers. Often these are authors from developing countries who require publication measures to graduate or retain their jobs. Legitimate publishers are hugely critical of predatory publishers and campaign against them, but really it is hard to see very much difference between the two – except that legitimate publishers charge authors very much more to be published. To a remarkable degree, legitimate publishing has learnt from the predatory industry and has sometimes become even more buccaneering. Whole rafts of its lesser journals carry the brand of the brand of a publisher's most successful journals (Khelifaoui and Gingras, 2020) and journal

---

<sup>1</sup> The *Lancet* has since doubled its JIF for 2022, entirely as a consequence of media coverage and resulting citation of the vast numbers of papers the journal published on covid-19 the previous year (Retraction Watch, 2022; see also Clark, 2023).

publication has been linked to conference attendance. Both sell services to authors, their customers, which stop just short of writing papers for them, both publish marketing material disguised as academic journals, and both push their own journals to academics as recommended reading. The academic's every internet action provides suggestions for further 'reading' (Gingras, 2020), all from the publisher's own stable, of course. For some editors, the goal is to publish papers which cite nothing that is not from their own journals, thereby boosting JIF at the cost of isolating their journals from external knowledge.

For the modern academic, the value of a paper is private and lies in its citations. The paper's content - its potential value to the public - is very much a secondary matter, as it is to editor and publisher.

*... it doesn't matter what the fuck you publish, only where you publish it. (academic quoted in Butler and Spoelstra, 2014, p.542)*

*... never before in the history of humanity have so many social scientists written so much with so little effect or of benefit to anyone. (Alvesson et al., 2017, p.3)*

Academic papers are written to be counted rather than read. It follows that readers have become reluctant to waste time on an exercise which has become unrewarding. Internet articles now indicate how much time is likely to be invested in reading them and the market for summaries is thriving:

*Based on your entire viewing history, you could have saved 12,564 minutes [about 6 years] by using Summaries. (email to author from Academia.edu, 15 August 2021)*

## **5 Corruption and contagion**

The academic establishment is keen to be seen as cracking down on what it portrays as bad apples, individuals who cheat and tarnish the reputation of academic publishing. There is a large literature on their misconduct, but strangely limited to fabrication, falsification and plagiarism (FFP) and, more oddly still, assuming that universities should be policing this misconduct (see Bulow and Helgesson, 2019). FFP barely scratches the surface of misconduct in academic publishing and universities are complicit in much of it. Also complicit is every other part of academic publishing – authors, editors and publishers are all, to some extent, rotten.

In medicine, the decay is so advanced that the rot can no longer be hidden. As the editor-in-chief of the *Lancet* puts it, '[medical] journals have devolved into

information laundering operations for the pharmaceutical industry' (Horton, 2004). Pharmaceutical companies often look to medical communications companies (MCCs) to organize their publication programmes:

*I wanted to introduce you to one of [Proctor and Gamble's] external medical writers, Mary Royer. [...] are you thinking of drafting the publications first and then let Mary take over or would you like Mary to write from the beginning? I'm very flexible. Mary and I have just finished writing a publication with Steven Boonen (Richard you will be contacted as you're a co-author!) and Mary was involved at the very beginning and wrote from scratch. (email from Ian Barton of Proctor and Gamble to Richard Eastell and Aubrey Blumsohn, academics at Sheffield University, April 2003).<sup>1</sup>*

The MCC will write the paper to order, steer it through to publication, and organize its cross-citation with other papers to establish the orthodoxy that is so important in medical research (Fava, 2004).

*One thing we could do now on this is to contact Roger McClellan at CRC<sup>[2]</sup> and see if they would be amenable to putting this publication in Crit.Rev.Toxicol.<sup>[3]</sup> (email from William Heydens, regulatory product safety assessment lead at Monsanto, February 2015)<sup>4</sup>*

Prominent academics are selected, with the complicity of their universities, to be authors, though they may never have even read the paper which bears their names.

*An option would be to add Greim and Kier or Kirkland to have their names on the publication, but we would be keeping the cost down by us doing the writing and they would just edit & sign their names so to speak. Recall that is how we handled Williams Kroes & Munro, 2000.<sup>[5]</sup> (email from William Heydens, regulatory product safety assessment lead at Monsanto, February 2015)<sup>6</sup>*

Organizers of medical conferences routinely write papers for delegates to present (Healy, 2004).

*Dear David I am delighted you are able to participate in our satellite symposium [...]. In order to reduce your workload to a minimum we have had our ghost-writers produce a first-draft based on your published work. I attach it here [...]. (email to symposium presenter cited in Healy, 2004, p.227)*

Authorship has acquired a new meaning in medicine; it is determined by entitlement rather than contribution to content. Some papers have hundreds of authors, none of whom knows who actually wrote the paper, a situation that has spawned a minor literature not on changing the system, but on the proper criteria for determining the order of so many 'authors'. Medicine warns of a fate that could await other academic disciplines. Corruption - especially corruption justified - breeds further corruption. Universities pay bounties for publishing in top journals, but senior managers feel entitled to authorship (which no longer implies writing) and thus to the bounty. The bounty system is just about universal in China (Quan *et al.*, 2017): the going rate at Zhejiang University College of Medicine for a paper in *Nature* or *Science* was US\$30,000 in 2011 (Shao and Shen, 2011). Authorship of papers already accepted by journals is openly bought and sold.

## **6 The last redoubt**

The marketisation of academic life has made referees hard to find. What incentive is there to volunteer for unpaid, unrecognized work, that is often actively discouraged by employers?

*People are already working 60 hours or more a week and have no time for reviewing submissions; editors have to press friends into doing them favors or tell authors who have had their submission accepted that they will be expected to do a few reviews in return. (Moret, 1997)*

Editors cope by leaving more and more selection to desk review by editorial assistants who may not understand a paper's contents, but can tell whether an author has cited himself and the journal sufficiently, and whether he comes from a decent university (which will increase citations of the paper). Author affiliation has become crucial to whether a submission is sent for peer review. Universities now pay academics from prestigious overseas universities to join the author list

on papers produced by their own staff. This is how Saudi Arabia can lay claim to the world's second most highly-cited papers (King Abdulaziz University is just slightly behind Harvard). South Africa comes in third (Gingras, 2014). Very few papers submitted to even top journals are still sent to referees. Their editors and publishers may still claim a high rejection rate as a mark of quality, but rejection is by people who have little knowledge of the contents of papers.

*I would like to thank you for your ongoing support of EMJ [the European Management Journal], and update you on how well the journal is going . . . The rejection rate has raised [sic] from 80% to 86%.<sup>1</sup>*

A high rejection rate is most commonly achieved by desk rejection rather than peer review. Editorial assistants throw out papers that will contribute insufficiently to the journal's impact factor, papers that do not cite other papers in the journal (Pearson and Sharma, 2015), papers with few co-authors, papers with short reference lists (see Corbyn, 2010; Harzing, 2013). Only a tiny minority of submissions - the ones assistants have no reason to reject - ever goes to referees and some 30% - 50% of these are accepted (Lawrence, 2007), which rather gives the lie to claims of top journals having rigorous peer review.

*We ... [used] ... to make our acceptance criterion those articles that we felt would make a contribution to the international literature. Now our basis for rejection is often 'I don't think this paper is going to be cited.' (editor of medical journal as quoted in Chew et al., 2007, p.146)*

Peer review is the final redoubt of academic publishing is peer review. Individuals may be more reluctant than ever to referee (not least because of the corruption in which academic publishing is mired), but the institution itself is what is valued. A system hallowed by centuries survives to safeguard academic standards, or so the argument goes. But even referees are besmirched by the corruption. Those few individuals who do answer the call tend to see themselves as working for the journal rather than any academic college, and like editors and their teams, are more interested in the citability of papers than their contents.

No group supports peer review more ardently than academic publishers, not because it improves the quality of academic papers, but because it is fundamental to a process which is accepted as guaranteeing the quality of a paper - not that it necessarily does anything of the sort - and therefore underwrites the value of the publisher's product. As editors now find referees hard to recruit, publishers are

---

<sup>1</sup> Email from editor of European Management Journal, November 2010.

compensating for their failure by finding referees themselves, thereby crossing the boundary between the editorial and the commercial. They do this by making a willingness to referee for a journal as part of the manuscript submission system they supply to the journal, a coercion that is ultimately dependent on keywords.<sup>1</sup> Taylor & Francis advises its editors to humanise its manuscript submission system:

*... edit the wording in the reminder emails to sound more personal if necessary ... highlight the benefits that peer review brings to scholarly publishing. (Meager, 2015).*

The UK Information Commissioner has recently ordered Elsevier to change its ways. The largest of all large academic publishers had been pooling data on willingness to referee for individual journals into one vast database that all its editors might dip into for referees. Elsevier has been ordered to stop storing personal information without the knowledge and permission of individuals, and to cease offering editors the services of these individuals as referees.

Metrics have made gathering and processing data big business in academic publishing - and therefore confidential. Exactly how the JIF is calculated has always been a commercial secret, known only to the privileged (see Oravec, 2017). The very JIF listings are proprietary (see Willmott, 2011, p.440). Also confidential are the meetings large academic publishers hold with Clarivate ISI to establish what room there might be for adjustment of their journals' JIFs (Metze, 2010).

## **7 Clearing up the mess**

How to get out of this mess? A start would be to admit that the metrics used to measure academic performance do no such thing, in small part because achieving the measures has become an end in itself rather than the means of achieving the performance, and in large part because, as the end, the metrics are universally gamed (Biagioli and Lippman, 2020). Amateur gaming is inexorably being replaced by the sophisticated gaming that has reached such extreme levels in medicine. When no one knows who has written a paper except that it is unlikely to have been any of the paper's listed authors, this is extreme gaming. It is extreme gaming when authorship slots are openly sold and bought, and when publishers take on some of the MCC functions and sell tailoring services to fit papers to the

---

<sup>1</sup> *The author has been asked to referee his own submission on several occasions. The author's paper on high technology policy entitled 'Milking the myth: innovation funding in theory and practice', and published in R&D Management, resulted in a request from another journal altogether to referee a paper on the dairy industry.*

requirements of their own journals. It is illogical - and a distraction - to castigate essay mills and predatory publishers when very similar services are provided by the 'legitimate' academic publishers.

It does not help that the notion that the author publishes for personal gain has become ingrained in law. In the subscription model of academic publishing the author cedes copyright to the publisher. When the author pays the publisher, the author retains copyright so that the information in his paper (or rather the manner of its presentation) remains his. This has implications. Take plagiarism, the copying of another's work and a heinous offence in universities not because of the theft itself - universities actively plagiarise and encourage staff to follow suit if it improves their performance measures - but because the theft makes a mockery of marking. To discourage students, universities engage Turnitin, now a very large company that can report on the originality of any student script. Turnitin ensures that this process grants it ownership of every student script it inspects, which can then be used to check against yet other scripts. Thus does the university conspire in the theft of the intellectual property of its students. Mario Biagioli (2022, p.477) isolates this aspect of the problem nicely: there is a clash between 'the property-based copyright regime of authorship and the responsibility-based system of scientific authorship'

*... if the essential features of predatory publishing are unethical behavior and a focus on profit, then many publishers using the subscription model are even bigger predators than some new OA publishers. (Krawczyk and Kulczycki, 2021, p.8)*

Peer review, its performance for too long excused by the democracy defence - that everything else is worse - is in tatters.

*We portray peer review to the public as a quasi-sacred process that helps to make science our most objective truth teller. But we know that the system of peer review is biased, unjust, unaccountable, incomplete, easily fixed, often insulting, usually ignorant, occasionally foolish, and frequently wrong. (Horton, 2000, p.248)*

Peer review does little more than help sift the most citable wheat from the less citable chaff. In medicine, even referees' reports can be ghost-written (McHenry, 2018). In the uncompromising opinion of medicine's senior editors, the peer review of practice has done nothing in decades to prevent the publication of worthless papers (Altman, 1994; Smith, 2014). Yet, even in its decrepitude, peer

review is paraded by the establishment of academic publishing as the safeguard of scholarship.

Those who claim authorship of what they did not write are, by definition, plagiarists (Sanders, 2020), guilty of defrauding the public (Stern and Lemmens, 2011). They are also guilty of undermining scholarship (Marušić *et al.*, 2011). The morass of high-scoring rubbish resulting from gaming in medicine is probably being replicated in other disciplines. Purging is required, purging much more ruthless than a few retracted papers, purging of the excrescence of the age of publish or perish and its performance metrics, purging that tears aside the cloak of scholarship which hides the diversion of public property to private purpose.

Merton's depiction of the scholar standing on the shoulders of giants is now unfamiliar in higher education. Anyone who can manipulate the metrics can be a scholar (Biagioli, 2019); there is no need for giants. Only the obtuse cannot be aware of what can be achieved by manipulating the metrics (Oravec, 2017). Spoofs galore have been testing the integrity of academic publishing for decades and have often found it wanting. Scott Armstrong (1982), for instance, submitted papers that had already been published to a range of journals. A change of name was enough to fool most editors and referees, but not enough to change the system. The world's sixth most-cited academic does not exist and has never existed (Labbé, 2020; see also López-Cózar *et al.*, 2014; Harzing, 2016). Notwithstanding, like Antkare continues to publish (e.g., Antkare, 2020).

Top journals are top journals largely because they are most active in manipulating the metrics and have most to lose from failing to maintain their manipulation. A top journal is just that because citation makes it so (Nieminen *et al.*, 2006; Brembs, 2018; Dougherty and Horne, 2022); in a competitive environment, this can happen only through manipulating the metrics. Editors of top management journals are renowned for coercing citation from authors (Wilhite and Fong, 2012) and for turning a blind eye to plagiarism (Honig and Bedi, 2012). Gaming has become so entrenched and institutions have become such beneficiaries of the system that they feel there is no going back (Biagioli *et al.*, 2019).

Academic publishers have extorted a fortune from a public too trusting to question whether the industry really is working in the public interest. The public still thinks of the world of academic publishing as benign; it is in awe of such academic institutions as peer review. During the covid-19 pandemic, the media (which knows its public well) was able to use peer review as a shorthand: what

had been peer-reviewed could be trusted, what had not been peer reviewed could not be trusted (Schultz, 2023). Of such gullibility are fortunes made.

*The journal editor says: what's wrong with publishing an industry-funded editorial or review article as long as it gets appropriate peer review? (Elliott, 2004, p.21)*

Clarivate's algorithms could easily be adjusted to exclude self-citation from contributing to the JIF, but they are not. Self-citation might also be discounted in calculations of research productivity and appropriate rewards, but it is not (Baccini et al., 2019).

*You have to understand that there are some people in [academic publishing] for whom, when Impact Factors are published, it's their life ... it's what they've been waiting for all year. It's bigger than Christmas. And people will do their utmost to get the highest Impact Factor possible. (David Tempest of Elsevier quoted in Burboles, 2015, p.722)*

Academic research, misled by previous research, rapidly infects future research (Ross-White et al., 2019). The science base, already distorted by citation determined by the opportunities presented by publication metrics, is further corrupted when authorship is determined by precedence, status and commercial requirements. A science base consisting of whatever citation generates the most favourable publication metrics is not sturdy enough to support much of substance (Higginson and Munafò, 2016).

Self-regulation has failed to protect the public from the ravages of academic publishing. The time has come to consider whether an independent regulator might succeed where academic self-regulation has patently failed. In other industries, regulation is often required to limit anti-social behaviour and reduce costs to the public. Certainly the costs to the public of academic publishing are high in terms of both industry profits and a polluted science base. And surely, despite every effort to pass off the product of academic publishing as scholarship authorised by peer review, there is evidence enough of anti-social behaviour to justify drastic action.

## Abstract

The purpose of the paper is to study human-centered knowledge management in start-ups, reveal challenges, its peculiarities, and framework. The technology start-up teams used experiential design thinking, agile and lean approaches to design and validate the hypotheses of minimal viable products and repeatable and scalable business models. The exploratory qualitative research was conducted with 27 cross-functional start-up teams in a period 2019-2023. The research reveals: (1) the necessary knowledge set for start-ups which facilitates entrepreneurial teams to launch new ventures, design products and business models by using human-centered knowledge management framework that includes social-based and technology-based parts for acquisition, creation, sharing/transferring, and application of tacit and explicit knowledge in start-ups; (2) specific set of peculiarities and challenges of KM in start-ups; (3) dominance of the mode "Socialization" in the discovered 3-mode SEI (socialization, externalization, and internalization) knowledge conversion model for early (fuzzy front end) stage of product/business development in start-ups; (4) evidence that conversion "explicit to tacit" knowledge in "Internalization" occurs effectively in combination of explicit knowledge obtained in exploratory prototyping inside of start-up and the knowledge generated by generative AI at the requests of a startup. Practical implication of the research is understanding of framework and challenges of KM in start-ups, and opportunity to use the research results in start-ups management at the fuzzy front-end stage.

**Keywords** – Human-centered, Knowledge management, Start-up, Experiential design thinking, Innovation.

## 1 Introduction

In digital era, knowledge has become a key resource and valuable intangible asset to gain and sustain competitive advantage through innovation for either large or small companies (Ferreira et al., 2020; Marchegiani, 2021; Durst, et al., 2022; Durst, et al., 2023). Therefore, companies need to acquire, create, and use knowledge effectively and efficiently to create value for their user/customers and to be competitive (Wong & Aspinwall, 2004, 2005). Knowledge management (KM) has become current topic and critical objective in today's large companies, small and medium enterprises (SMEs), and start-ups (Davies and Warren, 2011; Hagmann and Gillman, 2016; Chandler, 2021; Cerchione et al., 2016; Durst et al., 2022, 2023; Centobelli et al., 2017; Cerchione et al., 2016; Audretsch et al., 2020; Audretsch et al., 2021; Ahmed et al., 2021). KM theory and models have developed to facilitate knowledge workers to organize and lead knowledge in organizations since the 1990s (Nonaka and Takeuchi, 1995; Nonaka and Toyama, 2003; Laptev and Shaytan, 2022; Wiig, 1993; Szulanski, 1996; Sveiby, 2001; Dalkir, 2005; Evans et al., 2014; Spyropoulos, 2020; Sima et al., 2022). In Industry 4.0 context, development of ICTs, IoT, RS, AI, etc. provides new technological tools to support KM practices (Becerra-Fernandez, 2008; Bigliardi et al., 2010; García-Álvarez, 2015; Santoro et al., 2018; Colnar et al., 2022; Korzynski et al., 2023).

For a long time, the mainstream of KM research was large organization, less small and medium entities (Massaro et al., 2016; Cerchione, 2016; Durst et al., 2023), and start-ups were neglected almost. There are significant differences between larger companies and SMEs. Small organizations are not little big ones, thereby one cannot transfer KM tools and practices from large organizations to SMEs (Welsh et al., 1982; McAdam and Reid, 2001; Durst and Bruns, 2018). Traditional KM tools/models/frameworks (Gamble and Blackwell, 2001; Dalkir, 2017; Sartori and Frederico, 2020; Hilger and Wahl, 2022) are not simply adaptable to the SME context (Hutchinson and Quintas, 2008; Zieba et al. 2016; Sima et al. 2022). SMEs have limited resources in which they require to be

competitive in volatile, uncertain, complex and ambiguous (VUCA) world (North and Babakhanlou, 2016; Sartori and Frederico, 2020).

Start-ups are companies at the very early stage of development, where like in a lab entrepreneurs set up experiments and test hypotheses, identify, pursue and capture the value from business opportunities (De Massis, 2018), design products and look for repeatable and scalable business models (Blank, 2013). Creating successful innovations is a challenge for startups. A specific startup culture is characterized by openness, collaboration with various categories of stakeholders, and human-centricity. Agile, lean, design thinking practices/methods/tools, and competencies of entrepreneurial management are the key ingredients of start-ups. Nevertheless, scholars still tend to apply approaches developed originally for larger companies on SMEs and there is only very limited number of preliminary ideas of knowledge management roadmaps and frameworks for SMEs (Lisanti and Luhukay, 2014; Centobelli et al., 2017; Sima et al., 2022).

The aim of this study is to propose a human-centered knowledge management frame for the early-stage innovative SMEs (start-ups) when they develop and test product concepts (MVPs), and repeatable business models. The goals of the study are (1) to identify key peculiarities and challenges of KM implementation at start-ups; (2) to propose a human-centered knowledge management framework based on experiential design thinking approach for start-ups.

The paper is structured as follows. In the coming section, authors briefly discuss the background associated with definition and specifics of start-up, knowledge management, experiential design thinking approach. Next, we introduce research design and process. The main finding of the field analysis are illustrated in the fourth section. In conclusion, the results and the direction of further research are formulated.

## **2 The background of the research: start-up definition and specifics, knowledge management, knowledge management, experiential design thinking**

### ***2.1 Start-up is a learning organisation***

The lifespan of SMEs can be divided on three stages, i.e. "existence", "survival" and "success" (Lewis and Churchill, 1983). The first one, where a new venture is infant and incubated named start-up. Start-up is defined as newly established

organization with the aim target for customer discovery/validation and for disruption of the current state of the industry with innovation (new products or services) (Blank, 2013). Blank (2013) definition of start-up is "A *startup is a temporary organization designed to search for a repeatable and scalable business model*". Start-ups tend to be no bureaucratic, less formal and flexible organization (Durst, 2023). In order to understand the challenges facing entrepreneurs and innovative managers of start-ups with knowledge management, it is necessary to understand specific of startups and their features.

A start-up launches with ambitious and relatively imprecise hypotheses about where an opportunity may lie, and then entrepreneurial team tries to validate the hypotheses through numerous iterations by designing minimal viable products (MVPs) and looking for repeatable and scalable business models (BMs) (Blank, 2013; Ries, 2011). Typically, the entrepreneurs radically change their MVP and BM hypotheses through multiple stages of knowledge gathering and learning by pivoting up to the MVP and BM are revised to arrive at the validated final version (Girotra and Netessine, 2014; Ries, 2011; Blank, 2013; York and Danes, 2014). The action-learning process through iterated "hypothesis – build – measure – learn – new hypothesis" feedback loop. A regular assessment of actions ensures the creation and sharing of knowledge (intangible asset) in start-ups (De Massis et al., 2018). The "lean start-up" approach based on agile experimentation and customer feedback (Ries, 2011; Blank, 2013) allows to enrich a startup with knowledge created and shared within a venture and acquired from external stakeholders.

Resource (capital, time, people) scarcity is the biggest challenge faced by start-ups (Wong and Aspinwall, 2005; Ahmed et al., 2021). That is why start-ups need to use their limited resources to the maximum extent. The knowledge, especially tacit, is one of the main resource, i.e. important intangible asset, for start-ups. Efficient knowledge management (KM) can improve learning process and opportunity of a start-up to design successful product and scalable BM.

## **2.2 Knowledge management in start-ups**

KM includes the different forms (explicit, implicit, tacit) of knowledge, generation of knowledge, knowledge transferring/sharing (Ahmed et al., 2021; Oe and Mitsuhashi 2013), and its conversions (Nonaka and Takeuchi, 1995; Laptev and Shaytan, 2022), knowledge acquisition. KM associates with practices related to the

capture, store, and transfer of explicit knowledge and also with practices linked to develop techniques to share tacit knowledge (Alvarez et al., 2016).

Challenges that start-ups face with the KM are the following: 1) temporary nature of the entrepreneurial team members may break streamlined knowledge transfer/sharing process (Kasvi et al., 2003); 2) focus on short-term tasks which restrict using knowledge management as a business strategy (Lindner & Wald, 2010); 3) many start-ups run out of funds before validating MVP and BM (Cantamessa et al., 2018); 4) decision-making is in the hand of one or small number of people (Culkin and Smith, 2000); 5) lack of organization memory, i.e. most knowledge is kept in the minds of entrepreneurial team members (Alvarez et al., 2016). Some economic, geographical, human, and organizational factors affecting KM, and social network KM tools and practices were studied for start-ups (Presutti et al., 2011; Dalmarco, 2017; Liu et al., 2012; Laitinen and Senoo; 2019).

The literature identifies only few specific KM practices and factors affecting KM, but does not offer comprehensive KM framework used by start-ups in Blank (2013) definition. The authors propose to fill in this gap by human-centered knowledge management practice and tools.

### ***2.3 Experiential design thinking for knowledge management***

Design thinking (DT) is user-centred, iterative process driven by multidisciplinary team for innovation design through idea generation where emphasizes observation, collaboration, iteration between stages, exploratory prototyping, user testing and learning (Kelley, 2001; Brown, 2008). Nowadays, DT evolved to participatory-centred approach to complex problem solving with focus on innovations in collaboration with different types of stakeholders (users, customers, suppliers, etc.) (Lockwood, 2009).

Over the past decade, users/customers are increasingly looking for individualised offers and a new experience (D'Entremont, 2020). User/customer experience (U/CX) has become a huge determinant of product and business success. Traditional DT process do not focus on U/CX entirely. Experiential design thinking (EDT) approach puts experiences at the centre by the user/customer experience-centric approach and collaboration with them (Batat, 2021). The process of collaborative innovation development is a complex combination of factors based on innovative thinking (Laptev and Shaytan, 2022) and

entrepreneurial behaviour, i.e. "creating opportunity without regard to the resources currently controlled" (Timmons and Spinelli, 2004).

In volatile, uncertain, complex and ambiguous (VUCA) world many tradition KM practices/tools fail due to misunderstanding of human need, their desire and motivation. EDT as human centred, participatory and driven by experimentation approach can greatly improve KM practice in start-ups where the culture of discovery is a greater extent. The crucial contributions of EDT to KM include the focus on empathy, participatory design, experimentation through rapid prototyping and testing of hypotheses. Mistakes in EDT are referred as leverage toward a right solution and failures are a source of learning. EDT places a greater emphasis through interaction and provides deeper info about users/customers and bring holistic insight of BM. Using MVP approach, EDT combines top-down and bottom-up approaches to problem solving that helps to avoid big fail and design lean innovation. EDT accepts agile approach at the early stages of product and BM design. EDT accepts agile approach, brings better interaction between stakeholders, improves interpersonal conversation and that lead to better knowledge extraction, co-creation and sharing. EDT includes using digital tools, i.e. 3D printing for exploratory prototyping, social media, professional communities and generative AI (like ChatGTP) for knowledge acquisition and sharing.

Considering that start-ups operate in VUCA environment, and that discovery is the main part of their activities, it can be assumed that KM organized on the principles of EDT will be appropriate and effective. Next sections authors looking for confirmation of this assumption.

### **3 Research design and process**

The exploratory qualitative research was conducted during and after 7 university incubation/acceleration programs in 2019-2023. Qualitative methods for research on SMEs were recognised previously (Romano, 1989; Chetty, 1996). The research framework included literature review (97 WoS/Scopus papers), sampling, collection of data and data analysis, through sequential categorizations levels. The sample frame is 27 cross-functional start-up teams, about 4-6 persons each, with mix backgrounds that acquired, created, transferred/shared knowledge, generated and tested hypotheses in collaboration with users/customers. The studied start-ups are technological, design digital or

physical or phygital products. The start-up teams used EDT, agile and lean approaches and iterate “hypothesis – build – measure – learn – new hypothesis” in feedback loop at early (fuzzy front end) stage to create valuable MVP and repeatable/profitable BM (Blank, 2013; Koen et al. 2014; Pereira et al. 2917). The modified EDT model consists of 5 building blocks: 1) Empathic understanding of users/consumers and their problems/needs/desires; 2) Design task (point of view) definition to develop innovative solution; 3) Ideation U/CX and product in user-centric collaboration; 4) Prototyping and testing U/CX and product solution; 5) Business model generation and testing (Shcholakova and Laptev, 2022).

The data collection took place both during and after incubation/acceleration programs on the principle of triangulation applying multiple sources of evidence with the aim to strengthen validity. The research survey is based on observations of the start-up team’s work, reflective journals, and in-depth interviews with them and instructors of the EDT activities. After the end of incubation/acceleration programs, which lasted 10 weeks, the members of start-up teams gave feedback by answering closed and open-ended questions prepared by the researchers. The authors visited each research site at least five times to get an idea of knowledge management in practice of start-ups, compare these observations with the interview notes. In cases of contradiction between information from start-up owners and team members, and observations on work conducted, receive further clarification from the owners and managers. Researchers carried out first and a second cycle coding (Saldaña, 2016). Throughout the iterative coding process, the researchers revised and refined categories and themes, i.e. develop categories from the recoded material and structure the categories to get broader themes.

## **4 Findings**

### **4.1 Knowledge set for start-up**

The result of the analysis, 12 categories combined into 3 themes, represent a cumulative set of knowledge in different domains that a start-up team should have for product designing and business modelling (Fig.1). The first theme “Knowledge about Product” includes the following building blocks: *Empathic understanding of user/customer needs, wants & desires; Knowledge about technologies, components & "secret sauce" for product design; Knowledge about product features/specification* and the second theme “Knowledge about Market”

with following building blocks: *Empathic understanding of user/customer & purchasing behaviour; Knowledge about lead sources & lead generation tools/activities; Knowledge about sales funnels & customer actions.* The blocks *Knowledge about user/customer journey/experience; Unique/"unfair" competitive advantage; Knowledge about market (type, size & strategy), and Unique value proposition* are shared between these two themes. The third theme "Knowledge about Financing" includes two building blocks: *Knowledge about venture finance (investment, valuation, source of capital); Financial plan (costs forecast, cash flow statement, P&L, etc.)*

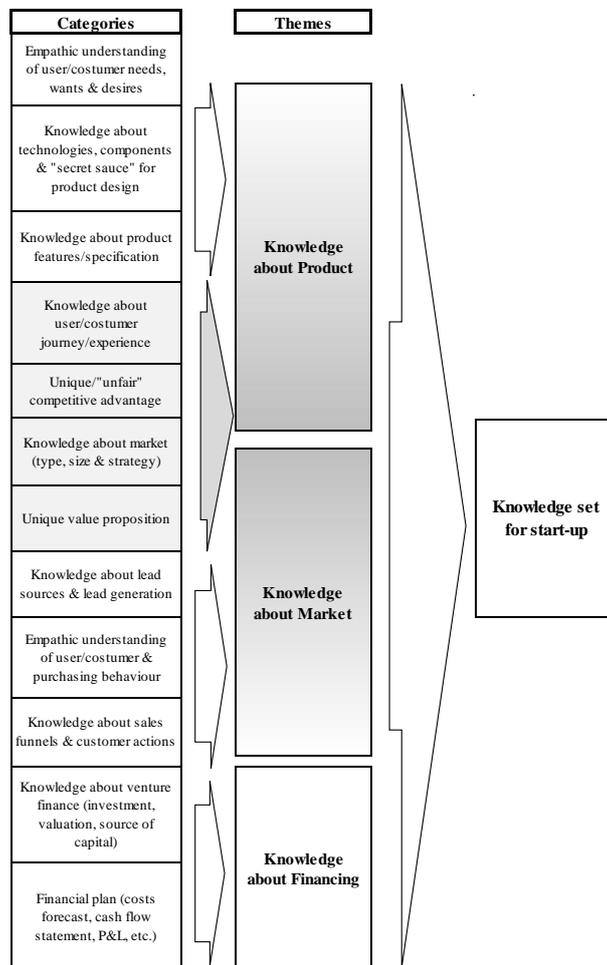

Figure 1. Knowledge set for start-up.  
Source: author's elaboration.

The research revealed the necessary knowledge set for start-ups that facilitated entrepreneurial teams to launch new ventures, design products and business models by using human-centered knowledge management framework that included social-based and technology-based parts (Figure 2) for acquisition, creation, sharing/transferring, and application of tacit and explicit knowledge in start-up.

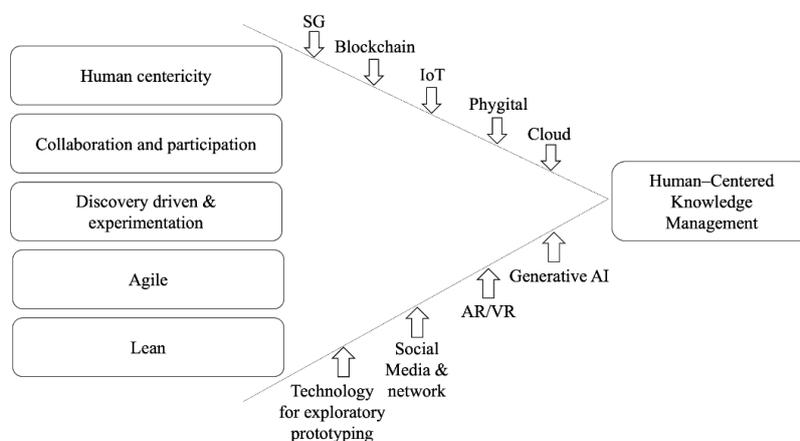

Figure 2. Human-centered knowledge management framework for start-up.

#### 4.2 Knowledge management peculiarities in start-ups

The study identified specific set of peculiarities of KM in start-ups.

##### 4.2.1 3-mode SEI knowledge conversion model, key roles of "Socialization", exploratory prototyping in "Externalization", generative AI in "Internalization"

The dominance of the mode "Socialization" in the previously discovered SEI (socialization, externalization, and internalization) 3-mode knowledge conversion model for early (fuzzy front end) stage of product/business development (Laptev and Shaytan, 2022; Nonaka and Takeuchi, 1995; Nonaka et al., 2005). Socialization helps to move and share tacit knowledge between start-up team members and innovative users that are close to each other, i.e. within walking distance. High level internal trust, friendly and like-minded environments provide easier and more effective knowledge sharing in tacit form. The negative outcome of this phenomenon is expressed in "not having dedicated organization memory". Authors proposed SEI model that can be considered as a special case of the

general SECI model of knowledge conversion (Nonaka et al., 2005). The "Combination" mode that related to the lack of "explicit to explicit" knowledge conversions due to limit of resources (money, people, time,) in start-ups was neglected. The authors found that exploratory prototyping and systematic representation was the main means that provided conversion of "tacit to explicit" knowledge in "Externalization". The research revealed that conversion "explicit to tacit" knowledge in "Internalization" occurred effectively in combination of explicit knowledge obtained in exploratory prototyping inside of start-up and the knowledge generated by generative AI at the requests of a startup.

#### *4.2.2 Using external sources of knowledge*

Start-ups are resource constrained and cannot spend efforts inside to create in full needed knowledge. They are looking for knowledge outside the venture. Universities, research centers, suppliers, business partners and other stakeholders are sources of external knowledge for start-ups. One of them is innovative users, with them a startup can acquire knowledge and enrich team with additional knowledge. Social media, professional communities and now generative AI are external knowledge suppliers for start-ups. Given that a start-up is a relationship business, the relationships (Pellicano et al., 2016) as a socio-economic phenomenon are increasingly important element in knowledge management.

#### *4.2.3 Human-centered management*

Knowledge in start-ups is created, shared/transferred, and applied by people by use of face-to-face and online meetings, workshops, training observations, and collaborative activities with stakeholders. Start-ups use technology mostly limited of simple automation of the process. Start-ups put knowledge generated into practice immediately, don't put it on a dusty shelf. Start-up teams check the received solution and finalize it without delay with new portion of knowledge and learning iterating "hypothesis – build – measure – learn – new hypothesis" in feedback loop.

### **4.3 Knowledge management challenges in start-ups**

The study revealed the challenges of KM implementation in the research sample of start-ups.

#### *4.3.1 Lack/primitive of KM system*

Four start-ups in the research sample didn't have and six had primitive KM system, which had very high risks of start-up knowledge loss. Nowadays start-ups highly depend on social messaging tools, such as Telegram/WhatsApp to communicate and generative AI services, such as ChatGPT, to find valuable information and new knowledge.

#### *4.3.2 Lack/primitive of KM procedure*

The start-ups are new ventures, and their business processes and procedures are primitive, or not well established yet. This also concerns KM. Respondents told us that they did not think that KM procedures were a top priority for a start-up, given the other commitments already made by new venture. Based on the survey, only two start-ups had managed their knowledge at the strategic level. Other startups had no KM strategies at all. And that was one of the main reasons that KM did not well support the start-up business and why they couldn't take good advantage of knowledge assets.

#### *4.3.3 Lack of resources (money, time, people, etc.)*

Start-ups are lacking resources always, such as budget, talents, and time. Some of the examined companies considered that their priorities were development and growth. They had to invest such limited resources in more critical tasks rather than just focus and allocate them to KM. Somebody thought that KM was an advanced management activity that did not match current status of business start-up, i.e. "...the time has not yet come, we will return to this when we have more resources...".

#### *4.3.4 Lack of information/knowledge about KM*

The majority of respondents demonstrated understanding of the importance of knowledge in business practice. But the real awareness of 1/3 of the respondents were at a low level and they did not have chance to take advantage of KM to increase their business competitive advantages. Respondents often confused the concepts of data, information and knowledge. In many cases the fragmented understanding of the importance of tacit knowledge and insights for innovation design was discovered. In some cases, the focus was on the selective knowledge areas and cumulative set of knowledge in different domains did not get due

attention. The authors revealed this in the research and proposes study, the necessary knowledge set for start-up, see 4.1 "Knowledge set for start-up".

#### *4.3.5 Knowledge loss with leaving of owner of key knowledge.*

Taking into account the fact that the system of knowledge storage is not developed in start-ups, tacit knowledge might be in the mind of a limited number of members of the technology start-up team. Authors revealed that the leaving of a team member who was the owner of key knowledge needed for the product design or any activities in a start-up, brings problems and can even be fatal for a start-up. This situation with a technology start-up differs significantly from a similar situation in a large company or SME, where leaving specialist with certain competencies is replaceable.

## **5 Conclusions**

The exploratory qualitative research was conducted with 27 cross-functional start-up teams in a period 2019-2023. The research revealed the necessary knowledge set for start-ups which facilitated entrepreneurial teams to launch new ventures, to design products and business models by using human-centered knowledge management framework that included social-based and technology-based parts for acquisition, creation, sharing/transferring, and application of tacit and explicit knowledge in start-up. Start-up was defined as a temporary organization designed to validate the hypotheses of MVPs and BMs. The study identified specific set of peculiarities of KM in start-ups, such as 3-mode SEI knowledge conversion model, external sources of knowledge, human-centred management. The study revealed the challenges of KM implementation in start-ups. The limitation of the study is related to limited sample size. At the next step, we plan to study human-centered knowledge management framework in more details with influence of exploratory prototyping and generative AI (ChatGPT) on knowledge acquisition and sharing in start-ups.

### **Abstract**

As fast fashion brands expand, society and customers pay more attention to environmental and social sustainability. This study will examine the impact of environmental and social sustainability on customer purchase intentions and the moderating effect of knowledge management strategies on this relationship, based on the general understanding that knowledge management (KM) can be a strategic tool to achieve sustainability and communicate with outside sources. Three hundred and twelve students from mainland China were surveyed. The moderating effect of knowledge management strategies on environmental and social sustainability has been examined through regression analysis. Results confirm that environmental and social sustainability positively impacts customer purchase intentions. The study shows some interesting moderating effects associated with human-focused knowledge management strategies. In this study, the contribution of context-dependent environmental and social sustainability to customer purchase intention is examined, as well as the potential influence. This study also analyzes the contribution of context-dependent environmental and social sustainability to customer purchase intention as a knowledge management strategy.

**Keywords** – Environmental sustainability, social sustainability, Technology-focused KM strategy, human-focused KM strategy, Customer. Purchase intention.

**Paper Type** - Academic Research Paper

## **1 Introduction**

### ***1.1 Research background***

The fast fashion industry can be defined as a business that leads by fashion and reduces the processes involved in the customer buying cycle, which makes getting new products into a store in a very "fast" way to satisfy consumer demand at a peak level (Barnes & Lea-Greenwood, 2006). Successful fast fashion brands are famous for frequently renewing and updating their product line. The rise of fast fashion brands such as UNIQLO, Zara, MUJI, and H&M in the multinational market is characterized by shorter Production Life Cycles (PLC), lower prices, and increasing fashion cycles with accusations about pollution, and high humanitarian concerns (Wei & Jung, 2022). These ethical compromises humiliate the image of fast fashion brands.

According to the value-belief-norm theory (VBN), customers have an ethical concern and environmentally friendly tendency when evaluating consumer value and consumer intention (Fauzi et al., 2022). Customers become increasingly aware of fashion brands' social and environmental sustainability, impacting their purchase intention (Stringer et al., 2020).

Knowledge management (KM) is a proper approach for fast fashion brands to achieve environmental and social sustainability goals. A consensus from the literature review is that KM is a systematic tool for creating, storing, and sharing knowledge within and around a company (Rowley, 1999). The benefit of establishing an appropriate KM strategy for fast fashion brands can be enhanced in customer relationship management (CRM) and management information systems (MIS) when it is a moderator between sustainability and purchase intention. (Gebert et al., 2003)

The Resource-Based View (RBV) study defined KM as intellectual capital management (Rehman et al., 2021). Organizational knowledge management systems (OKMS) present a potential for KM to mediate between environmental and social sustainability and customer purchase intention (Meso & Smith, 2000).

### ***1.2 Research objectives***

Considering the inconsistency between environmental and social sustainability-purchase intention in global fast fashion brands, this study aims to find the

relationship between environmental and social sustainability and customer purchase intention on fast fashion items and the potential moderating effect of KM strategy.

One objective of this study is to examine the effects of environmental and social sustainability on consumer purchase intention. Considering the fast fashion industry, two environmental and social sustainability practices (animal welfare and over-produced pollution, worker welfare and charity activity, respectively) and the level of purchase intention were applied to test the hypothesis.

The other objective is to investigate the possible moderating role of KM strategy in influencing environmental and social sustainability on customer purchase intention. Two forms of KM strategy — technology-focused and human-focused (Ling, 2019)- are based on RBV as a moderator between environmental and social sustainability and customer purchase intention.

## **2 Theoretical Background and hypothesis development**

### ***2.1 Theoretical framework***

The prior step can be understood as environmental and social sustainability to envisage the research framework better. In contrast to sustainable development focused on the macro-level, environmental and social sustainability stand at the micro-level of the organization (Durst & Zieba, 2020). Environmental and social sustainability practices can be associated with environmental and social issues caused by them. While the fast fashion industry expanded to more than US \$21 billion in 2021, encouraging over-consumption with over-production becomes one of the most severe unsustainable and unethical issues to be criticized. Another environmental issue — animal abuse can track back to the 1980s with an anti-fur campaign (Stringer et al., 2020). These days, fast fashion brands must be concerned about animal welfare to balance the ethical brand image and product value when launching a product. For social issues, since most fast fashion clothing can be seen as a labor-intensive industry, the manufacturing plants typically locate in developing countries. Workers' welfare concerns customers, including working conditions and minimum wage rate, and may impact purchase intention. Also, nowadays, the charity activities held by a company can be one of the most direct standards by which customer judge the social sustainability.

KM is a traditional way to help implement environmental and social sustainability and make customers see the outcome. An organized KM supports the right people can get the proper knowledge at a suitable time to enhance productivity, shortens the supply chain to save resources, and demonstrates the appeal of human resources (Evangelista & Durst, 2015). On the other hand, KM can be a good tool used in CRM to continuously show that the fast fashion brand has excellent and ethical behavior toward their customer and improve purchase intention. Two kinds of KM strategies may use in this process:

(1). technology-focused KM strategy: emphasizes the management of knowledge using information technology such as big data and IT systems or intellectual capital management such as enterprise search systems and text analytic tools.

(2). human-focused KM strategy: emphasize the management of knowledge utilizing human resources such as communication in customer services.

So based on the explanation above explanation, the research model is to test if environmental and social sustainability can influence the level of purchase intention and if KM strategy played a moderator when it is combined with environmental and social sustainability, as shown in Figure 1.

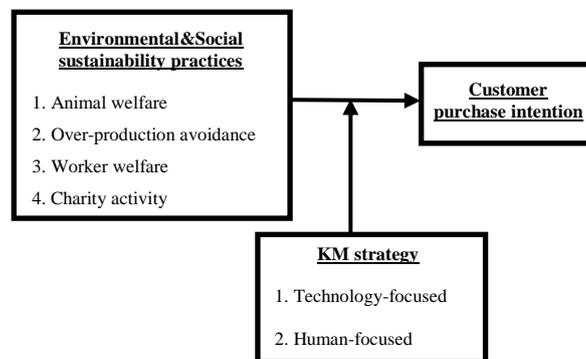

Figure 1. Research Framework

## 2.2 Hypothesis Testings

Four types of variables will be found in this study - 1. Independent variables (IV), that is, four environmental and social sustainability practices include animal welfare, over-production avoidance, worker welfare, and charity activity. - 2. Dependent variables (DV) are the degree of customer purchase intention. - 3.

Moderating variables (MV), a second independent variable believed to affect IV-DV, KM strategies used in the process significantly. - 4. control variables (CV), i.e., irrelevant variables, refer to the variables that may affect the IV-DV, but the effect is not at the core of the problem studied, including the economic condition or consumption trend

To find the possible relationship between IV-DV, a study in 2022 Shows that sustainability claims have adverse effects on brand management and further decrease purchase intention. As the hypothesis in Table 1 outlines, environmental and social sustainability may enhance a purchase intention.

Table 1. Environmental and social sustainability impact on purchase intention

H1	While environmental and social sustainability tends to positively associate with customer purchase intention, diverse sustainability practices' contribution to purchase intention will differ.
H1.1	Practices on over-production avoidance are more possibly to associate with customer purchase intention positively.
H1.2	Practices on animal welfare are more possibly to associate with customer purchase intention positively.
H1.3	Practices on worker welfare are more likely to positively associate with customer purchase intention.
H1.4	Practices on charity activity are more likely to positively associate with customer purchase intention.

Technology-focused knowledge management strategies are required to better understand moderating variable (MV) 's influence and transfer sustainability knowledge to customers to generate a green and ethical brand image. In the human-focused KM context, better corporate social responsibility (CSR) and community relations may act as moderating factors. (Table 2)

Table 2. Technology-focused and Human-focused KM Strategy Hypothesis

H2	KM strategy is the moderation between environmental and social sustainability and purchase intention.
H2.1	Technology-focused KM strategy will have a favorable moderation effect between environmental practices (over-production avoidance and animal welfare) and customer purchase intention.
H2.2	Human-focused KM strategy will have a favorable moderation effect between environmental practices (over-production avoidance and animal welfare) and customer purchase intention.
H2.3	Technology-focused KM strategy will have a favorable moderation effect between social practices (worker welfare and charity activity) and customer purchase intention.
H2.4	Human-focused KM strategy will be a favorable moderation between social practices (worker welfare and charity activity) and customer purchase intention.

### 3 Methodology

#### 3.1 Data collection

Since university students are the most important buyers of fast fashion brands, they will be the study's target population. The sample of this study was collected from 414 university students in mainland China, and 312 of these responses are considered effective. The questionnaire items were designed in a standardized form. A five-point Likert Scale was extended to measure the level of sustainability fast fashion brands expected to achieve and the strength of their purchase intention.

Table 3 shows descriptive statistics of the data collected, including the sample size and the maximum, minimum, mean, and standard deviation of each item. As illustrated in the table, each item is a relatively modest value.

Table 3. Sample Descriptive Statistics

Variable	Sam ple	Maxim um	Minim um	Mean	Stand ard devia tion
Pollution avoidance	312	5	1	3.561	1.041
Animal welfare	312	5	1	3.683	1.096
Worker welfare	312	5	1	3.647	0.994
Philanthropy	312	5	1	3.718	1.05
KM 1	312	5	1	3.526	0.938
KM 2	312	5	1	3.532	1.017
Purchase intention	312	5	1	3.558	1.022

### 3.2 Measurements

#### 3.2.1 Validity and Reliability

To assess validity and relevancy, we used a correlation coefficient to review the questionnaire items to ensure the respondents could understand the research questions and that the data we collected were valid. The finding suggests that environmental and social sustainability and KM are related to customer purchase intention to fast fashion products. Table 4 shows the result of the correlation analysis.

To examine the validity, we use the model of Pearson correlation analysis. The correlation results provide definitive evidence of a good appropriacy to the data, indicating the construct validity to be acceptable. It confirms that purchase intention coincides with environmental and social sustainability, including four dimensions, pollution avoidance ( $r=0.597$ ,  $p=0.000^{***}$ ), animal welfare ( $r=0.58$ ,  $p=0.000^{***}$ ), worker welfare ( $r=0.583$ ,  $p=0.000^{***}$ ), and Philanthropy ( $r=0.551$ ,  $p=0.000^{***}$ ), KM strategies including two dimensions, technology-focused ( $r=0.568$ ,  $p=0.000^{***}$ ) and human-focused ( $r=0.493$ ,  $p=0.000^{***}$ ).

Based on the above results, the study enjoys a relatively high internal consistency; all variables fall over 0.4-0.7 intervals. (Table 4)

Table 4. Correlation Analysis for Sample Data

	<b>Purchase intention</b>
Pollution avoidance	0.597(0.000***)
Animal welfare	0.58(0.000***)
Worker welfare	0.583(0.000***)
Philanthropy	0.551(0.000***)
Technology-focused KM	0.568(0.000***)
Human-focused KM	0.493(0.000***)
Purchase intention	1(0.000***)

Note: \*\*\*, \*\*, \*represent the significant level of 1%, 5%, 10%, respectively.

### 3.2.2 Regression Analysis

Regression analyses were then applied to verify the main effect of environmental and social sustainability on purchase intention and the moderating effect of KM strategies in the association. Table III shows the impact of four environmental and social sustainability actions on customer purchase intention.

It is found as shown in Table 5, that environmental and social sustainability positively contributes to customer purchase intention of fast fashion products. Concerning the influence of pollution avoidance, model 1.1 shows a significant positive effect ( $\beta=0.586$ ,  $t=13.091$ ), indicating that pollution avoidance has a positive association with purchase intention. Concerning the influence of animal welfare, model 1.2 shows a significant positive effect ( $\beta=0.541$ ,  $t=12.547$ ), indicating that animal welfare has a positive association with purchase intention. Concerning the influence of worker welfare, model 1.3 shows a significant positive impact ( $\beta=0.6$ ,  $t=12.648$ ), indicating that worker welfare has a positive association with purchase intention. Concerning the influence of philanthropy, model 1.4 shows a significant influence coefficient ( $\beta=0.536^{***}$ ,  $t=11.632$ ), indicating that philanthropy has a positive association with purchase intention. H1 is supported by confirming that environmental and social sustainability positively contributes to purchase intention. H1.1, H1.2, H1.3, and H1.4 are also supported.

Table 5. Regression Analysis Based on Sample Data

	Model 1.1	Model 1.2	Model 1.3	Model 1.4
Pollution avoidance	0.586*** 13.091			
Animal welfare		0.541*** 12.547		
Worker welfare			0.6*** 12.648	
Philanthropy				0.536*** 11.632

R <sup>2</sup>	0.356	0.337	0.34	0.304
Adjusted R <sup>2</sup>	0.354	0.335	0.338	0.302
F Value	F=171.368 P=0.000***	F=157.44 P=0.000***	F=159.982 P=0.000***	F=135.3 P=0.000***

Note: \*\*\*, \*\*, \*represent the significant level of 1%, 5%, 10% respectively.

Concerning the moderation role of the two KM strategies, Table 6 lists the sustainability-purchase intention association. The figures show that the technology-focused KM strategy combined with environmental and social sustainability does not significantly impact customer purchase intention. Overall, the technology-focused KM strategy as a moderator does not hold a considerable effect, which means H2.1 and H2.3 are not significant and not supported.

Concerning human-focused KM strategy, Tables 7 show the effect of human-focused KM strategy as a moderator among the sustainability-purchase intention association. As Table 7 shows, human-focused KM strategy as a moderator plays a significant role in social and environmental sustainability-purchase intention association. Specifically, human-focused KM strategies in environmental sustainability positively contribute to customer purchase intention, including pollution avoidance ( $\beta=0.075, t=1.928$ ) and animal welfare ( $\beta=0.142, t=3.829$ ). Specifically, human-focused KM strategies in social sustainability, including worker welfare ( $\beta=0.134, t=3.336$ ) and Philanthropy ( $\beta=0.129, t=3.259$ ), positively contribute to customer purchase intention. Overall, the human-focused KM strategy as a moderator has significant effects, especially with pollution avoidance, which means H2.2 and H2.4 are substantial and supportive.

## 4 Conclusion

This research inspects the impact of environmental and social sustainability and KM strategies on customer purchase intention in the fast fashion industry. The study verifies context-based environmental and social sustainability and moderating effects of KM strategies among environmental and social sustainability and customer purchase intention.

As for managerial implication, this research provides possible guidelines for fast fashion brands to enhance the purchase intention of their major consumers in mainland China. The results suggest that sustainability actions can positively increase customer purchase intention and create value. Also, this research gives an idea of sustainability-KM to propagate the company's sustainability efforts to potential customers to give them a good impression of the brands and further contribute to a purchase decision. And the alignment of human-focused KM sustainability can be considered a better alignment that probably has an amazing contribution to enhancing purchase intention. As a result, fast fashion brands should pay more effort into delivering their effects on KM in human resources and CRM.

The current research is not without limitations. For instance, the region and population we collected sample are limited to mainland China university students, respectively. Also, the research takes the whole fast fashion industry as the subject to find the impact of environmental and social sustainability on customer purchase intention and the moderation role taken by KM strategy. In fact, many brands are involved in the fast fashion industry. Different brands have various conditions which make environmental and social sustainability has a different level of influence on the customer purchase intention of each specific brand. Also, the moderating effect should be reconsulted in case of a particular fast fashion brand.

### Abstract

This paper aims to investigate the role of digital platforms in improving knowledge sharing and the effectiveness of waste recycling by co-creating value. In order to do so, this research undertakes a single qualitative case study focusing on Alpha, a small-sized digital platform provider that operates in the highly fragmented Italian market of waste management.

The case analysis relies on the Resource Interaction Approach as main analytical framework since it provides a practical tool - the 4R model - to classify resources involved and value outcomes emerging from their integration.

Findings show how the digital platform fosters recycling practices engaging citizens, municipalities, and waste management companies in a shared co-production program. They support the literature on digital platforms serving value co-creation processes. The platform acts as a circularity broker between various stakeholders with complementary goals having a different impact on the process and outcomes of value co-creation.

**Paper type** – Academic Research Paper

## 1 Introduction

While being aware that Circular Economy (CE) and the European Waste Hierarchy (Directive 2008/98/EC) prioritizes waste prevention to reduce environmental impacts, it is acknowledged that most products end up landfilling or incineration after usage (Egüez, 2021; Statista 2023a). Therefore, recycling is undoubtedly a necessary component of CE and represents a sustainable strategy that the European Union aims to increase as demonstrated by the so called "circular economy package" adopted by the European Parliament on April 18<sup>th</sup>, 2018, which imposes binding targets for municipal waste recycling. Data indicate that the overall recycling rate of municipal waste in European Union increased from 27% in 2000 to 47% in 2020 (Statista, 2023b).

Recycling is a process that involves different value chain actors (e.g., waste generators, waste collectors, logistic companies, sorting plants and waste management facilities). In Europe we often find large and vertically integrated waste management companies, which are in charge of collecting, transporting and processing waste. These companies are increasingly investing in digital technologies to implement more cost-effective solutions for waste treatments compared to traditional methods (Eionet Report, 2020; World Bank, 2022).

In recent years, Industry 4.0's key enabling technologies have driven significant advancements in waste management, moving beyond the traditional focus on mechanical technology for waste collection, transportation, sorting, treatment, recycling, or incineration (Ranjbari et al., 2021). New technologies such as sensor-equipped smart bins, robotic automation, semi-autonomous trucks, and artificial intelligence are being increasingly used in waste management for optimized waste collection, transportation, sorting, and recognition and separation of waste materials (Sarc et al., 2019; Borchard et al., 2022; Khadke et al., 2021).

However, the waste management sector seems still struggling in implementing CE processes such as recycling because it suffers from poor collaboration among the different actors involved along the value chain (see Figure 1). Knowledge silos, lack of data compatibility and poor architectural interoperability are the main barriers that hinder the integration of knowledge from different actors and domains and do not allow for the activation of learning mechanisms necessary for improving recycling effectiveness and efficacy (Esmaelian et al., 2018; Cohen and Gil, 2021).

Figure 1. Waste Value chain

With respect to this issue, digital platforms represent both a promising new technology and ecosystems that allow to close the economic circle (De Reuver et al., 2018; Khadke et al., 2021). Often based on reliable peer-to-peer models, digital platforms can support the implementation of CE practices in the waste management sector by enabling knowledge sharing and cooperation among various stakeholders, including municipalities, waste management companies, and citizens (Chauhan et al., 2022; Ferreira et al., 2022).

However, the detailed role of digital platforms in developing more effective waste management services is still poorly investigated. Empirical research is necessary to understand which aspects or resources make a digital platform successful in this specific sector where different types of actors, both public and private, businesses and citizens play an active role. Coherently, we formulated our first research question as follows:

*How do digital platforms favour knowledge sharing useful for enhancing waste recycling?*

In addition, academic literature indicates that interactions allowed by digital platforms may contribute to the process of value co-creation in many public service ecosystems (Petrescu et al., 2019) as they allow implementing strategies that combine online and offline activities in a single co-production program (Mu et al., 2022). Municipal waste management and recycling is a public service necessary to protect public health, where value co-creation represents a crucial factor for improvements, but research reported many difficulties that prevent the development of co-creation processes as in the case of Swedish waste management industry (Svingstedt and Corvellec, 2018). Therefore, we formulated our second research question as follows:

*How does knowledge sharing via digital platforms contribute to co-creating value?*

In order to address these research questions, we conduct an explorative analysis of a single case study (Yin, 1994) regarding Alpha, an innovative small-sized firm that has developed a digital platform aimed to i) support households to correctly sort their waste and ii) connect municipalities, waste management companies, and citizens. The company, based in Emilia-Romagna region (Italy), has been chosen to provide the perspective of a service provider operating since 2015 across 1600 Italian municipalities in a national context characterized by the highest recycling rate in Europe (Statista, 2023c) despite the great fragmentation of waste management companies and many different local rules for waste sorting (Sarra et al., 2017).

Drawing on primary data collected through an open-ended interview with two key managers, the empirical analysis relies on the Resource Interaction Approach (RIA) (Baraldi et al., 2012) as main analytical framework. The RIA approach has been adopted as it provides a practical tool named the 4R model (Hauke-Lopes et al., 2022), which represents a suitable framework to explore how value arises when different actors deploy resources in terms of technology, knowledge, information, skills and experience within a value creation process (Gerbauer et al., 2010).

Findings contribute to the literature on the role of digital platform in waste management (Frempong et al., 2018) by fostering the discussion on how waste recycling can benefit from the use of digital platforms (Kurniawan et al. 2022) as resource integrators. More broadly, findings also contribute to the literature on the role of digital technology in supporting the implementation of CE (Liu et al., 2022; Abbate et al., 2023).

## **2 Literature background**

### ***2.1. Digital platforms, circular economy and supply chains***

Research suggests that the creation of solutions to sustainability-related problems requires system thinking, which in turns calls for the assembly of different knowledge and perspectives (Elia & Margherita, 2018) and collaboration across upstream and downstream supply chain actors (de Bas et al., 2017). Similarly, CE requires interaction between groups of users with complementary needs, which can be facilitated by digital platforms (Ciulli et al., 2020; Charnley et al., 2022; Rejeb et al., 2023). Recent literature indicates digital platforms as a key

enabler of the CE because they are virtual environments that bridge structural holes between different entities and facilitate collaboration and information sharing (Bressanelli et al. 2018; Blackburn et al., 2022).

In the field of waste management, there is a growing attention on key enabling technologies related to Industry 4.0 in supporting the implementation of CE processes (Sarc et al., 2019). Digital platforms contribute to waste reduction by supporting the sharing of surpluses matching the supply and demand (de Almeida Oroski and Monteiro da Silva, 2022) and blockchain-based platforms create collaborative environments that promote CE (França et al., 2019; Rejeb et al., 2022). By facilitating the sharing of best practices, digital platforms also led to the development of innovative waste management solutions with respect to recycling tasks (Jang et al., 2020) and favored customer engagement in secondhand fashion which contracts textile waste (Charnley et al., 2022).

According to the literature, the platform provider plays a key role. Blackburn et al. (2022) define digital platforms as meta-organizations based on orchestration mechanisms deployed by platform owners to facilitate value creation. In the same vein, Ciulli et al. (2020) focus on orchestration mechanisms between upstream and downstream supply chain actors, their activities and resources. However, there is a lack in discussing the barriers that hinder the full implementation of cooperation practices, especially those regarding the integration of consumers when compared to business entities (Masi et al., 2018; Ciulli et al., 2020).

Yet, consumers involvement is fundamental to promote the adoption of sustainable practices. Digital platforms should focus on the dissemination of knowledge to the downstream of supply chain, fostering the creation of a collaborative and shared learning community and providing useful information and resources. Therefore, we argue that in-depth research is needed for understanding how digital platforms involve consumers as well as other actors to set up a value co-creation process. Value is created from a collaborative process between users and providers of products or services, where they combine pre-existing resources to create new value (Frempong et al., 2020) only if strong relationships and high-quality interactions between organizations and customers are established (Jaakkola and Alexander, 2014).

## **2.2. Public value co-creation and digital platforms**

In managerial literature, the process of value co-creation has been extensively analyzed using the service-dominant logic approach (Vargo et al., 2008). Described as a process that is beneficial to all parties, it is often started by suppliers to gain benefits from the use of consumers' or counterpart's knowledge and skills. This appropriation of value by a private actor is somehow contested in public service environment. A public service like health care, transport, or waste management is organized or controlled by the government or an official body because it shall provide public value, i.e., value to the society (Laitinen et al., 2018; Petrescu, 2019). Services delivering public value are designed to contribute to the common good. Therefore, organizations offering public services need to create something with social legitimacy, political sustainability, and economic feasibility (Dudau et al., 2019).

Scholars investigating the value co-creation within public service production processes describe how citizens, users, and service providers interact in the co-design and co-production phases (Osborne, 2021) and emphasize the shift from organizations as a merely value creators to resource integrators, involving users in the development process through the investment of time, resources, and insights (Frempong et al., 2018; Hollebeek et al., 2019; Landi and Russo, 2022).

In this context, digital platforms represent an opportunity for public managers to gather collective intelligence and improve their service offerings while contributing to positive social impact (Petrescu, 2019). However, studies on the co-creation of public value using digital platforms are still limited. There is a need for in-depth research to understand how the combination and re-combination of technical and organizational/social resources provided by decentralized network actors concur to the creation of value (Hauke Lopes et al., 2022).

## **3 Methodology**

In line with the explorative nature of the study, this paper adopts a qualitative research methodology based on a single case study (Yin, 1994). The methodology was selected due to both the novelty of the research problem and the vagueness of the current theories (Halinen and Törnroos, 2005) on value co-creation and digital platforms in waste management. The paper follows an abductive approach for coding information and elaborating results (Dubois and Gadde, 2002).

The case firm is Alpha, an Italian innovative (according to Italian Law) small-sized enterprise established in 2014, whose main business is software development for waste management. Alpha has been chosen since a) it operates in Italy, which represents a particular context characterized by high geographical fragmentation of waste collection services that hinders efficiency (Sarra et al., 2017); b) its mission is to offer digital solutions that connect waste management companies, municipalities, and households to facilitate waste sorting process (i.e., prevent incorrect sorting of materials at home) and create the virtuous circle of recycling.

Data has been collected through direct semi-structured interviews to two key informants. The semi-structured approach has been chosen in order to guide the direction of the discussed topics. The key figures interviewed are two co-founders of Alpha who differ for backgrounds and responsibilities in business and technical operations respectively. Interviews were conducted in October 2022. Every interview had an average duration of 1 hour and both of them have been recorded and transcribed verbatim. Furthermore, secondary sources like company website, sectorial magazines and press releases were included in the analysis to better assess the setting of the case study and its implications. Information from interviews and secondary sources have been triangulated to examine data consistency (Patton, 1999).

The RIA approach and 4R model (Håkansson and Waluszewski, 2002; Baraldi and Wagrell 2022) have been adopted to understand how resources are combined and re-combined to create new valuable solutions (Hauke-Lopes et al., 2022). The 4R model helps to classify resources into i) technical resources (such as products and facilities), which have material properties, and ii) organizational/social resources (such as organizational units and relationships), characterized by social features and displaying intangible characteristics (Strömsten and Waluszewski, 2012).

Within the 4R model, resource interaction is the interplay between technical resources and organizational resources, which represent technologies, knowledge and relationships (Baraldi et al., 2012). Products are described as artifacts, goods, and services. Facilities concern interdependent technical resources and equipment (plants, logistics, infrastructures, and information systems) used to create products. Organizational units include individuals, internal units, or firms and represent key resources encompassing various intangible elements, such as procedures, skills, experience, knowledge, trust, identity, and reputation. The last

class of resources is relationships, that is, the ties and links created by actors in interaction and mobilized by organizational unit resources.

#### **4 Case Description: The main features of Alpha's digital platform**

Alpha is an innovative Italian small-sized enterprise established in 2014 by five friends with strong ICT expertise. It aims to offer cloud-based solutions for the cleantech sector. Its main and only solution currently sold is a digital platform that mainly connects subjects producing waste (citizens, travelers, businesses, etc.) with waste management companies through a mobile App. Since Italy has a high geographic fragmentation in waste collection (i.e., differences are at municipal level) that makes difficult for households to contribute to correct sorting and recycling, the App aims to respond to the information needs of citizens and travelers on how to treat waste.

The digital platform dialogues with the smartphone camera to recognize barcodes of products and GPS functions to geo-localize the camera images. The platform associates the location of the users to the local rules for sorting the materials contained in the product or its packaging. Since the barcode does not report the materials used, Alpha has internally built a product catalogue that classifies materials. This product catalogue is a database currently containing 1.800.000 items. About 25% of them have been signaled by citizens and users that upload information and therefore may strongly contribute to enrich the catalogue. From the co-founder's point of view: *"our platform is an ideal link that connect all the players of the world of urban waste management, where the citizen, however, is the main actor."*

The information on waste sorting is provided by municipalities and/or waste management companies that have to pay a subscription fee. While the App is free for users, both municipalities and waste management companies pay to put the local rules for waste collection and other information they believe useful for citizens and tourists. For example, users may find information on different material-specific waste bins and colours, as well as city maps with collection points (eco-centers, large or dedicated bins, special collections, etc.). The App currently includes 7.500 on a total of 8.000 waste disposal rules set by Italian municipalities. In addition, users may signal sanitary problems to municipalities by simply uploading a picture of abandoned waste or other issues.

In 2017, Alpha also started to implement, in partnership with a high-tech start-up, an Artificial Intelligence system that speeds up the categorization of products and uses algorithms to create new knowledge on products' material composition and its end-of-life management beside the existence of a barcode. Its main aim is to support the citizen in the correct sorting of the waste that has no packaging nor barcode. In the words of one of the co-founders: *"This new functionality represents our shift from packaging to objects"*.

In a nutshell, Alpha's digital platform favour communication among municipalities, waste management companies and citizens/users but also contribute to optimize waste collection processes. This creates a win-win situation for everyone involved in the waste management process. Waste management companies gain in process efficiency and efficacy because they reduce costs for informing citizens, obtain better sorted waste from the households (which means higher quality waste and less controls at waste management plants) and improve their transparency and relationship with citizens. Municipalities have a quick and easy channel to improve collaboration with waste management companies and have less unhappy citizens. Lastly, citizens find answers to their information needs and aspiration to contribute to sustainability.

## **5 Discussion**

Case study evidence suggests that the digital platform represents a circularity broker as it undertakes four different brokerage roles (i.e., connecting, informing, mobilize, integrating) according to Ciulli et al. (2019). Notably, Alpha leveraging cloud-based technology connects different stakeholders involved in the supply chain, also providing a space in which relevant information can be shared, integrated and exchanged by the various actors, thus creating a direct information flow between the brokered parts.

The use of the 4R model as interpretative lens (Baraldi and Waluszewski, 2005; Baraldi and Wagrell, 2022) highlights that the platform performs its brokerage role relying on four types of resources:

1. Products: the product catalogue database classifying products and the database of waste disposal rules of Italian municipalities.
2. Facilities: the graphical user interfaces internally developed by which different actors can dialogue with the platform.

3. Organizational resources: company's computer scientists and the Artificial Intelligence-based system that mimics the work of a business unit.
4. Key relationships with municipalities, waste management companies, and citizens.

In this case, digital resources (i.e., products and facilities), defined as virtually created material resources, interact with non-digital resources (i.e., organizational units and relationships). Such interaction fosters the continuous developments of the service provided by the platform: a valuable solution is emerged (Hauke-Lopes et al., 2022) as outcome of a co-production process.

In this context, a key role is played by knowledge sharing and knowledge processing. Alpha's computer scientists, who possess technical knowledge, skills, and expertise in developing both the databases' infrastructures and graphical user interfaces, could not work alone. Municipalities and waste management companies contributed to the database by sharing their knowledge on disposal rules and other helpful information for citizens. Additionally, citizens helped populate the product catalogue database by scanning images and improving the AI system's object classification accuracy. All these actors can be viewed as organizational units with relevant knowledge. Actors' knowledge exchange has enabled Alpha to recombine both technical, demographic and business knowledge to enhance its services that positively impact on waste recycling effectiveness.

In addition, the digital platform has the merit to activate two key knowledge processing strategies (Sjödin, 2019): open communication and end-user involvement, which help both waste management companies, municipalities and the platform provider make sense of the requirements and demands stemming from all partners involved, which are necessary to secure successful process innovation outcomes.

Open communication and end-user involvement favour the integration of data, experience, skills, and knowledge between actors that Alpha has deployed in a gamified co-production process (Helme Falk and Roselund, 2020; Mu et al., 2022). Alpha leverage on these resources to create new resources (new knowledge, new experience) or new configurations of resources (Ciabuschi et al., 2012) finally leading to the co-creation of sustainable value (Botti and Monda, 2020).

Value is created for both individual users (citizens, travelers, small commercial enterprises) and the society at large. The platform supports users in properly

sorting and disposing of waste at the source by providing information on correct procedures, reducing human errors, and simplifying the task of sorting (Emery et al., 2003; Babaei et al., 2015; Landi and Russo, 2022). This increase in users' knowledge about how to handle waste (Handayani et al., 2018) benefits citizens who find satisfaction for their information needs. In other terms public value is created as the digital platform allows public managers to solve the collective needs and aspirations of citizens to participate to more sustainable consumption patterns (Alford and O'Flynn, 2009). Moreover, the platform contributes to creating value at the systemic level by promoting virtuous behaviors that benefit public health and the environment (Landi and Russo, 2022).

## **6 Conclusion**

This study explores the role of digital platforms in improving the effectiveness of waste recycling by sharing knowledge and co-creating value.

The case study investigated shows how a digital platform, acting as a circularity broker (Ciulli et al., 2020), can favour knowledge sharing among different stakeholders (i.e., citizens/users, municipalities, and waste management companies) and lead to value co-creation processes. Notably the study shows as a digital platform for waste management may enable and mediate interactions among different categories of stakeholders. Such direct and indirect interaction among actors help to overcome the barriers related to the existence of supply chain's structural hole (Burt, 2004) co-creating new value through the integration of resources, developed thanks to process of continuous interaction (Corsaro, 2019) between actors with complementary goals, in terms of knowledge against material and non-material rewards (Landi and Russo, 2022).

The case analysis contributes to both the literature on digital platform in waste management (Frempong et al., 2018) and Industrial Marketing and Purchasing (IMP) literature that focuses on resources interaction. For what concerns waste management literature, the study shows how the sector could benefit from the use of digital platforms (Kurniawan et al. 2022) as a bridge between different stakeholders interested in a sustainability and circular economy initiative. In addition, the study contributes to the RIA literature by deepening the categorization of resources within the digital context. In details, it indicates that technical resources, such as databases, cannot be exclusively classified as products or facilities (Mersico et al., 2022). A database is both a product

developed by organizational units using facilities and a facility useful to create or reconfigure products through their deployment by users.

A managerial implication can be formulated at the light of the results of this study. Software houses offering software solutions as a service (SaaS) need to consider both key technical and organizational resources in the phases of design, development and deployment of the platform in order to be competitive in the waste management sector. In this regard, this study has highlighted key variables that need to be considered when designing such an initiative, including the development of technical and organizational resources.

However, this study does not come without limitations. First, as with any case study, it is not possible to generalize the results beyond the context under examination. Secondly, this study focuses on a specific type of digital platform operating in a particular country as Italy. Thus, further research should include different types of digital platforms operating in different contexts.

### Abstract

The article focuses on collective knowledge formation processes in which an understanding of sustainable public administration (PA) is constituted. We turn the perspective from the production of sustainability data to the epistemic aspects of sustainability: to justifications, rationalities, and knowing in the specific context of sustainability management in public organizations. We approach sustainable policymaking as an ambiguous and complex process that requires collective sense-making of what public organization is and desires to be. This process may lead to a reconsideration of organizational identity, especially concerning core values, purpose and expectations of PA. Through a scoping review of the organizational identity literature, we explore what is known about identity construction and identity work in the PA context. The results of this review will provide insights to further analyze what sustainable PA means through the lens of organizational identity. We suggest that, as an ambiguous policy aim, sustainability will describe the new mission of PA and set strategic ambitions for transformation. In public

organizations, identity construction can be used as a tool for collective sense-making and knowledge formation that responds to the critical strategic questions of why PA exists, what it should achieve in the future, and how its tasks are prioritized. The article contributes to sustainability management discussions by linking public and knowledge management studies and extending the understanding of sustainability as a strategic aim in both fields of research.

**Keywords** – knowledge formation; sustainability information; organizational identity, public administration, policymaking.

**Paper type** – Academic Research Paper

## 1 Introduction

Although the objectives of economically, socially, and environmentally sustainable activities have been the subject of societal and scientific debates for decades, it remains unclear how to operationalize these goals in practice. Therefore, researchers, as well as policy practitioners, are struggling with the different political rationales — how to simultaneously pursue ecological, economic, and social goals, and how to make sense and thus ensure sustainable development both at the institutional macro-level policy and at the administrative and organizational levels in public service management. This kind of institutional complexity, with multiple competing rationalities and operational logics (cf. DiMaggio & Powell, 1983; Greenwood et al., 2011; Raynard 2016) related to the sustainability information and knowledge utilization in public administration (PA), and public sector knowledge management more in general, have received relatively little attention in the knowledge management (KM) literature (cf. Currie & Suhomlinova, 2006; Laihonon & Kokko, 2020).

Besides, sustainability has only recently become a conceptual focus of PA (e.g., Fiorino, 2010; Krause et al., 2016; Figueira et al., 2018; Trondal, 2021). Discussions on sustainability in PA have focused on the issues of sustainable development, especially from the perspectives of the environment, development goals, or accounting and reporting for sustainability (e.g., Greco et al., 2015; Hossain, 2018). Prior literature has not widely studied sustainability as an organizational issue. For example, Ball et al. (2009) and Zeemering (2018) stressed the need to understand the sustainability implementation process and its relationship with different aspects of sustainability in management activities and practices. Still, the

foundation of sustainability information as a socially constructed knowledge and existential part of PA, has not been studied so far.

Knowledge formation in sustainable policymaking is a complex process. We argue that the conception of sustainable PA is continuously reinterpreted and redefined through social interaction among multiple stakeholders and in various cycles of policymaking. This knowledge formation process in society is thus fundamentally dialogic and sociopolitical in nature (cf. Whitworth 2014). In this study, we approach public sector KM from the perspective of knowledge formation, where the foundation of sustainable PA is constituted. We explore what sustainable PA means through the lens of organizational identity with the aim to understand how organizational identity work and knowledge formation process reconcile different desires and expectations of PA. As a strategical ambition, sustainability describes the mission of PA: why it exists and what it should achieve in the future.

Our study contributes to public sector KM literature by emphasizing the social process of knowledge formation in sustainable policymaking. First, we turn the focus from sustainability data production to the ontological and epistemic aspects of sustainability in PA: justifications and rationalities that inform planning and implementing sustainable public policies. Second, we argue that as a result of this negotiation process, a conception and the intentions of sustainable PA will emerge and be constantly shaped. Consequently, sustainability reflects the many values, purposes, and identities of PA (Wæraas, 2010; Zalmanovitch, 2014). Different dimensions of sustainability, such as ecological responsibility, social equity, and economic performance, reflect the essence of PA.

The remainder of this article is organized as follows. First, we provide a brief overview of the premises related to knowledge formation in PA and continue by reflecting on this in the context of sustainable policy making. To understand what sustainable PA is and what it aspires to be, we introduce and analyze the literature on organizational identity. The results of this scoping review are then briefly described in section 4. Finally, we will discuss the potential of utilizing the concept of organizational identity as part of framing knowledge formation and its relationship with sustainability policy goals in PA.

## **2 Knowledge formation of sustainability in policymaking**

Sustainable policymaking is a strategic challenge to public management despite technological advances (Milano et al., 2014). Construction and utilization of knowledge for sustainable policy development is a complex process involving politics and multilevel decision-making with collaborative governance efforts. Surprisingly, literature on public sector KM has left the social processes of knowledge formation with little attention. This has led to the dominance of a rationalist-optimist view advocating technical and evidence-based knowledge in policymaking (Laihonen et al., 2023).

Despite the wide acceptance of knowledge as socially constructed, rationalistic approaches such as evidence-based policy and KM tend to dominate the discussion of public sector KM both in theory and in practice. The prevailing KM approaches prioritize data over meaning (Dumay, 2020; Spender, 2014) and fail to address wicked social problems, such as sustainability (Hess & Adams, 2002; Kay, 2011). Traditional knowledge-based problem-solving approaches still focus on the production of more information and sustainability data rather than the actual dynamics of decision-making and politics (Pollitt, 2006; Laihonen & Mäntylä, 2017; 2018). Critics argue that culturally and historically contingent aspects of evidence-informed policymaking and pluralistic views of truth are left uncovered (Sanderson, 2002; Dillard & Yuthas, 2013), with KM literature focused extensively on producing more information to manage 'tame organizational problems' (Dumay, 2020).

While a long history (e.g., Henry, 1974; Wiig, 2002) and an increasing body of recent literature promoting KM in the public sector exist (e.g., Agrifoglio et al., 2021; Dumay et al., 2015; Massaro et al., 2015), not enough attention is paid to the ways public actors constitute their understanding of sustainable PA, and what kind of policy programs, management strategies or practices they expect to lead to a sustainable future. Therefore, we turn the focus of KM to those social processes in which knowledge and understanding of sustainable PA are constituted.

Knowledge formation in PA highlights 1) the interactive and social processes by which the evidence base of sustainable PA is constructed, 2) the relevance of institutional complexity and organizational responses to sustainable development policies, and 3) the meanings that public actors attach to data and information on sustainability. From this, a threefold framework for analyzing knowledge

formation in PA has been suggested (Laihonen et al., 2023). This framework considers knowledge formation as a continuous interplay of institutional complexity, organizational responses, and individual sensemaking and argues that as a result of the process, the mission, goals, and values of PA take shape.

From the knowledge formation viewpoint, the perception of sustainable PA is continuously (re)created through collective sense-making processes bounded by the institutional demands and organizational responses contingent to the prevailing societal circumstances. Sustainable PA is thus enacted by individuals, the members of PA, based on their interpretations and understandings (Weick et al., 2005). Indeed, knowledge formation is an ongoing process (Lunkka et al. 2022), that represents the evidence, values, and objectives of society. More specifically, we assert that in the policymaking context, available sustainability data and information are enriched with the collective expertise and experiences of multiple stakeholders such as policymakers, policy advisors, managers, civil servants, and citizens.

For us, sustainability provides a timely and highly relevant phenomenon to contextualize the analysis of knowledge formation in PA. Sustainability is variously interpreted and valued in different organizational contexts making it challenging to operationalize. Such pluralism is typical for sustainability discourse, but management is often streamlined. This leads us to study the foundation of PA, its role, and the logics of identity, that is, what ultimately defines PA.

### **3 Methodology**

#### **3.1 Research task**

We challenge the rationalistic approaches of KM by taking an interpretivist position (Crotty, 1998; Guba & Lincoln, 1989) on how knowledge of sustainable PA is constructed in a politico-administrative context and in organizational processes. We do this by reviewing the literature on organizational identity in PA. As this is a conceptually oriented article, our aim is to analyze how identity building of PA could inform knowledge formation, which defines the priorities that public organizations attach to the policies and strategies dealing with the different societal phenomena..

Instead of a static description of what sustainability is or could be in PA, we strive to understand the elements of the knowledge formation process in which

conception of sustainable PA is constituted. We see sustainability as a profound strategic ambition, that concerns not only the sustainability data processing functions in public management but also transforming PA identity, its values and intentions to respond future policies. Knowledge of sustainability is constructed on many levels of PA, and organizational responses vary in producing the idea of a sustainable PA.

### **3.2 Data and methods**

As far as we know, no previous research has investigated how knowledge formation and identity of PA are connected, and therefore, we started our research journey by carrying out a scoping review (Arksey and O'Malley, 2005; Munn et al., 2018) which aims to uncover how organizational identity in PA context has been studied. The scoping review is useful for identifying gaps, general topics, and concepts used in the research field (Arksey & O'Malley, 2005).

Instead of systematic approach, our preliminary search was conducted in November 2020 from Scopus and Google Scholar with the search string "organizational identit\*" AND "public administration" OR "public services" OR "public sector". The initial search was intentionally as wide as possible, as our aim here was to gain the general scope of the research field, which could be at later phases then refined and specified more in detail for systematic review purposes (Arksey and O'Malley 2005; Munn et al., 2018). The Scopus search produced 34 articles and Google Scholar 2810 articles. We screened 604 research articles based on titles and language (English), their relevance, and online availability. After reaching saturation and removing duplicates, we obtained 27 articles that were fully read. During this phase, ten articles were excluded because they did not respond to the research task. Thus, our data consisted of 17 articles on organizational identity in the context of PA (Table 1).

## **4 Identity of Public Administration**

The results of the literature review reveal that many studies covered change aspects, which stimulate the identity formulation process as a response either to organizational change or public management reform. Studies on organizational identity in the public sector context show that constructed identities may be both defensive and proactive responses to managerial reforms. Most of the studies were qualitative case studies or conceptual. For instance, higher education

contexts seem to be highly relevant to study how organizational identities are constructed during managerial reforms (e.g., Garcia & Hardy, 2019; Fumasoli et al., 2015; de Boer et al., 2007). The theoretical background of organizational identity lies mainly in organization studies deriving from the fields of management sciences, social sciences and psychology. The topic has only recently become a subject of public management and public administration studies in the 2010s.

Three main approaches to studying organizational identity can be identified according to Rondeaux (2006). **Interpretative** (representations of who we are as organization, multiple contradictory identities involving sensemaking and incremental evolution), **interactionist** (emphasis on membership and collective creation of organization, co-constructed and negotiated identity, acknowledging inter-related groups, interactions and discourses) and **functionalist** (managerial action in building organizational identity, organizing and promotion of “shared” identity, symbolic management). (Rondeaux 2006).

Table 1 Scoping review of organizational identity in public administration context

<b>Authors</b>	<b>Approach</b>	<b>Organizational identity</b>	<b>Context</b>
Bankins & Waterhouse 2019	functionalist	identity construed of external image, management style and individual public service motivation	public sector identity in the labor market (conceptual)
Beech et al. 2008	interactionist, interpretative	identity as dynamic and changeable, inherently complex and constructed through interaction	public sector change (conceptual)
Brunsson & Sahlin-Andersson 2000	interpretative, interactionist	identity as an idea of being special and different from other organizations	public sector reforms (conceptual)
Czarniawska-Joerges 1994	interactionist, narrative	identity construction as a continuous process of narration	public sector organizations, state agencies
de Boer et al. 2007	Interpretative	identity as socially constructed, symbolic and cognitive side of organizations stimulating new ideas, changing attitudes and frames for action.	higher education, reform, university
Fumasoli et al. 2015	functionalist	identity as a flexible risk reducing device in strategic planning multiplicity functions	higher education, university
Garcia & Hardy 2007	Interactionist, interpretative	identities constructed by narratives	higher education, university

Mönkkönen & Puusa 2015	interactionist, narrative	identity as multiple interpretations of organization core characteristics	governmental offices, organization merger,

#### **4.1 Perceptions on organizational identity**

The concept of organizational identity has its roots in the work of Albert and Whetten (1985). They defined organizational identity as a construct that members use to describe what is central, enduring, and unique to their organization. Organizational values are also an essential part of organizational identity (Wæraas, 2010). More recently, studies on organizational identity have suggested that identity is not necessarily coherent and stable, but constantly changing, and that organizations can have multiple identities with different values (Wæraas, 2010). Instead of being explicitly established, organizational identity can be understood as a collective understanding shared by organizational actors that

have different perceptions of organizational identity, reflecting what the organization is, what it is becoming, and what it wants to be (see Rondeaux, 2014).

According to de Boer et al. (2007), organizational identity emphasizes the symbolic and cognitive side of organizations and their role in stimulating new ideas, changing attitudes, and new frames for action. Thus, identity is understood as a socially constructed concept of what an organization is or would like to be. The questions that an organization may ask itself include who we are, what kind of organization is this, and what makes us different. Constructing such an identity may include strengthening organizational autonomy, controlling collective resources, constructing boundaries, and defining 'being special' as an organization. According to Zalmanovitch (2014), the socially constructed identity of PA is grounded in the existence of and interaction among three pillars: political interests (what can be achieved), legal (under what structures, limitations, rules), and managerial tools (how it may be attained).

Mönkkönen and Puusa (2015) refer to ambiguity in organizational identity, which implies multiple possible interpretations of organizational core characteristics. Through dialogue, organizational actors can move from groups and practices toward joint action and into a more collective interpretation of their organizational identity. These narratives can act as stories of identity. Czarniawska-Joerges (1994) employed a framework that combines institutional theory with a narrative approach to study organizational identity. Organizational identity is based on the elements of temporality, locality, metaphors, interaction and narratives.. "The central questions are as follows: Who are we? What do we do? Who are we like? The labels from the private sector became metaphors in this specific context" (Czarniawska-Joerges, 1994, 207).

The new public management doctrine has influenced identities of PA. Skålén (2004) concludes that NPM reform initiatives create fluid, heterogeneous, and even conflicting organizational identities rather than a uniform and stable business identity for public organizations. Two types of identities can be discerned: one related to the ways in which organizational actors perceive the organization and other related to the perceptions that the organization is ascribed to others. For him, organizational identity is a metaphor for discussing and analyzing the organization.

Public organizations are characterized by contradictory and inconsistent values and identities. According to Palma et al. (2010), organizational identity refers to

the system of meaning that guides organizational actors' behavior, providing cohesion and security. In public sector organizations, unique characteristics and public identity imply bureaucracy, such as strong hierarchy, rule orientation, and policy dependency (e.g., Brunsson & Sahlin-Andersson, 2000; Palma et al., 2010). Wæraas (2008) discusses the challenges of introducing corporate branding in part of public sector organizational identity and argues that public organizations could benefit more from branding due to inconsistent values and multiple identities, rather than trying to promote one set of values and one identity at the expense of others.

Rondeaux (2014) suggests that the integration of different perspectives on organizational identities can complement each other. Reissner (2019) theorized that organizational identity is the outcome of collective sensemaking processes that connects the organization and its members recursively and ensures that their understanding of the organization matches its purpose and external expectations.

Organizational identity can be a management instrument with multiple functions that responds to changes in the organizational field. Organizational identity acts as a strategic tool for risk management to guide the desired future state of public organizations (Fumasoli et al., 2015). The management is responsible for the communication of the desired identity of the organization, and this vision reflects the way the organization is perceived by others. (Fumasoli et al., 2015.) This may also produce multiple identities with implications for human resource management. Bankins and Waterhouse (2019) characterize organizational identity as consisting of external, intra-organizational, and intra-individual factors, such as organizational external image and reputation, human resources management practices, and public service motivation of employees. Rondeaux (2006) shows that the universal values, mission, and purpose of public organizations are linked to the two identity logics of public service and public managerialism that define the identity of PA.

#### **4.2 Identity construction process**

Organizational identity construction can be used to examine how public organizations respond strategically to internal and external expectations, demands, and environmental changes (Fumasoli et al., 2015). Change seems to be a natural condition rather than an extraordinary event in the construction of organizational identity.

Simpson and Hibbert (2008) assert that organizational identity in PA is socially constructed through continuous interaction, traditions, social habits, and performative actions. They argue that identity construction is an emergent and dynamic interplay between the embodied interpretations of traditions and the spontaneous performative actions of organizational actors. Mönkkönen and Puusa (2015) highlighted interactive processes and stressed the meaning of conscious identity work. For them, dialogue and discourse are essential in examining organizational identity construction.

Public management reforms are ways to construct public organizations. Rondeaux (2014) considers organizational identity a prominent issue in public sector reforms and studies how organizational actors experience identity when modernizing PA. Therefore, understanding the environment and multiple perceptions is essential for organizational identification. There is not necessarily an agreement on institutionalized organizational identity, and different alternative organizational identities may coexist within the same organization. Similarly, Garcia and Hardy (2007) concluded that organizational identities are constructed by the narratives of organizational actors. For instance, how individuals talk about themselves, the group they belong to, other groups, their organizations, and other organizations. Through this process, specific individual and organizational identities are formed and different outcomes are achieved.

Reissner (2019) identifies two mechanisms that can help in the organizational identity construction process: 1) relational positioning that draws on possible configurations of institutional logics and associated identity resources, and 2) discursive framing that captures members' hopes and expectations. In addition, de Boer et al. (2007) highlight 1) constructing organizational boundaries such as defining own activities, environments, relations with other organizations, and government; 2) controlling collective resources such as commanding entry and exit and finances; and 3) being special as an organization, such as having a special task or way of working. Features of organizational identity in PA emphasize at the same time the idea of being special and part of general category of public sector organizations (Brunsson & Sahlin-Andersson, 2000). Public organizations have common features, such as autonomy, collective resources, and constructing boundaries. However, they also have characteristics that make them different from others, such as special purpose, competence, resources, or structures as well as culture and history (Brunsson & Sahlin-Andersson 2000).

Palma et al. (2010) see that following the NPM, a split between operational and strategic control has taken place. and as a result organizational mission is transformed into a more business-oriented mission. This has a significant impact on operations, employee profile, and organizational identity as identity provides meaning and security. Public organizations may identify with values that imply a more lenient identity, distancing themselves from "traditional" authoritative and bureaucratic identity. This kind of value statements can be considered symbols for constructing an organizational identity where (Wæraas 2010).

In public organizations, modern identity construction is a continuous process of narration in which the elements of narratives, "autobiographical acts", are constantly formulated and edited. Identity formulation is an interactive and collective process that can be managed as an organizational process. (Czarniawska-Joerges 1994). Thus, sustainability can act as a powerful idea that requires translation for formatting organizational identity and making sense of what sustainability means in public organizations.

## **5 Conclusions**

This study examined the identity of PA in the context of sustainable policymaking. Our premise in this study was that the social processes of knowledge formation would ultimately define the essence of PA, representing its basic values, objectives, and tasks. This led us to investigate the organizational identity of PA. From our preliminary literature review, the key elements of knowledge formation in PA identity are:

- Public management reforms act as a catalyst for transformation and considering who we are as organization
- Identification process and identity work is a social process
- Organizational members sensemaking, activity of individuals in identity construction process
- Tradition is a resource for knowledge needed in identity work
- Communication and dialogue are prerequisites for collectively interpreted identity construction, managers create forums for social interaction that promote cooperation and collaboration
- Context matters, institutional power play: instead of institutionalized identity, multiple and dynamic identities, hybridization.

Although sustainability was not discussed in any of the reviewed studies, the review provided many insights into the role of knowledge formation processes in identity work. First, studies focusing on public sector reforms (e.g. Brunsson & Sahlin-Andersson 2000; de Boer et al. 2007; Rondeaux 2006) and new public management in particular (Skålén, 2004; Palma et al. 2010) stress that a change in organization or strategy necessitates dialogue and collective sense-making of the transformed situation. It was highlighted that the identity of PA is socially constructed (e.g., Beech et al., 2008; Garcia & Hardy, 2007; de Boer et al., 2007; Zalmanovitch, 2014) and due to long-standing traditions of the bureaucracy in public organizations, more attention must be paid to the contextual determinants of change (external, inter-organizational, and individual factors, see Bankins and Waterhouse 2019) It is a task of management to promote collaboration, dialogue, and social interaction to construct knowledge for organizational identity (Mönkkönen & Puusa, 2015).

Second, the literature shows that multiple identities of PA may exist at the same time due to inconsistent values, and PA modernization efforts may spur identity hybridization (Rondeaux, 2006; Wæraas, 2010). Thus, the critical question for identity dynamics in public organizations is, who are we? This is an important issue when considering sustainability and its implications in public management. Management doctrines, such as NPM, have transformed public organizations' traditional universal values (Palma et al. 2010; Rondeaux, 2014). In the context of sustainability, public organizations may favor a softer organizational identity instead of their bureaucratic public sector identity (Wæraas, 2010). Thus, identity can be used as a strategic tool for promoting sustainability and organizational change or defending stability and continuity in organizations representing their future state (Fumasoli et al., 2015).

Finally, the literature brought out the issues of communication processes, brand, and image in public organizations that are used to demonstrate the specific mission and organizational identity of public organizations (Bankins & Waterhouse 2019). From the perspective of knowledge formation, the results demonstrate that, in each organization and decision-making situation, an understanding of the many purposes and values of PA is constructed. Therefore the role of individuals, narratives and values of organizational members cannot be ignored (Czarniawska-Joerges, 1994; Garcia & Hardy 2007; Wæraas, 2010). Simultaneously, in this knowledge formation process, the PA reinvents itself and

its identity is thus constantly evolving and reformed. As a result, in PA, there may be heterogeneous and conflicting organizational identities (Skålén, 2004).

For us, the review evidenced the importance of identity construction and identity work when public organizations confront such a wicked problem of sustainability. According to Zalmanovitch (2014), in principle, the political pillar of identity determines what needs to be achieved whereas the managerial pillar decides how it is to be achieved. Sustainability is illustrative example of a strategic ambition or a policy goal. However, in concert, it represents the core values of PA: efficiency, effectiveness, and equity (Bartle & Leunenberger, 2014) and these key tenets are related to sustainability in various dimensions. Thus, PA is characterized by profound sustainability in its processes and practices (Trondal, 2021).

These observations encourage to continue studying more systematically 1) sustainability as an ambiguous policy goal and as a strategic objective of public sector organizations, and 2) collective sense-making and knowledge formation processes where understanding of societal and organizational values are constructed. Through the interaction and dialogue, an idea of the sustainable PA emerges, describing what it is like and what it should achieve. Although national governance systems vary in their historical-cultural contexts, the problem of knowledge formation to ensure sustainable PA and its implications for research or policymaking is indeed a global one.

### **Abstract**

In the Italian context, inner rural and mountain areas suffer from depopulation, an ageing population, a lack of services, and extreme seasonal tourism. In order to counteract this phenomenon, the Italian National Strategy for Inner Areas (SNAI) identifies sustainable tourism as a promising accelerator of local development, along with agricultural and food production, renewable energy supply chain, and handicraft.

In particular, in this paper the new 24 Italian mountain inner areas, selected by SNAI in the second programming cycle (2021-2027), were considered case studies representing challenging contexts for the development and implementation of innovative and sustainable cultural tourism ecosystems through digital services. More specifically, this work analyses a set of web platforms to identify the best practices in cultural and

experiential tourism, their lacks and their main features and thus support both public and private bodies in New Product Development (NPD) processes of digital tourist services aimed to enhance and promote specific territorial contexts.

A 5-phase knowledge management approach is proposed to evaluate different tourism digital ecosystems that foster the enjoyment of specific sites and territories by disseminating the knowledge on them, providing different tourist experiences and improving their tourist vocation. The evaluation procedure is an iterative circular process based on three steps aimed at analysing the digital ecosystems' objectives and the quality of a series of features characterising them.

Applying the proposed knowledge management approach to the preidentified case studies highlighted that most new Italian mountain inner areas still need an innovative and sustainable cultural tourism ecosystem. Still, two best practices among the selected platforms were identified, reaching very high scores both for their objectives and the quality levels of their features. Results showed that most of the considered web platforms present high-quality showcases of places, offered experiences, and relatively good communicative and informative aspects. On the contrary, the features with the lowest quality levels are the active profiling tools and the presence of written interviews, testimonies and videos with people who tell their stories.

## 1 Introduction

In the Italian context, inner rural and mountain areas suffer from depopulation, an ageing population, a lack of services, and extreme seasonal tourism. Nevertheless, precisely because they have never been intensely inhabited, these areas have undergone fewer changes over time. Therefore, they preserve an essential part of the national historical and cultural heritage, handing down historic buildings and the most ancient traditions, crafts, material culture, natural landscapes and customs.

The national strategy for inner areas (SNAI) identifies sustainable tourism as a promising accelerator of local development, along with agricultural and food production, renewable energy supply chain, and handicraft (Lucatelli, 2016). Most inner areas rely on tourism as a dominant driver to implement long-run and sustainable local development. In recent years some tourist trends have reversed, such as the increase in proximity and sustainable tourism against destinations

overexposed and undergo mass tourism, but more is needed to ensure these areas' subsistence or sustainable development (Romagosa, 2020; Salmela et al., 2021). In rural environments characterised by a rich endowment of historical hamlets, archaeological heritage, monuments, museums, UNESCO sites, and natural parks, the tourism offer is based on cultural heritage, environmental recreation, sports activities, food and wine enjoyment (Andreoli and Silvestri, 2017).

The reactivation and enhancement of inner areas currently represent key challenges both at national and local levels: different funding measures and policies have been addressed for tourism development, but these must be used in favour of the development of resilient, circular, and sustainable models of cultural tourism and to avoid well-known phenomena of territorial over-tourism (Dodds and Butler, 2019; Ivona et al., 2021). Otherwise, territorial networks and cultural events can act as a real engine of development for the cultural tourism ecosystem as well as the increasingly widespread use of digital technologies (Baggio, 2020).

In the last 15 years, a profound debate has concerned the hypothesis of territorial development driven by tourism, theoretically and empirically. On the one hand, the typical conditions for economic growth, such as political institutions enforcing property rights, prices stability, and public investments in infrastructure and education, can favour any rental activity and, among others, tourism since the institutional solidity and local communities with a high level of quality of life act as the strongest attractor to foreigners and tourists (Payne and Mervar, 2010).

On the other hand, Information and Communication Technologies recently radically changed the global business context, generating innovative tools, methodologies and functions to be applied also for the development of tourism digital ecosystems. These are now facilitating and fostering strategic management, marketing (also territorial), sales and customer services to support companies and municipalities in developing competitive new digital services (Nikoli and Lazakidou, 2019).

Digital services are today considered essential, especially for promotional activities (Tichaawa et al., 2017). ICTs for tourism can be considered as an ecosystem of connected tools that can mutually foster communication (Serafeim, 2020) and interaction, also reducing the cultural, geographical, political and communication boundaries. Furthermore, such tools can also analyse data about, for example, competitive destinations and guest complaints, and even better

forecast tourism demand or communicate statistical information. In detail, applications accessible through social web pages have been studied to gain insight (Milano et al., 2011) into how travellers use them to: plan their journeys (Burgess et al., 2009; Tham et al., 2013; Xiang and Gretzel, 2010); to choose destinations between many possibilities (Di Pietro et al., 2012; Huete-Alcocer et al., 2019; Shafiee et al., 2016) that can be considered the combination of beliefs and impressions developed over time based on information gathered and processed from different sources (Phillips et al., 2017); to exchange users' information (Parra-López and Martínez-González, 2018; Tatsiopoulos and Boutsinas, 2010); to look for specific territorial food (Vila et al., 2021) and to build relationships by creating, sharing, and consuming social media content (Kang and Schuett, 2013; Munar et al., 2013).

In this line, the tourism supply is based on online platforms for territorial communication and marketing, thus enabling municipalities, local bodies and small villages to communicate and offer their touristic services worldwide. These platforms' effectiveness, efficiency and updating allow for the excellent or lousy promotion of a peripheral territory locally and globally. Grounded in the knowledge-based view of the New Product Development (NPD) intended as a cognitive process characterised by the use, development and management of knowledge assets, this paper, employing a multi-case studies analysis, stresses the importance of considering knowledge assets as value drivers that can support NPD process performance improvements.

In this framework, this paper proposes a 5-phase knowledge management approach including an iterative evaluation process to assess tourism digital ecosystems. In particular, a set of web platforms related to the new 24 Italian mountain inner areas, selected by SNAI in the second programming cycle (2021-2027), were considered case studies representing challenging contexts for the development and implementation of innovative and sustainable digital services. The evaluation of these web platforms, in terms of efficiency and efficacy, is aimed to identify best practices in cultural and experiential tourism, their lacks and their main features and thus support both public and private bodies in New Product Development (NPD) processes of digital tourist services aimed to enhance and promote specific territorial contexts.

The proposed knowledge management approach can highlight a useful overview on mountain inner areas' web platforms by employing positioning maps based on different parameters, such as their objectives, the quality of a series of

features and the offered experiences. The choice of parameters and their correlations are made by following a systemic approach capable of bringing out virtuous relations to be applied in specific territorial contexts (Bistagnino, 2009; Rolando et al., 2022a, 2022b). Some key parameters are related to the determination of the most widespread types of experiences proposed to understand the most common goals of digital tourism ecosystems and their positive impacts on the communities in improving the quality of life of citizens and tourists (Cutler and Carmichael, 2010; Obenour et al., 2006; Ryan, 2010). Furthermore, various web platform tools are analysed by drawing a map of the most efficient tag networks and the most effective ways of feeding a local and a global web community. This analysis evaluates how knowledge management in tourism platforms should promote a slow and sustainable perspective and the empowerment of tourism destinations. The more sustainable tourism strategies and practices are finally interpreted by considering the challenge of achieving a tourism-driven development in inner areas to build innovative, resilient and smart tourism digital ecosystems.

The paper includes a brief description of the proposed five-step methodological approach in Section 2, while introduces the web platform data sample related to the selected case studies in Section 3. The results of the web platform evaluation process are illustrated in Section 5, and some concluding remarks are proposed in the last section.

## **2 Methodological approach**

This paper presents a methodological approach to evaluate tourism digital ecosystems that provide different digital tourist services and promote the enjoyment of inner areas.

The methodological approach is based on five sequential phases (Fig.1). It includes an iterative evaluation process that can support experts in analysing web platforms' objectives and purposes, the quality of a series of features, including service and some technical aspects.

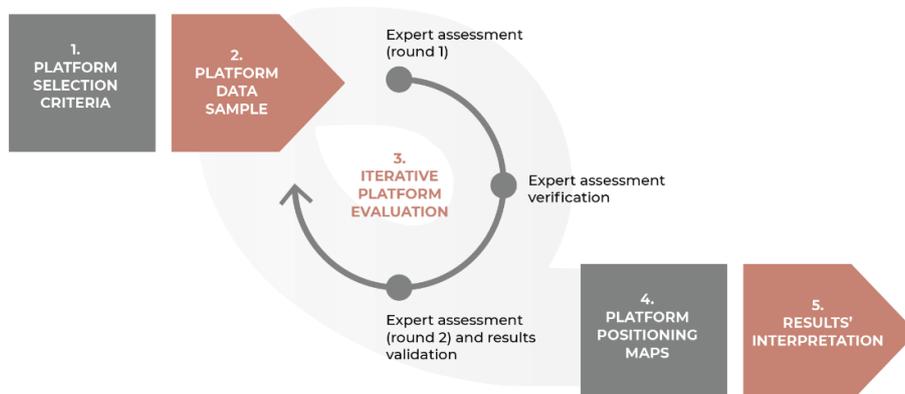

Figure 1. Phases of the methodological approach (Source: Authors' elaboration)

### **2.1 Platform selection criteria**

The first phase defines a preliminary set of criteria to select the web platforms coherently with the research objectives. In this phase, it is fundamental to choose the territorial scale of the analysis, which can be regional, national, or broader and might select a specific context (e.g., cities, inner territories, mountain areas or coastal towns). Furthermore, it is crucial to set the necessary criteria to analyse two main objectives of platforms closely related to the research questions (giving visibility to the territory and attracting tourists by improving the tourist vocation of the territory) and to define a series of variables that highlight their key elements (e.g., the presence of a showcase, calendar or stories).

### **2.2 Platform data sample**

In the second phase, the web platforms to be analysed are identified and selected based on previously defined criteria and variables. Therefore, data must be collected, structured, and organized in a sample that can be progressively completed and further detailed by including new cases or variables.

### **2.3 Iterative platform evaluation**

The third phase evaluates the selected platforms, representing a crucial step of the proposed methodological approach. The evaluation procedure is an iterative circular process in which the platforms can be evaluated and compared on different aspects, such as their primary objectives and the quality of a series of

features (services and technical aspects). Table 1 describes the two above-mentioned main objectives, five more specific objectives, and nine features related to services and technical aspects.

Table 1: Objectives and services and technical aspects

<b>Objective</b>	<b>Description</b>	<b>Evaluation scale</b>
Visibility	To make the territory more visible and well-known by publicising and raising awareness and attention on the territory.	0=absent; 1=marginal; 2=principal
Attractiveness	To improve the tourist vocation of the territory by promoting the regeneration of tourist areas/territories and boosting the tourism sector (attracting people).	0=absent; 1=marginal; 2=principal
Services	To offer valuable services to support travel or experiences organization in the area.	0=absent; 1=marginal; 2=principal
Community	To create a community of people interested in visiting the territory and sharing experiences through blogs and social media groups, through which users can interact and create different networks.	0=absent; 1=marginal; 2=principal
Built heritage	To exploit and enhance the built heritage of the territory by improving its knowledge and fostering its enjoyment.	0=absent; 1=marginal; 2=principal
Natural environment	To exploit and enhance the natural environment of the territory by improving its knowledge, fostering its enjoyment and promoting its sustainable use.	0=absent; 1=marginal; 2=principal
Social innovation	To foster and support social innovation through the proposed activities in terms of economic and social development in a specific community.	0=absent; 1=marginal; 2=principal
<b>Features</b>	<b>Description</b>	<b>Evaluation scale</b>
Showcase	Presence of a comprehensive showcase of places and experiences, with clear evidence of location, period and typology of them.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Map	Presence of a helpful geographical map to identify places and experiences and to support the travel organization.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Calendar	Presence of a helpful calendar to identify when specific events and experiences are scheduled and can be enjoyed throughout the year.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Tailoring	Presence of a series of sightseeing itineraries and experiences designed and planned for specific target users or themes. Possibility to create tailored travel	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent

	directly by the users: i.e., view favourite places on the map, choose in which order to visit them, plan the expected dates of the trip, save valid addresses for sleeping and eating, print and share one's travels with friends.	
Active profiling	Active or transparent profiling allows users to be aware of the personal information collected by the web platform, control their choice data and obtain an offer of a personalised product. Possibility to create a personal account.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Networking	Presence of the inscription to the newsletter, presence of a dedicated section for b2b and new investors. Presence of territorial/thematic cards as a passport to visit attractions.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Stories	Presence of stories (written interviews, videos, testimonies) which enhance local traditions, people and specific tales related to territory.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Usability	Presence of an optimal layout/grid of the site, a hierarchy of information presented, number of clicks to reach the information sought which make navigation quick and easy, and the main information is found in a short time	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent
Clarity	Presence of excellent correspondence between the communicative and informative aspects; a complete and exhaustive combination of texts, images and videos inform the user in the best possible way; the font chosen is adequate, and the texts are easily legible.	0=absent;1=insufficient; 2=sufficient; 3=good; 4=excellent

(Source: Authors' elaboration)

After the data collection, the consistency of the web platform data sample is verified in relation to the main objectives of the research ("visibility" and "attractiveness" in Table 1). Based on three phases, the evaluation of web platforms is led by a panel of experts who, during the first round, independently analyse and evaluate each web platform and fill the scores in a structured evaluation form. Then, the experts quantitatively check the scores expressed to correct any errors and avoid the subjectivity of the evaluation by defining specific thresholds for the standard deviation of the scores expressed for each characteristic. Finally, during the second round, the experts work together to correct the errors that emerged after the first round and the evaluation verification procedure.

## **2.4 Platform positioning maps**

After the evaluation results validation, it is possible to calculate the mean value of each objective/service to develop matrixes related to different pairs of variables. Furthermore, the quality of the evaluated platforms can be analysed by employing positioning maps to identify both those services/technical aspects that are generally present and adequate and those that are often missing or unsuitable.

## **2.5 Results interpretation**

In the last phase of the proposed methodological approach, results were read and interpreted in relation to a broader research context. In this phase, it is interesting to outline the most and the lowest scoring objectives and find the cluster of platforms that reach the higher overall score, identifying them as best practices for one or more variables. Finally, some specific topics can be focused on to deepen the analysis according to the aim of the research.

## **3 Case studies**

Tourism development is one of the possible measures to counteract the degradation problem characterising the rural territories and reactivate them. Thus, this paper considers the new inner areas selected in the second programming cycle (2021-2027) by the SNAI, and more specifically, the new mountain inner areas as case studies. In this second programming cycle (2021-2027), 43 areas were selected (Fig.2), from which 18 are located in the North of Italy, 10 in Central Italy and 15 in the South of Italy. It is also interesting that 24 can be considered mountain territories (in this case, a mountain area is considered an inner area with Average Altitude higher than 600 m.a.s.l.). Of these new 24 mountain inner areas, 16 are in the North of Italy, 7 in the South of Italy and only 1 in Central Italy.

This work investigates platforms that cover and promote a territory that corresponds as much as possible to a territory included within the boundaries of a certain inner area to identify the best practices, the lacks and the main features that characterise the state of the territorial promotion and branding of the new mountain inner areas in Italy. On this regard it is worth mentioning that the boundaries of the Italian inner areas are not defined for tourist purposes since the

SNAI criteria include also other socio-economic aspects (such as the presence of services related to education, health and transports).

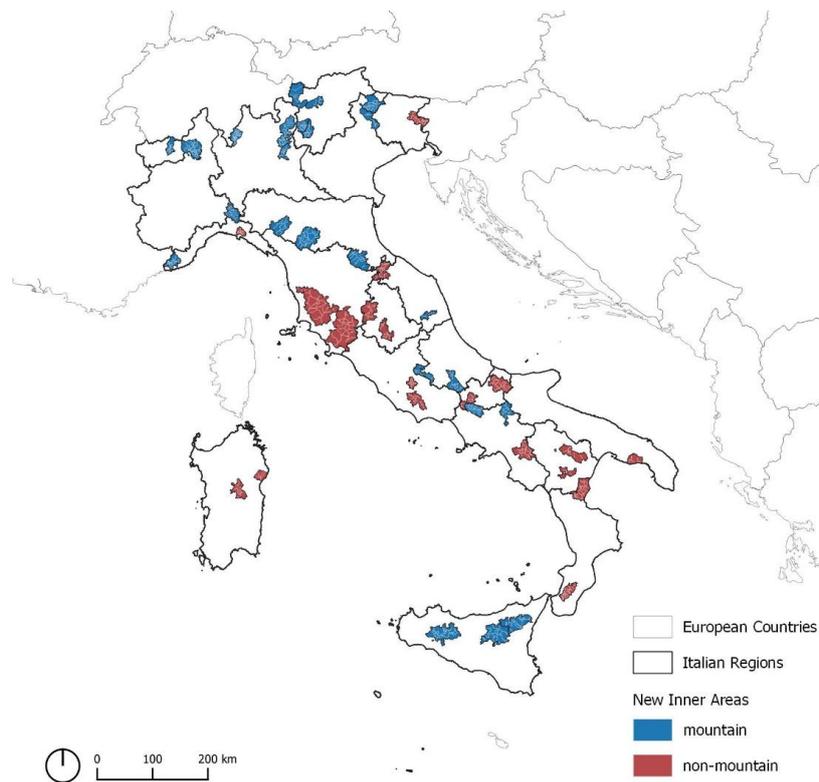

Figure 2. A map representing the 43 new inner areas, selected in the programming cycle 2021-2027 of SNAI, divided into mountain and non-mountain inner areas (Source: Authors' elaboration)

## 4 Results

The following paragraphs will present the results of each step of the applied methodological approach.

### 4.1 Platform selection criteria

To critically select the platforms that most accurately represent the research objectives, a list of 8 essential criteria was made (Table 2), which each web

platform must comply with to be included in the data sample and further analysed.

Table 2: List of the selection criteria identified

<b>N</b>	<b>Selection criteria</b>	<b>Type of criteria</b>
1	Platforms representing territories that have been identified as new inner areas according to the Italian National Strategy for Inner Areas (SNAI) in the second programming cycle 2021-2027, with an Average Altitude higher than 600m	Geographical
2	High correspondence between the area represented by the platform and the area included in a specific inner area	Geographical
3	Extension of the geographical area, promoted by the platform, on an administrative level not higher than a regional	Geographical
4	Exclusion of the simple informative websites - selection of only complex platforms offering tags, descriptions, filters etc.	Typological
5	Exclusion of apps	Typological
6	Fulfilment of the two first and main objectives identifies (Table 1) which are: 1) making the territory more visible and well-known 2) boosting the tourism sector (attracting people)	Content
7	Presence of experiences - related not only to accommodation and gastronomic experiences - but also to special itineraries, visits, laboratories etc.	Content
8	Presence of the possibility to purchase an experience directly from the platform to have direct contact with the specific operator providing it	Content

(Source: Authors' elaboration)

#### **4.2 Platform data sample**

After the initial identification of the new inner areas, selected in the second programming cycle (2021-2027) by SNAI, and all their corresponding municipalities, the Average Altitude of each inner area was calculated and was proceeded with the research of the platforms aimed to promote the newly selected mountain inner areas (the ones with an Average Altitude higher than 600 m.a.s.l.). It is interesting that of all 24 mountain inner areas, 10 of them do not present any web platform for territorial promotion. On the contrary, for the remaining 14 mountain inner areas, 19 platforms were encountered – a phenomenon that could be explained by mentioning that the boundaries of an inner area do not always correspond to the boundaries of a specific geographical area. Instead, the inner area often includes more than one geographical area.

After the application of all the selection criteria, from these 19 platforms, only 9 of them were selected as suitable (Table 3). It is interesting that all 9 of them are

promoting inner areas located in the North of Italy and that 2 of them are covering a territory of 2 inner areas each.

Table 3: The list of the 9 selected platforms

<b>id</b>	<b>Region</b>	<b>Inner area</b>	<b>Average Altitude (m.a.s.l.) *</b>	<b>Platform</b>	<b>Domain created Domain updated Age</b>	<b>Notes for the represented territory</b>
P01	PA Bolzano	Alta Val Venosta  Val d'Ultimo-Alta Val di Non-Tesimo-Lana	2245,24  1511,75	Südtirol	2001/08/01 2022/09/15 21 Years 7 Months	Big platform that covers 2 inner areas (Val Venosta and Val d'Ultimo-Alta Val di Non-Tesimo-Lana) and also some more territories outside their boundaries.
P02	PA Trento	Valle Rendena  Giudicarie Centrali ed Esteriori	1933,14  1046,84	Madonna di Campiglio	2010/07/05 2022/07/21 12 Years 8 Months	Platform that covers 2 inner areas (Valle Rendena and Giudicarie Centrali ed Esteriori) and also some more territories outside their boundaries.
P03	Veneto	Cadore	1572,88	Cadore Dolomiti	1997/11/27 2023/02/22 25 Years 4 Months	The platform covers an area smaller than the territory of the inner area, but still 8 of its 13 municipalities are represented.
P04	Lombardia	Valcamonica	1517,82	Valle Camonica - La Valle dei Segni	2012/06/04 2023/01/05 10 Years 9 Months	The territory represented by the platform corresponds to the territory of the inner area.
P05	PA Bolzano	Val d'Ultimo-Alta Val di Non-Tesimo-Lana	1511,75	Val di Non	2007/12/11 2023/02/07 15 Years 3 Months	The platform represents only one part of the inner area – Val di Non.
P06	Piemonte	Valsesia	1358,46	In Valsesia	2014/02/27 2023/03/15 9 Years 1 Month	The territory represented is smaller than the territory of the inner area. It lacks the geographical area of Valsessera.
P07	Piemonte	Valsesia	1358,46	Valsesia & Vercelli	2022/11/09 2022/11/09 0 Years 4 Months	The platform lacks the geographical area of Valsessera, a part of the territory of the inner area, while it also covers some areas outside its

P08	Emilia-Romagna	Appennino Modenese	804,26	in Appennino Modenese	2019/07/05 2022/06/28 3 Years 8 Months	boundary. The platform covers an area smaller than the territory of the inner area; nevertheless, 11 of its 18 municipalities are represented.
P09	Emilia-Romagna	Appennino Parma Est	753,71	Appennino Emilia	2021/07/26 2022/08/11 1 Years 8 Months	The platform covers an area much bigger than the territory of the inner area itself, but its entire area is included.

(Source: Authors' elaboration)

\*Weighted average calculated based on the average altitude of each municipality included in the specific inner area and its surface.

### 4.3 Iterative platform evaluation

The platform evaluation is an iterative process based on three steps, in this case, performed by a group of 5 experts. After the identification of the 9 platforms (Table 3), the first step was the verification of their coherence with the 2 main objectives ("visibility" and "tourists" presented in Table 1) by all 5 experts. Afterwards, each expert evaluated each platform, performing individually, according to the pre-identified objectives and features (Table 1). In the last step – verifying the scores, some but many incoherencies among the evaluations of the different experts were identified, mainly caused by the platforms' interface or menu unclarity.

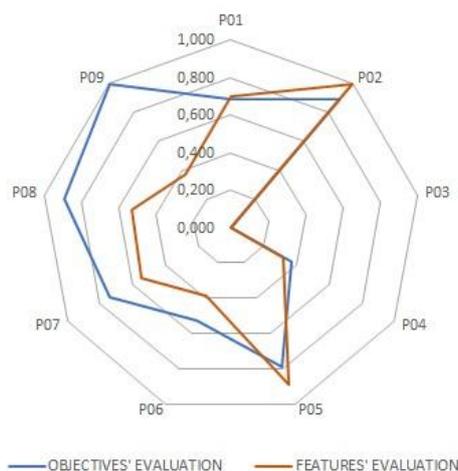

Figure 3. A spider graph representing the standardised evaluations of the expert group, where the numerations P01-P09 are the platforms' ids (Source: Authors' elaboration)

As a first result, it can be observed in Figure 3 that platforms P02, P05, P08 and P09 have obtained the best scores for the objectives' evaluation, while the best web platforms for the features' evaluation are only P02 and P05. More specifically, P02 and P05 platforms (Madonna di Campiglio and Val di Non) have obtained the best evaluation of their objectives and reached the highest quality levels of their proposed features. The P01 platform (Südtirol) can also be counted as among the best, even if it has some shortcomings in both the objectives and the characteristics. Otherwise, P08 and P09 (in Appennino Modenese, Appennino Emilia) show a big gap between their pre-stabilised objectives and the actual realisation of the platforms. This gap for P06 and P07 (In Valsesia, Valsesia & Vercelli) is a bit smaller. The lowest evaluation for both their objectives and features is observed for P03 and P04 (Cadore Dolomiti, Valle Camonica - La valle dei Segni). From these first observations, two platforms appear as best practices for different reasons - Madonna di Campiglio (P02) and Val di Non (P05). However other platforms present some specific optimal tool or feature that is worth to be explored.

#### ***4.4 Platform positioning maps***

In this step, the mean values obtained from the experts' group evaluations were analysed, and pairs of variables were chosen to construct two positioning maps. It was decided to create one map taking into consideration the two variables (relative to the platforms' features) with the highest scores, which in this case are the Showcase and Clarity (Fig.4a) and one map taking in consideration the two variables with the lowest score, which in this data sample showed to be the Active profiling and Stories (Fig.4b). This would allow us to analyse which are the best practices among the platforms both for the features that are widely used and mainly well-developed but also for the ones that are more often neglected.

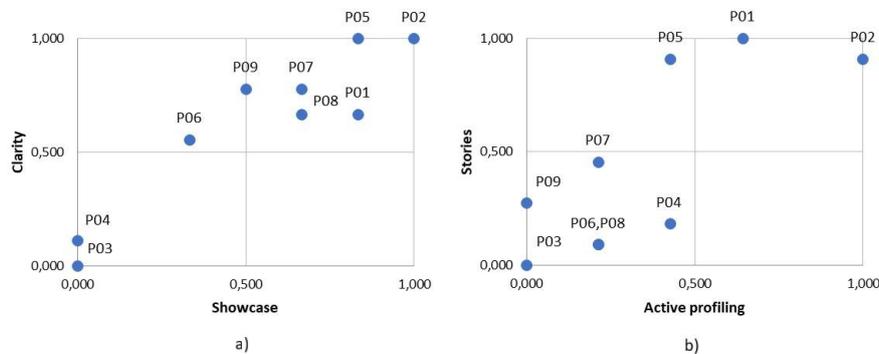

Figure 4. The positioning maps constructed: a) taking into consideration the pair of variables with the highest score in all the platforms (Showcase and Clarity), b) taking into consideration the pair of variables with the lowest score in all the web platforms (Active profiling and Stories) (Source: Authors' elaboration)

It can be clearly observed that regarding both the Clarity and the Showcase (Fig. 4a), the best example is P02 (Madonna di Campiglio) that have obtained the highest evaluation for both variables. Another best practice is P05 (Val di Non), which has also obtained the highest score for Clarity and is among the highest scores for the Showcase. Other good examples of Showcase and Clarity features are P01, P07 and P08 (Südtirol, in Appennino Modenese, Appennino Emilia). It can be noticed that the lowest scores regarding these two variables are those of P03 and P04 (Cadore Dolomiti, Valle Camonica - La valle dei Segni)

Regarding the features of Active profiling and Stories (Fig. 4b), the platform that could be considered as best practice is again P02 (Madonna di Campiglio) and also P01 (Südtirol). It is interesting the position that P05 (Val di Non) takes in this positioning map, showing some lacks in the Active profiling but achieving a very high score for the Stories feature. All the other platforms have obtained scores lower than the average for both the Active profiling and the Stories.

All these considerations also seem coherent with the first observations made in the previous step – showing as best practices platforms P02 and P05 and as underdeveloped ones platforms P03 and P04.

#### 4.5 Results interpretation

As mentioned, some best practices can be highlighted and insightfully exploited in designing new web platforms for inner areas. When assessing the quality of the offer of services, we carefully looked for authentic experiences in

which the territory would emerge as peculiar, and the local people could teach or tell their story. This is the case of P02 (Madonna di Campiglio), which showcases local experiences and/or made with local people (Fig.5a). P05 (Val di Non) web platform provides another excellent example, since this mountain area of Trentino alto Adige, for instance, is particularly renowned for apples and offers a series of themed experiences (Fig.5b).

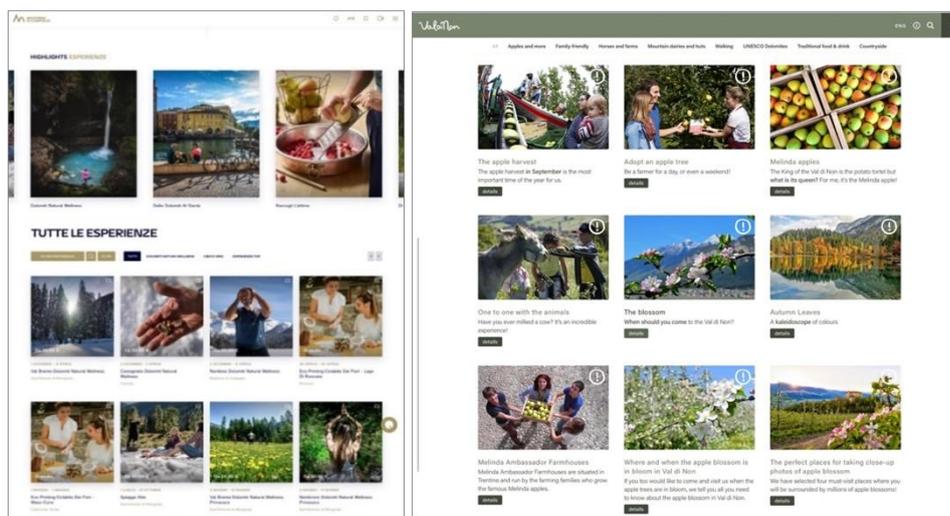

Figure 5. a) Madonna di Campiglio's Showcase of local experiences. b) Val di Non's apple Showcase of experiences. (Source a) Madonna di Campiglio Azienda per il Turismo S.p.A. b) Azienda per il Turismo Val Di Non Soc. Coop)

Therefore, the narrative aspect of the item concerning local stories is strictly correlated. For this aspect, we can state that P01 (Südtirol) offers a more comprehensive section of "stories". Figures 6a and 6b show some differences between the Italian and English versions of the web platform in terms of contents and layouts. The Italian version is more populated with two dedicated sections; "People in brief" and "Stories to be experienced". This means that the platform presents a quite different narrative offer for different targets, moving slightly towards what is probably the most sought-after by Italian and foreign tourists.

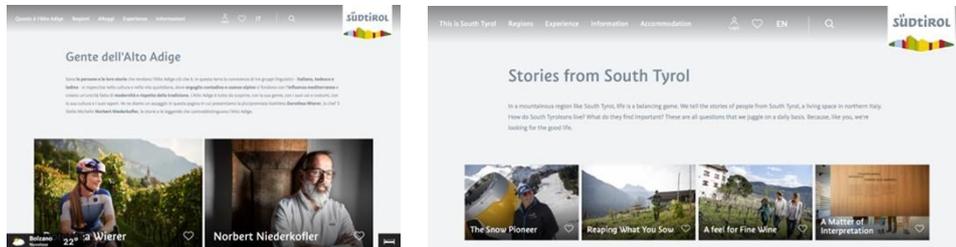

Figure 6. a) Italian version "People from Alto Adige". b). English section "Stories from South Tyrol". (Source: IDM Südtirol)

Finally, Figure 7 provides two examples of a page dedicated to personalities who have distinguished themselves in South Tyrol for invention, or sporting performance, or entrepreneurial model, or culture or other.

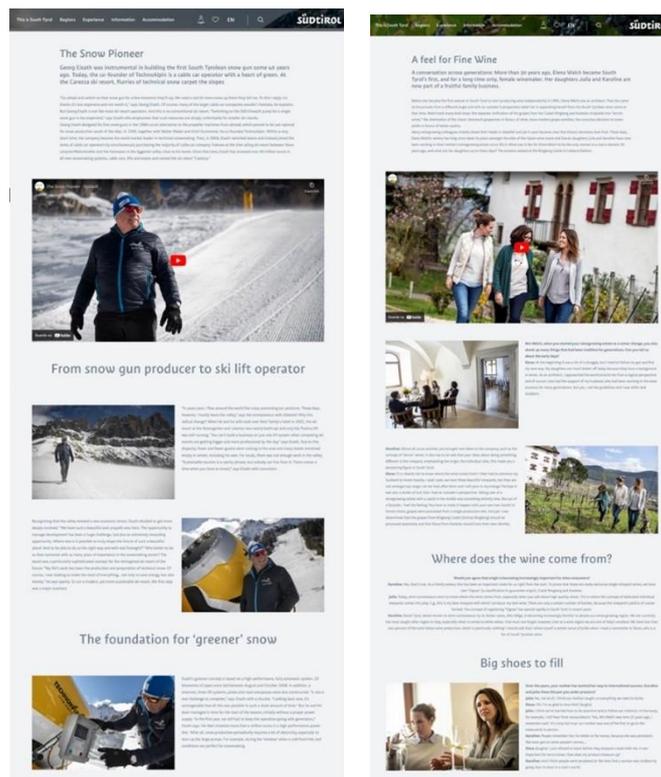

Figure 7. a) Example of a well-developed "Stories" section: "The snow pioneer, George Eisath".  
 Figure b) Example of a well-developed "Stories" section: "A feel for fine wine, Elena Walch".  
 (Source: IDM Südtirol <https://www.suedtirol.info/storiesfromsouthtyrol>)

Far from being exhaustive, the result section aims to show the potential of platforms' benchmarking, evaluation and comparison. Indeed, by analysing best practices or virtuous examples, it could be easier to support stakeholders in developing detailed guidelines for implementing new web platforms dedicated to enhancing inner areas by leveraging some communicative and operational aspects. Moreover, the results focused on pairs of items such as *Showcase/Clarity* and *Active profiling/Stories* items with the positioning map method; and *Showcase* and *Stories* with the case study analysis. These items have been identified as the worthiest qualitative aspects to be implemented when designing a new platform for inner mountain areas. Another important aspect often mistreated is the *Networking* relevance of the platform analysed. For example, some web platforms created newsletters, tourist cards or "territorial passports", which we interpret as evidence of the effort to connect and make the various territorial stakeholders dialogue. However, besides P09 (Appennino Emilia) – which we believed had among its goals to support social innovation – a dedicated section for b2b and new investors is often missing in the cases analysed.

## 5 Conclusions

In recent years, the economic and management literature has largely stressed the importance of knowledge assets for company competitiveness. Grounded in the knowledge-based view of the firm, which interprets the New Product Development (NPD) as a cognitive process characterised by the use, development and management of knowledge assets, this paper, employing a multi-case studies analysis, stresses the importance of considering knowledge assets as value drivers that can support NPD process performance improvements.

In particular, the new 24 Italian mountain inner areas, selected in the second programming cycle (2021-2027) by SNAI, were considered challenging contexts for developing digital tourism services. Implementing innovative and sustainable cultural tourism ecosystems (web platforms, apps and websites) aimed at disseminating knowledge on specific sites and territories and fostering their enjoyment represents a key objective for both public and private bodies to enhance inner mountain areas and improve their tourist vocation.

A 5-phase knowledge management approach supported the analysis and evaluation of a set of web platforms related to inner mountain areas, assumed as case studies and best practices in cultural and experiential tourism. Based on an

iterative circular process, the evaluation procedure guided 5 experts in assessing the main objectives of the selected case studies. The results highlighted two best practices (the web platforms of Madonna di Campiglio and Val di Non) that reached very high scores both their objectives and the quality levels of their features. The 5 experts evaluated the quality level of the platform features defined in the methodological approach (Showcase; Map; Calendar; Tailoring; Active profiling; Networking; Stories; Usability; Clarity) for each selected case study and built some positioning maps based on couples of the abovementioned features. Results showed that most of the considered web platforms present high-quality Showcases of places and offered experiences, as well as rather good communicative and informative aspects that reflect the Clarity of the platform's contents. On the contrary, Active profiling is often absent or has a low-quality level, together with the Stories section (written interviews, videos, testimonies) aimed to enhance local traditions, people and specific tales related to territory,

Furthermore, the evaluation results highlighted some interesting best practices or virtuous examples for specific features and services that could be assumed as a sort of guidelines for designing new web platforms dedicated to enhance inner areas by leveraging some communicative and operational aspects. On the contrary, some results also showed some cases that could be useful to avoid the most common errors.

The application of the proposed knowledge management approach for the analysis of the current web platforms of the new Italian mountain inner areas highlighted that most of them do not have an innovative and sustainable cultural tourism ecosystem, which could be developed by public or private bodies to empower those tourism destinations and to promote the knowledge of them worldwide. By analysing the specific features of the existing platforms, there is scope for improvement to foster inner areas' potentialities.

Nevertheless, it is worth mentioning that this research presents some limitations related to the small data sample, limited to 9 case studies, that could be extended by including the web platforms related to all 43 new inner areas (not only the mountain ones) in order to outline a more comprehensive overview on the current presence of adequate cultural tourism ecosystems in these fragile territories. Moreover, the quality level of other features could be deepened by building other positioning maps highlighting different issues that deserve improvement during the development of digital tourism services. Finally, the

platform evaluation procedure could be repeated by involving other experts and by comparing and thus validating the final results.

Identifying an inner area, which could be assumed as an actual case study for developing a web platform, represents an opportunity to use the identified main objectives and features as guidelines for developing innovative, resilient and sustainable digital tourism ecosystems.

### Abstract

Involved actors in healthcare processes have been reformulated: with systems servitization and patient engagement with awareness of their care pathway can be clarified through the Actor-for-Actor (A4A) approach. Referring precisely to this cyclically phased model, we focused on the structural prerequisites of engagement and relationships among actors and examined the determinants of the system and their commitment to the value of equitable care delivery: a system in which there are no unfair and avoidable or remediable differences between socially, economically, demographically, or geographically defined population groups. Looking through the A4A lens and using a dynamic systems approach, we find that motivational drivers for our digital technology actors' commitment to value-based care are rooted in meaningful data resource integration for meaningful interactions and timely, accurate decision-making. By analysing use cases of digital technology in support of the healthcare ecosystem such as artificial intelligence and robotics for telemedicine and remote patient monitoring, we witness the potential of equitable care to the population in compliance with the quintuple aim for health system performance.

**Keywords** Health Equity, Artificial Intelligence, Telehealth, Learning Healthcare Ecosystem, Sustainability

**Paper type** – Practical Paper

## 1 Introduction

A learning health system is an essential foundation for equity and sustainability (McGuckin et al., 2022; Bazemore et al., 2022; Gummesson et al., 2019). Learning care practice's main approach is to use predictive modelling in conjunction with evidence-based best practices to achieve and maintain population level health gains (Srinivasan et al., 2020). A learning pharmacy practice for example, continually generates data powered discoveries as a by-product of pharmacists' patient care process interactions, information from patients on drug interactions, to supplement clinical and research findings (Lester et al., 2020), transforming information for the service of equitable care. Every encounter generates data, which is then merged with existing data and analysed by teams of pharmacists and data scientists. The new knowledge gained is subsequently applied to all future contacts in the form of forecasts and actionable suggestions. The cycle of knowledge transformation creates a type of Information Common Goods that aid in the democratization of information and its availability for long-term societal growth (Badr et al., 2020).

Referring precisely to a cyclically phased model, we focus on the structural prerequisites of engagement and relationships among actors and examined the determinants of the system and their commitment to the value of equitable care delivery: a system in which there are no unfair and avoidable or remediable differences between socially, economically, demographically, or geographically defined population groups.

In this paper, we survey the contribution of digital health actors and the motivational drivers for value based care rooted in affording care equitably to the population in fulfilment of the quintuple aim. We reformulate involved actors in healthcare processes through systems servitization, technology innovation and patient engagement with awareness of their care pathway can be clarified through the Actor-for-Actor (A4A) approach (Barile et al. 2016; Polese et al., 2017). Looking through the A4A lens and using a dynamic systems approach, we find that motivational drivers for our digital technology actors' commitment to

value-based care are rooted in meaningful data resource integration for meaningful interactions and timely, accurate decision-making. By analysing use cases of digital technology in support of the healthcare ecosystem such as artificial intelligence and robotics for telemedicine and remote patient monitoring, we witness the potential of equitable care to the population in compliance with the quintuple aim for health system performance.

## **2 Methodology**

In the perspective of value-based healthcare, the roles of the actors involved in healthcare processes are being redefined. On one hand, services extend beyond the walls of medical facilities; on the other hand, patients' involvement and awareness of their care pathway can be clarified through the Actor-for-Actor (A4A) approach (Polese et al., 2017). A4A frames the interactions between actors in an ecosystem to understand the value chain. By referring to the cyclical model of A4A steps, we focus on the structural pre-conditions of actor's engagement, and relationships, then reviewed the system determinants and their engagement in the value of providing equitable care. Looking through the A4A lens, we can find those motivational drivers for engaging our digital technology actors using a system dynamics approach that includes proactivity, the convergence of ideas and values, shared intentionality, equality, cognitive alignment, integration of resources, emergence, and viability (Polese et al., 2017). Each actors becomes interested and 'engaged' in a given role within the care ecosystem (A4A - Actors' engagement). Therefore, actors in an equitable healthcare ecosystem become interested in the connection between people's access to and understanding of health services and their health. After the first 'connection' of important actors has led to the start of the engagement, it is feasible to observe ongoing interactions that are triggered by the alignment of aims and common purpose among all parties involved (A4A - Actors' relationships). When the context in which this engagement takes place is populated by multiple actors whose behavior can directly or indirectly influence (on the other hand, reciprocally) the engagement, this awareness becomes part of recognizing various spheres of equity that can influence the success of the engagement (A4A - Subjective awareness). Recognizing factors and constraints that influence each agent should lead to the development of shared purpose (A4A - Shared intentionality). When all parties involved cooperate, with shared intentionality, because they believe

that working together will result in mutual satisfaction, real or perceived, they can work toward common goals and bridge gaps (A4A - Finality Alignment). All aspects of the healthcare system, from practitioner, to patient, caregiver to information systems, law and payment systems to delivery design, assessment, patient engagement/democratization, training, and research, should be linked to improving the value and equity of healthcare during the next stage of transformation (Fiscella, 2019). In A4A, the latter is referred to as resource integration. (A4A – Resource Integration). Resource integration is critical for a system of actors to emergence in action. Once a care decision has been made, resources must be integrated to provide ongoing and accessible treatment to all groups of patients, regardless of location, social issues, or other limitations that can limit patient movement to the point of care.

### 3 Getting to Know our Digital Health Actors

Digital health, digital medicine, and digital therapies offer opportunities for life sciences and stakeholders to develop more personalized experiences and new ways of targeting patients as well as solutions to augment decision-making: Targeting medication non-adherence behavior (van Mierlo et al., 2015), in cases for hospitalization at home (Polese et al., 2018), and traceability (Dragoicea et al., 2021).

We review examples of digital health solutions in the literature, connected to equity in a learning healthcare ecosystem and identify such actors as Telehealth (TH), Artificial Intelligence (AI), cloud repositories, interactive portals with natural language processing (NLP). Additionally, solutions such as remote patient monitoring (RPM) that integrate devices and mobile APPs, robots and chatbots to avail equitable care at the reach of the population at large (Table 1).

Table 1: Getting to know our digital health actors - Technology in Focus with reference use cases

<b>Telehealth (TH)</b>	At Home Care (Allard, 2020); Pediatrics (Curfman et al., 2021; Cahan et al., 2020); Specialty care at a distance (Liddy et al., 2019); Midwifery & Telenursing (Sinclair, 2010; Silverio et al., 2021)
<b>Artificial Intelligence (AI)</b>	Cancer education (Wiljer, D., 2020); modelling work processes (Matheny et al., 2020); Models for improving bedside care (Smith et al., 2021); Centralized Electronic Platforms / AI-driven patient and caregiver engagement and connection platforms (van den Bemt et al., 2019)
<b>Interactive</b>	AI-based patient centricity and Tailored care (Kudumala et al., 2021) with Natural

<b>Portals</b>	Language Processing, for example.
<b>Remote Patient Monitoring</b>	Remote Patient Monitoring enable equity in access to Care at home (Baig & Gholamhosseini, 2013)
<b>Devices and Mobile APPs</b>	biosensors or wearable devices (Townsend et al., 2011); Vitals and adherence (Mohammed et al., 2019)
<b>Robots</b>	Robots shift the nursing function's unsettled resource-demand balance (Dankar & Badr, 2022).
<b>Cloud Repositories</b>	data aggregation and analytics (Celesti et al., 2019; Lai et al., 2020; Jadczyk et al., 2021; Laranjo et al., 2018; Jovanović, 2020; Kurup & Shetty, 2022)
<b>Chatbots</b>	Simulates human conversation (either written or spoken), allowing humans to interact with digital devices as if they were communicating with a real person (Nadarzynski et al., 2019; Softić et al., 2021). Intelligent triage assistant in COVID-19 "INAIL" (Duangdee & Lalitrojwong, 2021)

### **3.1 Telemedicine and Telehealth (TH)**

We start our review with Telemedicine as one of the most innovative and interesting applications in connected value-based healthcare and a viable alternative to in-person care (Mohtar & Badr, 2022). Telemedicine and the broader domain of telehealth make high-quality services available in previously inaccessible locations leading to equity in patient engagement and facilitating citizens' access to health information and services (electronic health records, electronic medical records, clinical document repositories, departmental systems, digital services to the citizen, etc.).

### **3.2 Artificial Intelligence (AI) and Interactive Portals with NLP**

Artificial Intelligence (AI) in healthcare is the theory and practice of health systems that can carry out tasks that would typically need human intelligence, such as speech recognition, visual perception, decision-making, and language processing. Models for improving bedside care continue to outpace adoption for quality care and equity (Smith et al., 2021). Decision-making and analytics provided through Artificial Intelligence, contribute to the realization of a learning health care system through modelling work processes, culture, equity, patient-provider relationships (Matheny et al., 2020). AI mitigates health inequities by improving partnerships between Physicians and technologists (Lin, 2022), and empowering multidisciplinary developmental science teams with expertise in cognitive development, medicine, psychology, computer science, and medical informatics (Israni et al., 2020). AI-driven patient and caregiver engagement and connection platforms (HCPs) can provide patients, partners with immediate access

to relevant, personalized content, and therapies (van den Bemt et al., 2019). Driving a next-generation HCP portals with natural language processing (NLP), Chatbots ease the literacy barrier and leverage AI enabled on-demand access to information for peer-to-peer opinion research to improve care delivery while expanding access opportunities (Kudumala et al., 2021).

### **3.3 Humanoids and Robots**

Artificial intelligence-driven robotics technology has advanced significantly in recent years (Pekkarinen et al., 2020) in a variety of industries, including healthcare (Johansson-Pajala & Gustafsson, 2020). Healthcare robots are starting to assume more prominence in helping people preserve their autonomy and caregiving responsibilities (Hosseini & Goher, 2017). With the aid of robots, elderly people can live independently at home, while healthcare professionals can operate more effectively in hospitals. Elderly people, healthcare professionals, family members, and the public have praised assistive technologies. More ubiquitously, healthcare robots are used to aid practitioners – such as surgical, radiotherapy, rehabilitation robots, nursing (Dankar and Badr, 2022) and laboratory robots. Robots are also assistive. Physically assistive robots (PARs), that are service robots that help individuals with daily duties (Hung et al., 2015), or Socially Assistive Robots, companion robots used to boost one's psychological well-being are known as socially assistive robots (Hersh, 2015).

### **3.4 Chatbots**

Akin to their humanoid cousins, chatbots are usually a software agent that simulates human conversation (either written or spoken), allowing humans to interact with digital devices as if they were communicating with a real person. The capabilities of this software agent are natural language and image processing, learning related to reasoning and planning, and finally social and environmental interaction (Tellex et al., 2020). The goal of chatbots is to foster access to information on referral sites through a natural conversational experience and improve the handling of queries by healthcare staff to avoid clogs and slowdowns in care delivery (Laranjo et al., 2018; Jovanović, 2020; Kurup & Shetty, 2022). For example, working through a partnership with INAIL (Italian Institute for Industrial Accident Insurance), Microsoft has made its Healthcare Bot available to Italian

diagnostic units prepared for coronavirus emergencies (Duangdee & Lalitrojwong, 2021). The Intelligent triage assistant – COVID-19 “INAIL”, can be easily adopted or customized by institutions of any size to deal with the pandemic through better self-assessment of symptoms.

### **3.4 Remote Patient Monitoring (RPM)**

Remote patient monitoring (RPM) is another example value-based healthcare, increasing access to healthcare services while optimising costs. RPM consists of observing the health status of patients outside medical facilities by employing integrated measurement devices in wearables or patient attached sensors. Such elements can be adapted to the needs of the person being monitored, the type of disease and parameters to be monitored, and to the requirements and capabilities of the medical facility or service provider services. Currently, most measuring devices work with technologies adapted for remote monitoring of patients. Different standards are used for wireless data transmission: Bluetooth, Wi-Fi, or GSM. Some measurement devices detect specific parameters and automatically send results without actively involving the user (e.g., biosensors or wearable devices) (Townsend et al., 2011). The most frequently monitored parameters are temperature, body weight, blood pressure, blood saturation, heart rate, and blood glucose (Mohammed et al., 2019). All data is stored in a cloud repository aggregation and analytics (Celesti et al., 2019). Patients, no matter their SDOH status, are under continual care by specialists who have real-time access to up-to-date information on their health. RPM saves time, helps patients maintain greater independence, and reduces the risk of complications (Yeter et al., 2021).

## **4 Motivational Drivers**

In this section, we look through the lens of the A4A approach and explicate motivational drivers for our technology actors in a learning healthcare ecosystem, engaging in a cognitive alignment around meaningful and informed interaction of these actors (Badr et al., 2022). The equifinality of patient centeredness promotes timely and effective decision making for equitable and sustainable outcome.

#### **4.1 Universal Access to Care**

Following the concept of shared intentionality (A4A), recognizing factors and constraints that influence each agent should lead to the development of shared purpose - Varied health burdens require regular access to care, self-efficacy, activation, and engagement (Knighton et al., 2018). In an equitable healthcare ecosystem, telehealth applications for at home care (Allard, 2020), for instance, provide a robust, comprehensive telehealth coverage, critical to improving access and quality of care and services, particularly for under-resourced populations (Curfman et al., 2021).

Telehealth services are available for specialty care at a distance (Liddy et al., 2019), pediatrics (Cahan, et al., 2020), even Tele-Midwifery and Telenursing (Sinclair, 2010) that provide education across the societal composition and geographic distances of the population. Course of preparation for childbirth by videoconference, to support women in a delicate moment like that of pregnancy and to limit the risks related to possible contagion, for instance (Silverio et al., 2021).

Virtual health may increase access to health care for many people, yet it may also exacerbate equity issues for those who have limited access to new technologies or who are technologically inept. Equitable integrated healthcare treatments would then require patient counselling, education, alert and monitoring, and communication (Knighton et al., 2018). Clinical consultations must accommodate patient technology demands for virtual visit preparation, as well as add new components for a better understanding of all participants' viewpoints.

#### **4.2 Cognitive Alignment - Meaningful and informed interaction**

Equity in healthcare access and service coverage includes the ability to make decisions, assess need and physical accessibility, as well as personal economic, social and cultural variables that influence access (Carroll et al., 2022). Interventions, often facilitated by technology, increase the potential improving health care outcomes by addressing patient resource, communication, and navigation barriers; these interventions are connected to (1) disease or condition type; (2) phase of the care process; and (3) technology accessibility in many cases (Knighton et al., 2018).

Health care providers must have the skills and ability to initiate change and define the future of their discipline and practices for developing high-quality care inside the digital ecosystem in order to help shape these new practices (Wiljer et al., 2021).

In order to make sense of the vast amount of data available to power AI technologies, practitioners and technology companies must interact to co-create, promote, or support innovation and insights that can potentially improve decision-making and healthcare fairness. High-quality data are necessary for healthcare research to achieve the quintuple goal, which incorporates care equity in its fundamental principles of quality care (Filliettaz et al., 2021).

#### ***4.3 Resource Integration - Timely effective decisions***

Artificial Intelligence (AI) is the science and engineering of making intelligent machines, with all what it entails of technology, data management and analysis components. AI technologies can greatly improve self-care options for persons seeking self-treatment or health-related information (Luxton, 2016). The top goal of AI is to build machines that are capable of performing tasks (e.g. Chatbot, robots and decision systems) that we define as requiring intelligence, such as reasoning, learning, planning, problem solving, and perception (Luxton, 2016). The use of intelligent care-providing machines also extends the benefits of telehealth services by availing services to care seekers in remote geographical areas and open access to specialty care services that may not be available in the patient's area. For instance, people who reside in areas without a sufficient population of mental healthcare practitioners can benefit from interactive virtual human care providers.

Accessible anywhere and at any time, even on mobile devices, virtual care avails information about health conditions, conduct question-and-answer assessments, deliver self-care counselling and therapeutic interventions. By integrating data from other intelligent devices such as environmental sensors, wearables, and biofeedback devices, intelligent systems can further customize services to the clinical needs of patients.

The confluence of technologies such as IoT and Cloud help fuel the capture, treatment and availability of data with the help of intelligent mobile and wearable devices to afford self-carers the possibility to monitor the progress toward individualized health goals. Machine perception is a form of AI powered by the

necessary hardware and software to recognize images, sounds, and touch, and even smell (i.e., machine olfaction) in a manner that enhances the interactivity between humans and machines, of which, Natural Language Processing (NLP) is an example. Ultimately, it can be argued that collaborative platforms, cloud computing, and artificial intelligence are strategic in healthcare to handle requests more quickly and effectively, providing benefits for healthcare workers, citizens and the entire healthcare ecosystem.

This favourable state of actor involvement serves as the basis for ongoing information exchange and resource sharing necessary to guarantee sustained value despite changing ecosystem conditions. Such resource integration is critical for a system of actors to emergence in action. Once a care decision has been made, resources must be integrated to provide ongoing and accessible treatment to all groups of patients, regardless of location, social issues, or other limitations that can limit patient movement to the point of care.

However, the growing usage of algorithms in a variety of medical professions increases the risk of health inequities. To improve data collection and coding, more clinical participation is required (McGuckin et al. 2022). The concept of digital compassion and digital empathy should grow, since AI work may mitigate, exacerbate, or perpetuate existing disparities, especially in times of pandemic (Röösli & Hernandez-Boussard, 2021). Those in charge of AI in healthcare must ensure that algorithms are objective and fair, as well as accurate. Because many clinical trial protocols and diagnostic tests consider the race and ethnicity of the patient, a debate has developed over whether this selection is evidence-based.

#### ***4.4 Equifinality of Patient Centeredness***

For people who have difficulty accessing medical care, remote monitoring allows regular health checks and consultations, health status, and medical consultations (Bombard et al., 2018). They allow rapid consultation with a medical specialist, facilitate the initiation of treatment and accelerate the adjustment of a treatment therapy (Gandy et al., 2021). Medical personnel can simultaneously monitor more patients and spend more time on communication and patient education, a key aspect in the prevention and control of chronic diseases (Paterick et al., 2017). For example, companies that provide remote patient monitoring solutions, present a complete ecosystem of scalable and interoperable products

that can be adapted to many needs, either by modifying and adding new devices or by integrating with external systems.

Research and companies are increasingly moving toward patient-centeredness, a concept that dates back decades (Greene et al., 2012). Patient-centeredness is more than just providing good quality care, it means turning patients into equal partners and putting them at the center of healthcare decisions (Saha et al., 2008): from patients to ecosystem actors for value co-creation (Ciasullo et al., 2017). Co-creation with the patient could change the decisions made by companies in the field, all along the process, including what to research, how to develop it, how to package and distribute it, and finally how to measure the results (Zhang et al., 2015; Birnbaum et al., 2015; Zhao et al., 2015; Marsilio et al., 2021).

Therefore, the steps that can be researched are co-ideation, co-design, co-evaluation, co-testing, and co-launch (Russo Spena & Mele, 2012). Digital and data solutions can help integrate patient-centricity along the value chain. Tracking consumer interest and actual use of technologies allows life sciences companies to focus more on the patient.

Equitable access must consider all age groups. Children, for example, face specific challenges during examinations, including the level of participation of the child during video conferences and the need to rely on another person to elicit physical indications in order to make accurate diagnoses (Gattu et al., 2016). Disparities in telehealth's impact on the workforce treating children, as well as its social consequences, have been identified in the literature, indicating that there are opportunities to establish a more equitable care delivery paradigm (Nguyen et al., 2022). As telehealth for paediatric populations becomes more widely applied, complex issues such as prudence, acceptability, design, interoperability, effectiveness, diffusion, cost-effectiveness, adaptability, monetizability, and security can help assure equity (Cahan et al., 2020).

The technical gap in the patient population must also be addressed. Patients who do not have a smartphone, for example, can still communicate with healthcare professionals by SMS. Older people, on the other hand, have restricted access to Internet-based services due to their low socioeconomic status and inadequate digital literacy; this disparity around telemedicine may exacerbate mental health issues and widen global health disparities (Zhai, 2020).

Trust in technology, design, cognitive impairment, and physical limitations such as poor vision, hearing, or sensory impairment are among the issues that telemedicine for the elderly faces (Tan et al., 2020). Without such efforts, tools

may represent the many different ways that data, computational, and analytic biases can be produced, resulting in increased inequity based on race, ethnicity, gender, and other sociodemographic variables connected to uneven health outcomes (Clark et al., 2021).

#### **4 Conclusions**

Enabled by innovations in digital health technologies, Value-Based Healthcare becomes be predictive, preventive, personalized, and participative (Baiardini & Heffler, 2019). The ability to create and integrate the knowledge base for exchange, management, re-use, sharing of information and responsible management of common data are key drivers of the evolution of societies, the progress of humanity and competitiveness. For a sustainable smart city, an adaptive capacity is becoming more and more important, requiring timely innovation technological and social innovation (Yigitcanlar et al., 2018). This leads to improved productivity where all actors, including the underprivileged can produce higher values that can be reflected in citywide economic growth. When cities attract skilled knowledge workers, they can bring new ideas, innovation, and prosperity (Spohrer and Maglio, 2008).

Alberti et al., (2013) recognized that driving "legislative actions regarding payment reform, health information technology, community health needs assessments, and expanding health equity research could be woven together to build an evidence base for solutions to health care inequities", by reducing unwarranted variations in care to maximize the value of healthcare for populations (Cheung and Gray, 2013). Enabled by innovations in digital health technologies, Value-Based Healthcare becomes be predictive, preventive, personalized, and participative (Baiardini & Heffler, 2019).

By functioning in this type of dynamic, a virtuous circuit of value cycles is leveraged to stay adaptive in the face of change. The value created by universally accessible care, through collaboration from digital actors in the ecosystem generates meaningful and informed interactions that can yield timely and effective decisions (Figure 1).

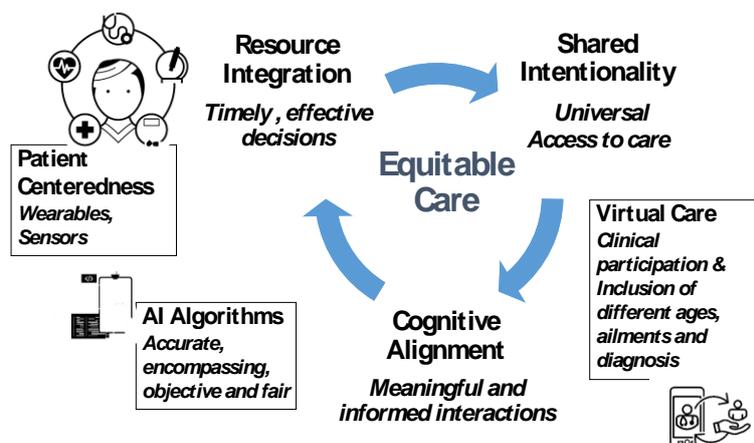

Figure 1: Digital Actors in Equitable Healthcare Service Ecosystem.

Complex smart service ecosystems are the outcome of systematic methods of continuous learning, timely data collecting, rational innovation, social responsibility, and network governance, rather than basic intuitions (Spohrer et al., 2011). Resource integration reinforces the shared intentionality for equitable care closing the cycle through cognitive alignment that maintains levels knowledge integration necessary to provide equitable care. Information gained from diverse actors in the healthcare ecosystem is at the heart of its processes, fostering long-term progress (Badr et al., 2020). The capacity to construct and integrate a knowledge base for the interchange, management, re-use, and sharing of information, as well as the responsible management of shared data, are fundamental drivers of society's growth, humanity's progress, and competitiveness. The goal of smart cities is to utilize technology to connect diverse infrastructures and services, as well as to better understand social aspects in order to construct human infrastructures and governance for institutional reform and public participation. Smart cities are said to have three primary goals: increased production, sustainability, and livability (Kim et al., 2021). Therefore, our digital health technology actors, become the cornerstone of value based healthcare that uses of evidence based decision making (to ensure that only interventions with strong evidence of cost effectiveness are used), emphasizes quality improvement (to improve outcomes), and cost reduction and to increase the value that is derived from the resources available for a population. Hence, the condition remains that in this debate's background, lest there be superficiality

and demagoguery, there should be real cooperation of all the actors involved in the ecosystem for the achievement of the quintuple-aim analyzed here.

There is a need to redefine a new set of values that will have to govern relations between the various areas of a world that is now globally connected at a time when common, truly universal demands are emerging, among them the right to health. It seems, therefore, desirable that what might be called a universal health consciousness be formed toward increasingly equitable and value-based care in which all actors are involved, as well as the digital ones.

## **5 Contribution and Limitations**

In conclusion, the paper makes several contributions to the field of healthcare augmented by digital technologies. First, it introduces the Actor-for-Actor (A4A) approach, which can clarify the engagement and relationships between actors in healthcare processes. This approach can help identify the structural prerequisites of engagement and the determinants of system commitment to the value of equitable care delivery. Second, the paper demonstrates how digital technology actors, such as artificial intelligence and robotics, can support the healthcare ecosystem, particularly in telemedicine and remote patient monitoring. Through the use of these technologies, it is possible to provide equitable care to the population, in accordance with the quintuple performance aim of the healthcare system.

However, this paper also has limitations. One limitation is that the paper is practical because it illustrates use cases but with a conceptual perspective and does not provide an in-depth analysis. Although the paper highlights the potential benefits of digital technology, it is important to consider the ethical considerations of the use of digital technology in healthcare and their potential risks and unintended consequences that could occur. Another limitation is that the paper focuses mainly on the perspective of healthcare professionals and digital technology actors, rather than that of the patient. Future research could explore the patient's perspective and the impact of digital technology on patient outcomes and experiences with more in-depth analysis. Despite these limitations, this paper highlights the potential of digital technology in supporting value-based and equitable healthcare. By identifying the structural prerequisites of engagement and leveraging digital technology actors in the healthcare

ecosystem, there is a way forward in working to improve healthcare outcomes and reduce health inequalities.

### **Abstract**

Quality improvement is, for most countries, a central objective of health care system reform and service delivery, which is why health care managers must devote a great deal of attention and resources to ensuring a high quality of care for patients and must continuously strive to improve it.

Within healthcare organisations, managers have an important and obvious role to play in the quality of care and patient safety and this is certainly one of their main priorities everywhere.

However, it is not always easy to understand how to improve quality: there are numerous issues that healthcare managers have to deal with.

To assist and evaluate health managers in quality development, effective methods have been implemented and promoted at national and local levels, including external quality assessment mechanisms.

Many countries have a set of voluntary or statutory mechanisms for periodic external assessment of organisations against defined standards; these include ISO standards, which provide standards against which organisations or functions can be certified by accredited assessors. However, the ISO standards define the minimum level required and their evaluation is only done on documents. For this reason, other bodies, such as The Joint Commission International (JCI), have developed new standards and evaluation methods. The JCI method consists of stimulating the demonstration of continuous and sustained improvement in healthcare organisations through the application of shared international standards, international patient safety targets and the measurement of indicators.

This research aims to outline how the JCI method can improve the work of managers in improving organisational performance.

A qualitative approach is used to answer the research question and semi-structured interviews will be administered to a selected sample of CEOs of JCI accredited healthcare organisations in Italy (out of a universe of 24 total accredited healthcare organisations).

The questions to be asked will investigate three main areas: (1) the role of quality accreditation in better defining responsibilities among managers; (2) how quality accreditation can be used as a tool to improve organisational leadership; and (3) how quality accreditation can help health care organisations better achieve their performance goals.

Interviews will be transcribed and analysed using qualitative data management software (Dedoose), which involves the use of a pattern recognition process in which emerging themes become categories for analysis. The coding framework will be developed by all researchers involved in this work using a joint blind coding approach.

The expected results of this research will help to shed light on the differences brought about by quality accreditation in organisational performance: already accredited institutions will then have the task of sharing their experience to highlight the positive and negative aspects of accreditation.

## 1 Introduction

Quality has become an important concept in our lives. Users are always looking for quality products and services (Mosadeghrad, A. M., 2012). The existence of this need for quality has caused companies and organisations around the world to consider quality as an indispensable component of every service and production process (Chassin et al., 2013). Quality is therefore considered by

companies as a strategic differentiation tool to gain a competitive advantage (Cham et al., 2020). By improving quality through the improvement of structures and processes, it is possible to achieve a reduction in waste, rework and delays, a reduction in costs and an increase in patient satisfaction (Lagrosen et al., 2005, Rahaman et al., 2001); all leading to an increase in the effectiveness and efficiency of the organisation that benefits users and employees (Alexander JA et al., 2006). The term 'quality' can take on different meanings, which can make the term take on a more traditional or a more strategic definition (Aggarwal et al., 2019). For example, The American National Standards Institute (ANSI) and the American Society for Quality (ASQ) define quality as the set of characteristics of a care or service that affects its ability to meet certain needs (Bodade et al., 2021). Within the TQM (Total Quality Management) concept, which stands for an approach to quality extended to all business functions (Zamolo D., 2015), quality is defined as a strategy focused on user needs (Anubha et al., 2018). Joseph M. Juran (2010) defined quality "as compliance with requirements".

Very often in health care, quality is determined and evaluated by the expectations of health care providers and professionals (Aggarwal et al., 2019). The quality of healthcare delivery is determined by patient satisfaction, is based on patient expectations, and is linked to training and interpersonal relationships (Mandeep et al., 2014). It is very important to define, measure and improve the quality of health services. Quality has a subjective nature and intangible characteristics, that is why it is very difficult to define (Mosadeghrad, A. M., 2014). The quality of healthcare services is even more difficult to define and measure than in other sectors because the distinctive features of healthcare, such as intangibility, heterogeneity, and contemporaneity, make it difficult to define and measure quality (Joss R. et al, 1995, Naveh E. et al, 2005), Furthermore, it has been added that the quality of health services also depends on the health care provider because there may be differences in background, experience, skills and personal characteristics between them (Mosadeghrad et al., 2012). Another characteristic of the health service is that it is dependent on the service process and the interactions between customer and service provider (McLaughlin et al., 2006). There are also some attributes of health service quality, such as timeliness, consistency and accuracy are difficult to measure beyond a subjective assessment by the customer (Mosadeghrad, A. M., 2014). Quality in health care can be defined as the application of medical science and technology to maximize the health benefits they create without increasing the risk for the patient (Donabedian

A., 1980). Quality in health care can be defined as the application of medical science and technology to maximize the health benefits they create without increasing the risks to the patient (Donabedian A., 1980). quality can be divided into three components: 1) technical quality, 2) interpersonal quality and 3) services (Haddad et al., 1998). Technical quality refers to the effectiveness of care in producing a health gain. Interpersonal quality refers to the ability to meet patients' needs and preferences. Finally, services include characteristics such as the comfort of the physical environment and attributes of the organisation of services (Donabedian A., 1988). Øvretveit (2009) defines quality care as the "provision of care that exceeds patient expectations and achieves the highest possible clinical outcomes with the available resources". He has also developed a system to improve the quality of healthcare based on three dimensions of quality: professional quality, customer, and management quality (Øvretveit J., 2009). Professional quality is based on the professional's opinion that consumers need have been met using correct techniques and procedures. Customer quality is based on the fact that the direct feel they are getting what they want from the services. Management quality is about ensuring that services are delivered in a resource-efficient manner (Øvretveit J., 2000).

Therefore, quality improvement is, for most countries, a central objective of health system reform and service delivery (Li et al., 2020). Within healthcare organisations, managers have an important and obvious role to play in quality of care and patient safety and this is certainly one of their top priorities everywhere (Parand et al., 2014). However, it is not always easy to understand how to improve quality: there are numerous issues that healthcare managers have to deal with (Price et. Al., 2020). For example, access and continuity of care, clinical effectiveness, patient safety, value for money, consumer responsiveness and public accountability of services are just some of the issues that managers may encounter (Dykgraaf et al., 2021). To assist and evaluate healthcare managers in developing quality, effective methods have been implemented and promoted at national and local levels, including external quality assessment mechanisms (Shaw et al., 2002). Many countries have a set of voluntary or statutory mechanisms for periodic external assessment of organisations against defined standards (Shaw et al., 2002); these include ISO standards, which provide standards against which organisations or functions can be certified by accredited assessors; they were originally conceived for the manufacturing industry (e.g., drugs, medical devices), then applied to healthcare, particularly radiology and laboratories (Pomey et al.,

2010). However, ISO standards define the minimum level required and their evaluation is only done on documents. For this reason, other agencies, such as The Joint Commission International (JCI), have developed new standards and evaluation methods (The international joint commission standards for hospital accreditation). The JCI method consists of an accreditation process comprising a series of initiatives aimed at responding to the growing worldwide demand for an objective methodology for the evaluation of health services based on quality standards. The aim is to stimulate the demonstration of continuous and sustained improvement in healthcare organisations through the application of shared international standards, international patient safety targets and the measurement of indicators. Accreditation, therefore, is considered a reliable tool for assessing and improving the quality of healthcare (Hussein et al., 2021). JCI, like other accreditation bodies, has the task of providing accreditation to hospitals to improve quality and patient safety. (Alkhenizan & Shaw, 2011). JCI is the biggest international accreditation organization, it offers a huge number of guidelines for accreditation (Naveh et al., 2005). JCI accreditation aims to certify that accredited facilities possess certain characteristics such as, for example, management integration, communication to the public and confidence building, quality and safety, and international profile (Tabrizi, Gharibi, & Wilson, 2011). International certification can be useful to improve international recognition of healthcare institutions and demonstrate excellence in medical quality (Oh et al., 2013). However, its effect on performance and outcomes remains unclear. The aim of this research is to try to understand how quality is implemented within healthcare institutions and the actions that healthcare management can take to try to improve it. In addition, an attempt will be made to illustrate how and whether or not JCI accreditation helps the migration of quality within healthcare organisations.

## **2 Method**

The research question implies the use of a qualitative approach. A selected sample of chief medical directors has been selected among the 25 Italian health organisations listed as JCI-accredited. The methodology selected relies on privileged observer theory (Della Porta, 2014; Pratici et al., 2022), selecting respondents which are at the same time involved in the phenomenon and being at the top hierarchy of the organisations analyzed.

Two criteria have been followed to better define the sample: respondents had to (1) have been a chief medical director of a JCI-accredited organization for at least one consecutive year, and (2) have previous experience in other non JCI-accredited hospitals.

We invited 17 interviewees, out of the 25 total respondents meeting the defined criteria in Italy. However, only 9 of them accepted the invitation (36% of the total universe considered).

Even if the percentage of interviewees compared to the total universe seems high, the low overall number of interviewees made impossible to run a structured interviews Therefore, we opted for a non-structured approach (Kvale, 1994).

Interviews consisted of 5 questions:

1. Quality development is a strategic goal of healthcare organisations: in which document does your approach to quality be described?
2. How does your medical directors organize the work to pursue quality development?
3. What tools does medical directors use to assign quality strategic goals at an operational level?
4. How does JCI accreditation help units' directions to better manage the organization?
5. What are the strengths and weaknesses of Italian NHS mandatory accreditation and international voluntary accreditation?

Interviews were thus transcribed and coded using a qualitative data management software (Dedoose®). A process of pattern recognition is used where emerging themes become categories for the analysis (Aberbach & Rockman, 2002; Della Porta, 2014; Price et al., 2020).

The coding framework was developed by all researchers contributing to the writing of this paper, in a joint process of double-blind coding (Price et al., 2020). The framework made it possible to identify the flows of information, characterizing key elements high- lighted by the interviewees, in both positive and negative meanings (Pratici et al., 2022).

### **3 Results**

Responses from the nine organisations have some common elements we have below described question per question:

### **3.1 Quality development is a strategic goal of healthcare organisations: in which document does your approach to quality be described?**

All respondents provide evidences about the fact that quality strategic goals in their organization have been described and formalized into top strategic documents. Generally speaking the document where quality goals have been described are broad strategic documents integrated that could represent the approach of the entire organization to the quality improvement and patient safety.

Majority of organisations identify this document as "Quality and Patient Safety Plan", in some case this document is the "Organization Strategic Plan".

### **3.2 How does your leadership organize the work to pursue quality development?**

Organizational models in Italian healthcare sector are not uniform, you can find differences according to the ownership (public vs private) and the mission (specialized vs generalist).

Responses highline some common characteristics:

- Direct link between quality department/unit/office and leadership: all organisations have identified an organizational unit with a specific goal about quality improvement with a direct connection (hierarchical or functional) to the leadership;
- Functional connection among quality department/unit/office and the other units focused on patient safety (risk management, facility management, infection control, ...)

Differences are related mainly to the dimension of the organization, the more the organization is structured the more are developed functional connections to the medical units/Departments.

### **3.3 What tools does your leadership use to assign strategic quality goals to the operational level?**

An organic approach to the quality improvement reflects the organizational choices of how to implement quality goals into operational activities. Moving from this perspective the strategic documents where all the goals are identified (see Q1) is the same tool used to evaluate how they are implemented. All

organisations have identified in the strategic documents the strategic responsibilities for each quality goal.

Organisations move from the strategic level (long-term) to the operational one (annual) using the "budget", tool used to identify multi-dimensional goals at unit level. All the organisations identify specific quality goals into the budget of each unit. For each goal have been identified: responsibility (who is in charge of reaching the specific goal) and indicator (how to measure if the goal has been reached).

How to define the quality goals is different among organisations. Majority of organisations have put in place a top-down process to identify them, a minority part of organisations have a bottom-up process and only one organization has in place a mix of both processes.

### ***3.4 How does JCI accreditation help your leadership better manage the organization?***

The impact perceived of JCI accreditation is an organic one, responses from organisations identify some areas where they have evidences about the fact the accreditation help them in facing some organizational issues.

Organization responses help us to identify 5 main areas of impact:

- All organisations agree on recognize to JCI accreditation a role in changing the way of orienting the governance approach to patient safety and quality improvement and increasing the level of cohesion for all the different organizational activities.
- A second main area of improvement recognized is on the ability to overcome the limit of the approach "per units", typical into the Italian NHS, to a patient centred one. Organization is more oriented to work per process focusing on the patient output/outcome as an integrated and unique result of a multidimensional clinical approach more than just a sum of different actions.
- Third area is the increasing knowledge about disaster management. Responses identify a strong and organic approach of accreditation in "preparing" organization to face maxi-emergencies both clinical (Covid) or structural (Fire emergency).
- A fourth area of impact is strongly linked to risk assessment. Accreditation helps organization in developing an integrated approach

to the risk management; defining a unique plan for all risks allow to have a more clear control and interaction of different units involved into managing it. Defining measurable goals and clear responsibilities but from a shared team have a positive impact on the organization safety culture.

- A fifth area, identified in the responses, refers to Clinical Governance. JCI Accreditation, with the implementation of privileging, helps organisations to better assess and map the competences of their physicians in order to better match them with the patient needs. Furthermore privileges allow organisations to plan and develop educational programs to face competences losses because of retirements or discharges.
- Last area identified in few organisations (because of the nature of them) is the increasing integration developed between clinical activities and teaching/research part.

### ***3.5 What are the strengths and weaknesses of Italian NHS mandatory accreditation and International voluntary accreditation?***

Organisations recognize different goals for the two accreditation tools (Italian and International).

Italian NHS mandatory accreditation is recognized as a useful tool to set the minimum standards necessary to provide care into the NHS. On the other hand it is perceived as a bureaucratic tool more oriented to check the alignment to the law than providing support in increasing quality of care.

International voluntary accreditation helps organisations in involving all the different parts of the organization to the common goal to improve quality and patient safety. They recognize an impact on the accreditation on the way of acting (behaviours) of professionals and units, in particular thanks to its orientation to evidence based approach. Accreditation is recognized as a competitive advantage for the organization both for its brand and for the fact that it improve the effectiveness of the clinical governance activities. On the other hand, a limit of the accreditation is its international nature that does not help a strong link with some national and local rules.

## 4 Discussion

Leadership has a key role into orienting the action of the healthcare organization to quality improvement creating the conditions (mission, vision, tools, ...) and the commitment necessary to be effective (Fanelli et al., 2017).

Leaders interviewed recognize the key impact of quality improvement into the way of managing (Chassin et al., 2013) effectively and efficiently (Øvretveit J., 2000) the organization. From the responses is quite clear that quality is perceived as part of the managerial process: identification of units/departments/office with a direct link to leadership and a clear responsibility on it. Defining quality improvement goals into the strategic plan guarantee the impact on the long-term sustainability of the organization itself. Developing the goals from the strategic level to the operational one, including them into the budget tool so they are linked to the organizational and individual performance system, reinforce their impact also on the short-term (annual).

International Accreditation has been perceived differently from the Italian NHS. Italian one is recognized as a tool useful to uniform at the same minimum level healthcare organisations but it is more oriented to check in a bureaucratic way the evidence from law than really checking quality standards. International accreditation is perceived as a useful tool to better manage the organization (Alkhenizan & Shaw, 2011). It has impact on how professionals act at clinical level (patient centred approach), on support activities (risk management, facility management) and on facing emergencies (Disaster Management).

## 5 Conclusions

In healthcare organisations, the concept of quality is directly linked to the organisation's core business as well as to the clinical culture.

These two features make it possible to state, as the research shows, that quality improvement strategies are, in healthcare organisations, catalysts for the exercise of clinical leadership at different levels of responsibility.

Through the search for quality patient need satisfaction and effective professional action are both simultaneously pursued. This statement, as our analysis shows, is even more true where healthcare organisations

- see quality as an essential element of their strategy;
- link quality goals to well-established systems of management by objectives and budgeting where present;

- opt for voluntary accreditation systems rather than institutional accreditation systems.

With regard to this last aspect, our research provides evidence of how institutional accreditation logics and mechanisms, especially in the case of Italian public hospitals, can be misrepresented. In fact they may be perceived similar to bureaucratic logics and tools of governance of public health organisations not consistent with the clinical culture of professionals, not understood by clinicians and considered mere formal requirements rather than opportunities.

This is not the case for voluntary accreditation which, if well managed, can activate virtuous circles of improvement by stimulating the exercise of clinical leadership and improving the overall effectiveness of clinical governance action.

Therefore, the existence of a voluntary accreditation system allows the organisation to value professionals as capable of giving a quality footprint to all their actions and also legitimises their intervention from an organisational point of view.

We believe that such evidence is certainly of interest in stimulating more in-depth future research on this subject. Further research is also necessary in view of the limitations of our study based exclusively on experiences deriving from the Italian context. An extension of the research to different national contexts is needed to validate and generalize the results of the study.

### Abstract

In modern society, digitalization has become increasingly pervasive, both in the lives of individuals and in business activities. Research thoroughly analysed the advantages and challenges of digitalization, suggesting that this not only involves the adoption of new technologies but also requires significant changes in the processes and capabilities of the firm. As such, human resources are among the most affected by companies' digitalization. Despite this, we observed a lack of studies investigating the interplay between companies' digitalization and individual responses. Most studies focus on analysing how digitalization affects individuals but fail to explain how individuals can, in turn, influence companies' digitalization. Aiming to help bridge this gap we first performed a thorough literature review to identify the main individual-level factors influencing companies' digitalization. Among these, we included digital skills, skills and capabilities, culture, and top management support. Then, to support literature results and lay the foundation for new theory development, we used a rigorous case study methodology to provide empirical evidence of how individual responses affect SMEs' digitalization. Specifically, we performed a series of semi-structured interviews with the managers of 4 Italian SMEs in the wine industry. We chose to focus on the wine industry since it is a sector characterized by both great opportunities, and significant obstacles to digitalization.

Ultimately, our analyses show that SMEs' digitalization is significantly affected by the management's actions, which also affect digital skills and organizational culture. Indeed, companies realized the importance of digital transformation and tried to foster it by hiring new professionals and by rethinking management processes. At the same time, SMEs lack the resources to invest in the development of advanced digital knowledge and skills. As a result, individuals still lack advanced digital knowledge and show strong resistance to the introduction of innovative solutions that would radically change traditional production processes. One of the tools that SMEs can leverage to overcome these obstacles is collaboration with external partners, who can provide the technology and digital skills needed without requiring direct investment by the companies.

## 1 Introduction

In modern society, digitalization has become increasingly pervasive, both in the lives of individuals and in business activities. While literature still lacks a unique, shared definition of digitalization, this can be broadly understood as the transformation of analogue information into digital data. Furthermore, common to many definitions is the idea that digitalization entails the use of digital technologies to improve business performance, in terms of economic results and value creation (Ritter & Pedersen, 2020; Vial, 2019). Indeed, researchers thoroughly analysed the advantages that digital technologies can provide to companies. These include improved efficiency, cost reductions, and a higher awareness of consumers' demands and market dynamics (Khin & Ho, 2019; Parviainen et al., 2017). On the opposite side, the literature highlights that digitalization also comes with significant challenges. The adoption of digital technologies often involves an evolution of the business model, which not only affects the value proposition but also significantly impacts firms' processes and resources (Bouwman et al., 2018; Rachinger et al., 2019).

Recent literature suggests that human resources are among those most affected by the digitalization of the company (Mazurchenko & Maršíková, 2019). For example, by changing processes and activities, digitalization often involves a redefinition of roles and responsibilities and requires the development of new skills and capabilities (Eller et al., 2020). Also, the adoption of digital technologies typically affects information and data management (Kristoffersen et al., 2020).

Again, individuals are not only required to adapt to new technologies but also to new mechanisms of communication and knowledge sharing (Faraj et al., 2018). Finally, digitalization often entails new standards and control mechanisms, which may significantly influence the work of individuals (Wilkesmann & Wilkesmann, 2018).

Overall, the literature suggests that there are many ways digitalization can affect individuals in firms. At the same time, we observe a lack of studies analysing how human resources can in turn influence the digital transformation of companies. Most works focus on investigating the impact and requirements of digitalization for human resources management (Mazurchenko & Maršíková, 2019; Strohmeier, 2020). While these studies highlight the key role of individuals, few studies discuss the competencies and skills needed to successfully adopt new technologies, focusing on the interplay between digitalization and individual responses (Caputo et al., 2019; Tataru, 2019). In this paper, we try to help bridge this gap by investigating how individual-level factors affect companies' digitalization. Thus, we also aim to provide managers with useful practical suggestions to effectively manage companies' digital transformation. Specifically, we aim to answer the following research questions:

- What are the individual-level factors influencing companies' digitalization?
- What is their impact on the digital transformation of the company? And how can managers leverage these factors to promote sustainable digitalization?

To answer the first question, we conducted a thorough literature review. This allowed us to identify the main individual-level factors that can influence the company's digitalization efforts, including digital skills, culture and management support.

To move our investigation further and provide empirical evidence of how individuals leverage these factors to affect companies' digitalization, we adopted a case study methodology, performing a series of semi-structured interviews with the managers of four Italian agri-food SMEs. Specifically, we chose to focus on the wine industry as we observed that digital technologies have the potential to become key drivers for the evolution of the sector (El Bilali & Allahyari, 2018). At the same time, the digitalization of agri-food supply chains implies a radical change in culture and skills, caused by the transition from an experience-driven to a data-driven form of management (Ingram & Maye, 2020; Klerkx et al., 2019).

This makes the wine industry a particularly interesting research field. Through a rigorous coding activity, we were able to identify key themes and insights, supporting previous results and enriching the debate with new elements. Also, we chose to focus on SMEs as they represent the vast majority of companies operating in the Italian wine industry (Bandinelli et al., 2020). This allowed us to provide the executives with useful practical suggestions to manage digitalization and foster the creation of a work environment conducive to sustainable and effective integration of digital technologies. The rest of the paper is organized as follows: the next paragraph provides the theoretical background underpinning our investigation. It presents the main individual-level factors that affect companies' digitalization. The next section illustrates the methodology we used to select and analyse the cases. In the following paragraph we present and describe the results. In the last sections we discuss the results and draw the conclusions, respectively.

## **2 Literature review**

The adoption of new technologies not only affects companies' strategy and value proposition but also entails profound changes in processes and skills (Verhoef et al., 2021; Warner & Wäger, 2019). Consequently, to reap the benefits promised by digital technologies it is important to understand and manage individual responses. Executives must not only consider how individuals' work and tasks are affected by the introduction of new technologies. It is also necessary to understand how individuals adapt to changes and can contribute to the company's digitalization (Rachinger et al., 2019).

As for the review methodology, the identification of relevant works was carried out using the online database of scientific publications Scopus, known for its reliability and versatility across multiple research fields (Amentae & Gebresenbet, 2021; Parida et al., 2019). Table 1 shows the search string and the results obtained. The string is conceptually composed of four "segments", separated by the conjunction "AND". The first two segments allowed us to bring together studies analysing companies' digitalization in relation to human resource management. In the third segment, we included terms such as "attitude or "behaviour" to include studies investigating individuals' responses to digitalization. The last segment allowed us to focus on the organizational and managerial dimensions. Starting from the 677 initial results, we limited the scope

of the search by defining appropriate selection criteria. First, we included only published articles in English with at least 1 citation, to ensure the quality and relevance of the results. Then, we included only the works pertaining to the subject areas: Business, Management & Accounting, Social Sciences, and Psychology, to align the results with the objectives of the study. Finally, we read the abstracts of the remaining 143 papers, to select only the works investigating how individuals affect companies' digitalization. We then proceeded to a full-text read of the final sample of 84 articles to identify the main individual-level factors influencing companies' digitalization, which will be presented in the next subsection.

Table 1 Search string and selection criteria.

Search string and selection criteria	Results
"digitization" OR "digitalization" AND "individual" OR "HR" OR "human resource" OR "Human" AND "factor" OR "response" OR "attitude" OR "behaviour" AND "company" OR "business" OR "management" OR "organization".	677
Articles in English with at least 1 citation.	233
Subject areas: Business, Management & Accounting, Social Sciences, Psychology.	143
Abstract read.	84

### **2.1 Individual level factors influencing companies' digitalization.**

The literature review allowed us to identify multiple individual-level factors that can influence the digital transition of companies. To provide solid theoretical support to the empirical analyses and present an exhaustive, yet synthetic background, we grouped the factors into four main categories, which we will present next.

Digital skills: this factor concerns the ability of individuals to correctly use digital technologies to improve processes and activities. A fundamental prerequisite is the knowledge of business processes and the understanding of how innovative technologies can change and enhance them (Paiola et al., 2021; Warner & Wäger, 2019). Relevant studies suggest that a significant obstacle to digitalization is the lack of awareness by management or employees of the full potential of innovative solutions, resulting in under-use and under-appreciation (Cetindamar Kozanoglu & Abedin, 2021). Another reason that makes the acquisition and management of digital skills complex is the need to keep them updated. the rapid transformation of businesses and the increasingly short life cycles of technologies require companies to constantly update their knowledge

base (Chetty et al., 2018; Witschel et al., 2019). Managers can hire new staff or invest in training activities. In addition to entailing a cost for the company, these measures could be interpreted by employees as threats to the stability of their position, leading to resistance and conflicts (Scuotto et al., 2021). Conversely, digitally competent personnel can not only be highly motivated, but can actively contribute to digitalization, optimizing processes and suggesting improvements (Blanka et al., 2022).

Skills and competencies: by affecting all aspects of the business, from the value proposition to the processes, digitization requires the development of capabilities that go beyond digital skills. Many relevant studies observe that the adoption of digital technologies changes the role and responsibilities of employees (Neumann et al., 2021; Tataru, 2019). For example, the use of information software changes data acquisition, transmission, and elaboration. In this context, employees can take on new roles and act proactively to use information effectively (Rachinger et al., 2019). Furthermore, one of the main advantages of digital technologies is the automation of operations and data collection processes. This contributes to shifting the role of employees from executors to supervisors and managers, requiring the development of high analytical and problem-solving skills (Brunetti et al., 2020; Sony & Mekoth, 2022). Finally, to manage a high amount of data and support the execution of the new business processes employees are required to develop advanced communication and coordination skills (Caputo et al., 2019; Sousa-Zomer et al., 2020).

Culture: this factor brings together the main psychological variables that influence the behaviour of individuals concerning the adoption of new technologies, including attitude, motivation, expectations, and perceived utility (Solberg et al., 2020; Trenerry et al., 2021). Literature suggests these elements can be either among some of the main drivers or, conversely, the main barriers to the adoption of digital technologies (Isensee et al., 2020; Warner & Wäger, 2019). In general, there are multiple reasons why employees or even managers may be reluctant or may actively resist the digitalization of the company. Some of these reasons are also connected to the factors discussed above. For example, employees' digital skills may be inadequate. In this case, they might resist the change for fear of losing their position or being replaced by new hires (Solberg et al., 2020) Furthermore, the changes entailed by the adoption of disruptive technologies are not limited to the development of digital skills but concern the redefinition of roles and responsibilities (Cetindamar Kozanoglu & Abedin, 2021;

Scuotto et al., 2021). Depending on each individual's attitude and expectations, this can be a strong driver or an additional source of resistance and conflict (Eller et al., 2020; Van Der Schaft et al., 2022). Employees and managers may also be reluctant to change established behaviours and practices, especially if they have led to past successes (Weking et al., 2020).

From a wider perspective, employees may tend to align their behaviours with the organizational culture. For example, employees of a company that has traditionally emphasized the professionalism and independence of its staff may strongly resist the introduction of digital technologies, considering them a source of limitation and control, or interpreting the consequent changes as a devaluation of their efforts (Cinar et al., 2019; Lifshitz-Assaf, 2018). On the opposite side, the employees of dynamic companies with advanced digital capabilities, more favourably oriented towards technological innovation could welcome the change with more enthusiasm (Blanka et al., 2022). In general, it seems extremely important for the company to establish a culture and work environment conducive to innovation to elicit favourable responses from the employees (Imran et al., 2021; Nadkarni & Prügl, 2021). The implications and tools useful to reach these goals will be briefly discussed in relation to the final factor we present.

Top management support: this factor considers how the management can influence the company's digitalization. Relevant studies suggest that executives can act at multiple levels and with different tools to support change processes (Verhoef et al., 2021; Witschel et al., 2019). First, management can direct the firm's efforts through strategic choices. Indeed, the disruptive effect of digital technologies can only be effectively managed by framing the digital transition in an appropriate strategy and business innovation path (Schneider & Kokshagina, 2021; Sousa-Zomer et al., 2020). Furthermore, the management is responsible for acquiring and allocating the resources necessary for the transformation. Executives must evaluate the costs and benefits of the available solutions, schedule activities, and manage human resources to ensure the necessary skills are available (Nambisan et al., 2019; Scuotto et al., 2021). Finally, management attitude is key to developing a culture conducive to the adoption of digital technologies (Cortellazzo et al., 2019; Gupta et al., 2022). Indeed, managers have some key tools to monitor and drive the adoption of technologies. For example, redefining activities can help align the workflow with the new communication and coordination possibilities enabled by digital technologies (Bouwman et al., 2018; Schwarzmüller et al., 2018). Furthermore, adequate control tools, such as reports

or indicators, allow the management to monitor the processes of adoption and adaptation to new technologies. From this perspective, it is important to balance control and autonomy, to prevent triggering negative responses from the employees (Morgan, 2019; Wilkesmann & Wilkesmann, 2018).

### **3 Case studies**

#### ***3.1 Methodology***

In this work, we use a case study methodology to investigate the interplay between companies' digitalization and individuals' responses. This methodology has been successfully applied to investigate a wide variety of problems in the business management field, ranging from operations to technological innovation management (Furjan et al., 2020; Jonas et al., 2018), and is effective to investigate complex phenomena within their real-life context (Ebneyamini & Sadeghi Moghadam, 2018). A key feature of the case study is the ability to combine empirical, context-specific analyses with existing theories. Thus, this methodology is particularly suited to explore new phenomena and emerging issues, while testing and elaborating on established results (Elsahn et al., 2020; Ketokivi & Choi, 2014). Thus, we contrast empirical findings against literature results, to advance theory and enrich the debate with new elements. In this, we follow Ketokivi and Choi's approach whereby case research must respect the duality criterion. This implies being both situationally grounded and delivering general results.

Specifically, for this study we adopted a multiple case study methodology, investigating how digitalization affected human resources management in 4 Italian SMEs in the wine industry. To select the cases, we adopted the following criteria. First, we decided to focus on the wine industry, since it presents significant opportunities for digital transformation, from cultivation to product management (Lezoche et al., 2020; Miranda et al., 2019). On the production side, digital technologies make it possible to use real-time data to monitor crops and optimize cultivation processes (Liakos et al., 2018; Queiroz et al., 2020). As for product management, the adoption of digital solutions throughout the supply chain can help streamline product flows and enhance traceability (David et al., 2022; Sørensen et al., 2010).

To reinforce this criterion, we decided to focus on companies offering high quality products, which acquired certification or are exported abroad.

Concurrently, we chose to limit the analysis to Italian firms for two reasons. On the one hand, the Italian wine industry is renowned for the quality of its products. On the other, more pragmatically, to ease case identification. We then decided to focus on SMEs, which make up the vast majority of Italian agri-food companies and thus best represent the current state of the industry (Bandinelli et al., 2020). Overall, in the selection of the cases we privileged the presence of common elements, rather than the identification of extreme or significantly different cases. Given the literature gaps we identified, we made this choice to focus the analysis on the current situation and provide a solid basis for future theory development.

Operationally, we contacted 65 companies via email or their websites, illustrating the context of the study and the contribution they could provide. 4 companies agreed to be involved. As for the acquisition of information, we performed a series of semi-structured interviews with the managers of the selected companies. Thus, we ensured that the interviewees were qualified to answer the questions knowledgeably. We recorded and transcribed each interview. The interviews lasted approximately 60 minutes each. We structured the interviews into three parts. An introductory part to collect information on the company, products, and activities. A second part aimed at identifying the digital technologies used by the firms and understanding their role in business activities, and a final part to focus the analysis on the interplay between technology adoption and individuals' responses.

As for data analysis, we first examined each case individually, transcribing the interviews and performing a coding activity. Following Hsieh & Shannon (2005) classification, we used a directed coding methodology. This is particularly indicated to test and expand existing theory, and thus perfectly fits the research goals.

According to this methodology, coding begins by associating to relevant text passages variables derived from the literature review. In the second phase, the relevant passages not yet categorized are associated with new categories, to expand existing theory. This is an iterative process that continues until unique and exhaustive categories are identified. The main weakness of this coding approach lies in favouring bias caused by the analysis of the pre-existing literature. To guarantee the trustworthiness and transparency of the results, three researchers independently coded the text and then collaborated to define the final categories. Furthermore, to strengthen the analysis we resorted to information triangulation (Ebneyamini & Sadeghi Moghadam, 2018; O'Brien et al., 2014). Specifically, we

asked the respondents to review our categorization to confirm or enrich the analysis. Finally, we compared the information provided by each company, to clearly distinguish between common elements and unique considerations.

### **3.1 Results – case description**

All the selected companies grow grapes, produce, bottle, and label the wine internally. All companies are SMEs, producing between 18.000 and 150.000 bottles a year. No company sells directly to final consumers or companies in the Ho.Re.Ca. industry. Instead, companies rely on trusted third parties for the distribution and marketing of their products. All companies produce high-end wines, which are sold both in Italy and abroad, especially in China and the United States.

As for the organizational structure, firms have a workforce ranging from 8 to 30 employees. To perform key field and production operations, companies hire up to 150 temporary workers in specific periods of the year. Among the permanent employees are the managers. Owners act as general managers defining the firm's strategy and value proposition. All firms have at least one operations manager, who supervises workers and production processes, and a sales manager, who manages sales channels and interactions with third parties.

As for digital technologies, all firms use third-party software to enhance product management and streamline workflows. These are cloud services and allow companies to integrate information regarding stored products, product batches, shipments, and customer databases. Additionally, all companies have a website to promote and sell products online and to receive external communications and feedback. Among the selected cases, only one company uses an advanced telemetry system operated by a third party, to obtain real-time data useful to monitor the condition of the vines and support the execution of field operations, such as seeding or fertilization.

Synthesizing, companies in the wine supply chain use mostly basic digital technologies common to most of the firms operating in the industry. This was also pointed out by one of the managers, who stated *"Any competitive company that operates in this sector now uses software for warehouse management and product traceability"*. Only one of the companies uses advanced technologies, and a key element is the collaboration with an external provider. One of the

interviewees stated: *"The technology is theirs (of the provider), we only use it, but they are the ones who manage the devices and ensure that it works"*.

#### **4 Discussion**

Moving on to the analysis of the individual-level factors influencing companies' digitalization, we start by considering the key role of management. Confirming previous results, we observe that the support of top management is a key element to foster the digital transformation of companies. In all the cases we analysed the driving force behind companies' digitalization efforts was the choices of the owners. As one of the interviewees stated: *"Management has pushed hard in recent years for the adoption of digital technologies because they are essential in the industry today"*.

Regarding the way companies implement their digitalization strategy, our analyses suggest that in addition to cost assessments, two other crucial individual-level factors require consideration.

On the one hand, a central theme is the management and development of digital skills. Owners rarely possess the knowledge to identify and select the most advanced and suitable solutions. Therefore, to support business innovation, the management hired new staff. Interestingly, the new figures possess mainly transversal skills which do not focus specifically on digital knowledge. All companies hired operations and sales managers, who consider digital technologies mainly as communication and coordination tools. As one of the managers we interviewed said *"Digital technologies are now essential to synchronize work, and to manage and track the products"*. Furthermore, one of the managers stated that: *"The company would find it especially difficult to hire a technological specialist, both because of the costs entailed, and because at this moment we do not feel such a need"*.

Moving from these results, we highlight a key relationship between companies' digitalization and individual-level factors. SMEs' owners are aware of the importance of digital technologies for business development. At the same time, the lack of resources prevents companies from hiring specialized staff. This causes a lack of high digital knowledge which, in turn, makes it difficult for companies to understand and leverage the full potential of innovative technologies. One of the ways for SMEs to solve this issue is by collaborating with external partners. Indeed, the only company that adopted an advanced telemetry system did so by

delegating the installation and management of the system to an external provider. Moreover, the managerial software used by the other companies is also provided by third parties. Ultimately, considering the limited resources available to SMEs, which prevents them from investing directly in the acquisition and development of employees' digital skills, we argue that collaboration with external partners could allow them to adopt innovative solutions while enhancing their knowledge and gradually accustoming employees to digital technologies.

A second fundamental element in explaining the relationship between the adoption of digital technologies and human responses in SMEs is the organizational culture. Again, top management plays a key role. Given the relatively small number of employees and the prevalence of direct communication mechanisms between top levels and the staff, management can exert a significant influence on the culture of the organization (Eller et al., 2020; Werner et al., 2018). As previously mentioned, in the cases we analysed the companies convincingly embraced the innovations mainly because the management considered them an essential element for the success of the company. In this regard, we stress that, just as management intervention can foster the adoption of innovative technologies, it can also represent a major obstacle. Specifically, we observe that none of the companies uses advanced technologies in the wine production processes. Available solutions could effectively support such activities, elaborating real-time data to monitor the status and progress of processes. For example, IoT systems could be used in combination with smart sensors to monitor the temperature and condition of the wort during fermentation. Or they could be used to assess the condition of the wine during ageing (Costa et al., 2013; Ruiz-Garcia et al., 2009). Despite this, and regardless of economic assessments, none of the companies is willing to consider the introduction of these technologies. We argue that one of the main reasons is to be found in individual cultural resistances, fuelled by management influence.

Indeed, as one of the interviewees stated: *"The owner is an internationally renowned winemaker who cares a lot about the quality of the product. Therefore, we do not use any technology in the production processes, because it is important for us to maintain the authenticity of the product unaltered"*. Furthermore, individual-level resistance can also appear as scepticism about the potential of technology. From this perspective, we observe that cultural resistance can be deeply connected to the lack of advanced digital knowledge. One of the interviewees stated: *"In my opinion, some operations, such as the dosage of*

*sulphites or the fermentation must be carried out in the traditional way, which is the real keystone of the company”.*

Furthermore, organizational culture and inadequacy of digital skills also affect the response of employees to the digitalization of companies. As pointed out by one of the interviewees *“Right now it is difficult to imagine introducing very advanced technologies on the production or warehouse side because there is a core of employees who are used to working in a certain way... and the introduction of these tools would slow down a process and change mechanisms that are currently perfectly functional”.* Furthermore, this would require *“training, hiring... and we don't feel the need to do it at the moment”.*

Ultimately, our analyses provide evidence that individual-level factors play a fundamental role in the digitization of SMEs. Supporting and moving beyond literature results, we argue that to promote an effective and sustainable digitalization process for SMEs it is essential to consider the influence and the relationship between top management support, culture, and individual digital skills.

## **5 Conclusion**

In this work, we analysed how individual-level factors affect SMEs' digitalization. In designing our work, we moved from the observation that the literature lacks works analysing the interplay between companies' digitalization and individual responses. To help bridge this gap, we first performed a thorough literature review aimed at identifying the main individual-level factors affecting SMEs' digitalization efforts. Results point to four categories of factors, namely digital skills, skills and competencies, culture, and top management support.

To support previous results and enrich the debate with new elements, we used a rigorous case study methodology to investigate how individual-level factors affect the digitalization of Italian SMEs in the wine industry. We chose to focus on the wine industry since previous literature suggests it is a sector with great opportunities, but also strong obstacles to digitalisation. Furthermore, aiming to provide a comprehensive analysis of the current situation and lay the foundations for future theory development, we tried to select representative cases of the digitization of SMEs in the wine industry. Thus, we focused our investigation on the elements common to the selected cases. Moving beyond literature results, we argue that SMEs' digitalization is influenced by two interconnected elements.

On the one hand, there are individual-level factors, which mainly concern management support, digital skills and employees' culture. Analysing the case studies, we found evidence that each of these factors can significantly favour or, conversely, hinder the digital transformation of SMEs. We also highlighted the relationships between these elements and observed that in SMEs the main tool for promoting the adoption of digital technologies is direct communication between management and employees, rather than the use of formal control and reward systems. We also observed that one of the main tools SMEs can leverage to enhance their digital transformation is the collaboration with trusted third parties, who could provide the necessary technologies and skills, without requiring direct investments by the SMEs.

On the other hand, SMEs' digitalization efforts are frustrated by the lack of resources. This not only limits the ability of small businesses to acquire new technologies but also makes it difficult to develop advanced digital skills while fuelling employees' scepticism towards innovative technologies.

### **Abstract**

The paper "The Tragedy of the Commons" by Hardin in 1968 highlighted the potential depletion of shared resources due to the self-interested behavior of individuals. This study sparked interest in scholars to understand how individuals make sense of shared resources and how to prevent over-exploitation. Elinor Ostrom challenged the assumption of the rational actor and showed that communities could self-organize and develop effective institutional arrangements to protect shared resources. She introduced systems thinking to understand the interactions between common resources and the broader system of socio-

material practices. This conceptual study aims to integrate the failure to refrain and act perspectives by developing a qualitative system dynamics model that expands the tragedy of the commons archetype. Systems archetypes are generalized patterns of behavior that abstract the underlying structure of complex systems. The study aims to discover and summarize archetypical patterns and factors that contribute to their emergence. This approach contributes to the common goods theory and systems thinking literature streams while offering a practical tool for policymakers to see trends and choose effective actions to enhance and regulate the system. Indeed, studying underlying patterns in the behavior of systems helps to distinguish between successful and ineffective actions.

**Keywords** – common goods, systems thinking, system archetype, sense-making

## 1 Introduction

In 1968, Hardin's seminal paper "The Tragedy of the Commons" was published in *Science* (Hardin, 1968). This study understands the commons simply as shared, exhaustible resources, such as a village's grazing lands. Based on classical homo economicus assumptions, which see humans as rationale and self-interested agents, Hardin argues that when a commons is at stake, even if the negative consequences of over-exploitation are crystal clear, people likely assume that the other users of the shared resource will not refrain themselves from over-exploiting it. For this reason, Hardin predicts that, when put in the condition to draw from a commons, most users will adopt the "get it while you can" strategy, and then the commons will be doomed to depletion. Hardin's reflection has attracted the attention of several scholars to understand how people's individual and collective sensemaking processes (e.g., Adams et al., 2003; Folke et al., 2005) can be governed to develop a shared understanding and knowledge while preventing the overexploitation of resources with low levels of excludability (i.e., it is difficult to prevent people from using such resources) and high levels of rivalry (i.e., resource exploitation by one individual hinders simultaneous exploitation by other individuals).

A famous response to these perspectives comes from Elinor Ostrom, who provides a new way to tame the free-rider problem or social dilemma. Her studies showed that, in order to prevent the tragedy of the commons, it is not necessary that the resource is privatized or that the State imposes and enforces rules to protect the common pool resource (Ostrom, 1990). Ostrom investigated how, in

many real-world cases, the community of users self-organized and developed ad-hoc, effective institutional arrangements to protect their common-pool resource from over-exploitation (Dietz et al., 2003). These results suggest that the rational actor assumption should be replaced by a much more complex understanding of the human being as, first of all, a social being (see, for example, Sigmund et al., 2010). Ostrom, and a viable research community around and after her, investigated the factors that enable the community of users of a certain common pool resource to successfully self-organize and develop local institutional arrangements that avert the tragedy of the commons. In her last years, Ostrom strongly contributed to introducing systems thinking in the studies on the commons (Ostrom, 2009). She clearly distinguished the common pool resources (in terms of stocks and flows) from the underlying processes of the system that may protect or (re)generate them. Hence, while in Hardin's conceptualization the tragedy of the commons was occurring mainly when people fail to refrain from resources' misuse or profiteering behaviors, Ostrom's broadened the perspective to the recursive interactions occurring between common resources and the broader system of activities and complexes of processes embedded in socio-material practices.

Drawing on this perspective, we develop a qualitative system dynamics model that aims to move one step forward by analyzing the virtuous and vicious loops activated by the complex system of cognitive, social, and organizational dynamics at stake in commons governance. Inspired by sensemaking literature, we develop a model that illustrates how actors make sense of the tragedy of the commons. In a world in which the socio-ecological equilibrium of many ecosystems is threatened by human carelessness and misappropriation, and in which technological advancements (such as Wikipedia years ago and ChatGPT nowadays) disrupt the way we pool knowledge, it is of the utmost importance to understand how humans behave to protect shared resources. The complexity, uncertainty, and value-laden character of the societal challenges we face (see Ferraro et al., 2015) increase the variety of possible plausible responses. So what happens when the commons we are expected to protect and (re)generate are not only forests, grazing lands, fisheries, but also knowledge commons, digital commons, urban commons, health commons, and cultural commons? What happens when environmental complexity creates more complex sensemaking systems?

## 2 Conceptual background: the tragedy of the commons archetype

To help visualize the dynamics related to the tragedy of the commons as unveiled in Hardin's conceptualization, in system dynamics scholars have usually referred to the "Tragedy of the Commons" archetype (Senge, 1990). System dynamics (Forrester, 1994) is indeed a field of study that seeks to understand the behavior of complex systems over time, as well as the underlying causal structures that characterize them (Richardson, 2011). Grounded in systems thinking (Meadows, 2008), one important aspect of system dynamics is the identification and analysis of archetypes, recurring patterns of behavior that describe the dynamic causal relationships between different variables within a system. In a never-ending chain of cause-and-effect relationships, every occurrence leads to another event. Hence, digging down to the systemic structure of complex phenomena is critical to understand the world as patterns of behavior across time. Accordingly, this kind of analysis is fundamental to unveiling the root cause of an issue rather than only its symptoms (Sterman, 2002). At the same time, it helps to understand what motivates the behaviors one can witness, identify possible leverage points to intervene (Meadows, 1999), and then take steps to achieve the expected outcomes, altering a system's structure or behavior. The systems approach may help us rethink existing issues from a fundamentally new viewpoint, which can help shed light on them. Traced in the form of causal loop diagrams, the ten identified systems archetypes (Senge, 1990) depict dynamic events that often recur in generalizable contexts and thus represent effective tools for diagnosing issues and locating highly effective leverage points.

Adapted from Kim (1992), Figure 1 shows a causal loop diagram of the tragedy of the commons archetype. Both actors A and B engage in actions like introducing animals to the pasture, and both players profit financially from their efforts. So, for example, A's activity led to an increase in the net gains for A, which further motivates A to increase his/her activity. In this sense, the positive link between the two variables "A's activity" and "Net gains for A" describes a direct causal relationship between them. If the cause increases or decreases, the effect will increase or decrease accordingly. The interaction between them depicts a self-reinforcing feedback loop (called R1), which can be associated with the system's exponential growth or decay behavior. Similarly, the net gain earned by B as a consequence of his/her activity is depicted by R2, the second self-reinforcing feedback loop of the model. Despite an increase in overall activity,

there is little to no productivity loss since they are not yet at the resource's maximum capacity and there is little to no impact on "gain/individual activity."

When the overall activity grows too much, actors A and B must eventually make a choice, since productivity declines as they get near the resource limit or its regeneration capacity. If they do what is "best for all concerned," then self-balancing loops B1 and B2 should prevail and activity should cycle down to a tolerable level. In any case, it takes some time to recognize that an increase of the system's level of activity impacts the individual benefits of the two actors and adjust their actions. As a result, the tragedy of the commons archetype describes a situation in which a shared resource is subject to overuse or depletion due to the self-interested behavior of individuals or groups. The term "commons" refers to a resource held in common by a group of people, such as a pasture, forest, or fishery. In the absence of regulation or restrictions (dominance of the self-balancing feedback loops), individuals or groups may have an incentive to exploit the resource for their own benefit, even if this leads to overuse or depletion of the resource over time (dominance of the self-reinforcing feedback loops).

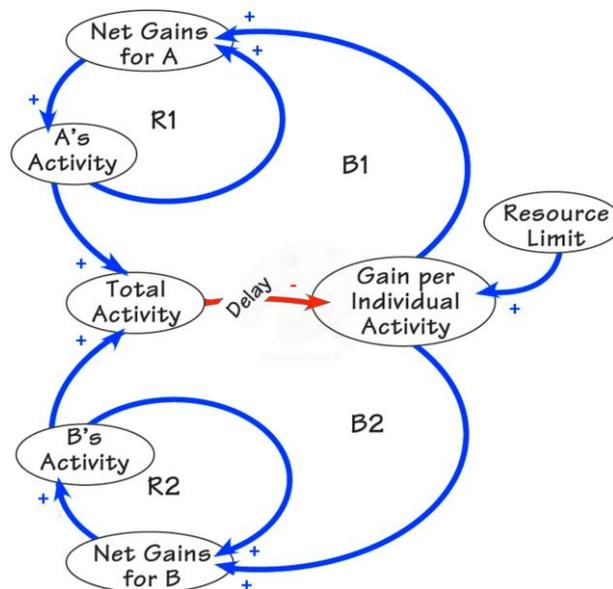

Figure 1. The tragedy of the commons archetype.  
Source: adapted from Kim (1992).

### **3 A first expansion of the the tragedy of the commons archetype**

Following the above-mentioned arguments, Hardin (1968) came to the conclusion that the commons need to be either privatized (free market) or maintained as public property where access and usage rights must be distributed and regulated. In some cases, privatizing the resource in question can help ensure that it is used in a more sustainable and equitable way. For example, suppose a pasture is held in common by a group of farmers. In that case, each farmer may have the incentive to graze as many animals as possible to maximize their profits. Differently, if the pasture is divided into individual plots and each farmer is given the exclusive right to graze on their own plot, they may have an incentive to maintain the quality of the pasture and ensure that it is not overgrazed. However, the creation of property rights is not always a practical or desirable solution. In some cases, the resource in question may be difficult to divide or privatize, or there may be cultural or historical reasons why it is held in common. Additionally, privatization may lead to unequal distribution of resources, with those who have more wealth or power able to acquire the most valuable resources. In these cases, the intervention of the regulators and the commons kept as public property should be preferred.

Furthermore, the original archetype does not consider that humans do not often act as globally rational actors but usually make judgments in light of their limited knowledge about the system they are part of (Garrity, 2012). In essence, if they lack input on the condition of the shared resource or the actions of the other users, they would make decisions based on their bounded rationality. So, supposing that they perceive the common resources and, consequently, their individual gain are depleted by the increase of the total activity toward the system's carrying capacity or desired level. By acting rationally, they could decide to contribute to the system but support only a part of the costs. As a result, they would increase their level of activity and, so, contribute to the whole system's activity. This would activate two additional self-reinforcing feedback loops, called R3 and R4 in Figure 2, further leading to the common resource depletion.

In this first expansion of the model, we also highlight that we decided to change the variable "resource limit" to "desired level". In fact, talking of a desired level helps make the model generalizable to systems where commons have an intrinsic regenerative capacity, with limits adjustable over time towards a desired level. Similarly, we believe this change helps better adapt the model to unveil the

dynamics characterizing not only commons that one would like to maximize but also to control or limit. One example of this latter perspective could be related to the stock of emissions in the air, which represents a common resource whose level should be minimized but could hardly be imagined in terms of a limited resource to be consumed or used.

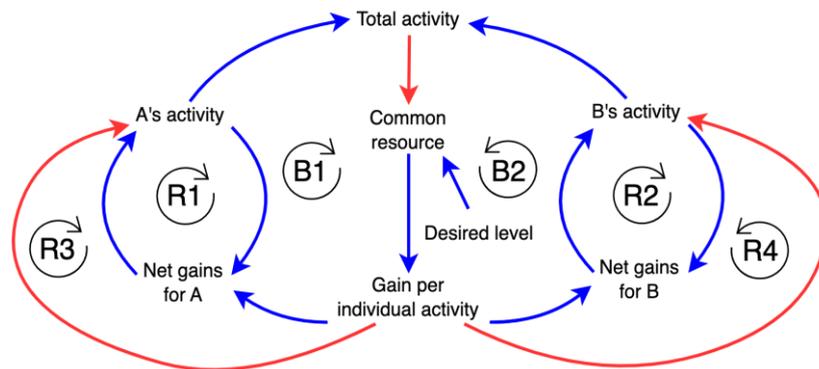

Figure 2. A first expansion of the tragedy of the commons archetype.  
Source: adapted from Garrity (2012).

#### 4 Adding two conceptual levels of analysis

Further expanding the archetypal model, in Figure 3 we linked what happens at the material level of analysis to the individual and collective sensemaking processes and responses to the tragedy of the commons. Hence, feedback systems that measure the common resource's level can activate people's individual and collective sensemaking processes (e.g., Adams et al., 2003; Folke et al., 2005). This would result in a shared understanding and knowledge that a tragedy of the commons is likely to happen. The problem arises when the benefits of exploiting the resource are immediate and personal, while the costs of overuse are shared among all users, leading to a situation where no single individual or group has an incentive to conserve the resource for future use.

People may thus perceive that preserving the commons requires the contribution of other individuals who could decide not to give their contribution but rather abandon the commons. On a collective level, this issue is related to what is usually called social loafing (e.g., Simms & Nichols, 2014), namely the perception of high efforts that reduce people's motivation to work. As a result, they may be less willing to contribute to the commons, increase the common

resource and, so, the sensemaking process related to the occurring tragedy of the commons (R5). Furthermore, the more people reduce their self-organized work, the more they will reduce their perception of future stranding (B3), having abandoned the commons.

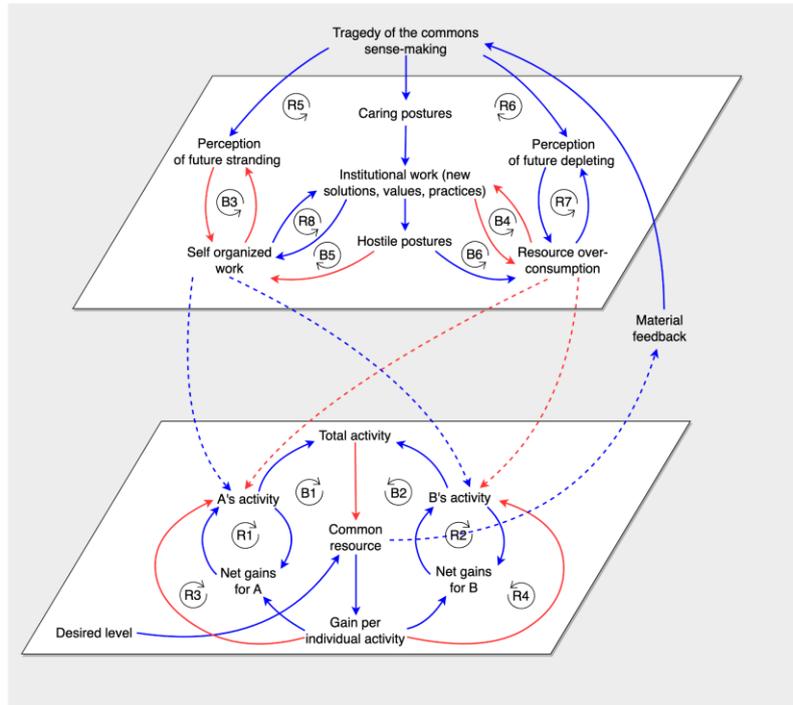

Figure 3. A complete overview of the expanded tragedy of the commons archetype.  
Source: Authors' own elaboration

On the other side of the model, when sensemaking processes are activated, if people perceive that the likelihood of the resource being depleted is high, they may be more willing to exploit the resource for their own benefit. Conversely, if they perceive that the likelihood of depletion is low, they may be more willing to refrain from using the resource to conserve it for future use and preserve collective benefit.

However, considering the first case, not refraining from resource overuse ultimately harms everyone in the long run, reducing individuals' activity. This increases the common resource's level, additionally leading to a high perception of future depletion (R6). Similarly, the more people overuse the resource, the

more they will perceive that others will do the same, further depleting the commons. This describes the self-reinforcing feedback loop R7.

In the end, to address the tragedy of the commons, it is important to develop collective norms and frameworks that encourage sustainable use of shared resources, as well as individual and collective awareness of the long-term consequences of possible social loafing or resource overuse behaviors. So, if people nurture caring postures toward the commons, they will practice institutional work resulting in new shared values, practices, and behaviors. This, on the one hand will increase individuals' willingness to contribute to the commons (R8), while on the other hand will reduce their willingness to overuse the resource (B4). However, not everyone is likely to adhere to this new set of shared solutions and practices and someone could mature hostile postures toward the commons. By doing so, they could reactivate the social loafing or resource overuse feedback loops by decreasing the amount of self-organized work (B5) or increasing resource overconsumption (B6).

## **5 Conclusions**

The paper "The Tragedy of the Commons" by Hardin in 1968 is a seminal work that highlighted the potential depletion of shared resources due to the self-interested behavior of individuals. Hardin argued that shared resources such as land, air, and water could be over-exploited if individuals acted solely in their own self-interest. Hardin's work sparked interest among scholars to understand how individuals make sense of shared resources and how to prevent over-exploitation.

Elinor Ostrom challenged the assumption of the rational actor, which assumes that individuals act solely in their own self-interest, and showed that communities could self-organize and develop effective institutional arrangements to protect shared resources. She introduced systems thinking to understand the interactions between common resources and the broader system of socio-material practices. Systems thinking involves understanding the complex relationships between the different components of a system, and how changes in one component can impact the entire system. Ostrom's work showed that individuals could work together to manage shared resources in a sustainable way. She identified several design principles for successful common-pool resource management, including clearly defined boundaries, rules that are adapted to local conditions, participation by those affected by the rules, and mechanisms for monitoring and

enforcing compliance. Ostrom's work challenged the conventional wisdom that only centralized government control or private ownership could prevent the tragedy of the commons.

Researchers have developed a range of conceptual models to understand how individuals interact with shared resources. One such model is the tragedy of the commons archetype, which, however, mainly captured the dynamics related to a resource over-exploitation as conceptualized by Hardin. This archetype represents a situation in which multiple individuals have access to a common pool resource, and each individual can choose to either refrain from using the resource or use it to their advantage. If everyone acts in their own self-interest, the resource will eventually become depleted, leading to a tragedy for all.

To address this problem, researchers have developed various policy interventions, including the use of regulations, taxes, and incentives to encourage individuals to conserve the resource. However, the effectiveness of these interventions depends on the underlying patterns of behavior that drive individuals' decision-making.

To better understand these patterns, in this study we turned to systems thinking and systems dynamics modeling. Systems dynamics modeling involves developing qualitative or quantitative models that represent the underlying structure of a system and the relationships between its components. By understanding the dynamics of the system, decisionmakers can choose interventions that are more likely to be effective. So, this conceptual study aimed to integrate the failure to refrain and act perspectives, as well as a third way related to the possibilities opened by caring postures and institutional work to mitigate those issues, by developing a qualitative system dynamics model that expands the tragedy of the commons archetype. By doing so, this study contributes to both the common goods literature and system thinking literature by discovering and summarizing archetypical patterns and factors that contribute to their emergence. Besides contributing to those literature streams, in this work we offer a conceptual tool for policy and decisionmakers to see trends and choose effective actions to enhance and regulate systems in which a common good is involved. Indeed, studying underlying patterns in the behavior of systems helps to distinguish between successful and ineffective actions.

### **Abstract**

Research has deeply investigated factors that may hinder or favour the possibility of daughters being chosen as successors in family businesses. Little is known, however, about daughters who voluntarily decide to leave the family business, despite the possibility of serving in the leadership role, to engage their entrepreneurial aptitude and potential in creating new enterprises.

This paper investigates the experiences of a successor daughter who decided to give up that role to start her own entrepreneurial venture. Placing in the research field of family entrepreneurship and drawing on the case study method, we identified the motivations behind her decision and how her entrepreneurial identity was formed in this context. Special attention was given to the role of the entrepreneurial family to understand how it may have influenced the daughter's choices and her identity construction process.

We show that the entrepreneurial family can play a decisive role in three different stages of a daughter's identity formation process, i.e. when: 1) the idea of starting one's own business emerges and takes shape; 2) the decision to pursue an independent entrepreneurial career is made; and 3) the new entrepreneurial activity is launched.

## 1 Introduction

This paper aims to investigate the reasons that may lead a daughter designated as a successor in the leadership role of her family business to decide to give up that role and leave the family business to start her own entrepreneurial venture. The results offer interesting insights into a topic that has not been investigated so far in the literature on daughters in family businesses. In fact, this research field has mostly investigated factors that may hinder or favour the possibility of daughters being selected as successors for the leadership role in the family business. In contrast, the experiences of daughters who voluntarily decide to leave the family business despite the possibility of serving in the leadership role have not been investigated. However, some scholars have recently observed that taking over the family business is not the only option available to daughters to express their entrepreneurial aptitude daughters may have formed within their family entrepreneurial context. Daughters could also express their entrepreneurial potential outside the family business, i.e., through the creation of new ventures.

This paper addresses this issue by analysing the experience of a daughter who decided to leave her family's business after working there for a number of years with a major managerial role. The objective of the investigation is twofold. First, it aims to identify the reasons behind this daughter's decision and, second, to understand how her experience in the family business may have contributed to the formation of her daughter's entrepreneurial identity, to the extent that it prompted her to start a new business venture outside the family business. Specifically, the analysis aims to answer the following research questions:

*(RQ1) What motivates a successor daughter to give up the leadership of her family business to start her own entrepreneurial venture?*

*(RQ2) How is her entrepreneurial identity formed in this context?*

To answer these research questions, we place our analysis in the research field of family entrepreneurship (Bettinelli et al., 2014; Randerson et al., 2015, 2021) and adopt an inductive approach based on a case study.

This analysis shows that the family can play a decisive role in a daughter's entrepreneurial identity formation. This role can manifest itself in three distinct stages of this process, i.e. when: 1) the idea of starting one's own business emerges and takes shape; 2) the decision to pursue an independent entrepreneurial career is made; and 3) the new entrepreneurial activity is launched.

The remainder of the paper is structured as follows. First, we highlight the theoretical background of the paper. We then set out the method employed and empirical focus of our study. The findings are then presented, followed by the discussion and conclusions.

## **2 Theoretical Background**

Family entrepreneurship (Randerson et al., 2015) is an emerging field of research that stems from the intersection of three systems – family, business, and entrepreneurship. It aims to deepen our knowledge of the entrepreneurial behaviour of individuals, families, and family-owned businesses and how they can shape and influence each other (Randerson et al., 2021). While investigations about mutual influence relationships between business and family have been widely investigated (Estrada-Robles et al., 2021), less is known about how individual entrepreneurial processes can unfold within family and family business contexts (Randerson et al., 2021).

Although it is widely recognized that entrepreneurial families, i.e. families that own one or more businesses and pursue entrepreneurial activities across generations (Capolupo et al., 2022), can stimulate an entrepreneurial attitude and behaviour in their members by exposing children to entrepreneurial role models (Zellweger et al., 2011), passing on skills, knowledge, career opportunities (Rogoff and Heck 2003; Bettinelli et al., 2014; Randerson et al., 2015), and providing social, financial and human capital (Estrada-Robles et al., 2021), we have little knowledge about motives, factors and conditions that may prompt children to pursue entrepreneurial careers outside family businesses. Most studies have investigated how entrepreneurial families can feed new generations' entrepreneurial attitude and motivate designated successors to ensure the viability of family businesses and their survival over time (Habbershon et al., 2010; Eddleston et al., 2012; Zellweger and Sieger, 2012; Michael-Tsabari et al., 2014; Zellweger et al., 2012; Canovi et al., 2022). Conversely, few scholars have focused on nonsuccessors and their entrepreneurial choices. For example, Combs et al. (2021) note that the entrepreneurial legacy that entrepreneurial families transmit to younger generations should extend beyond the successors. While designated successors feel the responsibility of having to ensure the continuity of the family business, nonsuccessors can have a greater range of choices and decide more freely whether and how to exploit the entrepreneurial legacy they have received from

the family. These authors also observe that most nonsuccessor adult children decide not to pursue an entrepreneurial career, while those who do may choose to start a business related to the family's firm portfolio or, conversely, to start a new venture in a completely different sector from that of the family context. Furthermore, the authors find that nonsuccessor daughters have fewer chances to engage in external entrepreneurial paths because of lacking emotional, business, and financial support from their families to start their own businesses. Since this phenomenon remains largely unexplored, Combs et al. (2021) call for further research to learn about nonsuccessor women's entrepreneurial careers "by listening to their unique narratives" and considering the role of family (p. 23).

The topic of daughters in family businesses has been mainly investigated looking at the reasons that may favour or, more often, hinder the possibility of being designated as successors for family business leadership.

Many investigations have also been done on daughters excluded from succession (Sentuti et al., 2019). In contrast, the case of daughters who prefer to start their own business despite the opportunity to take over the reins of the family business previously led by their parents has never been investigated.

Therefore, exploring what motivations may lead designated successor daughters to leave their family business to start a new business could be very captivating.

This paper contributes to fill this gap by investigating the case of a daughter who was designated as successors but decided to leave the family business leadership role and exert their entrepreneurial spirit in creating a new enterprise. For the reasons described above, this case has unique features that make it particularly interesting for understanding how the family context can help nurture and shape a daughter's entrepreneurial identity.

The latter refers to how entrepreneurs define themselves by answering the question "Who am I?" and relates to the meanings and behaviours associated with the entrepreneurial role (Murnieks et al., 2014; Radu-Lefebvre et al., 2021). Entrepreneurial identity is considered a key concept for understanding entrepreneurship (Mmbaga et al., 2020; Navis and Glynn, 2011) and is deeply investigated in the flourishing research about how daughters form their identity as successor in family business (Bettinelli et al., 2022; Bjursell & Melin, 2011; Fernandes & Mota-Ribeiro, 2017; Hytti et al., 2017; McAdam et al., 2021; Mussolino et al., 2019; Sentuti et al., 2023). An under-explored element of this debate is the experiences of daughters who decide to abdicate the role of

successor and set up a new venture outside the family businesses. We believe that this experience deserves to be considered also to account the heterogeneity that characterises the experience of women entrepreneurs.

### **3 Methodology**

To answer our research questions, a qualitative approach based on the case study method has been adopted. A single case study (Yin, 2003; Eisenhardt and Graebner, 2007; Miles et al., 2014) suitable for the aim of the research was chosen by the authors. In single-case research design, cases are chosen because they are unusually revelatory (Yin, 2003), help the researchers richly describe a phenomenon (Siggelkow, 2007), allow the investigation of a “transparently observable” phenomenon (Eisenhardt, 1989, p. 537) to gain new theoretical insights (Eisenhardt and Graebner, 2007).

The case was selected as part of a broader research aimed at investigating how nonsuccessor daughters who start their own businesses form their entrepreneurial identity (Sentuti and Cesaroni, 2021). The analysis revealed that some daughters decide to start a new venture and pursue their own entrepreneurial career after a few years of experience as family business leader. The most information-rich case among those belonging to this last group was selected. It allows one to “learn a great deal about issues of central importance to the purpose of the research” (Patton, 1990, p. 169). Specifically, the experience of Carlotta (fictitious name), a 37-year-old entrepreneur, was analysed. She has been designated as the successor to her family’s business, which has more than 500 employees and operates in the furniture and design industry. After some years of experience in the family business with managerial roles (mainly in marketing), she decided to leave the family’s business and started a new venture, now a Made in Italy small business emblem in the jewellery sector.

Both primary and secondary data has been collected. A direct interview is the primary source of data, supplemented with interviews from the press, social network profiles, blogs, and the websites of the family business and the company founded by the entrepreneur.

Data analysis was conducted by adopting an inductive and interpretative approach based on hand coding and following the Gioia method (Corley and Gioia, 2004; Gioia et al., 2013). This analysis made it possible to reconstruct the process of constructing Carlotta’s entrepreneurial identity and understand the

family's role during this process. The results are illustrated below, making extensive use of quotes extracted from the interview.

#### **4 Case analysis**

Data analysis allowed us to highlight the daughter's motivations underpinning the choice to leave the leadership of the family business and start a new venture and outline her entrepreneurial identity process of formation. This process can be broken down into three main stages, and motivations emerge in the first one. Namely, each step is characterized by a series of factors, represented by conditions, perceptions, interpersonal dynamics between family members, and relationships between the daughter and family business. These contributed to determining the reasons that initiated the process of forming the analysed daughter's entrepreneurial identity, how this process developed, and its final effect. These stages, along with factors characterizing them, are described and discussed below using excerpts from the interview.

##### ***Stage 1 – The idea of starting one's own business emerges and takes shape***

This phase refers to the context in which the idea of exiting the family business, renouncing the leadership role in this company and starting an independent entrepreneurial activity gradually took shape.

Carlotta is a brilliant marketing graduate. After a significant experience in a well-known multinational company, she decided to join the family business (a large company in the building sector) when her father began to suffer health problems: *"There was a problem with my father's health that led me to bring forward my return to the company. I say anticipate because I'm sure I wanted to try anyway."* Her father gave her 'carte blanche' and Carlotta set up the marketing department with great satisfaction and over time introduced important management innovations: *"When I joined the family business my father immediately gave me a great deal of space, he told me 'Come here and help me restructure everything [...] 'make yourself at home, because you are at home'. And so I started creating the marketing department."*

A path of growth within the family business started, which soon led Carlotta to become her father's right-hand woman and designated successor. Nevertheless, Carlotta felt ambivalent emotions. On the one hand, she was delighted with her job: *"I always felt very, very free to run the company as I thought was right, of*

course always confronting my staff depending on the issues. I felt very fortunate, I didn't experience the succession that can sometimes occur, where you feel chained and can't do anything. No, I felt very welcome and free in the family business."

On the other hand, she perceived a certain uneasiness, an underlying tension between her role as successor and her values and true ambition: "The family business is a very large and complex business to manage, requiring a lot of time and energy. Let's start with an assumption: in my opinion it is not true that men and women in the world of entrepreneurship can do the same things, especially if a woman decides to have children and wants to follow them. At least in my experience that's the case." And she added: "Such a demanding work is not part of my being [...] I wanted to do something of my own that would give me satisfaction without taking up all my time, i.e. that would also allow me to follow my family. Why else would one have children?"

It is in this context that the Carlotta's idea of "doing something else" began to take shape: "I never imagined myself as a self-employed entrepreneur, to tell the truth [...] but over time I start to think to give space, to give voice to another side of me that I recognise myself in, the one that is a little more creative, sparkling and also enterprising". For Carlotta the choice to pursue an independent entrepreneurial career was dictated by entirely personal motivations.

## **Stage 2. The decision to pursue an independent entrepreneurial career is made**

The decision to leave the family business leadership and start her own business gradually took hold in Carlotta's mind. She had become the mother of a little girl and was about to have a second daughter. At the same time, her father's health deteriorated, and it was time to make a choice. It was a tough and challenging time for Carlotta and she was increasingly determined to look for an alternative: "During this period, perhaps as a counterpoise, my urge to create and my desire to do marketing continued to be strong. It was summer, I was looking for some jewellery to wear to the beach but couldn't find it as I wanted it. Such a bit like that, for fun, I started to design and make jewellery myself."

Carlotta's father transferred the ownership of the company to his daughter. She still had a managerial involvement in the family business but at the same time she started thinking more and more concretely about her new entrepreneurial activity: "I decided to visit a jewellery fair, to see if anyone was making jewellery as I

wanted it. I saw that in fact there was no one. The style I had in mind, and I had it very clear in my mind, was not there. So I got in touch with a company that was participating in that fair and asked it to make my jewellery. 'I make it for me', I thought. In the meantime, again, a bit for fun, I said, 'Maybe I'll create a brand' and I immediately thought of a name that would evoke a sense of freshness, of lightness, a bit like the style of the jewellery should be. Then I chose the whole brand image and did some marketing work. And so I started wearing my jewellery." Carlotta recognised "My business and entrepreneurial education is the starting point that has allowed me to get here today. [...] I have had the opportunity to interact with professionals from very different backgrounds, with hyper-creative people, and this has enriched me enormously. I still benefit from my experience in the family business."

Carlotta felt increasingly distanced from the logic of the family business and, by mutual agreement with her father, decided to delegate the role of CEO to an external manager: "During the first two years [within the family business, n.d.r.] I was the mother of my first daughter: I used to leave home at 8 in the morning and come back at 8 at night, my mother raised my daughter. [...] If I had wanted to continue the company I would have had to completely sacrifice my life, my family, there would have been no room for anything else. [...] Thinking about this vision of my life, I preferred to keep the ownership of the family business, but to delegate the management to managers who were paid to do this."

Carlotta's family business was far from desire to be very close to her family and, at the same time, to pursue an entrepreneurial career in line with her interests and passions. All the conditions were in place for Carlotta to take over the family business leadership, but she was uninterested. She did not want to give up being a mother and knew that leading the family business would be too demanding and time consuming. At the same time, she had a strong entrepreneurial attitude, a great desire to realize herself and aimed to find a way to make the most of her skills and entrepreneurial legacy. Despite the decision to leave the leadership of the family business, the family's support does not diminish "My father was one of my biggest supporters. He understood what my vision of life was and so, together, we found a solution that would allow the company to move forward with a qualified CEO and, in the meantime, to me to guarantee myself a space."

### ***Stage 3 - The new entrepreneurial activity is launched***

Carlotta realised that her entrepreneurial spirit was leading her to a successful business: "Gradually, people were asking for my jewellery... I could see there was interest [...] Sales started to grow and, since my spirit is that of an entrepreneur, I said 'Well, if it has grown, then I must do a proper business' and so I created the e-commerce."

It was a big change. Carlotta found the new company, implemented a marketing plan using social networks and within a bit of time the business gained a foothold.

Thanks to her own small business, which is easier to manage and more in line with her needs, Carlotta was able to find her work-family balance because "It's one thing to manage this company, with a few employees where everything is much more flexible, and quite another to manage a company with 120 agents, 70 employees, 4 subsidiaries, one of which is abroad!"

Carlotta felt fulfilled now: "My jewellery gives me great satisfaction and seeing it worn by important influencers is a response to all my effort. Clearly the style I am pursuing is a style that people like". Today Carlotta is a satisfied entrepreneur and mother and a satisfied daughter. Her choice has not affected her relationship with her father and family, who still support and remain close to her.

## **5 Conclusions**

This paper aimed to answer the following research questions: (RQ1) What motivates a successor daughter to give up the leadership of her family business to start her own entrepreneurial venture? (RQ2) How is her entrepreneurial identity formed in this context?

With regard to the RQ1, our results show that Carlotta was greatly motivated to give up her leadership role within the family business by her desire to be an entrepreneur "in her own way", i.e. follow her genuine passion (jewellery), fulfil herself and reach a sustainable equilibrium between work, family, and personal life. Findings also highlighted that these motivations are part of a broader process of daughter's entrepreneurial identity construction, that is started with the idea of create her own business, continued with the decision to leave the family business leadership and ends with the actual launch of a new entrepreneurial activity outside the family business group. This concerns the RQ2, the question we tried to answer by examining, in particular, the entrepreneurial family's role throughout

this process. The three stages of the daughter's entrepreneurial identity construction process, along with factors characterizing them, are synthetised in Figure 1.

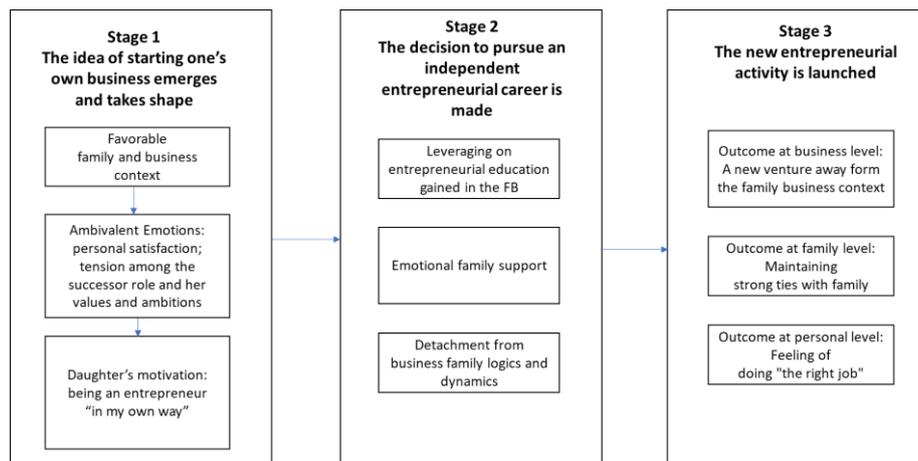

Figure 1 – How the daughter's entrepreneurial identity was formed  
Source: our elaboration.

In this regard, findings show that Carlotta developed an interest in business disciplines and the family business within her entrepreneurial family. She earned a bachelor's degree in marketing, had significant professional experience in other companies, and then successfully joined her father in managing the family business. However, precisely the experience in the family business unleashed Carlotta's true entrepreneurial spirit: it triggered her desire to express a new part of herself, the more creative and vibrant one, which had been more "dormant" within the family firm. She founded a new enterprise to create an innovative vision of the jewellery concept. In doing so, she detached herself from the logic of the family business – large and complex to run – in favour of handling a new business more congenial to her. At the same time, she leveraged on her entrepreneurial education gained through her experience in the family business and she could rely on the emotional support of her family and father in particular. The launch of the new entrepreneurial activity resulted in several outcomes that, consistent with the family entrepreneurship framework, can be measured on three levels: business, family and individual level.

Along this path, Carlotta built her entrepreneurial identity through a *metamorphosis process*. She transformed herself from a "family business

successor”, wholly and exclusively devoted to the family business, to an entrepreneur who create her “entrepreneurial ideal-self” selectively choosing those solutions which appear to be consistent with the “right balance”, as in her words, between life and personal interests, family and work, according to her values and her being a woman entrepreneur and not just an entrepreneur.

The study undoubtedly has some limitations. The empirical research was done with a single case study of an Italian daughter entrepreneur. We recognise the need to realise multiple case studies with different daughter entrepreneurs within the same or different cultural context to investigate intergroup similarities and differences as regards personal experiences and contextual factors related to entrepreneurial families. Nevertheless, this paper contributes insights into women entrepreneurs and the entrepreneurial families’ role by shedding new light on processes that can lead daughters who grew up in an entrepreneurial context to start their own businesses and how they form their entrepreneurial identity.

### **Abstract**

The present paper summarizes recently-started research inside the UNESCO Chair on Mediterranean Cultural Landscape and Communities of Knowledge whose objective, from a theoretical and operational point of view, is to elaborate a design-oriented knowledge model for a climate-resilient management of the UNESCO site of the Sassi and the Park of the Rupestrian Churches, in order to understand and maximize the potential of 'Community of Knowledge' concept around climate adaptation's challenge. Heritage climate adaptation is a newly emerging research field which intends to reduce effects and enhance the benefits from present or potential climate change impacts through planned strategies and actions. Within Heritage studies, an interesting transdisciplinary debate is arising on the relationship between heritage and contemporary uncertainties, in particular with climate change. Heritage is positioned as a crucial asset and a source of creativity for climate adaptation, also informing UNESCO and its advisory bodies' approaches. Considering heritage through the lens of climate change also challenge heritage understanding, knowledge production/management inside the design processes. The complex nexus heritage-climate change asks to re-define, from a design perspective, knowledge management approaches, methodologies and tools. Knowledge management is crucial inside the design process for heritage transition to climate heritage: the way and from whom we gather multiple data, analyze process, results and experiences and disseminate them are key aspects for increasing the effectiveness and impacts of adaptation process. With this regard, UNESCO cultural landscapes, as 'living' and 'continuous' landscapes, are envisioned as possible climate experimental laboratories, able to respond to the international organizations' calls for capacity-building, multi-level creation, management and exchange of knowledge through climate adaptative design process. With this purpose the site of The Sassi and the Park of the Rupestrian Churches, Matera, Italy has been selected as a hologram of Mediterranean cultural landscapes and a

possible prototype for a design-oriented knowledge model for climate resilience. From an experimental point of view, the research intends to elaborate the CROA (Climate Resilience Operational Atlas), conceived as a collective and inclusive platform which aims at sustaining a dynamic, multi-scalar, participatory and design-oriented knowledge process which will inform the update of the Site's Management Plan. The Atlas could be interpreted as knowledge process, understood as a mapping tool and a focus on what is possible, in which local groups and communities, and their Endogenous Way of Knowing, would play a central role in guiding socio-ecological adaptation processes opening to sustainable development scenarios.

**Paper type** – Academic Research Paper

## 1 Introduction

The present contribution summarizes recently-started research inside the UNESCO Chair on Mediterranean Cultural Landscape and Communities of Knowledge on climate heritage of the UNESCO cultural landscape of Sassi and the Park of the Rupestrian Churches, Matera, Italy. From a theoretical point of view, it intends to understand present constrains and future possibilities concerning design-oriented knowledge management process for climate heritage adaptation, by focusing on the nexus between climate change and heritage. From an operational point of view, its objective is to elaborate a design-oriented knowledge model for a climate-resilient management of the UNESCO site. The research process aims at elaborating a holistic, integrated and multidisciplinary knowledge model/process through which monitoring climate induced changes today and, in the future, and to plan adaptation strategies for the UNESCO site according to the 'Community of Knowledge' mission from UNESCO Chair. 'Community of knowledge' concept (Colonna, 2019, 36) which has also informed the property's Management Plan, explores the knowledge dynamics patterns inside the UNESCO cultural landscape of Matera- with a specific focus on community engagement, cultural significance and cultural identity processes and local knowledge mapping- guiding towards 'a solidarity-based knowledge economy.'(Colonna, 2020, 36) How can 'Community of Knowledge' of the Sassi cultural landscape can contribute in climate adaptation process? Which approach, what methodologies and tools can be implemented? The long-term ambition is

to transform the cultural landscape of Sassi and the Park of the Rupestrian Churches into an experimental laboratory and a prototype for climate heritage resilient adaptation, exploring the complexity underneath the Community of Knowledge concept, by addressing heritages, climate change and communities' entanglements.

## **2 Climate Change, Heritage and Adaptation. Changing perspectives**

Within the Heritage studies, an interesting transdisciplinary debate is arising on the relationship between heritage and contemporary uncertainties, in particular with climate change, one of the greatest challenges of our time (IPCC, 2013). From a 'stability under threat' (Terril in Harvey and Perry, 2005) starting vision - aimed at highlighting exclusively the negative impacts on heritages to be preserved as unchanged -, recently a more convincing line of investigation emerged which explores heritage and climate change nexus in all its complexity. Heritage, a 'fundamental resource for human development' (Albert et.al, 2013) is positioned, inside a socio-ecological framework, as a crucial asset and a source of creativity for climate adaptation, leveraging the differently adjectivized concept of transformation. (Folke et al., 2010; Pelling, 2011; Harrison, 2012; Harvey and Perry, 2015). Adaptation appears to be a key concept in exploring the nexus between heritage and climate change, slowly also informing UNESCO and its advisory bodies' approaches (ICOMOS, 2018), opening up to more up-to-date ways to support heritage-based sustainable development scenarios in a changing climate. In 'The Future of Our Pasts' (ICOMOS, 2019) the concept of adaptation is at the very center of the discussion and, its defined, as 'the ability of a system to adjust to potential damage, to take advantage of opportunities or to respond to consequences' (ICOMOS, 2019, 92), re-elaborating the definition from IPCC report. Adaptation continues to be explored inside climate change cultural heritage research field: 'reactive', 'proactive' and 'planned' (Sesana et. al., 2018), 'persistent', 'autonomous' and 'anticipatory' adaptation (Seekamp and Jo, 2020) and other definitions represent, through categorization, the effort to better understand adaptations dynamics inside cultural heritage challenged by climate change, and how this will impact on traditional practice. 'Cultural heritage, whether tangible or intangible, is sustainable to the extent that it has the capability to adapt to change through creative transformation and continues to develop' (Holtorf, 2018, 643). The continuity in changes, if we think about the

specific category of cultural landscape, is one of its founding characteristics: traditional communities continue to adapt the environment they live in according to ever changing economic, social, cultural and also climatic circumstances, and transformations occurring in the environment are the result of adaptation processes. Considering heritage through the lens of climate change also challenge heritage understanding, knowledge production/management inside the design processes, interpreted as a knowledge agent (Bertola and Teixeira, 2003); consolidated approaches and practices need to be re-discussed, in order to cope with present and future uncertainties. As quoted in the Paris Agreement, adaptation should be based on and guided by the best available science and, as appropriate, traditional knowledge, knowledge of indigenous people and local knowledge systems. (Paris Agreement Article 7.5, 2016). The issue of knowledge and understanding is crucial to sustain the adaptation process opening to climate heritage transition. In particular, the role of 'Community of knowledge' will be explored in order to understand operationally how this concept could inform a design-oriented knowledge management process focused on climate adaptation for the UNESCO Cultural Landscape of Matera.

### **3 UNESCO cultural landscapes as Climate Experimental Laboratory**

Blurring the boundaries between natural and cultural, non-human and human, tangible and intangible, place and landscape, local and global, scientific and traditional knowledge, UNESCO cultural landscape are expression of the dynamic and processual relationships between man and the environment; they could be interpreted as transient results of adaptation processes triggered by economic, political, social, cultural and also climatic changes, which originated unique bio-cultural diversities valued of global relevance. Climate change impacts on cultural landscape, both those already underway and those that will come in the future; it requires efforts to understand them, develop appropriate knowing methodologies and tools, in order to elaborate adaptive strategies and action, and share it inside UNESCO World Heritage List framework and beyond. UNESCO cultural landscapes, because of their global relevance and the network they are in, can be envisioned as climate experimental laboratories, able to respond to the Intergovernmental Panel on Climate Change (IPPC, 2014, 2018), United Nation Educational, Scientific and Cultural Organization's (UNESCO, 2008), International Council of Monuments and Sites (ICOMOS, 2019) calls for capacity-building,

multi-level creation, management and exchange of knowledge through climate adaptative design process that could open to sustainable development scenarios (Moscatelli, 2022, 2), coherently with the United Nations'2030 Agenda and its Sustainable Development Goals (UN, 2015). Inside the research, and coherently with the vision of 'Laboratory of Sustainability' (Management Plan, 2014, 89) the UNESCO site of Matera is envisioned as a hologram of Mediterranean cultural landscape, with a focus on present and future asymmetries climate change will introduce or exacerbate; it is also interpreted as a possible experimental laboratory to test process and practices for a more up to date design-oriented knowledge management process.

#### **4 The UNESCO cultural landscapes of the Sassi and the Park of the Rupestrian Churches**

Located in the southern Italian region of Basilicata, The Sassi and the Park of the Rupestrian Churches of Matera has been inscribed in the World Heritage List (WHL) in 1993 as a "[...] unique witness to man's activities." (ICOMOS, 1993, 12) The site shows that man occupation had evolved harmoniously with the environment over millennia. Its Outstanding Universal Value (OUV) "stems from the symbiosis between its cultural and natural characteristics." (ICOMOS, 1993, 12) Covering an area of 1,016 ha, the property, an example of "remarkable and intact troglodyte settlement" is made up of the ancient districts of the city of Matera (the Sassi) and of the Park of the Rupestrian Churches. "The morphology of the territory, characterized by deep ravines and bare highland plateaus, integrated with ancient cave churches, shepherd tracks marked by wells, and fortified farmhouses, form one of the most evocative landscapes of the Mediterranean." (UNESCO OUV Brief Synthesis, 1993). Inscribed in the WHL with criterion (iii), (iv) and (v), for the first time, the concept of cultural landscape was introduced inside the motivation for inscription, opening to other inscription in the next decades. "An ingenious system with a history stretching back thousands of years, where necessity has led to the best possible use of natural resources by managing water, soil and energy appropriately and harmoniously". A complex ecosystem resulted from the mutual adaptation between man and nature that has been interpreted as an "example for the sustainable city, a metaphor for a new model and a proposal for the entire planet." (Laureano, 2011, 21). Although this vision has been substantially disregarded from an operational and applicative point of view

since its nomination as a UNESCO site and later as Matera Capital of European Culture (2019), it still constitutes a founding horizon that the present research embraces in its attempt to look at the Sassi and the Park of Rupestrian Churches as a global hologram for climate resilient UNESCO cultural landscape. But its heritages are not limited to the UNESCO perimeter. Matera is a living heritage archipelago, made up by the Sassi and the rupestrian settlements, but also of the Post WW II modern experimental neighborhood and the community-based cultural significance process which are occurring in its widespread suburbs. Heritage process is assumed as possible asset for sustaining climate adaptation process beyond UNESCO zones. To free its potential, it is necessary to re-orient consolidated knowledge management practices, operationalizing the role of community and group and of the concept of Community of Knowledge in a climate resilience perspective. The UNESCO site is today affected by violent but also elusive climatic events, and will continue in the future. Heat waves are expanding their annual duration; flashfloods and windstorms are increasing in frequency and intensity. All this is producing negative ecological, social and economic impacts, affecting people's health and quality of urban spaces. The ecological paradigm, in its etymological meaning, is recalled in the Management Plan of the property asking for a discontinuity with the recent past and stressing the need of an experimental dimension (Management Plan, 2014, 54) able to reconnect community and its heritages by envisioning it as "bearer of knowledge." (Management Plan, 2014, 62)

Together with other anthropogenic pressures like tourism in the Core Zone, soil consumption and residential sprawl inside the Buffer Zone, climate change is making the UNESCO site more vulnerable and exposed to increasing risks, affecting both tangible and intangible dimension of heritage. Understanding impacts on heritage and communities, beyond the single event, in a longer time scale, is crucial to orient people-centered climate adaptation strategies and promoting a sustainable development coherently with Agenda 2030.

## **5 The Climate Resilience Operational Atlas**

From an applicational point of view, the research intends to elaborate the CROA (Climate Resilience Operational Atlas), conceived as a collective and inclusive platform which aims at sustaining a dynamic, multi-scalar, participatory and design-oriented knowledge process which -coherently with the four strategic

themes of the Management Plan: 1) Understanding of WH site, 2) safeguarding the OUV, 3) Use and promotion of the quality of life, 4) effective management (Management Plan, 2014, 87)- could help envisioning shared sustainable development scenarios through climate adaptation. The Atlas could be interpreted as knowledge process, understood as a mapping tool and a focus on what is possible, in which local groups and communities, and their Endogenous Way of Knowing, would play a central role in guiding socio-ecological adaptation processes. The concept of adaptive continuity is crucial for envisioning climate resilience and is assumed as structural inside the atlas process. To be more precise, the atlas is more like a collective and inclusive platform with a spatial dimension which intends to sustain people-centered climate-adaptive knowing process but also to understand past dynamics and future climate impacts, coping with the uncertainties of dealing with climate change's projections. It has been conceived around five strategic principles that had been inspired from 'The Future of Our Past: engaging cultural heritage in climate action' (ICOMOS, 2019) and which tries to operationalized the Community of Knowledge concept.

*People-centered value-based approach.* Prioritize what people value of the places through community engagement and participation, fostering social inclusion and equity, through people-centered inventory and cultural mapping process to inform climate heritage management. Understanding cultural significance of a site and social reaction to extreme climatic events, but not limited to, is crucial to stress present changes and their economic, ecological and social overlaying impacts. Explore how people perceived present climate variability, its signals and impacts on places is relevant to orient adaptation strategies.

*Adaptive continuity.* Understanding past adaptability, social, economic and environmental, and relate it to current challenges is crucial to understand present and future vulnerabilities. Exploring how local communities had faced and adapt to sudden (i.e. catastrophes, mass displacement) or slow changes, both natural and anthropogenic, and their implication on cultural landscape (i.e. land use, architecture, etc.) and on the Endogenous Way of Knowing (i.e. traditional knowledge and practices, etc.) (ICOMOS, 2019, 97) is essential. Understanding how communities interpret the cultural landscape as a continuum of adaptation process, also climatic, and how much of this adaptation persists within both tangible and intangible dimension of heritage is a fundamental issue. This multi-scalar, multi-temporal and multi-disciplinary knowing process can contribute to

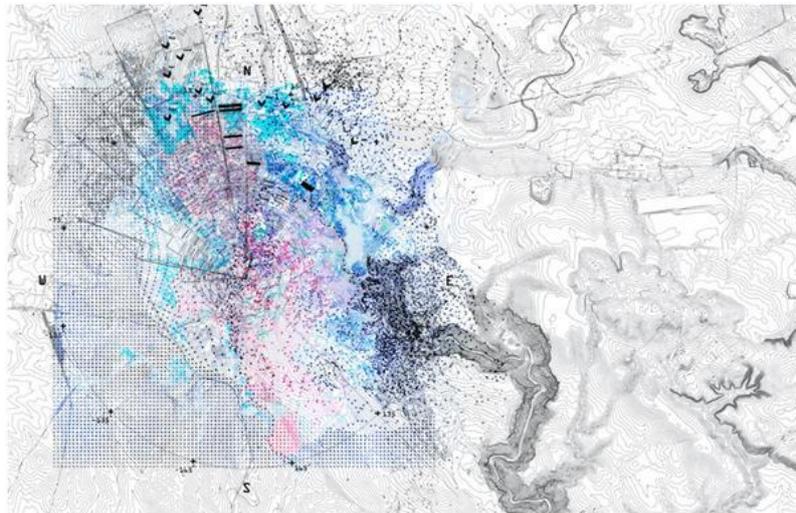

raise awareness of the living or continuous dimension of cultural landscape and to stimulate the emergence of a shared risk culture.

*Integrative and multidisciplinary mapping.* Acquiring, managing and sharing data is crucial and should be done in a holistic, multidisciplinary, integrated and dynamic way. Climate science and inter-sectoral datasets -concerning tourism, environmental patterns, etc.- should be integrated with predictive methodologies concerning climate risk and vulnerability. Spatialization can contribute to the integration of different dataset in time, making more accessible the information collected. Climate change is a long-term phenomenon and its impacts should be valued according to a multi-temporal, multi-scalar approach in order to consider past, present and future vulnerabilities and risks and also opportunities. Scientific dataset should also be integrated with intangible issues such as cultural significance, community vulnerability and resilience, traditional livelihoods in relation to heritage places.

*Complex monitoring.* Heritage monitoring is essential to understand present impact but also to define adaptation strategies and value actions in a long period. Impacts monitoring - that should be conducted through diverse knowledge producers, i.e., data scientist, researcher, institution, local people and groups- will regard heritage places, architecture, communities and local knowledge, both through high-tech and low-tech approaches, fostering the idea of a collaborative knowledge system.

*Transferability.* Sharing knowledge and information concerning adaptation process and practices. Transferability is crucial not only among stakeholders, researchers and professional involved in the UNESCO property of the Sassi and local communities, but also inside the network of UNESCO cultural landscape, fostering multi-level knowledge exchanges.

In a first phase, the mapping process will focus on the Buffer Zone area where, due to its characteristics, the combined effects of anthropogenic pressures can be found more extensively, thus being more fragile also to the present impacts of climate change. Inside a general a framework of present and potential fragilities, five quadrants at a territorial scale were chosen, summarizing in themselves a series of characteristics and recurring fragilities within the Buffer Zone.

*Fig 1. The CROA. Integrating climate change phenomena (windstorms, flashfloods and heatwaves), social and ecological vulnerability and tourism pressure in the UNESCO Cultural Landscape of the Sassi and the Park of Rupestrian Churches, Matera. © A. Raffa.*

An initial large-scale mapping process had been followed by field explorations and dialogue with group and representatives of local communities, with the objective to identify critical heritage places on a local scale, starting from what they consider urgent. Present and possible fragilities, as well as possible local impacts of climate change, were also introduced as another level of reading and interpretation, underlining the opportunities that adaptation actions could give in a small and large temporal/spatial scale, also raising awareness on the climate issue and the potential of community engagement and participation in adaptation process. The survey work has allowed to collect information of different nature -narrations, documents, practices, etc.-, concerning changes and adaptation that would hardly be possible to reach without community involvement. Once this preliminary phase will be accomplished then a multi-level, multi-oriented and dynamic operational topography will result, understood as an open project / process, which is elaborated thanks and will be offered to communities and local groups of active citizenship so that they can implement it through following explorations and specify it starting from their evolving needs and values (Raffa, 2021).

## 6 Conclusions

Intersecting complex issues such as cultural landscape, climate change and people-centered adaptation requires an integrated, holistic, multidisciplinary and open to differences approach to cultural heritage (Brabec and Chilton, 2015), which draws on scientific knowledge as well as on local and traditional knowledge, and which, in addition to supporting awareness-raising processes on climate issue, open to people-centered climate-adaptative development scenarios for the UNESCO site of the Sassi and the Park of the Rupestrian Churches. The ongoing process, which will inform the next update of the Management Plan, intends to frame the UNESCO site as an experimental laboratory on climate adaptation operationalizing the concept of “Community of Knowledge”, defining operational methodologies and tools that could be applied also in other UNESCO cultural landscapes.

## Acknowledgements

The present contribution has been developed inside ongoing research founded by PON R&I | FSE-REACT EU and also inside the UNESCO Chair on Mediterranean Cultural Landscape and Communities of Knowledge research group. A special thanks to the UNESCO Chair for the economic support for the participation to IFKAD 2023 and to the Chair Holder professor A. Colonna for the interlocutions which have informed this work.

### **Abstract**

Sustainable innovation has become an increasingly important topic in recent years, as society faces emerging challenges related to sustainability. Rooting on a wide review of sustainable innovation and framing digital platform ecosystems as a way to create new markets, promote regional specialization, and provide long-term horizons for political action, the paper proposes a conceptual framework to highlight the pivotal role of the platform sponsor in guiding and controlling the development of sustainable innovation on the whole platform ecosystem. This involves setting clear goals, defining metrics, and establishing rules for participation. The platform sponsor also plays a critical role in

fostering collaboration and co-creation among users, facilitating the sharing of knowledge and resources, and creating a culture of innovation and sustainability: in this, algorithms play a key role in enabling green and blue technology recombination, supporting sustainable decision-making. By integrating these technologies, digital platform ecosystems can support sustainable practices across a range of industries and reduce the environmental footprint of human activities.

**Keywords** – Sustainable innovation; digital platform ecosystem; green and blue; algorithms.

**Paper type** – Academic Research Paper

## 1 Introduction

The past two decades have witnessed an increase in interest in the topic of sustainability (Aghion et al., 2009; EC, 2010; Montalvo et al., 2011; Cillo et al., 2019) and several historically relevant forces contributed. Firstly, the great number of long-term challenges such as climate change, ageing populations, pollution, resource scarcity (Montalvo et al., 2006; Taleb, 2012; Harari, 2018); secondly, the reorientation of the international socio-economic environment towards multipolarity of interests and the consequent need to redefine competitive rules (Foray, 2009; Contractor et al., 2010; Taleb, 2018). Thirdly, the growing distrust and delegitimization, in an increasing number of advanced economies, towards policies aimed at ensuring social welfare and employment after the economic meltdown of 2008. The financial crisis has made clear how a 'contingent' mentality, centered on short-term strategies, policies, and actions, can result in loss of social equilibrium, ecological shocks, deep rifts in the fabric of values (Harari, 2018).

In the broad socio-political debate, there is broad consensus on the urgency of generating innovation to meet these challenges (EC, 2009; EC, 2010; OECD, 2010, 2011, 2012). Future competitiveness is no longer defined solely through the ability to survive in current markets, but above all through the ability to create new sustainable markets driven by innovation (Montalvo et al., 2011). In the case of the challenges posed by sustainability, the notion of innovation has often been deemed successful (Porter and Kramer, 2011). This is evident from the large increase in capital flowing into sustainable innovations (Ethical Markets Media, 2011; Montalvo et al., 2011). Sustainable innovations are creating new global markets, enabling the smart specialization of certain regions and offering

governments long-term horizons and new space for policy action (West, 2017; Harari, 2018; Mattila et al., 2020). Such evidence has contributed to increasing the interest of companies in implementing sustainable business models (Latour, 2020). Despite the great centrality of the topic at hand, however, little has yet been said about how (sustainable) innovations can be directed towards creating sustainable business models by establishing a link between the firm and its supra-systems of reference (Barile, 2009; Boons and Wagner, 2009; Wever et al., 2010; OECD, 2012; Cillo et al., 2019; Latour, 2020). The present work aims to fill this gap.

The paper is organized as follows: after a framing of the concept of sustainable innovation (Section 2), the paper deepens digital platforms ecosystem as emerging models for the diffusion of sustainable innovation thanks to green-blue technologies integration (Section 3). This is followed by implications, and conclusions (Section 4).

## **2 Digital platform ecosystems for sustainable innovation: the state of the art**

A platform ecosystem is a type of inter-firm/inter-stakeholder relationship in which a focal firm (the platform sponsor) mediates among multiple groups of participants (e.g., consumers and suppliers; developers and complementors), thereby creating value within the ecosystem itself. Platforms can be classified as transaction platforms (Jacobides et al., 2018; Cusumano et al., 2019), i.e., mediation channels (or marketplaces) between buyers and sellers; and innovation platforms that provide – in addition to simplified transactions – technological infrastructures to third parties, the complementors, for the development of products to be offered to platform users (Cusumano et al., 2019; Zeng et al., 2021). In addition to the platform sponsor, who acts as an orchestrator of values, resources and competences, platforms consist of two further sides: the demand side and the supply side (Calabrese et al., 2021; Zeng et al., 2021). On the demand side, consumers and buyers have access to a variety of services aimed at ensuring the reliability of transactions and the quality of the offer (e.g., via user ratings and reviews); on the supply side, users have to comply with the rules of access to the platform, pay transaction fees and meet the quality requirements set by the platform sponsor (Boudreau and Hagiu, 2009; Nambisan and Baron, 2013). Furthermore, both sides of the platform benefit from the value created within the ecosystem, which is not easily accessible from the outside: a common

infrastructure and a large pool of potential demand; the great heterogeneity of supply and the effectiveness of the feedback system.

Indeed, a central feature of platform ecosystems is the presence of indirect network effects among participants on different platform sides: the value realized on one platform side depends on the number of participants on the other side (Armstrong, 2006, Parker et al., 2016; Parker & Van Alstyne, 2018; Zeng et al., 2019). This is the well-known *chicken-or-egg problem* (Caillaud & Jullien, 2003): a sufficient number of participants from one side of the platform is necessary to attract those from the other and vice versa. Thus, the greater the market share gained, the easier it becomes for the platform to gain future market share (Arthur, 1996): incentivizing firms and customers to join a platform and interact with each other to trigger network effects is a key role of the platform sponsor (McIntyre & Srinivasan, 2017).

Moreover, such a network of relationships allows for the effective use of under-utilized resources, focusing on their accessibility rather than their exclusive ownership, on equitable and sustainable distribution, reduced costs of access to resources and thus their democratic diffusion (Botsman and Rogers, 2010; Albinsson and Perera, 2012; Martin, 2016; (Srnicsek, 2017; Chen et al., 2018; Zeng et al., 2021; Mair and Rathert, 2021), enhancing social, economic and environmental well-being and pushing innovations logics ahead (Black and Cherrier, 2010; Jin et al., 2018; Vith et al., 2019).

Therefore, the relationship between sustainable innovation and the pervasiveness of digital platforms possesses great transformative potential, giving rise to new models of territorial regulation, new ways of participation/distribution/recombination of value and resources, new welfare and market models and new types of social capital (Belk, 2014; Davidson and Infranca, 2015; Matzler et al., 2015).

This implies that socioeconomic value creation is shifted from the inside to outside of the platform boundaries. However, as mentioned, in creation, convergence and alignment of digital platforms' socioeconomic value, the orchestration role of the platform sponsor is pivotal.

Thus, digital platform ecosystems are revolutionising market logic, affecting international competitive dynamics and the evolution of several technological trajectories (McIntyre et al., 2020; Simone, 2020): they exploit technology to connect people, organisations, and resources within an interactive ecosystem that can constantly reproduce itself. These reproductive capacities allow digital

platform ecosystems entering and creating new markets (Simone et al., 2020). Under the lens of sustainability, this happens by combining very different functionalities and technologies and expand into new markets (Greenfield, 2017) and developing innovative, hybrid, and sustainable solutions (Mattila et al., 2020). A clear example of this dynamic is the integration of green and blue technologies: the first typology makes it possible the joint management of environmental challenges and value creation aims (OECD, 2009; 2011; Calabrese et al., 2021); the second typology (i.e., digital technologies) opens new spaces of possibilities and opportunities.

This green/blue binomial seems to permit the whole social fabric to coordinate environmental capitalism with digital capitalism toward sustainable innovation, giving also rise to new mechanisms of governance (Floridi, 2020).

However, it is licit to ask: what is meant by sustainable innovation? In what follows, the paper tries to frame an answer.

Indeed, in recent years, there has been an increasing recognition of sustainable innovation as a response to present environmental and social challenges.

Sustainable innovation is a type of innovation that integrates ecological, social, and economic considerations into social and business systems. This type of innovation requires a systemic, architectural, and radical approach that goes beyond incremental adjustments and requires the transformation of larger parts of production or consumption systems.

To further understand sustainable innovation, numerous definitions and perspectives have been proposed. The European Commission defined eco-innovation as "the production, assimilation or exploitation of an innovation in products, production processes, services, or management and business methods that aims to prevent or substantially reduce environmental risk, pollution, and other potential negative impacts from resource (including energy) use" (EC, 2008).

Carrillo-Hermosilla et al. (2010) followed by Adams et al. (2016), and Cillo et al. (2019) defined eco-innovation as an innovation that improves environmental performance.

Based on what emerges this debate, sustainable innovation can be defined as innovation that improves sustainability performance, where such performance includes ecological, social, and economic criteria (Calabrese et al., 2021). However, since these criteria are constructivist and cultural in nature, both its meaning and characteristics differ in different contexts (Hart and Milstein, 1999; Prahalad, 2005; Seelos and Mair, 2005, 2007; Tukker et al., 2008; Yunus et al., 2010).

Boons (2009) argues that innovations for sustainable development need to overcome the incremental logic, calling for a wider transformation of production/consumption systems. In this line, incremental innovations can only lead to improvements in sustainability performance but not to a concrete reconfiguration (Boons et al., 2013).

Following this logic, sustainable innovation can be analyzed along three levels: organizational, inter-organizational, or social (Boons & Lüdeke-Freund, 2013).

At the organizational level, the focus is on the ability single firms have in developing green technologies for effective value propositions design (even if, more than often, organizations themselves are seen as black boxes) (Arimura et al., 2007).

At the inter-organizational level, studies focus on the nodes of inter-organizational networks involved in innovation generation, examining the relevance of relationships with other actors in the governance of sustainable innovation processes. These studies also focus on the interactions between different factors that impact the innovative capacity of an enterprise (Edquist, 1997; Weber and Hemmelskamp, 2005; Seuring and Müller, 2008).

At the societal level, studies aim to understand transitions or paradigm shifts and how social change is connected to technological change. These studies are particularly interested in framing the value that brings actors together around a technology, whether existing or new. Additionally, the creation and diffusion of norms, values, and cultural practices play a crucial role in the adoption and success of sustainable innovations in society (Geels, 2004; Hargadon and Douglas, 2001; Shove, 2010).

Furthermore, the literature on sustainable innovation emphasizes the importance of collaboration and co-creation between different actors, including firms, governments, civil society organizations, and individuals, to achieve sustainable development goals (Bocken et al., 2015; Schiederig et al., 2012). This requires a shift from a traditional linear model of innovation to a more collaborative and iterative process that involves the participation and engagement of diverse stakeholders throughout the innovation process (Jansen et al., 2018).

### 3 Spreading sustainable innovation through digital platform ecosystems

As previously mentioned, a sustainable digital platform ecosystem can be developed by leveraging two key technology-driven pillars: green technologies and blue technologies. By combining these technologies, sustainable and innovative solutions can be achieved, which can fundamentally transform how firms and societies innovate, produce, and consume products and services. Green technologies are focused on creating value and innovatively managing environmental issues, while digital technologies are considered as blue technologies that can complement and enhance the capabilities of green technologies (Floridi, 2020). In real-life scenarios, the convergence of green and blue technologies is evident in the design of sustainable solutions, especially in modern cities where sustainable management models are being implemented. A prominent example of this convergence is the electric scooter, which is classified as a green technology. In cities, these technologies are linked to blue technologies, such as a scooter sharing app that enables users to access the service. Therefore, digital platforms can serve as a model to integrate green and blue technologies, facilitating their convergence towards sustainability (fig 1).

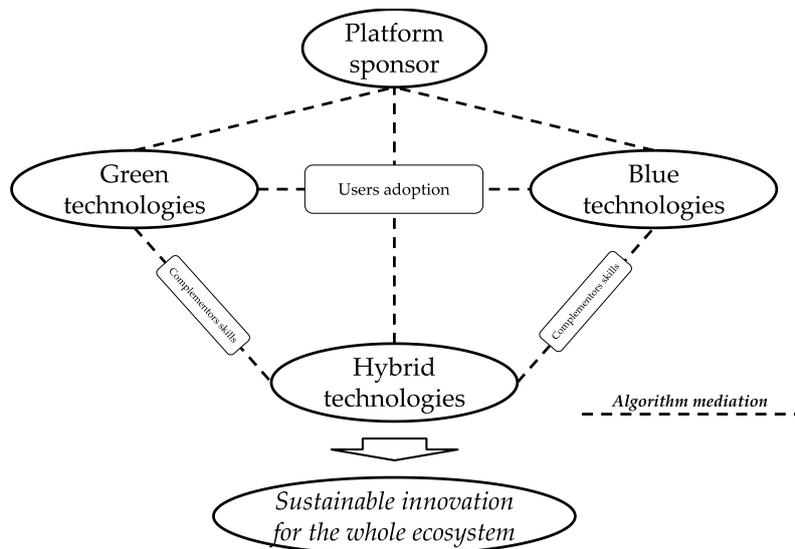

Figure 1. Green and Blue technologies integration towards sustainability  
Source: our elaboration

The goal of this section is to explain how a sustainable digital platform ecosystem emerges and emphasize the role of digital algorithms and platform sponsor in this emergence phase. Digital algorithms play a vital role for three main reasons (Calabrese et al., 2021):

1. *data collection and filtering* are carried out through algorithms that record, process, and filter the activities of each user and information from external markets in real-time;
2. the algorithmic language is adopted by the members of the digital platform ecosystem to communicate and share information, knowledge, and technologies with each other;
3. the algorithmic language allows for the hybridization of technologies since different technologies can communicate with each other, which enables the digital platform ecosystem to merge and hybridize green and blue technologies. This peculiarity facilitates the evolution of a sustainable digital platform ecosystem (Greenfield, 2017).

Indeed, green and blue technologies can merge by using the same algorithmic language, resulting in a sustainable digital platform ecosystem with powerful and hybrid ideas, as mentioned by Greenfield (2017). The development of a sustainable digital platform ecosystem involves four crucial steps Cusumano et al. (2019): identification of market sides, chicken-egg problem solution, collaborative governance model design, rules of conduct establishment and enforcement.

Regarding the first step, the platform sponsor needs to use the platform's digital algorithms to connect the supply and demand sides of the market. The algorithms should be instructed to search for green technology developers and users and to connect both market sides. For instance, Apple is particular about selecting green solution developers like Too Good to go, Ecosia and Recycle Coach.

Further, the second step attains to the chicken – or – egg problem solution: the platform sponsor must attract users from both sides of the digital platform, giving rise to both direct and indirect network effects, attracting users through the introduction of blue technologies which complement and integrate available or new green technologies, such seen in the case of Apple iOS platform.

The third step refers to the design of collaborative governance models: to ensure digital platform ecosystems being sustainable, the platform sponsor needs to create a business model that incorporates a collaborative-driven logic of governance, allowing all actors to communicate as peers through platform's

digital algorithms. These algorithms identify decisions shared by all ecosystem actors, ensuring that they all participate in decision-making and sustainable innovation processes, as exemplified by the *We Dont HaveTime Climate Change* iOS app.

Eventually, the fourth step refers to the need to establish and enforce rules of conduct.

To ensure smooth functioning of the digital platform ecosystem, it is the responsibility of the platform sponsor to establish and clearly communicate the participation rules to all ecosystem actors. The sponsor must also specify how digital algorithms monitor adherence to these rules and enforce penalties in cases of non-compliance by any actor.

Additionally, the sponsor determines the degree of decentralization in decision-making and takes on the role of guiding and controlling the ecosystem through instructions given to digital algorithms (Gawer and Cusumano 2002 a, b; Eisenmann et al. 2011; Cusumano et al. 2019). As an example, Apple's rules revolve around climate change, resources, and smarter chemistry (Apple, 2020).

Following these four steps, the platform sponsor could create a sustainable ecosystem characterized by peer-to-peer procedures through which actors sustainably co-create value (Barile et al., 2017).

#### **4 Implications and conclusion**

Even if the digital platform ecosystem phenomenon is under the spotlight of managerial studies, no frameworks show how sustainable digital platform ecosystems emerge and the importance of the platform sponsor and digital algorithms in this emergence phase. This paper is a first step in this direction, highlighting procedures to be followed to build a sustainable digital platform ecosystem. It shows the critical role played by the platform sponsor and the tool used by the platform sponsor, the digital algorithm, to design a sustainable digital platform ecosystem. The work also offers valuable support in the decision-making processes that affect the digital platform ecosystem in choosing strategies to be implemented. In particular, the proposed framework can guide the implementation of innovative, hybrid and sustainable strategies. In particular, it is explained how a digital platform ecosystem can evolve into a sustainable digital platform ecosystem by designing a technology ready to combine and recombine with new green technologies. The limits of the research are to be

found in the purely theoretical nature of the work. The main limitation lies in need to support this study with empirical evidence. Future research will be oriented toward overcoming this limitation and deepening the role of hybrid innovation, taking on different directions, peculiarities, and gradients thanks to the sustainable digital platform ecosystem.

Concluding, this paper has shed light on how green and blue technologies can merge into powerful, hybrid ideas through the digital platform ecosystem. By focusing on the role of the platform sponsor and digital algorithms used by digital platform ecosystems, the research elaborates a framework that illustrates the mechanisms through which a sustainable digital platform ecosystem can emerge, allowing green and blue technologies to merge. The paper shows that the clear identification of green developers and the construction of a collaborative governance model contribute to the emergence of the sustainable digital platform ecosystem. It reveals that the platform sponsor plays a crucial role in direction and control, while the algorithm plays a key role in rapidly connecting all the actors in the ecosystem and combining very different functionalities and technologies such as green and blue technologies. To conclude, the *sustainable digital platform ecosystem* represents a new organisational model that fully meets the need for a sustainable twist on innovation by allowing innovation and sustainability to be combined and allowing natural limits to be fully exploited (Crutzen, 2006).

### Abstract

In recent years, to solve the problems related to sustainability, there is an increasing need for a transition from linear production and consumption systems to new models oriented towards recycling, reuse, reuse and reuse. In the academic field, several scholars have turned their attention to the adoption by companies of the new circular economy models. Due to the interest of a large number of stakeholders in issues related to the circular economy, several scholars have begun to explore the circular economy disclosure practices of companies. Despite this, studies on the topic are still limited. The purpose of this study is firstly to examine the level of circular economy information disseminated through Twitter by companies and, secondly, to examine the impact of some characteristics of companies on the level of circular economy disclosure. Empirical results show that the most profitable and most indebted companies disclose a greater amount of circular economy information through their official Twitter accounts. This study contributes to enriching the academic literature and provides important practical contributions.

**Keywords** – Circular economy, Disclosure, Social media, Twitter

**Paper type** – Academic Research Paper

## 1 Introduction

Ecosystems are crucial for sustaining life on the planet, but they have not always been treated with care. Overuse, overconsumption and neglect have caused harm to many vital ecosystems (García-Sánchez et al., 2021; L'Abate et al., 2023). The current events of the COVID-19 pandemic and the Russia-Ukraine war have further highlighted the need to use resources responsibly and avoid waste. In this context, the circular economy is gaining more attention as a solution to environmental problems, especially in terms of recycling and recovering resources. In many countries and particularly in the European Union, it is considered a fundamental aspect of sustainable policies and a key driver of the transition towards global sustainability (García-Sánchez et al., 2022a). The NextGenerationEU Plan also recognizes the circular economy as a way to aid economic recovery following the COVID-19 pandemic (García-Sánchez et al., 2022a). The circular economy is an economic model in which materials and resources are used, recovered and regenerated in a continuous manner to maintain the value of resources within the economy for as long as possible (Gunarathne et al., 2021). The goal is to reduce waste and environmental impact, create resilient local economies and support sustainable development. The circular economy is based on three fundamental principles: designing out waste and pollution, keeping resources in use for as long as possible and regenerating natural systems (Millar et al., 2019). Despite the importance of the circular economy for stakeholders, companies are not effectively and clearly communicating data and information about this production and consumption model (Barnabè & Nazir, 2021). Even though more companies are starting to adopt circular economy disclosure practices, there are still issues and delays due to a lack of specific measurement tools and reporting standards (Elia et al., 2017), as well as a lack of a commonly accepted language for discussing these topics (Ünal et al., 2019; Barnabè & Nazir, 2021). These circumstances have led to a variety of different ways of measuring and presenting information about the circular economy, using different techniques and tools (Garza-Reyes et al., 2018; Barnabè & Nazir, 2021).

In recent years, the advent of digitalization has provided new digital platforms for the dissemination of circular economy information. In particular, one way is the use of social media (Dumay, 2016). Social media have changed the disclosure landscape, offering further opportunities for research on the role of disclosure.

They facilitate firm-directed, one-to-many communications that bypass traditional media and allow a firm to broadcast its intended message to a large network of stakeholders (Lee et al., 2015).

In light of the relevance of the circular economy and social media, this study, firstly, intends to analyze the amount of circular economy information disseminated by companies through Twitter and, secondly, the factors capable of favoring or hindering circular economy disclosure through this social platform. In this regard, this study, in the wake of Barnabè and Nazir (2021), uses the glossary provided by the U.S. Chamber of Commerce Foundation to identify terms related to the circular economy and a count of the number of tweets provided by companies on their official Twitter account containing those terms. Furthermore, it provides for the implementation of an econometric model aimed at identifying the determinants of circular economy disclosure through the Twitter social platform.

The rest of this work is organized as follows: Section 2 presents the literature review and hypotheses development, Section 3 introduces the research design, while Section 4 presents the results and draws conclusions.

## **2 Literature review and hypotheses development**

Due to the recent relevance of the circular economy, several scholars have begun to explore the way companies communicate circular economy information (Istudor & Suciu, 2020; Dagiliene et al., 2020; Barnabè & Nazir, 2021; Opferkuch et al., 2021; Tiscini et al., 2022; Vitolla et al., 2023). Specifically, several studies have examined the different channels through which companies provide circular economy information to stakeholders. In this regard, they focused their attention on the various company documents, including integrated report, sustainability report and annual report, examining not only the level and type of circular economy information contained in them but also the drivers of circular economy disclosure. Instead, in the academic literature there is a paucity of studies exploring other communication channels, such as websites and social media.

With reference to the integrated reports, scholars have begun to explore the communication methods of circular economy information in the light of integrated thinking, as it allows to capture the interconnections between the different categories of capitals and to provide a holistic view of this information (Kunc et al., 2021; Myeza et al., 2021; Barnabè & Nazir, 2021; 2022). In this regard,

Barnabè and Nazir (2021) conducted a content analysis on the content of the integrated report and a case study in order to examine the role of the <IR> framework in the dissemination of circular economy information. The authors demonstrated the presence of important differences in the communication practices of circular economy information, highlighting the relevance and potential of integrated reporting in representing such information. Kunc et al. (2021) came to the same conclusion about the relationship between integrated reporting and circular economy disclosure. In addition, Barnabè and Nazir (2022), through a case study conducted in the agri-food sector, explored how the principles of integrated thinking are applied in the communication and representation of circular economy information within integrated reports. Finally, Myeza et al. (2021), examining the integrated reports of South African mining companies, provided a regulatory framework for integrating circular economy practices into corporate strategy and observed the level of circular economy information contained within this document.

Other studies have examined the relationship between sustainability reporting and circular economy information (Janik et al., 2020; Marco-Fondevila et al., 2021; Opferkuch et al., 2021; 2022; Tiscini et al., 2022). In this regard, Opferkuch et al. (2021) observed that, due to the absence of guidelines for the identification and representation of circular economy information, there is a disconnect between sustainability disclosure and the circular economy. In this regard, Opferkuch et al. (2022), have highlighted that still few companies disseminate circular economy information within sustainability reports. Indeed, the authors observe that the information included in the sustainability reports concern circular economy indicators and objectives. In addition, Tiscini et al. (2022) highlighted that companies still disclose little circular economy information in relation to the circular economy strategy, governance, performance and management within the sustainability reports. Janik et al. (2020), by analyzing the sustainability reports of companies operating in the energy sector, found a focus on greenhouse gas emissions, while little attention was given to circular economy information. Finally, Marco-Fondevila et al. (2021), examining the largest Spanish companies, found that only half of them disseminate circular economy information in their sustainability reports. Other authors have instead explored the content of circular economy information communicated through sustainability reports (Stewart & Niero, 2018; Istudor & Suci, 2020; García-Sánchez et al., 2022a). In this regard, Stewart and Niero (2018), by analyzing a sample of 49 companies operating in the

consumer goods sector, discovered that business model tactics and circular product design received less attention than other aspects such as core product, procurement strategies, packaging, and end-of-life management. In addition, Istudor and Suci (2020) examined the sector of food and observed that companies disseminate information regarding emissions, waste reduction and recycling, correct use of resources and sustainable development. Furthermore, García-Sánchez et al. (2022a) found that companies focus their attention on information relating to the reduction of greenhouse gases, the correct use of resources and in general the role of the circular economy in the sustainable development goals. Finally, other authors have examined the drivers of circular economy disclosure (Wang et al., 2014; Dagiliene et al., 2020; Vitolla et al., 2023). In this regard, Wang et al. (2014) found that ownership concentration, institutional ownership and environmental institutional protecting pressures have a positive impact on the level of circular economy information disseminated within sustainability reports. External pressure was also examined by Dagiliene et al. (2020). In fact, the authors observed that the levels of circular economy disclosure are positively influenced by regulations and mimetic pressures, while coercive factors have no significant impact. Finally, Vitolla et al., (2023), examining the sustainability reports of 88 international companies, observed that firm size, firm profitability and firm financial leverage have a positive impact on the amount of circular economy information disclosed.

Finally, other studies have instead examined more types of corporate documents, focusing on the amount of circular economy information disclosed, on the drivers and on the effects of circular economy disclosure (Gunarathne et al., 2021; Kuo & Chang, 2021; Roberts et al., 2022). Specifically, Gunarathne et al. (2021), by analyzing the integrated and sustainability reports, found that Sri Lankan companies disclose a low level of circular economy information. Instead, Roberts et al. (2022), by examining the sustainability reports and annual reports, found higher levels of circular economy disclosure in companies in the automotive sector than in those operating in the aerospace and defense sectors. Still focusing on the sustainability and annual reports, Kuo and Chang (2021) examined the determinants and effects of circular economy disclosure in the Chinese context. More in detail, in relation to the determinants, the authors found that larger firms, state-owned enterprises and firms operating in environmentally-sensitive industries disseminate more circular economy information. Furthermore, in relation to the effects, the authors observed that the dissemination of circular

economy information has a positive impact on the profitability and growth rate of companies.

Instead, the academic literature has paid little attention to the dissemination of circular economy information through social media. Specifically, there is only one study conducted by Esposito et al. (2023) who explored social networks as a communication channel for circular economy information. In this regard, examining the agri-food sector, the authors found that Twitter represents a good channel for the dissemination of circular economy information. Despite this, the companies operating in the agri-food sector have dealt with only a few aspects, communicating on this social network only information on recycling and the circular economy in general.

The literature review shows limited attention to social media as potential communication channels for circular economy information. In addition, the absence of studies aimed at examining the drivers of circular economy disclosure through social media is evident. This study aims to fill this gap by focusing attention on three different corporate characteristics which, by increasing the pressures to which companies are exposed and the stakeholder base, could favor a wider circular economy disclosure. In particular, it examines the impact of three corporate characteristics: size, profitability, and financial leverage. In fact, these variables, for various reasons, influence the attention that companies dedicate to the interests of stakeholders and therefore could influence the level of circular economy information disclosed via Twitter. In fact, larger companies are more visible and have a greater impact on the external environment (Reverte, 2009; Vitolla et al., 2019; Nicolò et al., 2022) while the most profitable companies have a greater availability of monetary resources and want to distinguish themselves from their competitors also through a broad disclosure (Brammer & Millington, 2006; Schreck & Raithel, 2018). Finally, the most indebted companies have a greater need to consolidate a relationship of trust with stakeholders (Branco & Rodrigues, 2008; Andrikopoulos et al., 2014; Sharif & Rashid, 2014; Raimo et al., 2022). In light of this, it is reasonable to expect a positive impact of these variables on the level of circular economy disclosure via Twitter and it is possible to introduce the following hypotheses:

*HP1: Firm size has a positive influence on the circular economy disclosure level via Twitter*

*HP2: Firm profitability has a positive influence on the circular economy disclosure level via Twitter*

*HP3: Firm financial leverage has a positive influence on the circular economy disclosure level via Twitter*

### **3 Research design**

The sample of this study includes 141 companies belonging to the S&P 500 index. The choice of this index is justified by the need to examine larger companies as they are exposed to greater pressure from stakeholders in relation to transparency (Watts & Zimmerman, 1978; Manita et al., 2018). For the purposes of this analysis, only companies operating in the energy (or energy utilities), industrial and basic materials sectors were selected from the initial list. Subsequently, the companies that did not have an official Twitter account and those for which it was not possible to retrieve the data relating to the independent and control variables from the Bloomberg database were excluded. In light of this, the final sample is made up of 141 companies.

The dependent variable of this study is represented by circular economy disclosure level (*CEDL*). It is measured as the natural logarithm of the number of tweets containing information relating to the circular economy published in 2021 on the official Twitter accounts of the companies included in the sample. A manual content analysis was used to measure this variable (Vitolla et al., 2020a; Raimo et al., 2021). In particular, following Barnabè and Nazir (2021) and Esposito et al. (2023), a dictionary-based content analysis was used. The "Glossary of Circular Economy" developed by the U.S. Chamber of Commerce Foundation was chosen as the source for term identification. Following previous studies, the selected glossary was expanded with other concepts leading to the identification of 54 terms related to the circular economy. The terms related to the circular economy were considered both singular and plural form.

In line with the objectives of this study, the recording unit is represented by the individual tweets published by companies through their official accounts in 2021. The data collection was conducted through the "All My Tweets" web application. Each tweet was assigned a score equal to 1 in the event of the presence of one or more terms relating to the circular economy and a score equal to 0 otherwise (Massaro et al., 2017).

The independent variables included in this analysis are: *Firm Size*, *Firm Profitability*, and *Firm Financial Leverage*. *Firm Size* was calculated in terms of the natural logarithm of total assets (Vitolla et al., 2020b; Salvi et al., 2022), while *Firm*

*Profitability* was measured in terms of return-on-equity (Raimo et al., 2020), calculated as the ratio between net income and shareholders' equity. *Firm Financial Leverage* is a measure of the firm's debt and was measured as the ratio of total debt to total assets (García-Sánchez et al., 2022b; Salvi et al., 2022).

The control variables are: *Energy Sector*, *Board Size*, *Board Gender Diversity*, *Board Independence*, *Audit Committee Size*, *Number of Tweets*, and *Number of Followers*. *Energy Sector* is a dummy variable which assumes the value 1 if the company operates in the energy sector, and 0 otherwise. *Board size* was calculated as the total number of members who make up the board of directors, while *Board Gender Diversity* was measured as the percentage of women on the board of directors. *Board Independence* was calculated as the percentage of non-executive members included within the board of directors, while *Audit Committee Size* was measured in terms of total members who make up this corporate governance body. *Number of Tweets* was calculated as the natural logarithm of tweets posted by the company in 2021 through its official Twitter account, while *Number of Followers* was calculated as the natural logarithm of the number of individuals who follow the company's official Twitter account.

The model of analysis proposed by this study is reflected in the following equation:

$$CEDL = \beta_0 + \beta_1 \text{ Firm Size} + \beta_2 \text{ Firm Profitability} + \beta_3 \text{ Firm Financial Leverage} + \beta_4 \text{ Energy Sector} + \beta_5 \text{ Board Size} + \beta_6 \text{ Board Gender Diversity} + \beta_7 \text{ Board Independence} + \beta_8 \text{ Audit Committee Size} + \beta_9 \text{ Number of Tweets} + \beta_{10} \text{ Number of Followers} + \varepsilon$$

#### 4 Results and conclusions

Table 1 shows the descriptive statistics. The dependent variable of this study – *CEDL* – has an average value of 2.923. In relation to the independent variables, *Firm Size* shows an average value of 10.132. Furthermore, *Firm Profitability* has an average value equal to 24.330, while *Firm Financial Leverage* has an average value equal to 32.243. Table 1 also shows the results of the correlation analysis and the variance inflation factor (VIF) analysis which allow for the exclusion of multicollinearity issues.

Table 1 - Descriptive statistics, VIF and correlation analyses

Notes: \*\*\*Significant at the 1% level; \*\*Significant at the 5% level; \*Significant at the 10% level

Table 2 instead shows the results of the linear regression analysis. The results obtained in the regression model almost totally support the hypotheses postulated in this study.

The results do not support hypothesis 1 (HP1). Indeed, they show a non-significant relationship between *Firm Size* and *CEDL*. In light of this, company size does not have a significant impact on the level of circular economy information disseminated by companies through their official Twitter accounts. In addition, the results support hypothesis 2 (HP2). Indeed, they show a positive and significant relationship between *Firm Profitability* and *CEDL*. In light of this, the most profitable companies tend to disclose a higher amount of circular economy information through their Twitter accounts. Finally, the results support hypothesis 3 (HP3). Indeed, they show a positive and significant relationship between *Firm Financial Leverage* and *CEDL*. In light of this, the most indebted companies tend to disseminate a higher amount of circular economy information through their Twitter accounts.

This study aimed to investigate the drivers of the circular economy disclosure via Twitter. More in detail, this study investigated the effect of some characteristics of companies such as size, profitability and financial leverage on the level of circular economy information contained in the tweets published through the company official account. The results of this study showed that the most profitable and most indebted companies disclose a greater amount of circular economy information through their official Twitter accounts.

This study provides important contributions to the academic literature and practice. From an academic point of view, it first of all contributes to enriching the debate on disclosure policies relating to the circular economy which has become the object of interest of numerous scholars. Another important contribution is represented by the analysis of the factors capable of influencing the circular economy disclosure policies of companies. With reference to the practical contributions, this study first of all shows the need for certain types of companies to disclose circular economy information in order to mitigate the pressures to which they are exposed and satisfy the information needs of stakeholders. Furthermore, this study demonstrates the goodness of social networks and in particular of Twitter for the dissemination of circular economy information.

In conclusion, it is necessary to point out the limitations of this study. The main limitation concerns the focus of the econometric analysis on a single year. This limitation represents a starting point for future research. In fact, they will be able to extend the time horizon of the econometric analysis and allow the understanding of the evolution over time of the circular economy disclosure via Twitter.

### **Abstract**

Many fashion companies are increasing their sustainable offer by introducing into the market new sustainable clothing (e.g., bio-based garments). However, the level of acceptance of these products is still low among consumers due to barriers, such as high prices, lack of product knowledge or availability. To foster sustainable fashion consumption, a clear understanding of consumers' motivations to purchase this kind of clothing is needed.

This paper aims to investigate the determinants of consumers purchasing intentions and behaviors toward bio-based garments. To this aim, a conceptual framework was developed, based on the integration between the "Theory of Planned Behavior" (TPB) and the "Fashion Adoption Theory" (FAT). Sustainable fashion is considered a new trend, according to previous studies; therefore, the sustainable fashion adoption process was studied by reconducting the FAT variables in the TPB model.

This study adopts a quantitative methodology. A questionnaire was spread among Italian consumers. The linear regression technique will be used for data analysis.

The contributions of this study are manifold. From a theoretical point of view, the adoption of different behavioral theories and their modification using innovative and traditional

variables in different combinations. From a managerial point of view, (1) insights for developing marketing strategies for sustainable garments and specific consumer segments; and (2) information to evaluate how to best use digital channels to promote its sustainable offer. Concerning policy-related implications, this research will help define categories of target consumers on which to focus awareness campaigns.

## 1 Introduction

Nowadays, efforts are centered on shifting the fashion industry toward sustainability since this industry is responsible for high environmental impacts and contributes to climate change. Thereby, many fashion companies are investing in converting their production and their offer into more sustainable patterns. In this sense, biobased garments (e.g., Lyocell) represent a promising innovation. These garments are realized from biomasses, thus using natural materials averting the use of fossil ones.

However, the high prices, low consumer knowledge, and scarce availability prevent a wide diffusion and acceptance of these innovative sustainable garments into the fashion market (Harris et al., 2016). To help companies improve their sustainable offer and encourage consumers to choose this kind of product, understanding consumers' purchase motivation is critical (Apaolaza et al., 2022).

Scholars' attention to sustainable consumer behavior in the fashion industry is growing in recent years. Many studies are devoted to investigating consumers' purchase decisions toward sustainable garments (e.g., Amaral and Spers, 2022). Many theoretical approaches are used and the literature suggests extending existing theories (Dhir et al., 2021) using new variables (Park and Lin, 2020) and considering possible mediating, moderating or interaction effects among them (Pham et al., 2021). Studies focused on generic sustainable garments (e.g., Jacobs et al., 2018) or toward specific sustainable categories such as recycled (e.g., Nguyen et al., 2020) or organic (e.g., Thompson and Tong, 2016). However, studies on consumer purchase behavior for biobased garments are rare (e.g., Dangelico et al., 2022) and further investigations in this vein are needed

(Johnstone and Lindh, 2022). In addition, few studies investigate specific sustainable clothing items, such as t-shirts (e.g., Sonnenberg et al., 2014).

For the above-mentioned reasons, this study aims at investigating consumers' purchase behavior toward two specific items (i.e., underwear and jacket) of biobased garments. Underwear is associated with low visibility level and high skin contact, while the opposite is for jackets. The theoretical underpinning is based on merging the Theory of Planned Behavior (TPB) (Ajzen, 1985) and the Fashion Adoption Theory (FAT) (Sproles, 1974). The sustainable fashion adoption process was studied by reconducting the FAT variables in the TPB model. Finally, socio-demographic variables will be considered as control variables.

The paper is structured as follows. Section 2 presents the theoretical background. Section 3 presents the methodology. Section 4 presents the results. Section 5 presents the discussion and conclusions.

## **2 Theoretical background**

### ***2.1 Theoretical framework***

The theoretical framework of this study is derived from two behavioral theories: (1) the TPB (Ajzen, 1985) and (2) the FAT (Sproles, 1974). These theories explain consumer behavior through motivational components and specific consumer traits.

TPB is a theoretical model that aims to predict human behavior, it is widely used in psychological, social, and marketing research (Kalafatis et al., 1999). Three main components compose the model namely: attitude (i.e., "the degree to which a person has a favorable or unfavorable evaluation or appraisal of the behavior in question"), subjective norms (i.e., "the perceived social pressure to perform or not to perform the behavior"), and perceived behavioral control (i.e., "the perceived ease or difficulty of performing the behavior") (Ajzen, 1991, p. 188). Many studies demonstrated the effectiveness of this theory in predicting consumers' behavioral intention toward sustainable products (e.g., Sreen et al., 2018; Yadav and Pathak, 2016). Concerning sustainable fashion, the TPB has been used to investigate consumer behavioral intentions, both with the original model (e.g., Iran et al., 2019) and through its extensions (e.g., Becker-Leifhold, 2018).

Fashion adoption concerns the individual decision-making process to adopt a new style (Kaiser, 1990). Sproles (1974) formulated a theory able to explain the

fashion adoption process. This includes consumers' psycho-graphic and motivation characteristics as adoption process influencing variables. Three main variables compose the model, namely: pre-existing conditions (i.e., consumer awareness and current level of acceptance of the product), directing influences on fashion decisions (i.e., psychological and social forces), and the central channel of consumer decision-making (i.e., actual evaluation and purchasing decision). FAT was employed in many studies investigating apparel purchasing behavior (e.g., Belleau et al., 2001). Concerning sustainable fashion, FAT was applied to study organic (Gam, 2011) and bamboo-made (Thompson and Tong, 2016) clothes.

This study integrates the TPB and FAT to build the research theoretical framework used to study sustainable fashion purchase behavior. Specifically, the attitudinal components are operationalized as environmental concern and fashion involvement; the social influence components as celebrities, influencers, and social media influence; the control components as product availability. Further, the role of knowledge is considered.

## **2.2 Hypothesis development**

### *2.2.1 Environmental concern*

Environmental concern (EC) can be defined as "the degree to which consumers are concerned about environmental problems and support efforts to solve them" (Dunlap and Jones, 2002, p. 485). Scholars consider it as a relevant predictor of customers' green purchasing (Testa et al., 2020) since it is a critical factor in the consumer decision-making process (Diamantopoulos et al., 2003). A high level of EC may be directly associated with a high level of purchase intention and willingness to pay for sustainable products (e.g., Joshi and Rahman, 2015). Several studies found the positive influence of EC on sustainable fashion purchases concerning diverse sustainable product categories, such as purchase intention toward organic (Yoo et al., 2013), second-hand (Cervellon et al., 2012), bio-based (Dangelico et al., 2022), and recycled (Park and Lin, 2020) garments; and willingness to pay for bio-based (Notaro and Paletto, 2021) and organic (Gam et al., 2010) garments.

Thus, it was hypothesized that:

*(H1) Environmental concern positively influences the consumers' purchase intention and willingness to pay for biobased garments.*

### 2.2.2 Fashion interest

Fashion interest (FI) can be defined as the extent to which a consumer considers fashion clothing relevant to his/her tailor and creative self-expression of identity (O'cass, 2000). Fashion-involved consumers may adopt new styles earlier, driving and influencing the fashion adoption process (Chan and Wong, 2012). FI concerns consumers' attitudes and involvement toward fashion products and styles (Thompson and Tong, 2016) and was used in the literature to study the adoption of new fashion products (Gam, 2011).

Several scholars demonstrate that FI may positively affect PI for sustainable fashion garments (e.g., Hasbullah et al., 2022), such as second-hand (Kleinhückelkotten and Neitzke, 2019) and organic (Thompson and Tong, 2016) garments. Despite no studies highlighting the positive relationship between FI and willingness to pay for sustainable fashion products exist, since the effect of product involvement was found to be positive in literature (see e.g., Hwang et al., 2021; Rahman, 2018), it is reasonable to hypothesize that FI can influence the willingness to pay for sustainable garments.

Thus, it was hypothesized that:

*(H2) Fashion interest positively influences the consumers' purchase intention and willingness to pay for biobased garments.*

### 2.2.3 Celebrities and Influencers

Nowadays companies embrace celebrities and influencers (CI) as brand ambassadors (Djafarova and Rushworth, 2017). Thereby, CI are able to influence the consumers' purchasing decision process, such as by intensifying consumers' purchase intention toward several product categories recommended (Meng et al., 2021) or the willingness to pay (Chung et al., 2013).

CI may enhance consumer acceptance of new fashion products by acting like fashion opinion leaders (Saleem et al., 2014). Thus, CI are social force able to influence consumer purchasing behaviors. The literature highlighted the positive impact of CI on consumers' purchase intention toward sustainable garments (e.g., Johnstone and Lindh, 2022). No studies investigate the impact of CI on consumers' willingness to pay for fashion garments. Nevertheless, previous research demonstrated the positive effect of CI on consumers' willingness to pay for sustainable products (e.g., Santos et al., 2019).

Thus, it was hypothesized that:

*(H3) Celebrities and Influencers positively influence the consumers' purchase intention and willingness to pay for biobased garments.*

#### *2.2.4 Product availability*

Product availability (PA) can be defined as the consumer's effortlessness in procuring the product (Chakraborty et al., 2022). Many studies highlighted barriers towards sustainable consumption, including the lack of PA (Peattie, 2010). Indeed, sustainable PA can encourage sustainable consumption (Ottman et al., 2006). The literature found a positive effect of PA on consumers' purchase intention toward green products (e.g., Tudu and Mishra, 2021; Walia et al., 2020).

Scholars found that consumers reported difficulty when finding sustainable garments in traditional stores and that only a limited range of sustainable garments with desired attributes is available (e.g., Wiederhold and Martinez, 2018). Sustainable product unavailability averts consumers from sustainable garments purchasing (Tran et al., 2022). Ho et al. (2020) included PA in the perceived behavioral control construct; their findings revealed that high PA is positively associated with high purchase intention toward sustainable garments. There are no studies investigating the impact of PA on consumers' willingness to pay for fashion products. Nevertheless, in other industries, it was demonstrated that PA might affect the willingness to pay a premium price (e.g., Osei Mensah et al., 2020).

Thus, it was hypothesized that:

*(H4) Sustainable garments availability positively influences the consumers' purchase intention and willingness to pay for biobased garments.*

#### *2.2.5 Product knowledge*

Product knowledge (PK) can be defined as the amount of information available in consumers' memory about product features and attributes (Philippe and Ngobo, 1999). Sustainable PK influences the consumers' purchasing goods decision-making process (Bernard et al., 2015). If consumers have scant knowledge of the product, their purchase intention is reduced (Maloney et al., 2014). PK reduces the risks associated with a good purchase as the consumer is aware of the quality and benefits of the product (Nekmahmud et al., 2022).

Scholars found that sustainable garment knowledge positively affects purchase intention toward sustainable garments (e.g., Frommeyer et al., 2022). Further, it

was found that subjective knowledge positively influences the willingness to pay for organic (Han, 2019) and biobased garments (Dangelico et al., 2022).

Thus, it was hypothesized that:

*(H5) product knowledge positively influences purchase intention and willingness to pay for biobased garments.*

#### 2.2.6 Garment visibility and material used

Finally, the literature highlighted that consumer behavior might differ depending on the garment visibility and the specific material used (Dangelico et al., 2022). Thus, two clothing items were chosen as the study objectives, namely underwear and a jacket. These clothing items have opposite levels of visibility and skin contact.

Thus, it was hypothesized that:

*(H6) consumer purchase behavior might differ based on the level of visibility and skin contact of the clothing items.*

### 3 Methodology

To achieve the objectives of the study, a questionnaire was created. The scales used to define each variable included in the study are based on previous research (Table 1). The questions relating to the intention to purchase and the willingness to pay premium price were repeated for the two clothing items (i.e., underwear and jacket). The questionnaire was distributed in Italy through the snowballing technique. A final sample of 165 respondents was obtained. Statistical analyses were conducted using the SPSS 26 program. Firstly, a factor analysis was conducted using the principal component method, and all the scales used were found valid and satisfied test criteria. Secondly, a linear regression analysis was performed to test the hypothesis, one for each specific clothing item respectively.

Table 1 - Measurement items

Variable	Reference
<i>Environmental Concern</i> I am very concerned about the environment I would be willing to reduce or change my consumption to help protect the environment Protecting the natural environment increases my quality of life	D'Souza et al., 2015

<p><i>Fashion Interest</i></p> <p>Fashion Clothing is a significant part of my life  I am very interested in Fashion Clothing  Fashion Clothing is important to me  I would say Fashion Clothing is central to my identity as a person</p>	O'cass, 2000
<p><i>Celebrities and Influencers</i></p> <p>I follow various celebrities, bloggers and/or influencers online  The relationship I have with a social media influencer (e.g. a celebrity or blogger) informs my fashion choices  The ability to exchange information on fashion garments with a social media influencer is important to me  I am more likely to buy a product if an online influencer reviews it positively  Being part of an online community is important to me  Connecting with people online who have similar values is important to me</p>	Johnstone and Lindh, 2022
<p><i>Product Availability</i></p> <p>Biobased garments are easily obtained in the market  It is easy to find biobased garments  It is easy to have access to biobased garments</p>	Adapted from Singh and Verma, 2017
<p><i>Product Knowledge</i></p> <p>I am very familiar with clothing made from biobased material  I feel I know a lot about clothing made from biobased material  I am an experienced user of clothing made from biobased material  I would classify myself as an expert on biobased textiles</p>	Adapted from O'cass, 2004
<p><i>Purchase Intention</i></p> <p>I would consider buying underwear/jackets made from biobased material  I am willing to purchase underwear/jackets made from biobased material  There is a strong likelihood that I will buy underwear/jackets made from biobased material</p>	Adapted from Sweeney et al., 1999
<p><i>Willingness to pay</i></p> <p>How much more are you willing to pay for underwear/jackets made from biobased material compared to traditional garments?</p>	Adapted from Dangelico et al., 2022

#### 4 Results

Results of regression analysis show the following results.

Concerning *biobased underwear*, it was found that EC ( $b=0.156$ ,  $p<0.1$ ) and PK ( $b=0.140$ ,  $p<0.1$ ) have a positive effect on consumer purchase intention. In other words, the higher consumers are environmentally concerned and knowledgeable

about the product the higher their purchase intention. Conversely, PA ( $b = -0.151$ ,  $p < 0.1$ ) has a negative effect on consumer purchase intention. The other variables (FI and CI) reported no significant effect. Regarding the effect on the consumers' willingness to pay a premium price, it was found that only EC ( $b = 0.151$ ,  $p < 0.1$ ) and PI ( $b = 0.310$ ,  $p < 0.001$ ) reported a positive effect. Environmentally concerned consumers willing to buy the product are willing to spend more on biobased underwear. The other variables were found to have no significant impact on the willingness to pay a premium price.

Concerning *biobased jackets*, it was found that only EC ( $b = 0.243$ ,  $p < 0.01$ ) has a positive effect on consumer purchase intention. In other words, the higher consumers are environmentally concerned the higher their purchase intention. Conversely, PA ( $b = -0.206$ ,  $p < 0.01$ ) has a negative effect on consumer purchase intention. The other variables (FI, CI, and PK) reported no significant effect. Regarding the effect on the consumers' willingness to pay a premium price, it was found that only EC ( $b = 0.147$ ,  $p < 0.1$ ) and PI ( $b = 0.222$ ,  $p < 0.01$ ) reported a positive effect. Environmentally concerned consumers willing to buy the product are willing to spend more on biobased jackets. The other variables were found to have no significant impact on the willingness to pay a premium price.

Following the hypotheses discussion. H1 is fully supported, i.e., environmental concern has a positive impact on consumers' purchase intention and willingness to pay for both biobased garment categories. H2 and H3 were not supported, i.e., FI and CI do not affect consumer purchase behavior for biobased garments. H4 is not supported, i.e., PA impacts consumers' purchase behaviors toward both biobased garments categories, however, the effect is negative toward purchase intention and not significant toward the willingness to pay. H5 is partially supported, i.e., PK has a positive effect on consumers' purchase intention toward biobased underwear. However, the effect of PK on consumers' purchase intention toward biobased jackets and on willingness to pay for both biobased garments categories was found not significant. Finally, H6 is partially supported, i.e., for the purchase intention results show consumer behavior is different based on garment category (i.e., PK reported a positive effect for biobased underwear while not significant for biobased jackets). In other words, consumer behavior might differ based on the level of visibility and skin contact of the clothing items.

## **5 Discussion and Conclusions**

This paper investigates the impact of several variables on sustainable fashion consumer purchase behavior toward two different items of biobased garments (i.e., underwear and jackets).

Several implications can be mentioned. From a theoretical point of view, this paper extends the TPB model through the FAT variables; this paper broadens the knowledge on new sustainable garments (i.e., biobased), considering and comparing two different clothing items. From a managerial point of view, this research provides insight for sustainable fashion marketers. For instance, it has been shown that accessibility does not have a positive impact on purchasing decisions. The diffusion of these products in the market does not seem to impact the purchase decision. In other words, the consumer does not buy biobased clothing because they are widespread, instead, he/she is willing to buy them regardless of their accessibility, a priori consumers start with the idea that he/she wants to buy them. In addition, it was demonstrated that PK might positively impact consumers' purchase intention. Companies should provide clear and reliable product information and spread them among consumers.

This study is not without limitations. The main limitation that should be acknowledged concerns the non representative sample of the Italian population.

Concerning future research direction, scholars could test the model in other contexts to compare the obtained results. Further, other clothing items and sustainable categories could be investigated in future studies. Finally, scholars should further investigate the role of PK in favor of sustainable fashion consumption behaviors.

## Villa Adriana as a Paradigm: The New Unesco Buffer Zone between Sustainability and Innovation

---

Valerio Tolve

Department of Architecture and Urban Studies  
Politecnico di Milano  
via Bonardi 3, Milano, Italy

### Abstract

The 17 goals for sustainable development of the UN 2030 Agenda defines some of the main issues related to the environment, the climate change, the rational consumption of resources and the commitment to reduce inequalities between different countries and people themselves. Aspects whose solution today seems increasingly undeferrable: the succession of opposite climatic emergencies – for example from drought to floods – and the recent energy crisis impose a change of course with respect to the globalization trend that characterized the second half of the 20<sup>th</sup> century and the beginning of this new millennium, in the wake of mass production and consumption. However, the contemporary debate around these issues often suffers from the infodemic of our hyperconnected time and even more often from greenwashing practices. Even architecture, within its competence, must have the responsibility to really include these goals in its programs and conscientiously reconsider the use of resources, the choice of the best construction technique in relation to the theme and the context and the reduction of consumption of soil, towards a necessary rebalancing between nature and artifice, between construction and landscape.

This contribution wants to introduce some recent experiments conducted by a multidisciplinary research group who have attempted alternative approaches to the more consolidated ways of making cities and landscapes. *Learning from Villa Adriana*, is the project that offered us the opportunity to experiment these themes on a double layer: specifically, by investigating new forms for the re-signification of the Unesco Buffer Zone of Villa Adriana, and more generally by investigating tools for landscape management and cultural heritage with a view to truly sustainable development. This project was an opportunity to experiment new forms for the re-signification of Unesco Buffer Zone of Villa Adriana, re-establishing the ontological relationship between the Villa and its landscape – the *ager latialis* – removing it from the ‘non-place’ of the modern township to return it to the complex system of relationships between man and the environment. The project imagines a contemporary *locus amoenus*, extending from the Villa to the Aniene, which investigates the relationship between ancient/new and between nature/artifice. The landscape is the appointed tool for recomposing these antinomies within an overall design that redefines the terms of the necessary and sustainable transformation of a place.

*The Grand Villa Adriana. The new Unesco Buffer Zone. Masterplan*

*Learning from Villa Adriana*, project by A. Bottelli, A. Raffa, V. Tolve, J. Mias, (Architecture; Politecnico di Milano; Universitat Politècnica de la Catalunya); P. Carafa, F. Slavazzi (Archaeology; Università degli Studi di Roma La Sapienza; Università degli Studi di Milano); RE/Lab (Urban planning and Transports); AG&P (Landscape); Astrapto (Lighting design). The project was awarded with an honorable mention in the *International Call for Design Projects "The Grande Villa Adriana. Designing the Unesco Buffer Zone"* (Accademia Adrianea di Architettura e Archeologia, Rome 2018) and won a special mention into "Technological green and receptivity" category at *EcoTech Green Award 2019* (Paysage Topscape, Padua 2019).

## **1 Locus amoenus**

*Quae nunc abibis in loca / Pallidula, rigida, nudula / Nec, ut soles, dabis iocos.*  
This is how Hadrian addressed to his own soul at death's door. *Nec, ut soles, dabis iocos.* You will never have the usual distraction. Of which distraction does Hadrian

regret the imminent lack? It is widely assumed that the main reference is addressed to the Villa on Tivoli's slope. These words are the reasons of the birth and the lasting of the myth and fascination over the centuries of this place, that starting from Renaissance has become one of the unavoidable destination of every architect, artist or literate passing through Italy. The myth of Villa Adriana contains an unsolved dichotomy in the gap between reality and invention, between visible and conceivable. This gap has made possible that generations of architects would have imagined which were Hadrian's distractions with truthful or wrong reconstructions, result of a pursuit ideal world rather than the archeological reality.

In the past arriving in Villa Adriana from Rome meant leaving behind the city to enter the fields that separated the *Urbe* from Tivoli, populated by grazing flocks among ruins, in a sort of tridimensional arcadian landscape that raised the visitors' imagination and built the *locus amoenus* that had the Villa as the ideal terminal.

Nowadays the *ager latialis* is a dispersed landscape where the shapes of modern anthropized settlements, the shapes of nature and the shapes of archaeological ruins are compared in a small distance. The result is a landscape that is obviously different from the original, for the greater incidence of human settlement but above all for the substantial difference between the shapes of nature and those of artifice, no longer linked by a mutual relationship. So Villa Adriana's landscape it's a clear example: a palimpsest devoid of continuity where the great complex of the Imperial Villa is 'other' respect to its place and to the specific site's characters that defined its shape. Nowadays the original atmosphere is found only inside the Villa: outside – in its Buffer Zone – the difference between old/new switch from the dichotomy reality/invention to place/no-place. This project replaces the '*Grande Villa Adriana*' territory inside its own field, subtracting it from the spreading no-place, in order to give it back to the meanings place, that lives the relationships between human being and natural environment. A contemporary *locus amoenus*, that looks into the relationship between antiquity and contemporary without romantic sense, configuring a possible future where past and present are recomposing with continuity.

## 2 The 'Great Plan'

Addressing the project of the '*Grande Villa Adriana*' means thinking about the theme of the 'Great plan' which is such not so much for its territorial or geographical extension, but rather for the stubborn desire to find an overall compositional design – unitary but not totalizing – capable of bringing together again in a balanced compendium, nature and artifice. This is the greatest lesson that we can still draw also today from Villa Adriana: beyond the formal quality evoked by its ruins, its plan suggests that it's the settlement principle of architecture that defines the careful transformation of a place.

## 3 The new-order

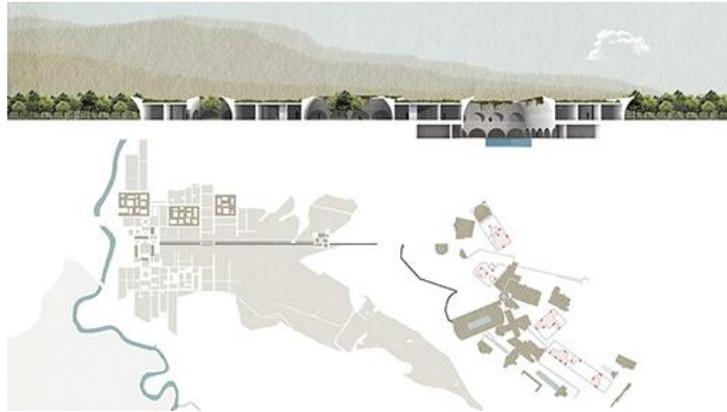

Two different layers, overlap and relating, rule the whole design proposal.

The first one, in the under-ground level, follows the direction of *via Maremmana*, that becomes an underground and distributional internal street. The second one, on the upper-ground level, derives from the existing directions of trees and the transverse east-west axis, that links the exedra of the '*Pantanello*' with the Travertine quarry beyond the Aniene river. This axis isn't only an infrastructure: it's a sequence of remarkable places that starts from Villa Adriana, it passes through the *Domus agricola*, the *Porta al Parco*, the *Commercial Hub* and the *Welcome Center*, it reaches the Travertine quarry, the Aniene and the renovated paths that lead to Villa d'Este.

The 'under-ground' layer and the 'upper-ground' one are strongly related, creating tension in the vertical section thanks to courtyards and holes that allow lighting and air diffusion inside the hypogeum spaces, as the roman architecture way.

All the architectures are inspired by the compositive and typological principles of Villa Adriana, applying the '*enclosure*' issue in its different morphological shape.

The *Parco* and *Orti adrianei* are the connective tissue of the project and they are developed from the Aniene bed to Villa Adriana, conceived as an unitary drawing that starts from the typical elements of this place: soil, orography and hydrography. Into this pattern are included the tracks of the new rivers, the renewed ground profile, the existing architectures or the new ones. The result is a delicate balance that describes the transformational action operated by human beings on nature.

*The Grand Villa Adriana. The new Unesco Buffer Zone. Scheme and profile of the new Parco*

#### **4 The Architecture inside the Parco**

Inside Hadrian's Garden a series of architectures is developed in sequence on an east-west axis which connects the Villa to the Aniene and, beyond the river, to the Travertine quarries, the place of production of the material with which the Villa itself was originally built.

The *Hotels* and the *Congress center*, the *Commercial Hub* and the *Domus Agricola* rework and update the theme of the enclosure, identified as a constitutive element of the architecture of the Villa. The morpho-typological definition of the architecture is therefore inspired by the type of courtyard and enclosure: each architecture is conceived as an open courtyard, bounded by pavillions. The degree of openness of the enclosure, in favor of the park and the river, breaks the introverted character of the architecture and defines the physical and visual continuity between the different parts of the project. The same settlement principle of the architecture helps to rediscover a relationship with the Aniene – now denied by the modern settlements – and with the new cycle-pedestrian paths along its banks, up to Villa d'Este.

The *Porta al Parco* arises from the landscape as a landmark: a walkable architecture defined by two parallel walls, in which trapezoidal sections are located the stairs that bring to the panoramic terrace. The internal walls are characterized by an articulated profile that follows the structural order of the brickwork. The walls' surfaces in the external part of the building are treated as a huge storied plane, that anticipates the content of the exhibitions set up in the renewed Museum of the Villa and the activities program of the Park.

The *Reception center* is located besides the Aniene: this building, consisting of *Hotels and Convention center*, contributes in defining the shape of the project, in continuity with the greenery and building pattern.

The morpho-typological definition of architecture is inspired by the courtyard and the enclosure idea: every building is conceived as an open courtyard defined by the perimeter of the room pavillions and its service spaces. The disposition itself of the *Hotels* spanning the via Maremmana contributes to find a relationship with the river bed and the cycle and pedestrian paths. The five-stars hotel is placed near the Aniene, and it is provided with hypogeum baths and conference center, linked to the Commercial hub and the accommodation facilities.

The *Commercial Hub* has a strong relationship with the via Maremmana that goes underground, in order to favor the continuity of 'upper-ground' paths. Although the hypogeum complex of commercial and service facilities is placed in relationship with the street direction, the project rejects its settlement principle, getting in line the courtyard and shops spaces with the axis that guides the position of the parts: the morphological break within the two different directions is solved on the edges 'adapting' the pavillions shape in order to maintain the formal and geometrical precision of courtyards.

The Aniene has been chosen as the preferred view, so the project takes position against the modern and contemporary construction that takes the street as the main alignment, denying any relationship with the river, that becomes a forgot backside. On the contrary the project finds a different relationship with the Aniene, a natural infrastructure chosen to connect the Villa Adriana area with the Villa d'Este one. A cycle and pedestrian path along the river bed rules the sequence that links remarkable places, monumental or environmental ones, that are supposed to be requalified.

Beyond the river, the Travertine quarries are considered the park extension: they are places in which the compendium between nature and artifice is celebrated.

Along the east-west axis toward Villa Adriana, it's placed the complex of *Domus agricola*, conceived as a multiple courtyards building, in which the main *impluvium* rises as the core of the composition. Around of it the pavillion volumes and the working courtyard are located as a kind of quadrangular enclosure, defined by the pavillions perimeter and developed on two levels linked by the soil. The courtyard becomes the production but also the meeting place, with a theatrical effect, in which is celebrated the *mise en scène* of work. At the lower

level are placed the productive functions and the managing office of *Domus* (olive-press; store room for equipment and machines; warehouses for products, conceived as a showpiece, open to the public). The upper level houses educational functions and the manufacturing sector training (kitchen laboratory with restaurant, tasting area and shop, multiple function pavillions for exhibitions and presentations).

Inside the *Parco*, the design proposal tries to satisfy not only the traditional aesthetical and agronomical requirements, but also the environmental compatibility ones, choosing the species on account of their carbon dioxide and gaseous pollutants absorbing capability. The landscape project has been developed following some criteria:

- analysis of the local flora features (as in the very close area as in the bigger setting), soil features, its settlement, exposition and medium, maximum, minimum temperatures;
- the necessity to consider the presence of plants and farming systems able to low down excessive levels of soil lead by foliar metabolism, with the collection of the dry substance and the root one (phitoremediation and phytostabilization phenomena);
- the consideration of the existing track of the local crops, such as olive grove;
- recalling the Hadrian's explored and lived landscapes in the plants choice (even for educational purposes), avoiding the introduction of exotic species that don't belong to the Tivoli area (it's an easy operation, as the majority of the local plants, trees and shrubs come from the Mediterranean and Asia Minor basins where Hadrian lived for a long time);
- the creation of an environmental and multifunctional communion, employing low maintenance impact and limited water consumption vegetale essences and farming systems;
- the creation of agricultural production settlement and nutritional plants (fruit, vegetable and essences) aimed to be sold and manufactured in the *Domus Agricola* itself;
- the attempt to support the reading and the characterization of places through plants, using them along paths as rows (orientation), on buildings rooftop (insertion in the built environment), as rows and cultivated lots (producing evocation), such as flowerbeds in the

courtyard, arrival and break areas, in the orchard and in the olive grove (ornamental value) or as green perimetral Buffer Zone and camouflage towards the nearby area (filter function). The project of the external arrangement, that completes the overall proposal, is articulated in five different landscape unities.

*Green rooftops.* For a better environmental settlement and for minimizing the low-rise building impact (commercial centre, hotels) it was thought to introduce green rooftops, applying the most recent techniques: small section composition with efficient drainage, a minimal growing medium and precutivated plants carpet of mediterranean species: *Lippia nodiflora*, *Mesembrianthemum*, *Delospernum* and *Sedum* mix, completing the camouflage effect with *Rosmarinus prostratus* falling from the top along some walls.

*Courtyard gardens.* The connective pattern around the built environment and the several closed cloisters that are placed in the core of buildings are characterised by little and lush gardens of perennial plants and ornamental mediterranean bushes (*Plumbago spp.*, *Rosmarini*, *Lavande*, *Mirti*, *Teucrium fruticans*, *Escallonia myrtifolia spp.*, *Convolvoli*, *Oleandri*, *Osmanthus spp.*, *Solanum spp.*, *Agapanti*, *Iris*, *Artemisia*, *Strelizie spp.*, ecc.), little pomegranates, citrus trees and strawberry trees. Water completes spaces with little pools and fountains, that quotes features of the archaeological area. The filtered water will be managed with recovering and recycling systems.

*The orchards and the gardens.* Beyond the *Porta al Parco*, on both sides of the path that brings to the *Villa*, nearby the *Domus agricola*, there are fields partially characterized by olive grove. In these areas it was supposed the introduction of a huge orchard that follow the tracks and the distances of olive trees, completing the scenery with suitable other olive trees species and new citrus tree rows (*Lemons*, *Oranges*, *Kumquat* and *Grapefruits*), *Pomegranates*, *Figs*, *Almond*, *Apricot* e *Peach trees*. In the more sunny areas inside the orchard there will be little garden fields of aromatic and medicinal plants (*Rosmary*, *Lavander*, *Borag*, *Savory*, *Artemisia*, *Balm*, *Oregano*, *Thyme*, *Vervain*, *Myrtus tarentina* ecc...) instead of vegetables (too expansive managing); other little fields will be characterized by perennial rustic ornamental plants (*Perowskia atriplicifolia*, *Gaura lindhmeri spp.*, *Verbena bonariensis*, *Cistus spp.*, *Teucrium*, *Polygala myrtifolia*, *Echinacea spp.*, *Rudbeckia spp.*, *Salvia nemorosa*, *Lythrum spicata*, ecc...). Among the rustic ornamental plants that will be part of the little flowering field, there will be some species able to fix the soil lead in the roots, avoiding its transmission to the air

parts and leaves, such as *Heather*, *Cystus*, *Genistas* and *Hipericum*. All the fruits and medicinal plants will be harvested, transformed and manufactured to be sold directly with the *Domus Agricola* logo. The perennial plants and ornamental shrubs will be an aesthetic recall and they will be placed along secondary paths that lead – from the main path with different perspectives – to the archaeological site toward the new agricultural area.

*Rows along paths.* The main path will be characterized by a Cypress row on the downstream side. The higher plants, already existing along other paths of the archaeological site, will guide visitors toward the destination. Rows inside the orchards will do the same with secondary places. Along the main path a water canal will mark the row track as linking *fil rouge* between the Buffer Zone and the archaeological site.

*The perimetral of Unesco Buffer Zone.* The Buffer Zone, as the wide area that divides the archaeological site core, presents boarding areas that in some cases need greenery strips with visual and acoustic filter function, but always with a landscape settlement function. These strips, especially the planted ones, will be differently composed and will introduce local plants with good lead bioaccumulation properties (in particular *Poplars* and *Willows*). In some cases the planted strips will include local shrubs *Stawberry trees*, *Myrtels*, *wild roses beds*, *Prunus*, *Genistas* as well as shrubs and perennial plants with good lead bioaccumulation proprieties as *Cystus* and *Silene*.

*Hadrian's Garden. The new Landscape*

## 5 The Architecture inside the Villa

At the end of the axis, from the exedra of the *Pantanello*, a new path inside the Villa begins, reactivates a part of the ancient monumental entrance through the *Grande Vestibolo*: from the *Cento Camerelle* it can reach the *Canopo* and the *Antiquarium* through the network of existing underground paths, re-opened to the public and set up.

Having recognized the methods of construction of the architecture of the Villa, for terraces and substructures, the project operates by additions in continuity with them. Thus the recovery of the *Antiquarium* is articulated on both levels of the original building: the lower one are new exhibition spaces for the Museum in the evocative vaulted architecture, while the upper level, overlooking the *Canopo*' valley, host the studios, having the largest spaces of the Casino and the possibility of building new pavilions on the remains of the cells, whose punctual sequence of views becomes a loggia towards the *Canopo*. The architecture of this new building takes the ancient idea to take the opportunity of the collapse of architecture in order to present a variation. The punctual sequence of the views becomes a continuous loggia with a vaulted ceiling that looks toward the *Canopo* and the *Grande Vestibolo*. The loggia is also the distribution element to the new exhibition rooms, conceived as the extensions of the ancient cells along the terrace depth. All this spaces are covered by an unique roof, which section, in its different relationship between the intrados and extrados, discloses the continuity and the transformation: the part of the building facing the *Canopo* and the *Grande Vestibolo* follows the pitched roof, whereas the rooms extended along the depth toward the terrace at a first sight are pure shaped volumes externally, contrasting with the evocation of vaulted ceiling of the cells internally.

The internal exhibition is well-finished and polished, trying to follow the spirit and the lesson of Italian museography through the attention toward the coexisting relationship between place, object and exhibit medium.

From the *Antiquarium* complex are developed two different paths toward different direction: one reaches the *Roccabruna* area, the other one passing the *Pretorio* terrace where the *Archeological Village* is located: it is composed by laboratories for archeological excavation, guest houses, studying spaces.

The necessity of new additions as grafts that are directly introduced in the architectural composition of the Villa is the main topic subtended in this part of the project. So our proposal reflects on the generative features of the place

starting from its founding character and on the constructive way of architectures of the Villa, that is always looking for relationships with the orography and the artifice.

*The Grand Villa Adriana. The archaeological village*

The *Library* and the *Hall* are the core of the educational center, conceived on the tracks of *Plutonium*. The project arises on a platform that today is largely set in the ground. It consists in rebuilding a part of the temple, that exists as a ruin at the opposite side. In this way the ruins on one side and the finished shape of the new volume on the other one - that follows the original idea of the court yard - face each other on the central void. The hypogeum level, partially uncovered, is requalified for exhibition activities, linked to the visiting itinerary of the Villa and to educational activities placed into the new building.

Just over, behind the *Bocca degli Inferi*, there is the guest house: it arises on the top of the *Muro delle Fontane* that starts from the *Accademia*. This way of approaching to ruins is directly assumed from the building principle of the Villa. In this way the ancient wall becomes the building substructure: the guest house is developed along the longitudinal axis on the wall. The architecture presents a

double loggia: the first one, toward the valley, faces the Villa and it is the distribution to the four blocks of the rooms; the second one, upstream, faces the *Accademia* terrace.

The need of new volumes for *Laboratori di scavo* doesn't mean adding a new direction in the Villa composition, rather than establish an excavation grid in which they are included. It has been assumed an 'Archeological excavations plan', locating four different studying areas that have been defined with a perimeter and a settlement. The first area sets alongside the *Pretorio*' terrace; the second one includes the *Macchiozzo*, the third one is located on the top of the terrace under the *Library* yard; the last one matches the supposed '*Hippodrome-Stadium*' drawn by Piranesi close to the *Pantanello*, that could be connected to the marble model found in the *Grandi Terme*. In this area we have been chosen three focusing points, that it is possible to develop in sequence and according to the archaeological findings. In this proposal the *Laboratories* are conceived as punctual and modular structures matching the excavations plan, as *en plein air* pavillions that define and equip the perimeter. They are open to the view and show the archaeological activities. The new volumes of the *Archaeological village* are simple shaped as pure volumes, inspired by the ruins. They are conceived with low prefab technology, with steel or wood structure and hardwood panel coating. The construction is intended in the classical sense: a strongly expressive action toward the 'exact construction' in which architectural shape, built shape and materials are involved.

Finding the new *Grande Villa Adriana*.

### **Abstract**

Waste collection and recycling processes represents a strategic activity in supporting the circular transition. The present research deals with disposable diapers collection; indeed, in order to increase the recycling rates of such typologies of waste, during the very recent years, waste management companies initiated to collect those separately from other household waste streams with different typology of collections.

Making use of a case study grounded on raw data from six municipalities within Lucca province (Italy), our research aims at assessing, using an Analytic Hierarchic Process (AHP), six possible scenarios for used disposable diapers collection.

Results shows that the best scenario is represented by the one where disposable diapers are collected from users by a curbside door-to-door collection system on a weekly base. Results are discussed under a managerial perspective in order to support future decision-making processes in waste management companies.

**Keywords** - Circular economy, Business model innovation, , Waste management, Decision Making and AHP methodology

## 1 Introduction

The linear take-make-dispose economic system, perpetuated for decades, generated two gigantic matters; on the one hand, the scarcity of natural resources, while on the other, a huge waste generation. In the very last years, the vision in redesign processes to reduce the use of natural resources and minimize the environmental impacts by incrementing product recycling brought to the formulation of a new paradigm called circular economy (Ellen MacArthur Foundation, 2013).

The idea behind the circular economy model is to involve as much as it is possible of the existing material capacity in economic systems into efficient use (Korhonen et al., 2018). In order to obtain such a goal, waste collection and recycling processes certainly represent a strategic aspect.

The European Union, in order to increase recycling rates, issued several policies and regulations. The Extended Producer Responsibility (EPR), which aims at making producers responsible for organizing and paying the treatment of their products reaching the end of the life cycle, is certainly an example of the EU's effort in increasing collection and recycling rates (Corsini et al., 2017). According to the most recent data, in the European Union (EU28) in the recycling rates of municipal waste largely increased raising from 35% in 2007 up to 46.4% in 2017 (EUROSTAT, 2018). However, in order to switch European global economy to a more circular one still much effort is needed. Within this context, there are some products that, according to the new consumption patterns, started to become crucial under a collection and recycling point of view. Disposable diapers are surely a typology of product that demands consideration (Colón et al., 2011; Mendoza et al., 2019) as the consumption trends are firmly rising. In most of European countries the reduction of birth rate slightly hindered such market

while, on the other hand, the consumption of disposable diapers for elderly people climbed as life expectancy largely increased (Inkwood Research, 2018). For instance, in Italy, the National Institute of Statistics (Istat, 2019), in computing the annual index representing the basket of consumer goods for the year 2019, for the first-time added diapers for elderly people.

Considering such trends, more research is therefore needed to address the end of life of such products. Our research deals specifically with disposable diapers collection; the reason for such a choice is related to the fact that, to increase the recycling rates of such typologies of waste, during very recent years, waste management collection companies initiated to collect those separately from other household waste streams with some ad-hoc collection (Pires et al., 2019). Waste management companies, indeed, introduced several typologies of collection strategies ranging, for example, from setting collection points accessible for the inhabitants to arranging a scheduled door to door collection. So far, to our knowledge, no one has deeply evaluated the ways of conducting diaper collection under an economical, technological and socio-environmental perspective.

With our research, we aim to fill this gap in the literature using a multicriteria decision making approach to evaluate six possible scenarios for disposable diaper collection. Our research deals specifically with the disposable diapers collection; the reason of such choice is related to the fact that, in order to increase the recycling rates of such typologies of waste, during the very recent years, waste management collection companies initiated to collect those separately from other household waste streams with some sort of ad-hoc collection (Pires et al., 2019). Waste management companies, indeed, introduced several typologies of collection strategies ranging for example from setting collection points accessible for the inhabitants to arranging a scheduled door to door collection. So far, to our knowledge, no one deeply investigated and evaluated the ways of conducting diapers collection under an economical, technological and socio-environmental perspective.

In detail, the model for assessing the scenarios was grounded on raw data from six municipalities in Tuscany region (Italy). In this area, Ascit, a waste management company, is in charge of the waste management collection (Altopascio, Porcari, Capannori, Montecarlo, Pescaglia and Villa Basilica). The area covers approximately 325 square kilometres with an estimated population of 79,398 inhabitants (ISTAT, 2018) and a production of municipal solid waste of 463.5 kg

per inhabitant per year (Ascit, 2017). More specifically, 25-30% of municipal residual waste comprises diapers products equal to 2,200 tons/year (Ascit, 2017).

To investigate the most suitable way for managing the collection of diapers, we selected potential alternatives (i.e. Scenarios) after an in-depth analysis of the literature regarding similar studies on diaper waste management (Arena et al., 2016; Kim & Kim, 2018) and structured interviews with seven different Italian waste management operators with a post-consumer diaper collection service.

The rest of the study is structured as follows. In section 2, we describe the scenarios under investigation, the data collection processes and the methodologies used. In section 3, we present the results obtained and the sensibility analysis conducted. Finally, the last section provides the main conclusions, as well as a discussion of their implications, limitations and ways forward in further studies.

## **2 Materials and Methods**

### **2.1. Data Collection**

The model for assessing the scenarios was grounded on raw data from six municipalities within Lucca province, in the Tuscany region (Italy). In this area Ascit, a waste management company, is in charge of the waste management collection (Altopascio, Porcari, Capannori, Montecarlo, Pescaglia and Villa Basilica). The area, covers approximately 325 square kilometres with an estimated population of 79,398 inhabitants (ISTAT, 2018) and a production of municipal solid waste of 463.5 kg per inhabitants per year (Ascit, 2017).

The data on generated baby and adult diaper waste were taken from the technical output of Ascit: 25-30% of municipal residual waste is made up of absorbent hygiene products (Ascit, 2017). Referring to this percentage, Ascit estimated a diaper waste production of 2,200 ton/year (Ascit, 2017).

Fig. 1 Ascit area (LU - Italy) and waste collection centers located within it

With regard to the waste collection, within the area under investigation, the most common types of municipal waste (residual waste, organic and yard, paper and cardboard, glass, plastic, tin) are placed in special color-coded bins that are readily available, free of charge and collected door-to-door. curbside door-to-door collection is supplemented by Waste Collection Centers (WCCs): centers equipped with bins for other types of urban waste, from aggregates to bulk, from electrical and electronic appliances to hazardous waste. Within the area under investigation there are six WCCs (Fig. 1), five located in the municipality of Capannori (Salanetti 1, Salanetti 2, Colle di Compito, Lammari and Coselli) and only one in the municipality of Pescaglia (Piegajo). All this has produced a recycling rate of 72,9% (Ascit, 2017), a better performance than those referred to Tuscany region (53.1%) and Italy (55.5%) (ISPRA, 2018).

## 2.2 Scenarios

In order to investigate the most suitable way for managing the collection of diapers we selected the potential alternatives, after an in-depth analysis of the literature regarding similar studies on diaper waste management (Nicki Souter Associates, 2013; Arena et al., 2016; Kyung-Shin Kim et al., 2018) and structured interviews with seven different Italian waste management operators, presented in Fig. 2, with a post-consumer diaper collection service. So, six alternatives with respect to the delineation of the best scenario for baby and adult diaper waste

collection in municipal solid waste management, were delineated and assessed by our research.

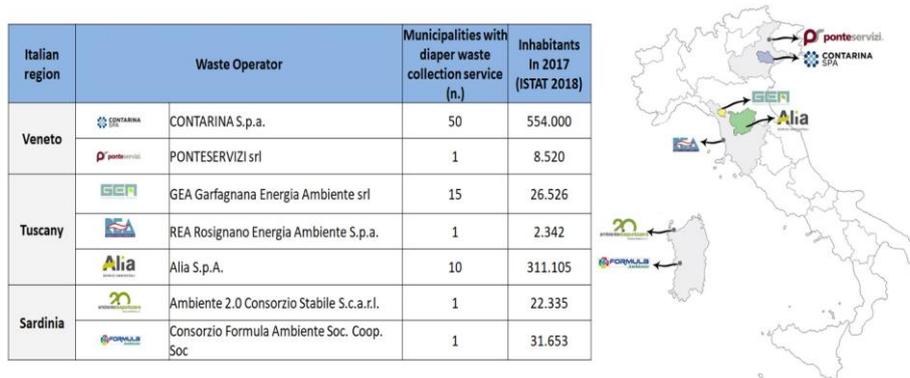

Fig. 2 Italian waste operators interviewed for this project

The system boundaries for all alternatives exclusively include the collection of post-consumer diapers from private homes to the waste collection center/waste transfer station.

The first alternative (Scenario 1) is represented by a scenario where consumers individually transport the used diapers to the WCC. We assumed the exploitation of only one waste collection center.

The second alternative (Scenario 2) is represented by a scenario where used diapers are collected by a curbside door-to-door collection system with a weekly based collection frequency. Purple semi-transparent sacks are provided to participants. In this case, the diaper waste system includes the creation of a specific waste transfer station within the WCC. Also, in this case, we assumed the exploitation of only one waste collection center.

The third alternative (Scenario 3) is represented by a scenario where used diapers are collected by a curbside door-to-door collection system with a weekly based collection frequency, exactly as planned for scenario 2. Purple semi-transparent sacks are provided to participants and a waste transfer station within the WCC is realized. Unlike Scenario 2, in Scenario 3 participants have to call for the diaper waste collection service by means of their phone: a specific call-center service is planned along with the development of a specific planning software to plan the diaper waste collection. This calling stage is mandatory to collect post-

consumer diapers. We assumed the exploitation of only one waste collection center.

Finally, three different hybrid alternatives have been elaborated: Hybrid Scenario A, Hybrid Scenario B and Hybrid Scenario C.

Hybrid Scenario A is represented by a scenario where Scenarios 1 and 2 are combined: the collection of post-consumer diapers is carried out by WCC and door-to-door waste collection.

Hybrid Scenario B is represented by the combination of Scenarios 1 and 3: the collection of post-consumer diapers is carried out by WCC and a door-to-door collection after consumers' request.

Hybrid Scenario C is represented by the combination of Scenarios 2 and 3: the door-to-door collection of used diapers is carried out by means of consumers' request along with a collection in a prefixed day. All scenarios are fully described by Fig. 3.

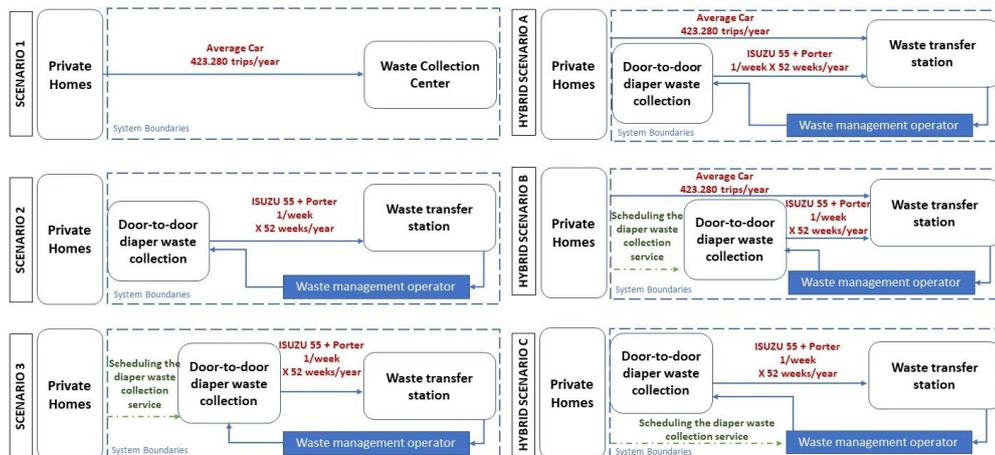

Fig. 3 System boundaries and scenarios presentation

### 2.3 Criteria

In order to evaluate the six scenarios presented above we selected several criteria and sub-criteria for after an in-depth analysis of the literature regarding similar studies on waste management scenarios (Bello-Dambatta et al., 2009; Nicki Souter Associates, 2013; Milutinović et al., 2014; Babalola, 2015; Gusmerotti et al., 2018). More in detail, after having selected all the relevant literature and having discussed with the waste management operator, a worksheet was

designed in order to collect the most useful criteria used in similar evaluations. Then, each of the criteria was read independently and iteratively discussed by the researchers involved in the project, thereby ensuring reliability through consensus and minimization of bias. Through this process, useless criteria were rejected, reaching a final number of 7 criteria. Those are: economic criteria (i.e. capital costs and operational costs), technical criteria (i.e. adaptability, training and user preference) and social-environmental criteria (GHG emissions in CO<sub>2</sub> equivalents and job creation). The following paragraphs give a short presentation of the chosen indicators.

### *2.3.1 Economic criteria*

Economic evaluation is a significant part of tactical planning and investment programming for any waste collection management system. Estimating the preliminary investment capital requires long-term operating and maintenance costs in relation to the different expected/planned waste management activities. We addressed economic aspects through capital and operational costs related to the diaper waste management activities planned by each of six scenarios. Those costs are frequently considered for evaluating alternatives in multi-criteria studies (Bello-Dambatta et al., 2009; Milutinović et al., 2014; Babalola, 2015; Pabule et al. 2015; Yap and Nixon, 2015; Gusmerotti et al., 2018).

The capital cost represents the amount required to construct the new diaper waste management infrastructures and facilities. For evaluating the investment costs, land costs, the costs of design and construction of waste facilities, the transportation/collection vehicles costs, equipment costs and staff training costs were all considered. More in detail, for the assessment of the Scenario 1, the purchase of a roll-off dumpster for the WCC was considered with the exclusion of the costs related to new waste collection vehicles. We assumed that consumers individually transport their own used diapers to the WCC. On the contrary, for the assessment of Scenario 2 and Scenario 3 we took into account the capital costs of the purchase of new waste collection vehicles (i.e. one PORTER Euro 6-GPL up to 2.2 ton and one ISUZU Euro 6-diesel up to 5.5 ton). For all six scenarios the capital costs related to staff training were added. Details of capital costs are presented in Table 1.

Operational costs in details include: supply chain costs (i.e. purchase and use of semi-transparent purple sacks), staff costs and cost of vehicles maintenance (e.g. energy, fuel, etc.). For the assessment of Scenario 1 we assumed that no waste

collection vehicle is used. So, the cost of vehicle maintenance was not taken into account. On the contrary, this operational cost was added for the evaluation of Scenario 2 and Scenario 3. For the assessment of Scenario 2 and Scenario 3, also costs related to the purchase and use of semi-transparent purple sacks for post-consumer diapers were taken into account (i.e. supply chain costs). For all six scenarios the operational costs related to staff were taken into account. Details of operational costs are displayed in Table 2.

Table 1 Details of capital costs in €/ton per year

	Scenario 1	Scenario 2	Scenario 3	Hybrid Scenario A	Hybrid Scenario B	Hybrid Scenario C
Land costs, design and construction of new infrastructures	1.36	1.36	1.36	2.52	2.52	1.36
Equipment	0.14	0	0	0.14	0.14	0
Vehicles	0	11.25	11.25	9.57	9.57	11.25
Staff training	0.45	2.28	3.64	2.38	3.54	2.96
<b>Total capital costs</b>	1.95	14.89	16.25	14.61	15.77	15.57

Table 2 Details of operational costs in €/ton per year

	Scenario 1	Scenario 2	Scenario 3	Hybrid Scenario A	Hybrid Scenario B	Hybrid Scenario C
Supply chain costs	0	7.04	7.04	5.98	5.98	7.04
Staff costs	3.75	18.80	13.16	22.55	16.91	25.38
Cost of waste collection vehicles	0	8.38	5.03	8.38	5.03	10.89
<b>Total operational costs</b>	3.75	34.22	25.23	36.91	27.92	43.31

Finally, the economic criteria measured in €/ton per year for each scenario are presented in Table 3.

Table 3 Economic criteria for each scenario

	Scenario 1	Scenario 2	Scenario 3	Hybrid Scenario A	Hybrid Scenario B	Hybrid Scenario C
<b>Total capital costs (€/ton year)</b>	1.95	14.89	16.25	14.61	15.77	15.57
<b>Total operational costs (€/ton year)</b>	3.75	34.22	25.23	36.91	27.92	43.31

### 2.3.2 Technical criteria

Technical criteria are particularly valuable when selecting waste collection options. Their importance is usually in view of the possibility of subsequent increases in the daily tonnage of waste that the facility will be required to manage, for added processing capabilities. These criteria also determine what equipment and training will be necessary to perform the waste management responsibilities.

First, this study considered the adaptability and the need of specific training for each scenario.

The adaptability regards the adaptability of the new scenario to existing waste management systems, whereas the training is related to the users of diaper waste collection service. This latter represents the user's ability to manage with new waste collection systems.

We assessed both criteria qualitatively using the 9-level scale (1 - Worst, 9 - Best) established by Saaty (Saaty, 1980). Three experts in the waste management field were involved for the assessment of these sub-criteria.

Among the technical criteria, we also included user preference, which is crucial to develop a new waste collection system. This sub-criterion represents the public acceptance. Public awareness, indeed, positively and negatively can influence people's approach to waste management and consequently, even the success for a new waste collection management system (Milutinović et al., 2014). In order to assess user preferences we developed a questionnaire that was administered in the period May 2018 - September 2018 in the area of the study. The questionnaire was sent via email, after being uploaded on a web platform, only to the users of baby and adult diapers contacted with the help of the waste management company. Reminders were sent every 15 days. As Tourangeau & Yan (2007) underline, social desirability represents the most common bias

affecting the validity of a questionnaire especially if dealing with such a sensible issue. This risk was, therefore, overcome by guaranteeing the anonymity of the respondents.

The questionnaire was structured to capture the general information about the respondents (e.g. age, sex, number of family members, etc.), the average amount of diapers used in a monthly time frame, the preference with respect of the 6 scenarios for diapers collection (Appendix A). The preference measurement over the 6 scenarios was performed with a 5-point Likert scale (Likert, 1932). A total of 147 responses were received and used in the subsequent analysis.

Table 4 Technical criteria for each scenario

	Scenario 1	Scenario 2	Scenario 3	Hybrid Scenario A	Hybrid Scenario B	Hybrid Scenario C
<b>Adaptability (%)</b>	8.9	39.9	10.7	14.7	9.0	16.9
<b>Training (%)</b>	17.0	9.8	11.9	29.2	25.1	7.0
<b>User preference (weighted average survey answers)</b>	1.74	4.44	2.91	3.83	2.87	4.13

### 2.3.3 Social-environmental criteria

We assessed the social-environmental aspects through two criteria: GHG emissions in CO<sub>2</sub> equivalent and job creation.

GHG emissions are one of the criteria used by the European Environmental Agency to measure the performance of municipal waste management in 32 countries (EEA, 2013). Similar criteria, including GHG emissions or pollutant emissions in general, are considered in many multi-criteria studies (El Hanandeh et al., 2010; Roussat et al., 2009).

We calculated emissions – on the basis of literature (Mckinnon et al., 2010; DEFRA, 2017) and technical outputs of the waste management operator. In our assessment of GHG emissions in CO<sub>2</sub> equivalents, we considered as boundaries of the system the point at which the used diaper is discarded by consumers into the waste stream up to the point at which it is collected/stored in the waste collection center/waste transfer station, according to Fig. XX. In detail, the measurement of GHG emissions in CO<sub>2</sub> equivalents took into account the transportation of diaper waste and the electric consumption of waste facilities, weighted on the diaper waste tons estimated per year. As regards conversion factors we used conversion

factors elaborated by the Department for Business, Energy & Industrial Strategy of UK government (DEFRA, 2017).

Among the social-environmental criteria, we also included social sustainability. Social sustainability in waste management means the ethical behavior of the waste management system towards society (social acceptability, social equity and social function) (Gusmerotti et al., 2018; Den Boer et al., 2007). The social function (i.e. the benefit of the waste management system) can be measured through the employment rate (Gusmerotti et al., 2018; Den Boer et al., 2007). The level of employment in waste management, in terms of tons of waste per job, appears to vary significantly between different activities. Although there are some inconsistencies in the data, there is general agreement that the most labor-intensive activities (<500 tons of waste per job) are manual sorting, some separate collection process and waste and scrap wholesale. The least labor-intensive activities (over 1,000 tons of waste per job) are landfill, incineration and composting together with most forms of collection (Risk & Policy Analysts Limited, 2001). In view of the fact each scenario describes a specific diapers waste collection system, we elaborated the employment rate on the basis of the different collection activities planned by each of them, considering only the actual workforce needed for these waste collection services. The number of jobs for each scenario is presented in Table 5.

Table 5 Social-environmental criteria for each scenario

	Scenario 1	Scenario 2	Scenario 3	Hybrid Scenario A	Hybrid Scenario B	Hybrid Scenario C
<b>GHG emissions (kilograms of CO<sub>2</sub> equivalents for each ton of waste managed/year)</b>	207.84	2.77	2.77	227.86	227.86	4.08
<b>Job creation (n.)</b>	0.2	1	1.5	1.2	1.7	1.8

## **2.4 AHP methodology**

The Analytical Hierarchy Process - AHP, developed by Saaty (Saaty, 1980), allows dividing the decision problems into understandable parts; each of these parts is analyzed separately and integrated in a logical manner. It is a comprehensive methodology designed to facilitate the decision-making process by using both empirical data and subjective judgments, allowing to derive a scale

of priorities that are valid to make complex decisions. Such method has been used for solving complex decision-making problems in various disciplines and currently is widely used in the field of waste management (Soltani et al., 2015).

According to the axioms on which the AHP methodology is based (Vargas, 1990), we structured the goal of delineation of the best scenario for collection of post-consumer diapers in four levels. In detail, we structured the decision hierarchy according to the goal in the following order: the objectives from a broad perspective, through the intermediate levels (criteria on which subsequent elements depend) up to the lowest level (a set of alternatives). According to Fig. 4, the hierarchical structure of the decision-making consists of following levels: the first level represents the ultimate goal of the decision hierarchy (assessing the best used diapers collection scenario), the second level introduces the criteria, the third level shows the sub-criteria that are utilized in this work and finally the fourth level shows the alternatives.

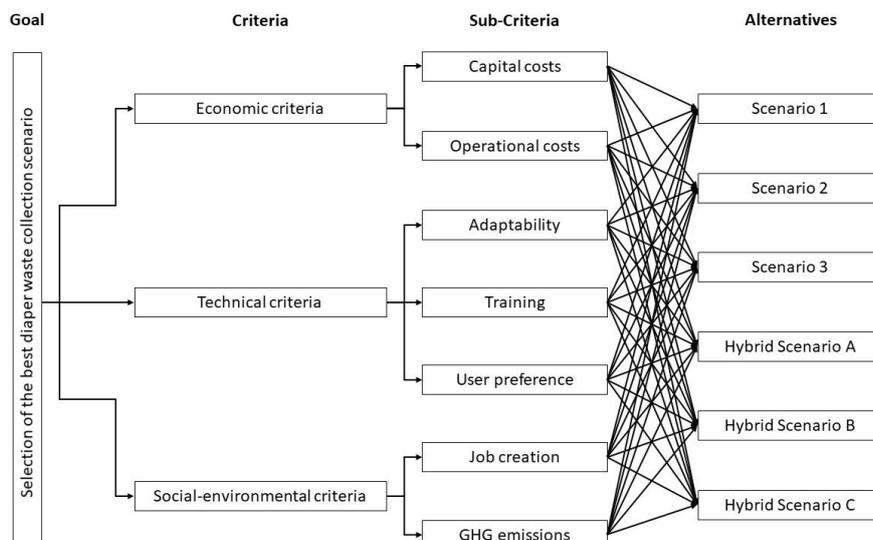

Fig. 4 Hierarchical structure for the selection and evaluation of a sustainable waste management scenario

### 3 Results

#### 3.1 Criteria ranking

The AHP methodology implies to broke down the judgment into series of pair comparison matrices, where the experts are required to evaluate the importance of each criterion with respect to the established goal. As rule of thumb, a 9-point scale is used for the expert evaluation. The scale ranges from 1, which indicates that the two criteria are of equal importance, to 9, which indicates that a criterion is absolutely more important than the other. The major strength of such methodological approach is related to the fact that it enables the expert to evaluate the contribution of each criteria to the goal independently, making simpler the decision-making process (Saaty, 2000).

More in detail, a judgmental matrix, denoted as  $A$ , has been built up using the experts' evaluations collected. Each entry  $a_{ij}$  of the judgmental matrix is formed comparing the row element  $A_i$  with the column element  $A_j$ :

$$A = (a_{ij})(i, j = 1, 2, \dots).$$

The judgmental matrix  $A$  built up assume the form of a positive reciprocal pairwise comparison matrix. Then, the weight coefficients of the criteria have been calculated by finding the principal eigenvector  $w$  of the matrix  $A$ . At the end, the values of all the criteria ware normalized to 1.

Finally, in order to check the overall judgment consistency, we calculated the consistency ratio (CR); such index is usually considered acceptable for values lower than 0.1 (Ramanathan 2001). In our case, the CR was 0.014 so considered largely acceptable. The results of the pairwise comparisons made by the experts are presented in Fig. 5.

Fig. 5 Pairwise comparison

The operational costs represent the most important criterion according the experts followed by the adaptability to the existing collection system and by capital costs. The job creation, on the contrary, represented the one rated as less important among the 7 criteria. We used the so ranked criteria to evaluate the best scenario among the 6 presented in the previous section.

## 4.2 Scenario ranking

Making use of the ranked criteria, we assessed the performances of each scenarios. The results are presented in Fig. 6.

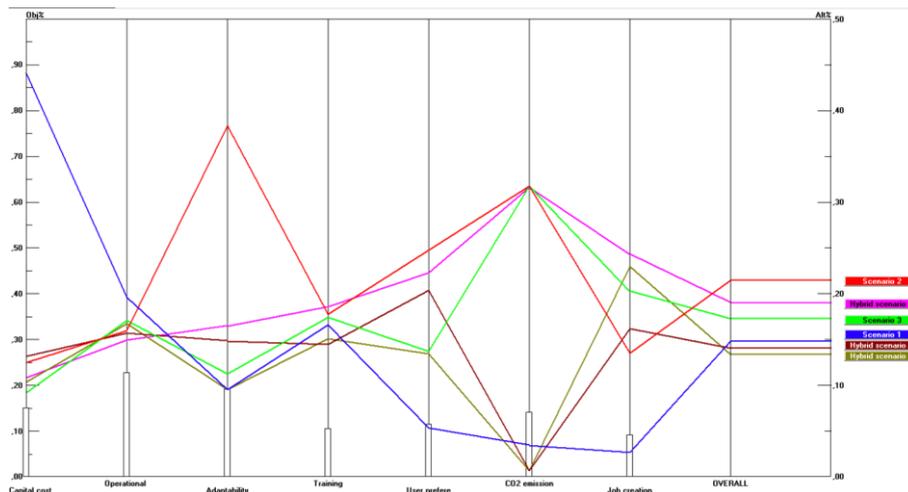

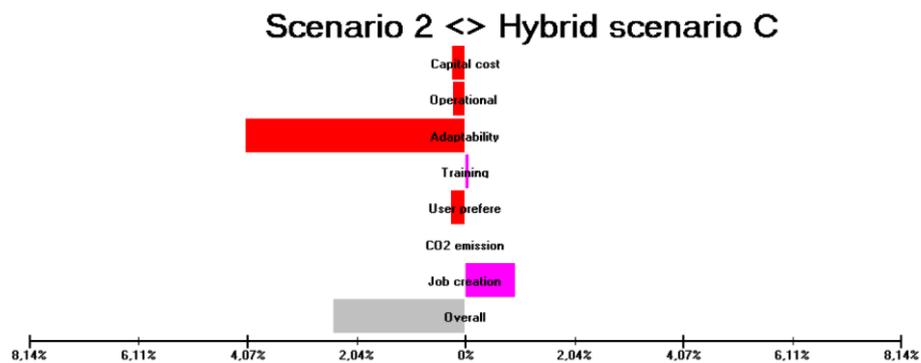

Fig. 6 Scenario analysis

More in detail, Fig. 6 shows how the best scenario performs compared to the other scenarios in terms of single criterium and in terms of overall performance. The figure, on the left y-axis, provides both information on each criteria's priority and on the performance of each scenario in relation of each criterium. Results shows that Scenario 2 resulted to be the best one among the six evaluated followed by the Hybrid scenario C that performed 2.5% worse.

In order to deeper investigate the top two ranking scenarios, we produced also a head to head assessment of Scenario 2 vs Hybrid Scenario C which is presented in Fig. 7. The biggest difference between the two scenario is represented by the degree of adaptability which in Scenario 2 is about 4% higher than the one provided by the Hybrid Scenario C.

*Fig. 7 Scenario 2 vs Hybrid Scenario C*

## 5 Discussion and conclusion

Our results show that Scenario 2, where used diapers are collected by a curbside door-to-door collection system with a weekly based collection frequency, resulted to be the optimal one and the most consistent for disposable diapers collection.

Under a managerial perspective, our work provides useful considerations for the design and implementation of specific separate collections within the waste management system. Indeed, the results of our evaluation support the fact that a dynamic collection organized through a booking service (i.e. by call or by an online booking service) remains the best option for collecting large and bulky waste. In such case, indeed, the waste collection company can perform a superior organization of the logistic activities by optimizing the routes and the loads, organizing them also over a longer time frame. Disposable diapers are in fact unsuitable to be stored for long period of time by citizens.

Some considerations can be done also for the waste collection centers (WCC). Also, in this case, our results confirm that such kind of collection is mostly suitable for large and bulky waste and for those typologies of small size waste that can be also stored for long period of time (such as for instance waste electrical and electronic) with no hygienic problems. Such aspect is further supported by the fact that also the hybrid scenarios concerning the usage of WCC together with an additional way to collect diapers (i.e. Hybrid Scenario A and Hybrid Scenario B) are as well bottom ranked in our investigation. Within this respect, a factor that could influence such ranking, might be represented by the number of WCC and the geographical localizations of those. Waste management companies

with fewer economic resources aiming at implementing a diapers waste collection might also leverage on WCC (i.e. the cheapest option) if those are fairly accessible by a large share of population. In such case, other managerial issues (e.g. openings time, trained personnel required, etc.) must be then wisely evaluated.

Under a methodological perspective, our research represents also an example on how different methodological approaches and data gathering procedures (i.e. structured interviews, questionnaires, industrial data, expert decisions) can be used together for an in-depth scenario building and complex scenario evaluation for the activities conducted in waste management companies. Further research could test the replicability of the approach also in other industrial settings (e.g. evaluation of alternative production cycles, logistics planning, sustainable supply chain partner selection, etc.).

Despite the relevance of our results there are some limitations we must acknowledge. For instance, the behavior and potential response from citizens was measured only with one question. Future researches can dig deeper in order to test a scale more reliable for such assessment. Moreover, we must also acknowledge that the "adaptability", which ranked second out of seven criteria, was assessed in a qualitative way using only experts' evaluation, as a different approach wouldn't be possible; also, in this case, future research can contribute in better shaping such indicator also through some quantitative indexes.

Finally, we must consider that our investigation was conducted in an area where a curbside door-to-door collection was already in place. Different results can be achieved in assessing similar scenarios in a context where the waste management company and the inhabitants are unfamiliar with this waste collection methods. Future research can deeper investigate such aspect grounding the scenarios in a different context where a door to door collection was never tested before.

### Abstract

A sustainable healthcare system requires moving assistance from the hospitals to patients' homes. This new model of care requires the home care organizations to review the role of home care professionals. This change of work practice is particularly relevant for nurses that are a key figures in the process of value co-creation. To support healthcare providers and policy-makers in guiding this change, this research aims at studying the mechanism of task shifting in home care nurses using an ecosystem perspective. Given the exploratory aim of the study, a multiple-case study methodology was chosen by selecting four home care providers in Italy.

Results revealed that the role of the nurses is evolving through all three typologies of task shifting: enhancement, innovation and delegation of activities from general practitioners to healthcare assistances. The types of activities that were shifted among professionals, patients and their caregivers were interactive and administrative activities mainly, but also care and educational tasks. The root causes that led to the shift of tasks during home care assistance were organized into four categories: organizational, patients' needs, environmental and individual forces. Finally, this research made a first attempt to study the influence of task shifting on the other actors of the service ecosystem. Results revealed

that the activities that nurses performed in addition to their routine activities influenced the micro, meso and macro levels.

## 1 Introduction

A sustainable healthcare system requires moving assistance from the hospitals to patients' homes (Glomsås et al., 2022; Hoel et al., 2022). The 'aging in place' has been pinpointed as one of the main drivers for improving the quality of life of elders and the sustainability of the health and welfare systems (Pillemer et al., 2011). However, the home care organizations have faced several challenges in adopting this model of care. Moving professionals from the hospital to the house of the patients required home care organizations to coordinate professionals, promote inter-professional cooperation, and provide adequate infrastructure to all professionals (Carlson et al., 2014; Fatemi et al., 2019). Meanwhile, the home care setting created limited occasions of interactions between colleagues and opportunities of career development, affecting the work satisfaction of home care professionals negatively (Maier et al., 2022).

Within this scenario, the role of home care professionals needs to be reviewed and rethought (Abrokwa et al., 2022; Groenewegen et al., 2021). This change of work practice is particularly relevant for *nurses* that are key figures in the process of value co-creation (Echeverri, 2022). In discussing the role of home care nurses, Melby et al (2018) stressed the importance of strengthening the professional expertise and organizational skills of nurses (Melby et al., 2018). More recently, scholars claimed that updating nurses' competences might not be enough because the role is evolving constantly. As piece of a complex puzzle, the role of home care nurses is the result of the interactions between different parts of the integrated healthcare system. The exchanges between nurses and professionals of their or other organizations (organizational force), patients and their families (patients' needs force), and the economic, technological and social context (environmental force) influenced the boundaries of the nurse's role (Bartram et al., 2022; Chen et al., 2022). There is a need to study the evolution of the nursing role for supporting its profession advancement, the effective implementation of the

'aging in place' model of care, and, thus, the co-creation of value (Chen et al., 2022; Katsuda et al., 2022).

This paper provides a first contribution in this direction by studying: *"How do home care nurses interpret and adapt their role to the environmental, organizational and customers needs changes?"* In doing so, it contributes to the human resource management research by clarifying the evolving mechanism of the nursing role in the home care setting. Meanwhile, it also helps healthcare organizations and policy makers in recognizing (and managing) task shifting phenomena. Ignoring task shifting may reduce nurses and other professionals' motivation and effort in overcoming the boundaries of their roles. As presented afterword, nurses and other professionals change their roles for facilitating the process of value co-creation. Thus, not recognizing (and managing) professionals' effort in this direction may have negative impacts on patients and professionals' well-being, and on the performance of healthcare organizations and national healthcare systems.

## **2 Theoretical background**

### ***2.1 Role of professionals in the process of value co-creation***

Echeverri (2022) claimed that front-line professionals, such as nurses, are key actors in the process of service delivery. The interactions and exchange of resources between front-line professionals and customers are the key source of value co-creation (Echeverri, 2022). The inability or unwillingness to address customers' needs and requests can lead to negative consequences on patients and the healthcare organization (Plé, 2017). For this reason, recent studies have started to devolve attention to the process of value co-creation (Osborne et al., 2018). The source of value is not the organization but the moment in which front-line professionals and customer interact (Grönroos, 2011).

In this direction, Katsuda et al (2022) investigated how the evolution of nursing role can influence the process of value co-creation. Findings revealed that the innovation of nurses role influenced the process of value co-creation at micro, meso and macro levels (Katsuda et al., 2022). In other words, the revision of nurse's role had some effects on the nurse and their patients (micro level), on the healthcare organization in which the nurse is employed (meso level), and on other public or private organizations that are involved in the process of service delivery

(macro level) (Palumbo & Manna, 2018). This finding highlighted the importance to study, understand and monitor the evolution of roles among health professionals using an ecosystem perspective (Chen et al., 2022). Indeed, the evolution of role is the results of a dynamic and complex mechanism that can affect all the stakeholders of the service ecosystem (Katsuda et al., 2022).

## **2.2 Task shifting**

Task shifting was defined by the World Health Organization (WHO) in 2008 as 'the rational redistribution of tasks among health workforce teams'(WHO, 2008). This definition has been usually seen as the shift of easy task from high to less professionalized professionals (Fulton et al., 2011). Schalkwyk et al. (2020) considered this interpretation of task shifting definition too simplistic. Thus, they proposed a new comprehensive framework that deconstruct the traditional linear professional hierarchy. Nurses, doctors, pharmacists and the other home health professionals are at the same hierarchical level and can shift tasks from each other. Within this exchange of tasks, patients and technologies have also a role. Empowered patients can simplify the role of professionals by performing caring and administrative tasks alone. Similarly, technologies (such as information systems) can decrease the number of administrative activities for professionals (van Schalkwyk et al., 2020). The modalities through which tasks are shifted among professionals, patients and technologies were conceptualized into three main typologies:

1. *Enhancement*: increasing the scope of the role by enriching the tasks or skills of a particular group of workers;
2. *Substitution/delegation*: shifting one activity from one professional figure to another, breaking traditional professional boundaries;
3. *Innovation*: creating new role by introducing a new type of worker (or technology) (European Commission, 2019; van Schalkwyk et al., 2020).

The healthcare literature conceptualized and organized the types of tasks that can be shifted among professionals, patients and technologies. Andrade et al (2017) organized the nursing practices in home care setting in four main groups of activities:

1. *Interactive activities* include the communication tasks and the capacity of managing relations between the different professionals, caregivers and patients (Hjelle et al., 2018);

2. *Educational activities* refer to the training and educational support for increasing knowledge and capabilities to perform new activities (Toye et al., 2016);
3. *Care activities* include all the health activities, including self-care practices and the implementation of advanced/specific tasks (e.g. diagnosis of health status, medication treatment) (Craftman et al., 2018; Øfsti et al., 2020);
4. *Administrative activities* referred to all the organizational and managerial actions performed by professionals or patients (e.g. supervision and control or resources, joining decision-making processes) (Andrade et al., 2017; De Vlieghe et al., 2016; Saari et al., 2018).

Finally, the extant literature has devoted much effort in studying the root causes of task shifting. Why should tasks be shifted and role evolve? It would be much simpler leaving roles, activities and responsibilities as they were conceptualized years ago. However, the evolution of roles is often unpredictable and unstoppable. Being the result of the evolving dynamic relationships between professionals and the health ecosystem, the roles are evolving constantly. We organized the extant literature and classified the causes of the evolution of nurse's role into three macro categories:

1. *Environment forces* include the contextual causes of roles' change. For instance, the launch of new technologies (such as telemedicine), the introduction of new health policies, or the occurrence of external events (such as Covid-19 pandemic) can influence the role of nurse dramatically (Bartram et al., 2020, 2022).
2. *Organizational forces* refer to the necessity to review the modalities of collaboration among professionals for adopting new modalities of care (e.g. interdisciplinary teams), for increasing effectiveness and efficiency of organizations, and for facing the shortage of workforce and resources (European Commission, 2019).
3. *Customers forces* include the causes of role's evolution that are linked to the professionals' willingness to respond to patients and caregivers' needs. Since the needs of patients are changing constantly, the professionals are asked to modify their tasks to address their needs in a better way (Osborne, 2021).

Whilst these findings clarify the boundaries of the concept of task shifting, there is a dearth of evidence about the mechanism of the evolution of the nursing role in EU (Chen et al., 2022). This paper aims at filling this gap by investigating four empirical case studies in the north of Italy.

### **3 Method**

#### **3.1 Context**

Given the exploratory aim of the study, we chose to adopt a multiple-case study methodology (Yin, 1994) by selecting four home care providers in Italy. We preferred to select a set of cases that belong to the same country because they share the same rules and regulations, making results comparable. Italy was selected because the topics of home care and task shifting are much debated (Anelli, 2019; Presidenza del Consiglio dei Ministri, 2021). We selected a specific period (i.e. summer 2021) that allowed us to study the influence of Covid-19 pandemic. In addition to the legal and contextual factors, other drivers can influence the evolution of roles such as digital technologies and the organizational structure. Therefore, we selected a set of home care organizations that differ for (i) the level of digitalization and (ii) the type of contract with the home care organizations. In doing so, we took into account the organizational force (i.e. type of service and the type of nurses' contract) and the environmental force (i.e. the country's regulations, the Covid-19 pandemic and the level of digitalization). We did not take into account the customers' needs force because we supposed that patients in the north of Italy shared similar needs.

A brief description of each home care provider is summarized in Table.1.

Table 1 Italian home care providers

Home care organizations	Description	Environment-Level of digitalization	Organization-Nurses' contract
Six Case della Salute of the AUSL Piacenza	Six community centres that represent the point of first access to primary care and outpatient problems in Piacenza. Among the several activities, they manage the network of home care assistance.	Medium-high level	Nurses are employed by the organization
Fond. M. Grassi	An outpatient clinic that offers to freelance nurses the opportunity to create a reference point on the territory for nursing services, health education and prevention activities, and multidisciplinary home care services.	Low level	Nurses are free-lances
PAXME	A group of social cooperatives that provides home care assistance and services.	Medium-high level	Nurses are employed by the organization
OSA	A health cooperative that provides home care assistance and functional recovery activities, and manage nursing homes.	Low level	The majority of nurses are free-lances

### 3.2 Data collection and data analysis

For each case, at least one semi-structured interviews was performed. Each interview lasted approximately 40 minutes and was conducted online via Zoom or Microsoft Teams in June and July 2021. In accordance with the aim of the research, the interview main aim was to study how home care nurses were interpreting and adapting their role in response to changes at organizational, environmental and customers' needs levels. The interview's structure was organized in three main sections:

- Section 1 aims at studying the perception of their role and how is evolving in terms of activities not formally recognized that they perform;
- Section 2 aims at studying the contextual drivers that generate such activities;
- Section 3 aims at studying the opinion about the evolution of their roles in the future.

Table 2 Home care professionals involved in the interviews

Home care organizations	Number of interviews
Case della Salute	6 nurses
Fond. M. Grassi	1 nurse
PAXME	2 nurses
OSA	1 nurse

The interviews were recorded, transcribed and anonymized. All interviewees gave their consensus to use the interview for research purpose and to report results in aggregate form. The interviews transcripts were analysed through NVivo v.12 software. We decided to adopt a content analysis using an abductive approach (Spens & Kovács, 2006). Whilst the case study is exploratory and innovative in its nature, we preferred to investigate findings taking advantage of the existing frameworks and knowledge on task shifting in healthcare (Kovács & Spens, 2007). In particular, one author used:

- The dimensions of the theoretical framework of the European Commission to investigate the typologies of task shifting: enhancement, substitution/delegation and innovation (European Commission, 2019);
- The theoretical taxonomy of Andrade et al. (2017) to investigate the types of activities/tasks that are shifted or introduced: interactive actions, educational actions, care actions, administrative actions (Andrade et al., 2017).
- The root causes suggested by the healthcare literature presented in the introduction section: environmental, organizational and customers' needs changes. the empirical setting.

The issues related to the framework's capacity to explain the empirical observations were discussed among authors. The emerging 'deviating observations' were explained and discussed through 'the creative iterative process of theory matching' that aims at refining and mixing the prior theoretical framework with other theories (Kovács & Spens, 2005). In doing so, we added new dimension for the root causes (i.e. individual force). This new dimension confirms the existing literature findings regarding roles' evolution that recognize personality and attitude of professionals as a driver for task shifting (Manjunath et al., 2022).

The final coding matrix is organized in the following three dimensions and related sub-dimensions:

1. Typologies of task shifting
  - Enhancement;
  - Substitution/delegation;
  - Innovation
2. Types of activities
  - Interactive actions;
  - Educational actions
  - Care actions;
  - Administrative actions.
3. Root causes
  - Environmental force;
  - Organizational force;
  - Individual force.

## **4 Results**

The results were organized according the three macro dimensions of the final coding matrix: typology of task shifting, types of activities and root causes. Thus, the first two paragraphs clarify the phenomena of task shifting, while the last paragraph describes how home care nurses are adopting their roles according to the organizational, environmental and customers' needs changes.

### **4.1 Typologies of task shifting**

To investigate the typology of task shifting, we referred to the theoretical taxonomy proposed by the European Commission: enhancement, substitution/delegation, and innovation (European Commission, 2019).

The recurrent category of task shifting was enhancement (82% coverage of the dimension "typologies of task shifting"). This result shows that the role of nurses was not renewing completely. Nurses made incremental changes in their role by performing tasks that expand and enrich the traditional nurses' activities.

*"It is happening during patients visits. For instance, when you visit a patients, who received a medication two days ago. The lesion was dispensed with blood perfectly two days ago. But the day of the second visit, the lesion is black necrotic. Thus, you are aware that something is*

*wrong and you have the professional duty to ask yourself why [even if it is your nurse's responsibility]. You have to solve the situation despite nobody tells you any information or support." (Nurse; Enhancement)*

The second typology through which the role of nurses evolved was innovation. The Case della Salute introduced a new organizational model that led nurses to gain a managerial role. In each Case della Salute, one nurse was in charge to open and manage a clinic, in which one or two nurses were employed, supporting diabetic patients in their treatment. The nurses interviewed considered themselves no longer an executer that follow physicians' decision but a coordinator that manage a small team of professionals. This new model of care allowed nurses to assume a new role and to gain additional responsibilities.

*"Nursing outpatient clinics were opened for full and direct management of nurses" (Nurse, Cds; innovation)*

*"We are no longer health care workers there by accident: but I know what's going on in the next room, I know what's going on outside my square foot of outpatient clinic" (Nurse, Cds; innovation) 65*

There were only few examples of the third typology of task shifting: substitution/delegation. In particular, the general practitioners asked the nurses to perform activities of their place, such as evaluating the possibility to activate the home care assistance. The delegation of activities occurred only when the general practitioner had a trustful relationship with the nurse. The interviewees stated that delegating tasks in home care setting is difficult because nurses are alone at the patient's home. The limited interactions with other professionals (e.g. general practitioners, health assistance, physiotherapists) limits the chance to delegate the routine activities to other professionals.

*"The doctor calls me and says: come with me to this patient and you tell me whether to activate ADI or not" (Nurse, OSA)*

*"I was contacted by a GP that told me: "I got a call from a patient who wants to activate home care" I said: "Doctor, have you seen her yet?" "No, you go then tell me what to do" (Nurse; OSA)*

*"In ADI delegating is difficult, because when you're at home alone... You're alone. There is no colleague to ask to do something for you" (Nurse, OSA)*

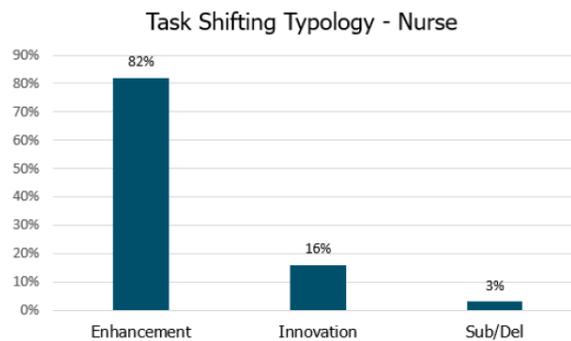

Figure 3 Task Shifting typologies

#### 4.2 Types of activities

The activities that nurses performed outside the boundaries of their role mirrored the taxonomy proposed by Andrade et al. in 2017: care, administrative, interactive, and educational activities.

The recurrent extra-activities that nurses introduced in their tasks were interactive activities at macro, meso and micro levels (39% of codes). Nurses had often to communicate with different actors such as specialized clinicians, general practitioners, social workers, and other healthcare professionals (meso and macro levels). Moreover, patients and their families often asked nurses advices and emotional support (micro level). In many cases, nurses became a reference point for families without being recognized at the regulatory level.

*“There is a part of what we do that is not formalized, which is the part related to the relational aspect, to communication, to the management of aggressiveness, to interpersonal relationships. For example, it is difficult to formalize “I went shopping because the patient needed milk and the family member was not there.” (Nurse, FMG; Interactive activities).*

The second type of additional activities performed by the nurses are the administrative ones. Nurses are in charge of managing and organizing patients' care in accordance with other professionals. In doing so, they often acted as a bridge role between the different organizations and entities of the local area, with a positive impact at macro and meso level.

*“The care provided by different healthcare figures must be coordinated because otherwise it's a useless job. However, the decision of contacting and coordinating out care with the one of other professionals is our choice.*

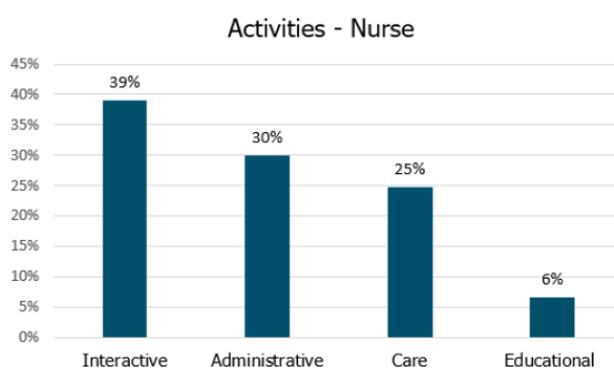

*Not every nurse decides to manage and coordinate his/her care with others; it's a very individual choice. At the same time, if we are not try to coordinate care, no one will do" (Nurse, OSA; Administrative activity)*

Nurses performed some care activities as extra-activities, enhancing the role of the nurse. They often made health care decisions and did caring activities that were not prescribed by the physicians or that were not within the boundaries of their role.

*"I saw a patient that needed an intravenous feeding; he is an elderly, cardiopathic and dehydrated patient, so I decided to measure his pulse: 150 beats. I immediately said, "I'm not going to put an intravenous feeding on a patient like that. Let's call the ambulance or the GP!" But I could have just put the intravenous feeding and left" (Nurse, PAXME; Care activity)*

Although the code of ethics requires nurses to train patients and their caregiver, sometimes nurses dedicated much more time and effort in these activities than what is required, with positive impacts on caregivers and patients (micro level). For instance, they provided advices even when this information did not refer to nurses' activities.

*"If you go there and you only want to perform the caring task, it takes 10 minutes. Instead, if you want also to train patients and their families about self-caring activities, i.e., nutrition's' principles for diabetic patients, how to wash, the visit will last a bit longer." (Nurse, PAXME; Educational activity)*

*Figure 2 Task Shifting activities*

### **4.3 Root causes**

The root causes that led nurses to shift their tasks can be organized in four main sections: patient needs' force, organizational force, environmental force and individual force, as reported below.

#### **4.3.1 Patient needs' force**

The health, social and economic needs of patients drove changes in the routine activities of nurses. These needs were unexpected needs, which arose during patients' visit all of a sudden, or persistent needs, which recurred for a medium-long period because they had never been satisfied. Patients' needs were a root cause of task shifting because nurses, who have the duty to help patients, were pushed to perform activities even beyond their role for addressing patients' needs.

*"All begins to help patients, which is our goal at the end of the day" (Nurse; PAXME)*

*"But since it is the only way for activating the service, you do it. As a nurse, you are aware of the patient needs, so prefer to do it" (Nurse; OSA)*

Interestingly, nurses changed their role to accomplish not only patients but also caregivers' needs. In many cases, nurses introduced additional activities to support and train caregivers in performing caring activities for their dear ones. During visits, caregivers were usually present and took advantage of the nurse's presence for making requests and questions about caring activities. For this reason, nurses felt the pressure to act professionally, be competent and able to manage the situation.

*"The caregiver is smarter and more competent. S/he is watching you and observing you constantly. You can't get rid of her/him. You have to be competent, professional, sensitive, and empathic." (Nurse, FMG)*

#### **4.3.2 Organizational force**

The lack of resources of home care organizations was a root cause for task shifting in nurses. More precisely, the lack of personnel was forced nurses to perform activities that were not within their role's boundaries. The lack of other professionals' availability led nurses to substitute others or integrate their activities.

*"There has always been too much work to do. It increased with the pandemic, but there would have been high workload anyway. More time pass[, less we are], more work becomes" (Nurse, OSA)*

*"Because if the nurse doesn't have time to do certain things, he or she will delegate them to the health working assistance" (Nurse, OSA)*

Moreover, the necessity to pursue a certain level of services' effectiveness and efficiency forces nurses to enrich and revise their role. For instance, home care organizations requested nurses to collaborate and integrate their activities with other professionals for increasing the effectiveness of the treatment.

*"If the nurses, health working assistance or any other type of operators working within the Case della Salute would see this opportunity to be able to work together in integration, this can evolve their figure" (Nurse, CdS)*

Finally, the working approach of the home care organizations influenced the role of nurses steadily. In the cooperatives, nurses were usually work alone. Thus, in certain situations, the nurses, who cannot ask for the immediate support of a colleague, have to decide the activities to perform, even if they are not of his/her direct competence.

*"When you're home alone, you're alone. There's no colleague so you say "look I don't have time to do this, you do it" because you're there. Sometimes we do things that are not part of the pure home care activity that we're responsible for" (Nurse, OSA)*

#### 4.3.3 Environmental force

The cultural environment influenced the behaviour and attitude of nurses. For instance, nurses have started to be recognized as a crucial figure in the home care setting in the last decade. Nurses were no more a mere executor of physicians' decisions, but the referring figure for patients and their families. This cultural shift influenced the roles of nurses steadily.

*"The change is certainly also driven by changing the vision where the nurse is only the one who detects the pressure or gives the injection; it means getting out of a purely performance dimension and understand that health is a much broader good" (Nurse, CdS)*

Moreover, some innovative policies led healthcare organizations to revise the role of nurses. In the Case della Salute, nurses were in charge to carry out additional activities such as promoting health and organizing prevention campaigns.

*"We started to redesign the chronic care according to the principles of preventive care. This was the main change that was introduced with the new model of care Case della salute" (Nurse, CdS)*

#### 4.3.4 Individual force

In some cases, nurses performed additional activities because they decided to do so. To meet the needs of the patients in a better way, they decided to interact more with patients/caregivers, or coordinate with other professionals. Nurses were highlighted that delivering high quality care sometimes required them to provide activities that cross the threshold of his or her own duties. In many cases, these activities were administrative and interactive activities that were put in place for improving the services' efficiency and efficacy.

*"Going above and beyond depends on what you want from your role." (Nurse, FMG)*

*"Currently, each nurse behaves according to their personal attitude and preferences, there are not tools or other guidelines for guiding us in monitoring [for instance] the training activities delivered to caregivers."(Nurse, CdS)*

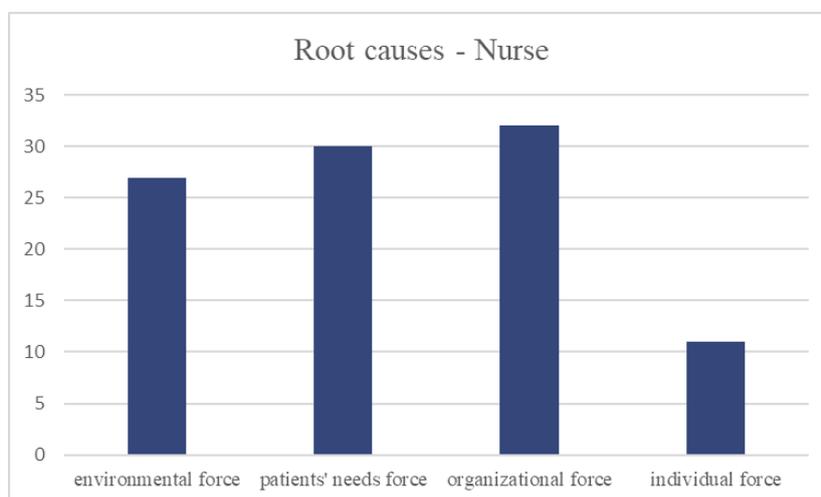

Figure 3 Task Shifting root causes

## 5 Discussion and conclusions

This study aims at investigating the evolution of the role of home care nurses. In doing so, it analysed the typology of task shifting, the types of activities shifted and the root causes. Results revealed that the role of the nurses is evolving through all three typologies of task shifting: enhancement, innovation and delegation of activities (from general practitioners or to healthcare assistances). The prevalence of innovation on delegation typology may be caused by setting of investigation. Indeed, six interviewees were nurses employed in the Case della Salute whose model of care had reviewed the role of nurses steadily. The types of activities that were shifted among professionals, patients and their caregivers were interactive and administrative activities mainly, but also care and educational tasks. Finally, the root causes that led to the shift of tasks during home care assistance enriched existing literature findings. Results confirmed the three main root causes suggested by the literature (i.e. organizational, patients' needs, and environmental forces) but they also revealed an additional one: individual force. The revision of nurse's role changed according to the personal attitude, motivation and behaviour of each nurse. Thus, the nurses' choice of modifying their role is the results of both external and internal forces. For this reason, the home care organizations in reviewing nurses' role have to dedicate time and effort in personalizing the career pathways and development.

Furthermore, this study analysed the phenomena of tasks shifting in the home care setting with specific attention to its influence at micro, meso, macro levels. Recognizing that nurses in modifying their role can influence the process of value co-creation, the results made a first attempt to study the influence of task shifting on the other actors of the service ecosystem. Results revealed that the interactive activities that nurses performed in addition to their routine activities influenced benefits the communication with specialized clinicians of their organization, general practitioners, social workers of external entities, with positive impacts at meso and macro levels. These interactive activities impacted positively also the micro level increasing the emotional support to patients and their families. Similarly, the administrative and training activities had some benefits on different levels of the service ecosystem.

In conclusion, the study is the first attempt to clarify the mechanism through which nurses make their role evolve over time. Drawing on the previous conceptual frameworks (e.g. (Chen et al., 2022; Katsuda et al., 2022; van Schalkwyk

et al., 2020), Figure 4 provides an overview of the task shifting mechanism of home care nurses. In doing so, it displays the existing literature findings in blue and highlights in yellow the main contribution of this paper.

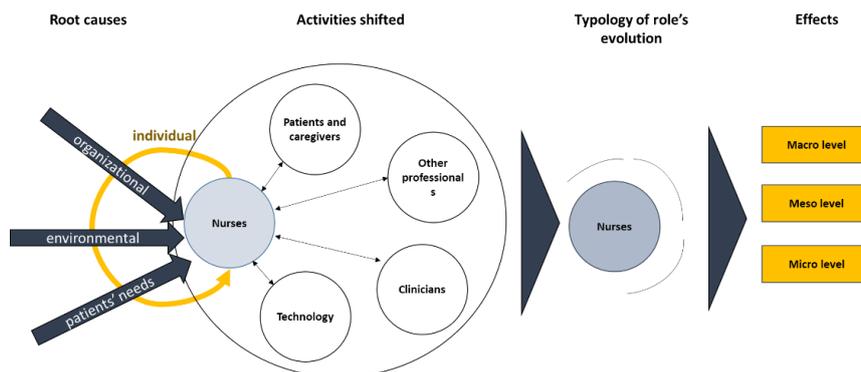

Figure 4 Task Shifting mechanism, starting from the conceptual frameworks of Chen et al., 2022; Katsuda et al., 2022; van Schalkwyk et al., 2020.

This research has some major limitations. First, the number of interviews are limited that made impossible to drive considerations from the specific characteristics of the four settings. Second, the exploratory nature of this study makes findings hard to generalize. Further studies are needed to test and validate the task shifting mechanism. Finally, the effects of the task shifting mechanism were only inferred from the analysis once the finished interviews. Future studies will have to enrich the interviews' transcript to assess the effect of task shifting on all the actors of the service ecosystem, with particular attention on the interdependencies between micro, meso and macro levels.

Matera, Italy

### Abstract

New technologies are being integrated into the urban space of cities and we are progressively talking about smart cities and smart tourism. Tourism is one of the production sectors with the greatest economic impact internationally, as it directly influences cities, the provision of their services and the way people live together. It is therefore from this that the smart and sustainable tourism destination approach is conceived, influencing city dwellers and the environmental footprint of the tourism experience. In the belief that combining digital intelligence with spatial systems can improve the standard of living and raise the quality of services, the aim of the research is to explore places where the environment and the technological system are closely related, creating a greater dialogue between the various social components of these spaces, with interesting effects also in terms of relational cohesion. Spatiality is not only a physical concept, but it is linked to notions of digital geography, which we define as Phygital, in which the physical and virtual environment are combined to enhance the tourist experience. Considering the strategic axes of innovation, digitisation, accessibility and sustainability, the resulting positive impacts are distributed among economic, social and technological actors, enhancing tourist sites with improved physical and digital accessibility, and generating a competitive and inclusive type of tourism. There are many virtuous examples of STD in the world to take inspiration from, and the article takes the case study of the city of Càceres as a reference to make some reflections on smart tourism.

**Keywords** – Smart tourism, smart city, phygital, empowerment of citizen and tourists.

**Paper type** – Academic Research Paper

## 1 Introduction

Contemporary society is experiencing a scientific revolution marked by the growing importance of Big Data and the development of related technologies, which permeate every aspect of our life and culture. The 21st century is characterised by interactions between the physical and virtual worlds, thanks to the progressive creation of a global connective space with a high intensity of information flows. Urban contexts are increasingly evolving towards digital ecosystems to improve the capacity of services, respect the environment, and boost the local economy by supporting businesses and enhancing the cultural and tourism sectors, in an eco-sustainable perspective as set out in Agenda 2030. The city of the future, in the face of a series of adaptations, transformations and integrations, coordinates its own urban and functional restructuring to rationalise services, functionalise neighbourhoods, reuse spaces, decongest traffic, save energy, involve citizens and boost tourism. Internet of Things, Internet of Everything and Internet of People are concepts that envisage how in the physical city objects, devices and people will be increasingly interconnected through the infrastructure, and relying heavily on new technologies, resilience, ecological efficiency and environmental control are envisaged, even in places far from the production hubs, through network access for all (Mezzetti, 2005).

Realising an intelligent city requires transformative processes according to the complexity of the human-environment interrelation and in overcoming what we call urban diseconomies. Design is not only built with data, but above all through everyday life spaces, representations, phenomena, symbols and shared values that mark spaces. Technology is not an end in itself, but a means to create what is called a 'humane city', where new ways of decision-making are proposed in a networked sense to activate the community's capacity for action and the involvement of human capital, resulting in outcomes that spread socially inclusive energies and initiatives (Governa, 2014). On the end of the smart community, which in the idea of the smart community aggregates small centres in jointly addressing issues of interest, the empowerment of individual citizens and tourists is fostered, who will be equipped with the skills to interact in the changing economic system. Urban planning must therefore take into account the relationship between the built and the non-man-made contexts, in order to preserve the integrity of ecosystems and increase those spaces that generate well-being. In this sense, the involvement of communities is fundamental in co-

designing because they live the territories, perceive their problems, have specific priorities, and it is right to take them into account in the general diagnosis for an urban regeneration capable of mitigating the effects of the social, environmental and climate crisis (Magnaghi, 2000). In a logic of sustainable development, it is the intelligent integration on an urban scale of a whole series of technologies that gives centrality to the human dimension, assuming citizen-driven as well as human-centred processes. The smart city cannot just be a technological challenge, it must above all be a social challenge. The key infrastructure of a smart city is its citizens and tourists. The contribution offered by technology for urban and territorial planning stems from that all-too-human talent that is reflected in algorithms to support choices that, however automated, will always be the result of human intelligence (Ratti and Claudel, 2017). Digital tools for managing complex systems are at any level a great achievement of the 21st century, it being understood that the most effective tool behind every digital device must remain the human capacity for discernment.

## **2 Smart cities and smart tourism**

Smart tourism, defined by the World tourism organisation as a type of tourism that is "clean, green, ethical and quality at all levels of the service chain", looks to technological innovation as a functional boost to the process of mutation of cities and territories with a tourist vocation. Digitisation and the connection of objects and territories to the Internet therefore enter fully into the DMO (Destination management organisation) with a set of new opportunities, guaranteeing the visitor a complete, attentive and intelligent experience and a more sustainable use of resources. Smart tourist destinations are places characterised by high accessibility and a wide availability of data, in which the diffusion of innovation processes follows an "open" and inclusive evolution, in favour of the community, facilitated by the possibility of creating virtual networks and participatory platforms (living labs) capable of interconnecting all the actors involved in the tourism sector. We can classify a city as smart when sustainable economic growth and a high quality of life have been achieved through investments in human capital, an adequate level of government participation and infrastructures that support the proper dissemination of information throughout the city (Magnaghi, 2005). While the focus of smart cities is on its residents, smart tourist destinations emphasise the enhancement of the tourist experience, thus simultaneously

improving the quality of life of its residents. This dual focus requires an inclusive ecosystem design, which can only be achieved through dynamic leadership and integration of all stakeholders in the development of the smart tourism destination. Therefore, it is important to understand how technology does not simply enhance pre-existing experiences, but takes them to a whole new level, reaching the Smart Experience component to extend the experience to new levels and enhance it through personalisation, context awareness and real-time monitoring. The capillary distribution of the tourist heritage throughout the country constitutes a great potential for development also locally, but it requires a greater effort to identify interventions and mobility services aimed at guaranteeing the accessibility of tourist sites in an adequate manner and within a reasonable timeframe (Gretzel, Zhong and Koo, 2016). Digital accessibility represents a qualifying element for the tourist offer, because through the use of innovative technologies, it enables the enjoyment of a tourist destination before physically reaching it. Digitisation makes the tourist more informed about the services offered and informs operators in the sector about tourist flows, improving the design of services and the travel experience, through a dynamic interaction between the traveller and the tourist ecosystem. The possibility of exchanging data between tourists, and between tourists and operators, allows the development of new services - integrated along the value co-creation ecosystem - at all stages of the journey: from the ability to support the tourist in the choice of destination, to the possibility of offering route planning tools, improving the enjoyment of the destination and transforming the journey into a shared experience. This has been well tested in several countries that have joined the network of European Capitals for Smart Tourism, affirming their relevance in different sectors. From the case of Màlaga and Copenhagen that have strongly invested in digitalisation, to the affirmation of sustainability for Gothenburg that monitors the events taking place in the city benefiting from the Event Impact Calculator, a tool that forecasts potential environmental impacts and helps organisers to evaluate events from an economic, social and environmental point of view, to the importance of digital and physical accessibility for every type of visitor for Lyon with the ONLYLYON Experience that allows to receive information in real time for attractions and transport avoiding congestion in tourist flows (Boes, Buhalis and Inversini, 2016). It is no coincidence that Valencia has been designated as the European Capital of Smart Tourism for 2022, the first European city to receive a double ITU and ISO certification for sustainable city development,

and widely engaged with PREDIF (State Platform for Representation of People with Physical Disabilities). Implementing change requires a structural reorganisation of holiday destinations from a smart perspective with a structural-organisational model that is able to exploit the opportunities arising from the digitalisation of the tourism sector and design evaluation tools suitable for measuring their performance.

### **3 Strategic research axes**

The orientation of this work has been outlined by the strategic axes of innovation, digitisation, accessibility and sustainability, which we decline as follows:

- innovation, understood as the introduction or improvement of new services, processes, marketing methods or organisation in the internal practices of the destination management organisation and in its external relationship with residents and tourists with the aim of improving the benefit they provide and their competitiveness. Innovation, to the extent that it is systematically implemented within an established management system, continually brings new ideas to the destination, proactively generates value through a better understanding of the needs and possibilities of the STD, helps to identify and reduce risks, harnesses creativity and collective intelligence, obtains value from the collaboration of all stakeholders, and promotes the involvement of all by fostering collaboration;
- digitisation, the impact of new technologies on tourism habits has to do with the implementation and extension of their use, in relation to socio-demographic and socio-cultural variables, and with the ability of the Smart Tourist Destination to meet the different needs of the tourist. The complexity of the technological scenario is marked by the diversity and rapid evolution of technologies. New technologies play a major role in the tourism sector, both from the point of view of destination management and from the point of view of the consumer and user of tourist services and products;
- accessibility, involves the development of tourism that allows access to all people, without exclusion, guaranteeing the right to equal opportunities to enjoy the environment, goods, services, products and

technologies in the safest, most comfortable, autonomous and natural way possible. The objective of any STD should first and foremost be to ensure an accessible tourism environment throughout the tourism chain and at all stages of the journey, in absolute freedom and autonomy;

- sustainability, associated with the protection of economic tourism activity in the present and future, with respect for the environment in the short, medium and long term, with the preservation and enhancement of the socio-cultural dimension and with guaranteeing the quality of life of present and future generations of STD. The dimensions of sustainability contemplated in the smart city paradigm are: the economic one related to competitiveness, the social one to quality of life and the environmental one to efficient management of natural resources. However, technology alone does not make a destination smart, a change in tourism management is needed: it must be accompanied by a process of change at all levels, starting with the tourism strategy that should lead to a new model of an innovative, accessible and sustainable destination. Management is therefore the central element in the transformation of the Smart Tourist Destination to be implemented in the face of changes in a complex tourism scene (Díaz, Esteban, Koutra, Almeida and Carranza, 2023). The management of the STD, in addition to considering the axes described, must observe the following principles:
  - effectiveness: in accordance with the set objectives, policy and appropriate measures;
  - efficiency: in the optimisation of resources;
  - openness: transparency towards the tourism sector and local society with an active communication and clear, accessible language;
  - participation: public-private cooperation and consensus;
  - responsibility: in the decision-making and financial process in order to achieve greater stability and financial self-sufficiency;
  - coherence: taking into account the set objectives and policies of the tourist destination.

#### **4 Theoretical model and methodologies employed**

Spain has launched a smart-destination initiative for DTIs (Destinos Turísticos Inteligentes), with guidelines (UNE) aimed at tourist destinations, so that they can take advantage of smart city dynamics and projects, also targeting the tourism sector. The presence of infrastructures and services for digital accessibility connotes tourism destinations as "smart destinations", as territorial ecosystems equipped with an advanced technological infrastructure and capable of collecting, processing and analysing information and data from the tourism system in real time, offering tourists the possibility of interacting with their surroundings and improving the quality of the tourism experience. In the urban context, the 'smart destination' is a smart city that provides services aimed more specifically at tourists and visitors: tourists are 'city users' who must be facilitated in their enjoyment of the city, encouraging them to 'experience' it and no longer just visit it. The tourist vocation of many Spanish cities guides their economic and social development strategy, since tourism is one of the most strategic sectors, especially for Smart Cities. It is necessary to have a methodological basis that allows the different tourism actors to approach the implementation of new solutions for the creation of STDs in the right way. We have identified four phases of analysis to follow, starting with the knowledge of tourism regulations. The Spanish UNEs for STDs represent the normative basis to refer to regarding the management system, indicators, tools and semantics applied to tourism. The second phase involves structuring the tourism reality for codification. The tourism manager knows the components of the destination (attractions, places, companies, events, products, etc.) and the traveller profiles. The objective is to sort the destination information and determine the relevant information for each address in order to link the data and create the logistical basis on which to structure the innovative tools to be applied. In the third phase, we can combine serialisation formats in line with the destination's strategy. Increasing the competitiveness of the tourist destination and enhancing the digital visitor experience is essential. To enrich the user experience on the web portal, app and other channels, we need to serialise data according to the Spanish UNE 178503 proposal and to give visibility to the destination websites in the search we can use schema.org (JSON). The fourth and final stage is the analysis and continuous processing of the information received from travellers. The content assigned to each user must be well connected in data chains that must be dynamic and

evolve in line with market trends. This ensures the availability of real-time services and a tourist experience in line with the expectations of tourists.

Urban tourism centres are called upon to combine land management policies with issues of culture, organisation, infrastructure availability, innovation and business, in order to strengthen identity, cohesion, hospitality and security at the local level and, at the global level, their recognition in the network of 'world cities' (Gretzel, Zhong and Koo 2016). Strategic choices and actions must be defined according to the principles of socio-economic and environmental sustainability, enhancing lesser-known destinations and highlighting territorial typicalities in terms of culture, traditions and biodiversity. In fact, one of the objectives is to innovate, specialise and integrate the national tourism offer: it is necessary to focus on a complementary, integrated and expanded offer with respect to the main tourist destinations and products from which to get to know the enormous historical, artistic and landscape heritage spread throughout the territory. Coordination with the Industry 4.0 strategy and its synergies with the service system is necessary to encourage the technological upgrading of the tourism supply system and strengthen its competitiveness. The theme of digitalisation and innovation is a particularly important aspect for the competitiveness of the tourist destination, trying to counteract the gaps in terms of digital public services, human capital, integration of digital technologies, internet use and connectivity. The impact on consumer behaviour of the content generated by travellers themselves on the web requires, as a goal to be pursued, the complete innovation of promotion techniques and channels, but also a great capacity for continuous adaptation of targets and content, fuelled by reputation monitoring and listening to demand (Ghobakhloo 2020). Dynamic must also be the way of selecting the components of the offer to be promoted, integrating the different territories in the national strategy, enhancing the most attractive territorial brands with the lesser known destinations, the many resources and values, with the plurality of tourism products ready for marketing. For this reason, it is essential to define a monitoring and surveillance system for the Plan based on specific quantitative and qualitative result objectives, shared within the framework of participatory and inter-institutional comparison, which are functionally linked to the permanent analysis of the evolution of competitiveness and global trends in the sector. As demonstrated by the already European capitals of Smart Tourism, digitisation makes tourists more informed about the services on offer and informs operators in the sector about tourist flows, improving the design of services and the travel

experience, through a dynamic interaction between the traveller and the tourist ecosystem (Peris-Ortiz, Bennett and Pérez-Bustamante Yábar, 2017). The possibility of exchanging data between tourists, and between tourists and operators, enables the development of new services, integrated along the value co-creation ecosystem, at all stages of the journey: from the ability to support the tourist in the choice of destination, to the possibility of offering tools for route planning, improving the enjoyment of the destination and transforming the journey into a shared experience.

## **5 The case study**

The application part was developed on the city of Cáceres. The city known as 'the city of a thousand coats of arms' is located in the region of Extremadura in west-central Spain. Its historic centre (or Ciudad Monumental) still retains its walls and was declared a UNESCO World Heritage Site in 1986 on the grounds that, 'surrounded by walls, it is rich in stone buildings that form a perfectly preserved urban fabric'. Cáceres has been committed in recent years to preserving, valorising and publicising its heritage, gaining a greater understanding of the behaviour of visitors and citizens in their relationship with the city, and activating strategies to retain tourists, diversify the consumption of the services on offer and build a system and management model that strengthens the local business sector. The World Heritage city, from ancient to contemporary city, has tripled the number of visitors in 25 years and has an influx of over 700,000 tourists per year. The initiatives promoted by the municipality of Cáceres have led to an increase in the average stay, the number of tourist facilities, the number of tourists and in general the growth of the tourism sector (Álvarez-García, del Río-Rama, Vázquez-Huerta and Rueda-Armengot, 2017).

The smart tourism idea to be implemented is aimed at both inclusiveness and competitiveness of the place, and thus revitalisation in terms of marketing, business and brand creation, but also at monitoring and forecasting risks. The data used for the development of our model are:

- spatial and geo-localisation data;
- data on tourist attractions (type of attraction, service offered, accessibility, maximum capacity);
- time data (average visit time, travel time by different means of transport and timetables);

- infrastructure data (available types of transport);
- data on accommodation (hotels, B&B, holiday homes, restaurants, agritourisms, etc.);
- health and safety data (hospitals, police headquarters, municipalities, etc.).

The software used to carry out the analysis with the opendata of the city of Cáceres are the Onesait platform, ELK Stack, DBeaver and QGIS. The Onesait platform was used to design the work, which integrates services that facilitate the accelerated development and efficient operation of any type of digital solution in an enterprise, accompanied by IoT, Big Data, Blockchain and Artificial Intelligence technologies, enabling descriptive and predictive analysis to improve scalability and business performance. The database has been organised to achieve the best analysis results with ELK Stack. Elastic Stack combines the potential and flexibility of the Elasticsearch, Logstash and Kibana modules for simple, real-time indexing, searching and visualisation of structured and unstructured logs and data. Thanks to the combination of these three components of the ELK suite, various analyses were carried out, which were then grouped in the dashboards (Chhaged 2015). DBeaver, a free software released under the Apache licence for database administration and query execution, was used to manage the city's open data. For relational databases, it uses a JDBC driver and provides an editor that supports code completion and syntax highlighting. This software is written in Java and is based on the Eclipse platform. The spatial data in geojson format were analysed and edited with QGIS, a GIS (Geographic Information System) software that supports both vector and raster data divided into layers, which can be analysed and from which the map image is created with custom graphics enriched with icons and labels dependent on the attributes of the map elements. Below is an example screenshot of the database organisation extracted from DBeaver (Fig.1) and an example dashboard of the tourist attraction analysis extracted from Kibana (Fig.2).

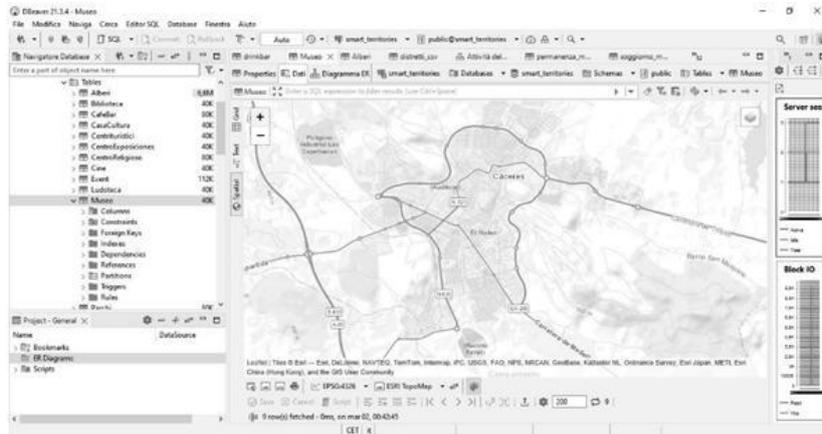

Figure 1: Example of application on Cáceres, extracted from DBEaver software. The different types of geodata contain a lot of information that can be displayed in tabular or map format.

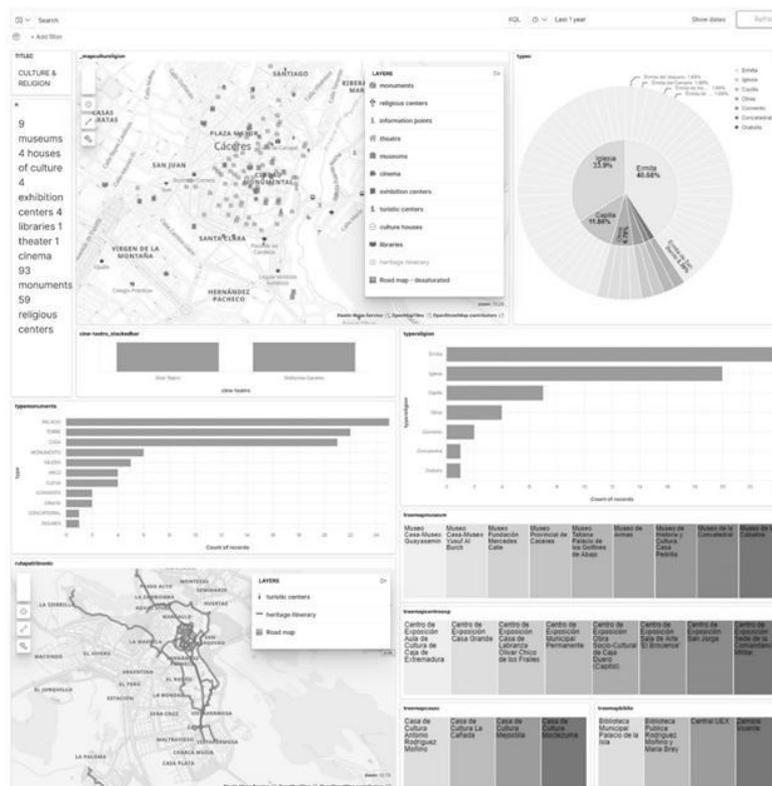

Figure 2: Tourism attraction application extracted from Kibana tool. The culture and religion sector is analysed with different types of maps (maps, treemaps, bars, pye etc.) and shows the distribution of the different types of attractions identified.

## 6 Conclusions

In the conviction that by combining digital intelligence with territorial systems it is possible to improve the standard of living and raise the quality of services, the objectives to be pursued, according to the strategic axes of innovation, digitalisation, sustainability and accessibility, are:

- Relaunching the competitiveness of the place in an innovative way;
- Creating a tourist offer accessible to all;
- Providing real-time services to residents and tourists using digital;
- Create a monitoring and forecasting plan for proper management;
- Monitoring tourist flows and their sustainability;
- Monitoring the health of places;
- Ensuring care, safety and health in the use of places.

A necessary requirement of the destination is to already have a well-defined tourism aplomb, which can be divided into one or more typologies (cultural, environmental, experiential, etc.) and the need to build a digital infrastructure suitable for the purpose. This makes it possible to increase the competitiveness of the tourist destination, enhancing its natural and cultural attractions, and to create other innovative resources and improve the efficiency of services that promote sustainable development and facilitate visitor interaction with the destination.

### **Abstract**

In recent times, there has been a surge in demands for transparency and accountability worldwide, particularly concerning information on environmental, social, and governance (ESG) aspects due to increasing stakeholder pressures. This demand is particularly important in high-tech sectors, where economic activities can have adverse impacts. However, the quality of ESG disclosure can vary widely across companies. Hence, this study aims to investigate how board characteristics, such as diversity, independence, size, average age, frequency of meetings, tenure, and membership in high-tech sectors, impact the quality of ESG disclosure, using agency theory as a foundation. The study utilizes the ESG disclosure score acquired from Bloomberg to measure the scope of corporate social responsibility (CSR) and comprises a sample of 864 international companies. A multiple linear regression model is used for cross-sectional analysis. The results show that diversity, independence, and size joined to high-tech industry membership have a positive impact on ESG disclosure quality. This study expands the scope of agency theory, by identifying additional determinants, and tests the influence of high-tech sectors on the quality of ESG disclosure. The results have significant implications for policymakers, regulators, and organizations seeking to promote sustainability and social responsibility.

## 1 Introduction

The contemporary era is characterized by two intertwined phenomena, digital technologies, and sustainability concerns, that have drastically changed our lives.

The rise in public awareness of social, environmental, and ethical issues, combined with the impact of climate change, depletion of natural resources, inadequate working conditions, and corporate scandals, has led to an increase in concerns about sustainability (Money and Schepers, 2007; Reverte, 2009). As a result, socially responsible business practices that align with societal values have gained greater attention (Aerts and Cormier, 2009; Chapple and Moon, 2005), with sustainability investments widely regarded as a means of creating value, presenting opportunities, mitigating risks, lowering costs, and ensuring long-term survival (Aureli et al., 2020). The recent United Nations report on emissions emphasizes the urgent need to reduce carbon footprints and adopt sustainable consumption and production practices (UN, 2022). Media reports suggest that consumers are increasingly demanding sustainable products and business practices (Huang et al., 2023; Berrone et al., 2013). Consequently, environmental, social, and governance (ESG) disclosure has become a crucial aspect of corporate reporting for both scholars and practitioners (Baldini et al., 2018). Firms are now encouraged to adopt sustainable practices that have a lower impact on the environment and society and effectively communicate these efforts through disclosure policies (Manes-Rossi et al., 2021; Eliwa et al., 2021; Raimo et al., 2021; Vitolla et al., 2020a; Wasiuzzaman et al., 2022). Governments are mandating that large businesses evaluate and disclose their impact on society and the environment (Haji et al., 2023) and companies are responding by increasing stakeholder engagement and communication (Ruiz et al., 2021; Herremans et al., 2016). The growing emphasis on sustainability is reinforced by the European Union's latest Corporate Social Responsibility Directive (CSRD) which recognize the social and economic importance of these issue and aims to improve its information dissemination.

Furthermore, in addition to the increasing focus on sustainability, the spread of digital technologies such as big data analytics, artificial intelligence, cloud

computing, robots, and the Internet of Things, has caused significant transformation to the global economy and society (Berman and Bell, 2011; Linz et al., 2017; Porter and Heppelmann, 2015 and Verhoef et al., 2019). However, ICTs have a significant impact on the environment with their power consumption and bandwidth usage accounting for over 0.8 gigatons. The industry consumed approximately 4% of the world's total power supply in 2021, and this is expected to increase to 10% by 2025. To address this issue, the industry is shifting toward using renewable energy technologies and energy-efficient practices (Mohanty and Moreira, 2014). Nevertheless, Hilty (2011) warns that under current economic conditions, the use of ICTs may not lead to dematerialization and could have negative environmental consequences. In contrast, according to Berawi (2020), the ICT industry can have significant indirect impacts on global sustainability (Marrone and Raimo, 2021), including energy consumption, data privacy and security, and governance and transparency. Besides, ICT firms must also consider social factors such as workplace conditions, diversity, employee engagement, and belongingness. Women may face harmful stereotypes and a lack of digital confidence (Grishunin et al., 2022). Other concerns include human rights violations by ICT company providers and leakage of consumers' private data. Sutherland (2016) found that ICT firms that follow the best environmental, social, and governance (ESG) practices demonstrated better financial performance. In this context, governance plays a critical dual role. Firstly, it ensures that companies meet ESG disclosure requirements by providing a framework for decision-making and accountability. This enables firms to promptly and efficiently identify and address ESG risks and opportunities. Companies with strong governance structures are better equipped to manage ESG risks, establish clear ESG targets and performance metrics, and communicate their sustainability performance to stakeholders. Secondly, effective governance is essential for companies operating in the ICT industry, as it has a significant impact on their performance (Rittenhouse et al., 2011). Consequently, by prioritizing ESG factors and implementing effective governance structures, companies can access financing and capital from investors who consider ESG factors in their investment decisions, and also create value for their stakeholders while mitigating risks associated with sustainability challenges.

Despite the increasing significance of ESG disclosure and its correlation with digital technologies in both academia and society, a substantial research gap persists in comprehending the role of governance. Furthermore, we have not

come across any studies that investigate the influence of high-tech industry membership on ESG disclosure quality. In the context of the existing literature, our study aims to investigate the influence of a comprehensive range of governance variables, while also taking into account the impact of digital technologies. Specifically, we analyze the levels of ESG (environmental, social, and governance) disclosure of 864 international firms and we take into account several governance variables, including board diversity (BDD), board independence (BDI), board size (BDS), board average age (BAG), board meeting frequency (BFQ), board tenure (BDT). Additionally, we test membership in a high-tech industry (HTI) to assess its significance.

The remainder of this paper is structured as follows. Section 2 provides a review of the literature, while Section 3 provides the theoretical background and introduces the research hypotheses. The methodology is described in section 4, and the results are presented and discussed in section 5. Finally, conclusions are presented in Section 6.

## **2 Literature review**

Suileek and Alshurafat (2022) suggest that the factors affecting ESG disclosures are diverse, continuously evolving, and numerous and, despite various research efforts to study corporate ESG disclosures, there is still no consensus on the factors that drive such disclosures (Terzani and Turzo, 2021). Given their variable nature across companies, the dimensions of governance play a critical role in this regard.

Several studies have investigated the relationship between board characteristics and environmental disclosure. Halme and Huse (1997) analyzed 140 European companies and found that board size did not correlate with environmental disclosure. This finding was also confirmed by Sartawi et al. (2014) and Fernandes et al. (2019). In contrast, other studies, including those by Akbas (2016), Trireksani and Djajadikerta (2016), Rao et al. (2012), and Raimo et al. (2021), have found that board size, independence, and gender diversity have a positive influence on environmental disclosure. Gender diversity, in particular, has been identified as having a positive effect by Rupley et al. (2012) and Raimo et al. (2021), while Akbas (2016) and Fernandes et al. (2019) found no correlation between gender diversity and environmental disclosure in listed companies. Fernandes et al. (2019) also found a positive correlation between board

independence and environmental disclosure. Sai et al. (2014) and Sartawi et al. (2014) discovered a positive effect of board age on environmental disclosure in samples of 120 annual reports of Malaysian listed companies. Khairredine et al. (2020) identified a significant positive effect of board size, independence, gender diversity, and activity on environmental disclosure. Additionally, Giannarakis et al. (2020) found a positive correlation between board activity and environmental disclosure in US companies. However, Michelin and Parbonetti (2012) and Ofoegbu et al. (2018) found no correlation between board activity and environmental disclosure in companies. Mahmood et al. (2018) found a significant and positive relationship between board size and sustainability disclosure of Pakistani companies.

Regarding corporate social responsibility (CSR), Barako and Brown (2008) discovered that board independence and gender diversity have a positive impact on the level of CSR disclosure of Kenyan banks. However, Khan (2010) observed no correlation between board gender diversity and CSR disclosure of Bangladeshi banks, unlike independence, which has a positive effect. Kiliç et al. (2015) found that board independence and gender diversity significantly influence the CSR disclosure of Turkish banks, while board size has no effect. Similarly, Said et al. (2009) found no negative impact of board size on CSR disclosure in a sample of 150 Malaysian listed companies.

In terms of ESG disclosure, Faisal (2018) examined a sample of 73 Indonesian listed companies and found that larger board size has a negative impact on ESG disclosure. In contrast, Giannarakis (2014) analyzed a larger sample of 366 Fortune 500 companies in 2011 and found a significant positive correlation between board size and ESG disclosure. Similarly, Khoiriawati and Nuswantara (2021) found a positive correlation between board size, independence, gender diversity, and level of ESG disclosure in Asian companies. Lavin and Montecinos-Pearce (2021) confirmed that both board independence and gender diversity have a positive influence on ESG disclosure. Additionally, Cucari et al. (2018) found a positive effect of board independence on ESG disclosure, while average board age had no significant effect on ESG disclosure in Italian companies. Husted and de Sousa-Filho (2019) pointed out that board size and board independence positively influence ESG disclosure, while board gender diversity has a negative impact. Conversely, Wasiuzzaman and Wan Mohammad (2020) found a positive impact of gender diversity on ESG disclosure in a sample of 78 Malaysian companies.

Regarding gender diversity, Giannarakis et al. (2014) examined 100 companies in the S&P 500 index between 2010 and 2015 and found no significant effect on ESG disclosure levels. Giannarakis et al. (2020) indicated that a lower average age of directors has a negative effect on sustainability disclosure, while higher levels of independence improve environmental disclosure. Moreover, Al-Amosh and Khatib (2022) found that foreign and state ownership are crucial factors in determining the level of disclosure, in addition to the role of independence. In terms of ownership, Chung et al. (2023) analyzed ESG disclosure practices in Hong Kong listed companies and found that concentrated ownership has a negative impact on the amount of ESG information disclosed, particularly during voluntary disclosure.

Ultimately, as noted by McBrayer (2018), governance factors are decisive determinants of the quality and consistency of ESG disclosure. This study seeks to comprehensively examine the relationship between ESG disclosure and governance variables while adopting an international perspective. National sampling has led to inconsistent findings in previous research, and high-tech companies have not been extensively studied in this area. Therefore, this study also aims to investigate the impact of the high-tech sector on ESG disclosure quality, which remains unexplored. By addressing these gaps, this study contributes to our understanding of the role of ESG disclosure in high-tech company governance from a broader, cross-national perspective.

### **3 Theoretical background and hypothesis development**

Building upon the existing literature that examines the impact of board characteristics and sector membership on disclosure (Barako et al., 2006; Donnelly and Mulcahy, 2008; Al-Shammari and Al-Sultan, 2010; FriasAceituno et al., 2013; Vitolla et al., 2020b; 2020b) this study is grounded on agency theory as formulated by Jensen and Meckling (1976). According to agency theory, when a principal delegates responsibilities to an agent, a contractual relationship is established to achieve outcomes that are favorable to the principal. However, the division of labor can result in information asymmetry, which can have detrimental consequences. To mitigate this issue, agency theory employs various methods and tools, including disclosure of information, to bridge the gap between managers and shareholders. To demonstrate their commitment to responsible business practices and risk management, firms and managers can provide high-

quality non-financial information, particularly ESG aspects. Therefore, the board plays a crucial role in monitoring and controlling management activities, reducing agency costs, and aligning interests (Fama and Jensen, 1983; Jensen and Meckling, 1976).

Academic research suggests that boards of directors can benefit from diversity in multiple aspects, such as informational and social diversity (Jehn, 1995). Academic studies indicate that diversity in decision-making is highly valued (Post et al., 2011), with gender diversity being the subject of much academic debate (Frias-Aceituno et al., 2013; Alfiero et al., 2017). Several studies have emphasized that women on boards of directors bring valuable experiences, skills, education, values, and commitment to creating a supportive workplace (Feingold, 1994; Hofstede, 2010; Huse and Solberg, 2006). In addition, research has suggested that women directors are more ethical and moral than men, and their presence is positively correlated with CSR (Bernardi et al., 2006; Bear et al., 2010). Gender diversity on boards also improves disclosure practices, particularly related to ESG disclosure (Barako and Brown, 2008; Bear et al., 2010).

Moreover, disclosure practices also benefit from independence. Donnelly and Mulchay (2008) found that non-executive directors increase disclosure. López and Rodrigues (2007) suggest that non-executive directors aim to protect their reputation by advocating transparency. Further studies have highlighted the importance of non-executive directors in improving oversight (Dunn and Sainty, 2009), enhancing the company's relationship with its environment (Garegnani et al., 2015), and addressing stakeholder demands (Johnson and Greening, 1999; Michelon and Parbonetti, 2012; Torchia and Calabrò, 2015), including disclosure of CSR (Biswas et al., 2018) and ESG issues (Cucari et al., 2018).

Vitolla et al. (2020c) propose that a larger board may have more diversity in experience, perspective, gender, and education, leading to increased efficiency. The evidence supports this idea, as a larger board provides access to a broader range of expertise (Hidalgo et al., 2011) and greater diversity in experience, skills, and opinions (Domínguez and Gamez, 2014; García Sánchez et al., 2011), which can improve efficiency and effectiveness of operations (Gandía, 2008) and result in better disclosure policies and greater transparency (Adams and Flynn, 2005; De Villiers et al., 2011).

Board age has been identified as a measure of experience by Anderson et al. (2004) and Giannarakis (2014), but it is unclear whether council age or education level is a better indicator of council experience. Hafsi and Turgut (2013) argue that

board members' ages negatively affect CSR performance, while Bantel and Jackson (1989) and Bilimoria and Piderit (1994) found the opposite. Post et al. (2011) found that ESG disclosure decreases with average board age.

Frias-Aceituno et al. (2013) and Lipton and Lorsch (2013) found that board meetings increase board activity and disclosure, while Xie et al. (2003) argue that more board meetings improve corporate control and oversight, and Kanagaretnam et al. (2007) showed that they reduce information asymmetry. Banghøj and Plenborg (2008) found a positive correlation between board meeting frequency and information disclosure, while Brick and Chidambaran (2010) suggest that managers may benefit from more annual board meetings.

The literature is divided on whether board tenure affects disclosure levels. According to Vafeas (2003), a long-lived board provides a better understanding of the company and its business environment changes, while Berberich and Niu (2011) found that a lack of effective management oversight has negative consequences for governance. Long-term relationships between boards and executives can increase agency problems and decrease the board's oversight function over executives (Byrd et al., 2010). Long tenure indicates experience, ability, and competence, which can make the board more critical (Bebchuk et al., 2005) and increase director interaction and information exchange (Rutherford and Buchholtz, 2007).

Industry affiliation has a significant impact on corporate disclosure practices, as evidenced by the findings of Bozzolan et al. (2003), who observed variations in the reporting of intellectual capital (IC) among Italian financial statements from different industries. The expectations of stakeholders also differ across industries, leading to diverse disclosure practices, as noted by Holder-Webb et al. (2008), Deegan and Gordon (1996), and Overfelt (2010).

Research and development (R&D) spending typically accounts for more than half of a company's technological investment according to Hall (2009). R&D-intensive companies possess unique intangible assets, and their intangibility leads to increased agency costs. Due to the ever-changing business environment, companies are often reluctant to disclose their R&D project information to avoid spillovers.

Lastly, Carpenter and Petersen (2002), Aghion et al. (2004), Brown and Petersen (2009), and Belloc et al. (2016), among others, have pointed out the relationship between high-tech industries with significant R&D expenditures and severe agency issues and their related costs.

In light of this, the following hypotheses are made:

*H1 The level of ESG disclosure is positively influenced by board diversity;*

*H2 The level of ESG disclosure is positively influenced by board independence;*

*H3 The level of ESG disclosure is positively influenced by board size;*

*H4 The level of ESG disclosure is negatively influenced by board average age;*

*H5 The level of ESG disclosure is positively influenced by board meetings frequency;*

*H6 The level of ESG disclosure is positively influenced by board tenure;*

*H7 The level of ESG disclosure is positively influenced by high-tech industry membership.*

## **4 Methodology**

### **4.1 Sample**

To explore the impact of governance variables and high-tech industry membership on ESG disclosure quality a sample of 1221 international firms was initially obtained from Bloomberg, but due to missing data on both dependent and independent variables, the final sample size was reduced to 864 firms.

### **4.2 Dependent variable**

In line with previous literature on ESG disclosure (Giannarakis et al., 2014; Fatemi et al., 2018; Raimo et al., 2021; Wong et al. 2021; Huang et al., 2022, and Chung et al., 2023), Bloomberg's ESG Disclosure Index evaluates and measures ESG disclosure levels of banks using a proprietary scoring methodology. It examines ESG-related information presented in relevant documents and focuses on crucial ESG issues such as labor standards, climate change, human rights, and corporate governance. The ESG Disclosure Score (ESGDS) is calculated using 100 out of 219 data points and ranges from 0 to 100, with higher scores indicating more comprehensive ESG information. The score is weighted to emphasize commonly disclosed information and normalized based on industry requirements. The index is a useful tool for investors and stakeholders to evaluate a company's ESG performance and risks.

### **4.3 Independent variables**

To test the seven hypotheses, we will examine seven distinct independent variables, namely:

- Board diversity (BDD) is a measure of the percentage of women on the board, as defined by previous studies conducted by Frias-Aceituno et al. (2013), Liao et al. (2015), Alfiero et al. (2017),
- Board Independence (BDI) is calculated as the percentage of independent board members, based on previous research by Frias-Aceituno et al. (2013) and Vitolla et al. (2020c);
- The size of the board (BDS) is determined by the number of members present on the board, as established in earlier studies by Frias-Aceituno et al. (2013) and Vitolla et al. (2020b);
- Board average age (BAG) is the average age of directors on the board, as measured by Bueno et al. (2018), Martikainen et al. (2019), and Nour et al. (2020);
- Board meetings frequency (BFQ) is the number of annual meetings of the board of directors, as calculated by Frias-Aceituno et al. (2013) and Vitolla et al. (2020b);
- Board tenure (BAT) is the tenure of directors on the board, as measured by Kim et al. (2014);
- High-Tech Industry membership (HTI), is measured through a dummy variable with value 1 if the company operates in high-tech sectors and 0 otherwise. According to Bozzolan et al. (2006) as high-tech sectors, we refer to biotechnology, entertainment, Internet, IT distribution, high-tech manufacturing, software, system integration and telecommunication, web services, and we include healthcare.

### **4.4 Control variables**

The present study incorporates control variables to enhance the reliability and validity of the regression model. To this end, firm size (FSIZE) is quantified using the natural logarithm of total assets and financial leverage (LEV) is calculated as the ratio of total debt to total assets.

#### **4.4 Model**

To assess the impact of the independent variables on ESG disclosure quality, we used a regression model with a cross-sectional design. We chose this approach over a panel analysis because there is limited variation in both the dependent and independent variables over time (Bavagnoli et al., 2018). The analysis is represented by the following equation:

$$ESGD = \beta_0 + \beta_1 BDD + \beta_2 BDI + \beta_3 BDS + \beta_4 BAG + \beta_5 BFQ + \beta_6 BAT + \beta_7 HTI + \beta_8 FSIZE + \beta_9 LEV + \varepsilon$$

## **5 Results and discussion**

### **5.1 Descriptive statistics, VIFs and correlation analysis**

Table 1 displays the results of the descriptive analysis of the variables. The dependent variable, ESG disclosure quality (ESGD), exhibits a moderate level of disclosure, with an average value of 56.62. The ESGD score ranges from 21.33 to 85.70, indicating a significant variation in disclosure quality among the sampled firms. The independent variables provide insightful considerations. The sampled firms demonstrate a modest degree of diversity in their boards (BD), with an average of 3.61% of women, a maximum of 11%, and a troubling minimum of 0%. In terms of board independence (BDI), the results are diametrically opposed, with an average value of 76.66%, a minimum of 11.11%, and a maximum of 100%. On average, the sampled firms have boards comprising 11 members, with a range of 5 to 24 members. The average age of board (BAG) members is 61.46 years, with the youngest board averaging 40.88 years and the oldest 77.93 years. The boards convene approximately 10 times per year, with a minimum of 2 and a maximum of 48 meetings, and hold office for an average of 7.23 years, with a minimum of 1.14 years and a maximum of 22.94 years. Notably, 30% of the companies in the final sample belong to the high-tech sector (HTI).

Table 1 – Statistical summary of the variables

Variables	Obs.	Mean	Std. dev.	Min.	Max
ESGD	863	56.62	10.68	21.33	85.70
BDD	863	3.61	1.62	0	11
BDI	863	76.66	18.77	11.11	100
BDS	863	11.19	2.72	5	24
BAG	863	61.46	4.18	40.88	77.93
BFQ	863	9.70	4.94	2	48
BAT	863	7.23	3.10	1.14	22.94
HTI	863	0.30	0.45	-	-
FSIZE	863	10.90	1.99	7.33	20.31
LEV	863	6.43	27.63	1.02	709.5

Pearson's correlation analysis was used to understand the relationship between governance dimensions, ESG disclosure, and control variables. The results are presented in Table 2. There was no evidence of significant multicollinearity, with the highest correlation coefficient of 0.6651 between BDD and BDS. Farrar and Glauber (1967) stated that harmful levels of multicollinearity occur when the correlation coefficient reaches  $\pm 0.8$  or  $\pm 0.9$ . A variance inflation factor (VIF) analysis was also conducted to assess the potential multicollinearity between the explanatory variables, and the results are shown in Table 2. The VIFs range from 1.01 to 2.14, with an average value of 1.43. According to Myers (1990), if any VIFs are less than 10, multicollinearity is not a significant concern in the regression model.

Table 2 –VIFs and Pearson's correlation coefficients

Variables	VIF	ESGD	BDD	BDI	BDS	BAG	BFQ	BAT	HTI	FSIZE	LEV
ESGD		1									
BDD	2.03	0.1999***	1								
BDI	1.26	0.0906***	-0.0828**	1							
BDS	2.14	0.1886***	0.6651***	-0.2063***	1						
BAG	1.37	-0.0101	-0.1352***	0.2753***	0.0110	1

BAT	1.44	-0.2876***	-0.1740***	0.0057	-0.0327	0.3829***	-0.2994***	1			
HTI	1.01	0.2354***	-0.0289	0.0626*	-0.0427	-0.0123	0.0131	-0.0606*	1		
FSIZE	1.39	0.1416***	0.0254	-0.2514***	0.2341***	0.0111	0.3412***	-0.2483***	-0.0198	1	
LEV	1.01	-0.0500	0.0088	-0.0309	0.0107	0.0201	0.0018	0.0380	-0.0680**	0.0222	1

## 5.2 Multivariate analysis results and discussion

The hypotheses were tested using a multiple linear regression model. The results of these analyses are summarized in Table 3. This table shows the results of the regression coefficients for all independent variables using ESG disclosure as the dependent variable.

Table 3 – OLS regression model results

<i>Variables</i>	<i>Coefficient</i>	<i>Standard Error</i>	<i>p-value</i>	<i>Sign.</i>
Cons	35.488	4.985	0.000	***
BDD	0.549	0.291	0.060	*
BDI	0.062	0.019	0.002	***
BDS	0.531	0.177	0.003	***
BAG	0.156	0.082	0.060	*
BFQ	-0.044	0.073	0.544	
BAT	-0.919	0.127	0.000	***
HTI	5.145	0.728	0.000	***
FSIZE	0.408	0.195	0.037	**
LEV	-0.012	0.012	0.286	

Notes:

n = 864

Adj R2 = 18.19

\*\*\*Significant at the 1% level; \*\*Significant at the 5% level; \*Significant at the 10% level

The adjusted R-squared score of 0.1819 means that the model can account for 18.1% of the variability of the dependent variable.

The results support hypothesis 1 (H1). Board diversity (BDS) shows a significantly positive association with ESG disclosure at  $p = 0.060$ , suggesting that firms with a higher percentage of women on the board of directors are more likely to disclose ESG information. This may be due to women's tendency to prioritize social responsibility and ethical decision-making, as well as their greater commitment and involvement in board activities (Liao et al., 2015). Moreover, the presence of women on the board is associated with best practices and a positive working environment, which may further encourage companies to be transparent in their ESG reporting. Our findings contribute to the existing literature on the positive relationship between board diversity and social disclosure (García-Sánchez et al., 2014; Verbeeten et al., 2016; Hussain et al., 2018).

The results support hypothesis 2 (H2). Board independence (BDI) shows a significantly positive association with ESG disclosure at  $p = 0.002$ , suggesting that firms with a higher percentage of independent members on the board of directors are more likely to disclose ESG information. Non-executive members play a crucial role in monitoring company activities and satisfying stakeholder demands, while also safeguarding the interests of minority shareholders (Birindelli et al., 2018; Elmagrhi et al., 2019; Chintrakarn et al., 2020). As such, companies with a greater proportion of non-executive members are more likely to disclose their ESG information, leading to greater transparency. These results extend previous research on the positive impact of board independence on ESG disclosure (Oliveira et al., 2011; De Villiers and Hsiao, 2018; Chijoke-Mgbame et al., 2020).

The results support hypothesis 3 (H3). Board size (BDS) shows a significantly positive association with ESG disclosure at  $p = 0.002$ , suggesting that firms with a larger board of directors are more likely to disclose ESG information. Larger boards have a greater range of skills and experiences, which can lead to more effective problem-solving and decision-making. This in turn can lead to greater disclosure of both financial and non-financial information, including ESG data. Our findings contribute to the existing literature on the importance of transparency in corporate reporting (Godos-Dìez, 2018; Lagasio and Cucari, 2019; Velte, 2021) and highlight the role of board size in facilitating ESG disclosure.

The results do not support Hypothesis 4 (H4); although the relationship between board average age (BAG) and ESG disclosure is significant it is positive and shows that, among the sampled firms, those characterized by older boards are more likely to disclose ESG information. It is worth noting that boards with a higher average age may be more attuned to ESG issues due to their experience of witnessing society's evolving attitude towards sustainability and corporate social responsibility. These board members may also be able to provide a long-term strategic vision of the company, including the importance of addressing ESG concerns to ensure the company's sustainability, protect its reputation, and attract investors.

The results do not support Hypothesis 5 (H5); the impact of board meeting frequency (BFQ) on ESG disclosure is not statistically significant. This dimension seems not to be related to a higher level of Environmental, Social, and Governance (ESG) disclosure.

The results do not support Hypothesis 6 (H6); although the relationship between board average tenure (BAT) and ESG disclosure is significant it is negative and shows that, among the sampled firms, those characterized by board in charge for longer are less likely to disclose ESG information. Long-serving board members may be influenced by personal relationships or vested interests, leading to a lack of transparency in sharing information and reluctance to disclose information that may reveal organizational problems.

The results support hypothesis 7 (H7). The high-tech industry membership (HTI) shows a significantly positive association with ESG disclosure at  $p = 0.000$  and a very strong impact of 5.145, suggesting that firms with a higher level of technologies are more likely to disclose ESG information. Companies in the high-tech industry have better access to data due to advanced technologies such as data analytics and artificial intelligence, allowing them to collect, analyze, and present ESG information more efficiently. Additionally, they face greater investor pressure and increased awareness of ESG risks and opportunities. These results align with previous studies by Hsu and Chang (2011), who noted that companies in highly knowledge-based industries such as high-tech are more likely to disclose intangible assets due to their importance to shareholder value. Furthermore, agency theory suggests that companies with higher levels of intangible assets will increase their level of disclosure to address information asymmetry with external stakeholders, as pointed out by Biscotti and D'Amico (2016).

Finally, the results reveal that among the two control variables (SIZE, and LEV), only firm size has a positive and significant impact on the level of ESG information disclosed by banks.

## **6 Conclusions**

This study investigates the influence of board characteristics namely diversity, independence, size, average age, meeting frequency, tenure, and high-tech industry membership on the quality of ESG disclosure using agency theory as theoretical lens. We analyze a sample of 864 international companies and find that diversity, independence, board size, average age, and high-tech sector membership have a positive effect on ESG disclosure quality. However, board tenure has a negative impact, and meeting frequency has no significant relationship.

Our study has significant implications for practitioners and policymakers. Practitioners and corporate managers should consider redesigning their boards to foster ethical behavior and increase ESG disclosure quality. Specifically, incorporating more non-executive and female board members can improve ethical behavior and increase ESG disclosure quality.

Our study extends the application of agency theory by providing a holistic and international view of governance's role in ESG disclosure quality. Moreover, it confirms that financial disclosure is a crucial aspect for sectors with higher R&D expenditures, and digital technologies are indispensable for improving sustainability reporting quality. Policymakers who prioritize sustainability can take a cue from high-tech sectors that have demonstrated effective sustainability reporting practices. At the onset of the European Union's latest Corporate Social Responsibility Directive (CSRD), these findings assume a heightened significance as they offer valuable insights for policymakers, regulators, and business managers alike.

Although this study contributes valuable insights, it is important to acknowledge its limitations. Firstly, the methodology used is based on a cross-sectional design rather than a longitudinal panel approach, which may have implications for the robustness of the findings. Additionally, certain board characteristics used in the analysis may be subject to limitations. Lastly, high-tech technologies have been operationalized solely in terms of sector membership, which may not capture the full extent of their impact on corporate governance.

Despite these limitations, this study provides a foundation for future research. For instance, future studies could adopt a longitudinal approach to investigate this phenomenon over several years, allowing for a more nuanced understanding of the relationships between board characteristics, high-tech technologies, and disclosure quality. Additionally, future research could explore the impact of other factors related and unrelated to governance aspects, such as firm size, industry, and ownership structure, and also the impact of different technologies on the disclosure quality.

### Abstract

Well-conducted requirements engineering (RE) activities account for a significant share of success in IT projects (Wieggers and Beatty, 2013). The RE process starts with identifying business objectives that define a context for eliciting business requirements. Because RE is considered a social interaction (Serna et al., 2017), a share of knowledge about business requirements is stored as unarticulated tacit knowledge possessed by individuals within an organization (Boyer and Mili, 2011). This personalization of tacit knowledge causes barriers to gathering valid requirements (Serna et al., 2017). Moreover, intra-organization knowledge sharing is often complicated by knowledge hiding (Connelly et al., 2012), resulting from a lack of interpersonal trust between employees and (external) analysts (Holste and Fields, 2010). In Knowledge Management (KM) literature, tacit knowledge sharing is mainly discussed from the cultural and psychological perspectives (Chen et al., 2018; Holste and Fields, 2010), which are out of the control of an external business analyst. However, some publications suggested specific methods and tools that business analysts can use to foster requirements elicitation, such as creating engaging environments (Nakano et al., 2013) and utilizing social web-based tools (Panahi et al., 2016, 2013). Although a large amount of focus in KM and RE was dedicated to knowledge and requirements elicitation, we see little integration of KM-based tools and techniques in RE. Therefore, in this paper, we draw on our experience facilitating a co-creation workshop to help other facilitators effectively deal with collecting tacit knowledge about the business

requirements in organizations. We started with a systematic literature search in two areas (knowledge and requirements elicitation) and identified one review for each area that lists elicitation methods (Anwar et al., 2022; Gavrilova and Andreeva, 2012). We used conceptualization of the identified methods to design a workshop. After the workshop facilitation, we reflected on our data from participatory observation and suggested recommendations for similar workshops. We addressed several issues that emerged during the workshop, namely (i) insufficient domain knowledge before the workshop, (ii) lack of validation, and (iii) issues with capturing tacit knowledge during the workshop.

European Union's Horizon Europe program supported this research, grant agreement No 101091536, Digitalised Value Management for Unlocking the potential of the Circular Manufacturing Systems with integrated digital solutions.

## 1 Introduction

Applied or experimental research, software development, policy design, and other fields use co-creation workshops as a primary “method” for requirements elicitation. Many Horizon Europe research proposals contain co-creation workshops; however, the concept of this activity is not clear nor universally understood. It can range from simple discussion or brainstorming to complex methodology. Well-conducted requirements engineering (RE) activities account for a significant share of success in IT projects (Wieggers and Beatty, 2013). The RE process starts with identifying business objectives that define a context for eliciting business requirements. Because RE is considered a social interaction (Serna et al., 2017), even if most of the knowledge is documented, a share of knowledge about business requirements is stored as unarticulated tacit knowledge possessed by individuals within an organization (Boyer and Mili, 2011). This personalization of tacit knowledge causes barriers to gathering valid requirements (Serna et al., 2017). Moreover, intra-organization knowledge sharing is often complicated by knowledge hiding (Connelly et al., 2012), resulting from a lack of interpersonal trust between employees and (external) analysts (Holste and Fields, 2010), causing problems in project consortia where industrial partners are present.

Standard requirements-gathering techniques such as interviews, questionnaires, user observation, workshops, brainstorming, use cases, role-playing, and prototyping could increase the chances of gathering the correct

requirements (Ribeiro et al., 2014). In knowledge management (KM) literature, tacit knowledge sharing is mainly discussed from the cultural and psychological perspectives (Chen et al., 2018; Holste and Fields, 2010), which are out of the control of an external business analyst. However, some publications suggested specific methods and tools that can potentially be used by business analysts, such as creating engaging environments (Nakano et al., 2013) and utilizing social web-based tools (Panahi et al., 2016, 2013). Although KM researchers focused much on knowledge capture and sharing, we see little integration of KM-based tools and techniques in RE.

Focusing on tacit aspects of knowledge is essential when eliciting business requirements. Yet little direct attention was paid to integrating techniques, tools, and methods from the RE field into KM or vice-versa. Therefore, in this paper, we used an opportunity of working on the Horizon Europe project called DiCiM<sup>1</sup> and compared the typical methods from both fields. We developed a design of a co-creation workshop for business requirements elicitation, facilitated the workshop, and reflected on data from our observations to derive recommendations for facilitating similar workshops in the future.

## 2 Theoretical Background

Overlap between the knowledge and requirements elicitation is not very thoroughly investigated. When searching for the keywords *knowledge*, *requirements*, and *elicitation* in a title, we found only nine relevant articles on the Web of Science that focus on this matter. Our understanding of the concepts we investigated is as follows.

Requirements elicitation is a process of understanding a problem and its application domain. The requirement elicitation aims to identify as many requirements as possible to prepare several alternate solutions for the stated problem (Khan et al., 2014). Business requirements elicitation techniques provide means to discover the issues, problems, opportunities, and needs of the users by the systems analysts. After it, systems developers can design the solution to solve the issues or leverage the opportunities (Gobov and Huchenko, 2020).

Knowledge elicitation (also referred to as 'knowledge acquisition') is conceptualized as an interaction between analyst and expert, aiming to capture

---

<sup>1</sup>Digitalised Value Management for Unlocking the potential of the Circular Manufacturing Systems with integrated digital solutions ([www.dicimproject.eu](http://www.dicimproject.eu))

and validate the knowledge of the latter (Gavrilova and Andreeva, 2012; Schreiber et al., 1999). Primary methods such as interviews, observation, storytelling, and brainstorming (Gavrilova and Andreeva, 2012) aim at externalizing expert knowledge in the form of knowledge objects. Simultaneously, secondary methods such as cognitive mapping (Kwong and Lee, 2009) establish links between earlier elicited knowledge objects. Although both fields are very close together, requirements elicitation does not always have to cover tacit knowledge.

When knowledge needs to be elicited to identify, document, and analyze requirements, a business analyst must overcome a barrier of personalization of tacit knowledge (Serna et al., 2017). The ambiguity of elicited requirements, mainly driven by differing stakeholders' views, can cause project failure (Anwar et al., 2022). Because the tacit part of requirements consists of intuition and inspiration and depends on an individual's analytical abilities, reflections, experience, and creativity (Al-Alshaikh et al., 2020), it is crucial to make it as easy for the stakeholders as possible.

Therefore, method(s) selection for elicitation is crucial, and the choice needs to be situational (Mishra et al., 2018). For this purpose, an evaluation framework was developed (see Mishra et al., 2018). However, the framework lacks detail because it uses a shallow granular approach to categorizing the methods. It allows the business analysts to be aware of available options but does not help them to design the elicitation phase.

### **3 Methodology**

We followed the idea of the design research (Peppers et al., 2007) methodology for designing a co-creation workshop aimed at eliciting business requirements. To achieve this purpose, we took the following steps. First, we systematically searched for literature following Tranfield et al. (2003) approach. We identified a list of methods for eliciting tacit knowledge in general and business requirements as a specific type of tacit knowledge. Second, we conceptualized and evaluated the identified techniques based on their applicability to co-creation workshops. Third, we designed and conducted the workshop. Last, we used the first phase of action research (Baskerville and WoodHarper, 1996; Mansell, 1991) to evaluate and reflect on the implementation of the workshop.

In a systematic literature search, we aimed to identify peer-reviewed literature reviews dedicated to the elicitation techniques in KM and RE. First, we queried

reviews in the KM field by using the combination of the following keywords: ("knowledge elicitation") AND ("techniq\*" OR "tool\*" OR "method\*") AND ("review") AND ("knowledge management"). This search yielded two reviews; however, we only considered the one by Gavrilova and Andreeva (2012) after the abstract screening relevant.

The second query we applied during the literature search was focusing on elicitation techniques in the field of Requirements Engineering and thus combined the following keywords: "requirement\*" AND "elicit\*" as the title, and "knowledge" AND "review" as the topic. Then, during the abstract screening, we included one paper (Anwar et al., 2022) since it provided the most extensive review of the tools and techniques of requirements elicitation.

In the next step, we conceptualized elicitation techniques specified in both reviews using context-aware backward search. Subsequently, we compared the identified techniques and selected those that matched our co-creation workshop's goals. Then, aligned with the design research principles (Peffer et al., 2007), we used this knowledge to design a co-creation workshop. Subsequently, we facilitated a two days workshop in a company preceded by a site visit. The workshop aimed to elicit business requirements for a digital technology development project. The workshop consisted of three facilitators and six stakeholders, and key users. Using participatory research and observations, we reflected on the observations of the workshop on the design and drew recommendations and conclusions.

#### **4 Design of a co-creation workshop**

We started by identifying typical methods used during the elicitation. As was stated earlier, we used two review papers to establish a list of methods. For KM methods, we used Gavrilova and Andreeva's (2012) taxonomy of primary knowledge elicitation methods (see Figure 1). For RE methods, we used a review study by Anwar et al. (2022) listing RE techniques (see Table 1). A comparison between the two sets of techniques is summarized in Table 2. The rest of this section conceptualizes the techniques.

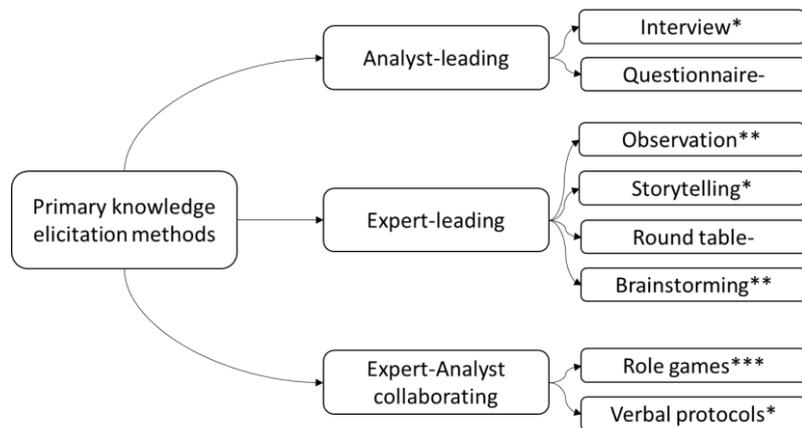

Figure 1: Taxonomy of knowledge elicitation techniques (adapted from Gavrilova and Andreeva, 2012). Notes: \*May work, \*\*Is appropriate, \*\*\*Is very suitable, - Not applicable.

Gavrilova and Andreeva's (2012) taxonomy outlines eight techniques for knowledge elicitation: (i) interview, (ii) questionnaire, (iii) observation, (iv) storytelling, (v) round table, (vi) brainstorming, (vii) role games, and (viii) verbal protocols. In addition, in their review, the authors mention the inapplicability of round tables for tacit knowledge elicitation, which puts this technique beyond the scope. Although the authors also referred to questionnaires as inapplicable, we considered them in our analysis since, unlike round tables, questionnaires can be used before the workshop to improve preparation. Moreover, the authors mention cognitive mapping as a secondary technique for tacit knowledge elicitation.

Table 1: List of requirements elicitation techniques sorted by frequency of mentioning in the literature (adapted from Anwar et al. (2022))

ID	Technique	Frequency
1	Interview - closed and open	79.31%
2	Questionnaire	72.41%
3, 4, 5, 6	Observation (including Ethnography, Social Analysis, and Active Observation)	72.41%
7, 8	Prototyping (also referred to as Joint Application Development)	68.96%
9	Brainstorming	68.96%
10	Scenarios	65.51%
11, 12, 13	Benchmarking (including Similar Systems, Requirement Reuse, and Application Analysis)	55.17%

14	Card Sorting	44.82%
15, 16	Protocol Analysis (also referred to as Think Aloud)	41.13%
17	Repository Grids	24.13%

In their review, Anwar et al. (2022) identified seventeen techniques applicable to requirements elicitation, with interviews, questionnaires, and observation being the most frequently used ones. Moreover, Anwar et al. (2022) mentioned document analysis as one of the techniques. It is worth mentioning that repository grids, the less frequently mentioned technique, was discarded in the process of conceptualization.

Table 2: Techniques for tacit knowledge and requirements elicitation

<b>Tacit Knowledge Elicitation (Gavrilova and Andreeva, 2012)</b>	<b>Requirement Elicitation (Anwar et al., 2022)</b>
Interview	Interviews – closed and open
Observation	Observation (including Ethnography, Social Analysis, and Active Observation)
Storytelling	N/A
Brainstorming	Brainstorming
Role games	Scenarios
Verbal protocols	Protocol Analysis (also referred to as Think Aloud)
N/A	Prototyping (also referred to as Joint Application Development)
N/A	Benchmarking (including Similar Systems, Requirement Reuse, and Application Analysis)
Cognitive maps (mentioned)	Card sorting

Although most of the techniques are applied in both fields, storytelling was explicitly mentioned by Gavrilova and Andreeva (2012), while prototyping, benchmarking, and document analysis were outlined only by (Anwar et al., 2022).

#### **4.1 List of elicitation techniques**

As summarized in Figure 2, with relation to the use of the techniques for a workshop, all the identified elicitation techniques can be split into three categories based on the moment when they are to be applied: (i) pre-workshop, (ii) on-workshop, and (iii) post-workshop.

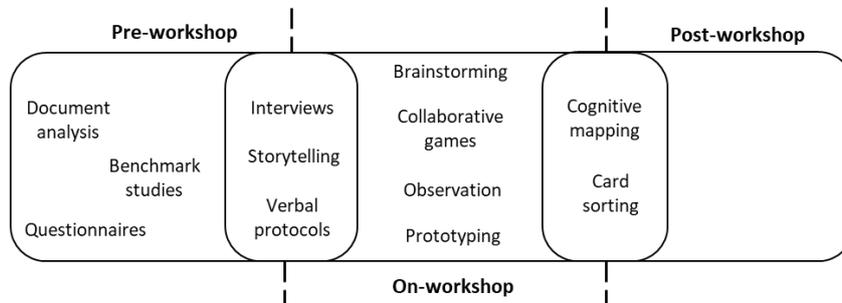

Figure 2: Elicitation techniques suitable for co-creation workshop design

Pre-workshop techniques aim at collecting evidence before the workshop and helping analysts develop on-site content. These techniques include (i) document analysis, (ii) benchmark studies, and (iii) questionnaires.

**Document analysis** is an approach that is used to elicit business analysis information, including contextual understanding and requirements (Gobov and Huchenko, 2020; Khan et al., 2014). It examines available documents that describe the business environment or organizational settings. Document analysis may be used to gather background information to understand the context of a business need. It may include researching existing solutions to validate their current implementation. Document analysis can validate findings from other elicitation efforts, such as interviews and observations. Document analysis involves gathering information from existing documentation and could involve interaction with a human expert to confirm or add to this information (Gobov and Huchenko, 2020; Khan et al., 2014).

**Benchmark studies** help analysts to compare organizational practices against the market best practices. During benchmarking, similar systems or applications could be analyzed. Sometimes, benchmarking is accompanied by a market analysis that studies customers to discover the products and services they need, the determinants of their purchase decision, and the competing companies, products, or services in the market (IIBA, 2015).

**Questionnaires** aim at the quick collection of information from many respondents. Respondents can represent a diverse (often dispersed) population that can be easily reached and relatively cheaply (Gobov and Huchenko, 2020; Paul et al., 2014; PMI, 2017).

On-workshop techniques aim at collecting evidence on-site and involve collaboration between an analyst and, typically, multiple experts. These

techniques include (i) brainstorming, (ii) collaborative games, (iii) observation, and (iv) prototyping.

**Brainstorming** is a technique to quickly identify a list of ideas (e.g., a list of risks, problems, business objectives, or potential solution options). Brainstorming is conducted in a group environment and is led by a facilitator. The group generates as many ideas as possible about the topic during a brainstorming session (IIBA, 2015; PMI, 2017).

**Collaborative games** foster collaboration, innovation, and creativity to achieve the goal of the elicitation activity. Gameplays are used to encourage team participation and enhance engagement. It helps the participants share their knowledge and experience on a given topic, identify hidden assumptions, and explore that knowledge in ways that may not occur during regular interactions. The shared experience of the collaborative game encourages people with different perspectives on a topic to work together to understand an issue better and develop a shared model of the problem or potential solutions (IIBA, 2015; PMI, 2017).

**Observation** provides a direct way of collecting information about how a business process is performed by observing it in a natural practical environment (Gobov and Huchenko, 2020; IIBA, 2015; Zhang, 2007). It provides means to develop a rich understanding of the application domain by observing human activities. In addition to non-tacit requirements, some are apparent to stakeholders but challenging to verbalize. We call them tacit requirements. This technique is helpful when process owners cannot share their expertise through other models due to the lack of time or difficulties expressing ideas and working practices. In addition, this method is used to understand complex societies rather than judge how ways of working could be improved or supported (Gobov and Huchenko, 2020; IIBA, 2015; Zhang, 2007).

**Prototyping** elicits and validates requirements through an iterative process that creates evolutionary models or designs of requirements or is used to model user experience, evaluate design options, and as a basis for developing the final business solution (Paul et al., 2014). Prototyping is an iterative process and part of the analysis phase of the system development life cycle, which helps get feedback from the users, as users can see facilities and provide a response (Khan et al., 2014). The system analysts can evaluate the response, modify the existing requirements, and develop new ones (IIBA, 2015).

Three techniques, namely, interviews, storytelling, and verbal protocols, require one-to-one interaction between an analyst and an expert (Gavriolova and Andreeva, 2012) and, therefore, can be implemented in both phases: pre-workshop (in online format) and on-workshop.

**An interview** is a formal or informal approach to elicit stakeholder information. It is performed by asking prepared questions and documenting the responses. Interviews are often conducted individually between an interviewer and an interviewee but may also involve multiple interviewers and interviewees. Questions that arise during the conversation can be discussed immediately, and the requirements engineer may uncover subconscious requirements through thoughtful questions (PMI, 2017; Pohl, 2010). An interview is a dialogue between an analyst and an expert. An analyst asks an expert several questions that can either be pre-defined (in structured interviews) or emerge in the interview process (in unstructured interviews).

**Storytelling** is considered one of the forms of interviews, where most of the structuring is left up to an expert, while analyst just sets the direction of this structuring as in the example below (Scheibelhofer, 2008):

*Could you please tell me everything that is involved in your coming to New York and how your life went on since then? I will listen and make some notes and I will not interrupt you until you have finished. Please take as much time as you feel necessary and tell me all the details you remember that, in your opinion, are connected to your living in New York.*

**Verbal protocols** are the last interview-based methods outlined by Gavrilova and Andreeva (2012). Verbal protocols are traditionally used in social sciences as cognitive interviewing (Willis, 2005). Experts are asked to “think aloud” in cognitive interviewing and reveal their decision-making process to an analyst.

Finally, two techniques applicable for the on-workshop and post-workshop phases include: (i) cognitive mapping and (ii) card sorting.

**Cognitive mapping** is a technique suitable for the on-workshop and post-workshop phases. Once an expert’s knowledge is elicited, an analyst might synthesize it as cognitive maps that validate the results of knowledge elicitation with experts (Kwong and Lee, 2009). A cognitive map puts all the fragments of the elicited knowledge in one space and defines relations between them.

**Card sorting** is a technique used to sort various knowledge objects. Participants are asked to organize individual, unsorted items into groups. Card sorting may be conducted as a series of individual exercises, as a concurrent

activity of a small group, or as a hybrid approach where individual activity is followed by a group discussion of individual differences (Tiwari et al., 2012).

#### **4.2 Workshop design**

While designing our workshop, we had limited access to the industrial partner representatives (i.e., users of future solutions). The only pre-workshop interaction we had with stakeholders was an 80-minutes interview, where we aimed to establish an understanding of a problem domain. Afterward, the stakeholders had minimal time to validate our understanding, which decreased the “active” workshop time.

Because not a single method can solve all the problems of requirements elicitation (Mishra et al., 2018), we employed several methods in our workshop design. Since we lacked an understanding of the problem domain, we needed to start the workshop by gathering data about the processes. Therefore, we organized a site visit to observe how the processes that are part of the requirement elicitation were executed.

The next day, we needed to capture the roles and needs of the relevant stakeholders. Therefore, we used parallel sessions where each workshop facilitator did storytelling (narrative interviews) with a stakeholder. Storytelling helped us to structure the subsequent sessions.

In the next session, we combined individual and group brainstorming techniques. First, we let each stakeholder compile a list of problems that could help the company. Then, the lists were swapped with another stakeholder who reviewed them and commented on them with their thoughts. We debriefed this session by creating a cognitive map that synthesized and summarized the brainstorming session.

In the subsequent activity, we worked with the cognitive map and used group brainstorming to develop potential solutions for tackling the identified problems. Each solution was taken for detailed scrutiny. For this, we used a combination of techniques consisting of scenarios, thinking aloud, and comparison to similar systems to create further cognitive maps as session outputs.

### **5 Evaluation of the design**

Our workshop encountered several problems that caused time management issues and lower quality of elicited requirements. The most significant problems

were: (i) insufficient domain knowledge before the workshop, (ii) lack of validation during the workshop, and (iii) issues with capturing tacit knowledge.

First, we lost a significant amount of time at the beginning of the workshop since it was dedicated to storytelling. Although storytelling sessions helped to improve facilitators' understanding of a problem domain, which they lacked due to the restrictions in the workshop preparation phase, it decreased the time available for other sessions (e.g., going deeper with individual requirements and features). Therefore, to address this issue in future workshops, we will substitute on-workshop storytelling with pre-workshop interviews.

Second, the post-workshop validation did not show to be of sufficient level. Cognitive maps are helpful for visualizations but sometimes lack explicitness and essential detail. We waited for the validation after the workshop when we finished the transcription of the sessions and developed a RE draft. Validating the document without properly validating outputs from the individual sessions was futile as stakeholders lacked time and context of the content of the RE draft. We planned short validation sessions in our agenda, but they were sacrificed due to the extended storytelling and brainstorming sessions. We did not find a solution in the literature, which mostly omits to discuss the validation of the elicited requirements. In the next workshop, we plan to divide the roles of facilitators in the way that one facilitator will focus on moderating the discussion with industrial partner representatives. At the same time, another one will, in parallel, produce outputs, which will then be taken to a discussion during validation sessions and incorporated into the workshop agenda.

Third, although we tried to employ several KE techniques, we did not successfully capture embedded knowledge. We discovered that without proper domain knowledge, it is complicated to understand all the terms and concepts that stakeholders naturally use. Studies listing and describing elicitation techniques raise the issue of complicated capture of embedded (tacit) knowledge. However, they lack practical solutions. In the next workshop, we could solve this by developing and validating the glossary of terms that could help us better understand the subtle differences in the meaning of terms and concepts unique to each organization during the pre-workshop preparations.

To summarize, we recommend that facilitators of the co-creation workshops focus on two aspects. The first is to do as much to understand a problem domain, including a glossary of commonly used terms and abbreviations in the enterprise, before the workshop. The second is to incorporate validation sessions in the

workshop agenda. These two actions are essential to improve the quality and efficiency of business requirement elicitation.

## **6 Conclusion**

We showed that the approaches to investigate challenges posed by embedded (tacit) knowledge in requirements engineering are being tackled in different fields. However, there were few attempts to integrate knowledge from (software) requirements engineering, knowledge management, and co-creation fields. The current knowledge is fragmented and, at the same time, overlapping across the fields. We suggest that the next step could be an integrative literature review of the relevant fields to describe the overlaps and gaps in the current knowledge precisely. Such a review could answer our study's first limitation: the restricted set of techniques. Although we used two literature reviews to generate the list of techniques, a thorough critical evaluation would likely add several methods to the list. However, we wanted to see if it is possible to identify relevant methods with a relatively small effort. In an ideal situation, a systematic literature review of methods would be more suitable for generating a robust list of techniques.

Furthermore, we suggest that the practice of requirements engineering and theoretical research should be more deeply aligned as they are decoupled. Therefore, we see the solution in employing a participative methodology. Combining design and action research seems ideal to align the practice and basic research. It covers the study's second limitation caused by trying our design only in one workshop. Before submitting this paper, we had no opportunity to facilitate another workshop and use the reflection to improve the design. We will remedy this by facilitating several workshops within the same project and thus will be able to fully use the added value of the combination of design and action research.

### **Abstract**

Videos are increasingly used for learning both in higher education and in organizational knowledge exchange. Though this tool enables flexible and effective individual learning, its effectiveness largely depends on its ability to maintain viewers' attention. Studies of learner attitudes towards video presentations show that they feel less engaged with digital pieces of training than before the pandemic and L&D professionals consider their virtual training experiences ineffective. As the production of instructional videos is time and resource intensive, it is essential to have a clear understanding of the factors and principles that should be taken into account when making and using this genre specifically. Our research aims to contribute to this goal with research findings and practical suggestions.

Since, to the best of our knowledge, only a little research has so far investigated the factors that influence the effectiveness of instructional videos for workplace learning (see one of these in Section 2.1.1), the current study presents some of the significant findings in the literature on the principles of the effectiveness of instructional videos supported by empirical research in different educational sectors (such as higher education, adult education, vocational training, professional or self-paced online learning). It also presents

the findings of an empirical mixed-methods study on the effectiveness and engaging capacity of instructional videos in higher education. Learner emotions (N=25) were identified by self-report questionnaires. Due to the high degree of similarity between the two learning environments, these conclusions are worth being considered for workplace-based instructional videos as well.

## 1 Introduction

The use of video tutorials is increasing in organizational learning: in 2020 and 2021, 91% of organizations offered virtual pieces of training (Huggett, 2021). Learners nevertheless feel less engaged with digital training than before, and 53% of L&D professionals consider their virtual training experiences ineffective (Ken Blanchard Companies, 2021). The effectiveness of instructional videos largely depends on their ability to maintain viewers' attention. The findings of this study support in-company knowledge exchange in improving instructional videos by exploring the factors affecting viewers' (dis)engagement, based on the literature and the results of a study using multimodal measurements.

## 2 Background

### 2.1 Instructional videos

#### 2.1.1 Factors influencing the effectiveness of instructional videos

The cognitive theory of multimedia learning (CTML; Mayer & Moreno, 1998) is the main theoretical framework applied for the design and evaluation of instructional videos (in different levels and sectors of education such as K-12, tertiary, adult and professional education). CTML is grounded in the understanding that "certain multimedia design principles lead to improved learning outcomes due to the nature of human cognitive architecture" (Fyfield et al., p. 155; 2022; Mayer, 2014). Mayer's list of 15 principles for efficient multimedia design was identified based on the examination of various forms of multimedia learning, including but not restricted to videos. A recent review of empirical

studies (Fyfield et al., 2022) therefore aimed to reveal which design principles have been confirmed to be effective by empirical studies, solely in the context of educational videos. The review defined effectiveness in terms of learners' ability to recall and/or apply to new contexts the content presented in the video. The principles proven as most effective in the case of video presentations are the following: *coherence* (reducing the content to the essential information), *integrating learning activities*, *embodiment*, and *shortening/segmenting* videos (see Table 1).

Table 1 - Instructional video design principles and their effectiveness, established by empirical studies (Own edited, based on Fyfield et al., 2022)

<b>Effective</b> Principles with the strongest support by empirical studies	<b>Principles with confounding findings</b> (e. g., they improve learning only in certain contexts)	<b>Principles underrepresented in research</b>	
<p><b>Coherence:</b> Including just the essential information</p> <p><b>Integrating learning activities:</b> Make students complete learning activities in addition to watching the video</p> <p><b>Embodiment:</b> include human movement or gestures</p> <p><b>Learner control:</b> Students should be given control over pause, playback, or play forward.</p> <p><b>Video length reduction</b></p>	<p><b>Modality</b> (refuted by most studies): Use spoken narration rather than written text</p> <p><b>Redundancy</b> (refuted by most studies): Written text should not be added when narration is present.</p> <p><b>Presenter's face:</b> Avoid including the presenter's face when alternative visuals are displayed.</p> <p><b>Signalling:</b> Important information should be highlighted to learners.</p> <p><b>Personalisation:</b> Narrations should use first/second person conversational speech</p> <p><b>Transience:</b> Video loses advantages over static media when too much information is presented too quickly.</p>	<p><u>Principles considered effective but examined by few studies</u></p> <p><b>Reviews</b> (3): Videos should end with a summary of the content.</p> <p><b>Pre-training</b> (2): Using words and pictures rather than words alone.</p> <p><b>Multimedia</b> (2): Using words and pictures rather than words alone.</p> <p><b>Misconceptions</b> (2): Conceptual videos dispel common misconceptions at the start.</p> <p><b>Spatial contiguity</b> (3) Related elements presented in close physical proximity on the screen (also called split attention).</p> <p><b>Perspective</b> (1): Videos shot from the learner's perspective are more effective than the third-person perspective.</p> <p><b>Dialogue</b> (2)</p> <p><b>Interactivity</b> (4) <u>Principles with confounding findings</u></p> <p><b>Guided discovery</b> (1): hints and feedback as the learner solves problems.</p> <p><b>Emotional design</b> (4): Warm, high-</p>	<p><u>Principles examined by no empirical research for instructional videos</u></p> <p><b>Voice principle:</b> Human superior to machine voice.</p> <p><b>Drawing:</b> Asking students to create drawings while reading the text</p> <p><b>Temporal contiguity:</b> Related elements (e.g., narration and visuals) presented at the same time.</p>

<p><b>Segmenting:</b> Longer videos should be broken into meaningful chunks.</p>	<p><b>Worked examples:</b> Include completed guidance or examples when solving problems or learning skills.</p>	<p>saturation colours and anthropomorphisms used in videos. <b>Sound effects</b> (1): to be avoided due to their distracting effect. <b>Background music</b> (3): to be avoided due to its distracting effect. <b>Speech rate</b> (2) (fast superior) <b>Audio quality</b> (2)</p>	
--	---	--	--

### 2.1.2 Videos applied in workplace learning

Most studies exploring the key factors for the effectiveness of instructional videos focus on higher education while very few studies have been carried out on the topic in the context of organisational learning. These studies aim to highlight the benefits of instructional videos in organizational knowledge exchange: They effectively support onboarding, increase the flexibility of the pieces of training, allow participants to progress at their own pace, they facilitate learning for diverse groups (Nederveld & Berge, 2015), and significantly contribute to the development of psychomotor skills (Wong et al., 2019). As regards the challenges of the application of videos for workplace learning, they received less attention. An experimental study investigating the effectiveness of videos applied for organizational learning (Okano et al., 2018) drew attention to the effectiveness of two incentives, both of which can increase the long-term retention of the content of the videos. The group of employees a) who took part in a structured discussion led by an instructor right after the video and b) who had to answer questions interpolated throughout the whole video, remembered the content substantially more (25~26% respectively) the next day, compared to those who just watched the video or discussed it spontaneously, among themselves. This result is consistent with the principle of "integrating learning activities", emphasized by Fyfield and his colleagues (2022, see Section 2.1.1.), based on numerous empirical studies.

### 2.2 Emotions influencing learning engagement

In the context of organizational learning, individuals play a crucial role in knowledge construction: they create meaning, share knowledge and apply it; thus, „effective KM strategy lies in the efficient management of individuals as knowledge resources“ (Ragab & Arisha, 2018, p. 212). L&D programmes are keys to developing employee knowledge (Ragab & Arisha, 2018) but efficiency is closely linked with emotions that play a significant role in cognitive processes

such as attention, learning, and memory (Altuwairqi et al., 2018; Tyng et al., 2017). Theories on emotions influencing effective learning have been widely studied in education science in the past two decades (Fredricks et al., 2016; Reschly et al., 2020) and its findings highlighted relevant connections for other disciplines as well (Noe et al., 2010).

### *2.2.1 Role and effect of boredom*

The control-value theory (Pekrun, 2006) argues that while some emotions activate, others hinder learning and engagement. One such emotional state, *boredom*, has been receiving attention in recent years, both in education science and organization science. A recent research review (Yadegaridehkordi et al., 2019), analysed the empirical studies carried out with the help of digital applications for emotion recognition (affective computing). The comparison of the studies shows that in the past 2 decades, a wide range of emotions has been examined with the tools of affective computing. Of all these emotional states, "boredom" has been the one for which most studies have sought answers. Boredom is characterised by reduced attention and task involvement which harms goal attainment while it can also motivate the search for alternative goals and opportunities (Bench & Lench, 2013).

Most studies agree on the deactivating effects and unpleasantness of boredom (Pekrun, 2006; Sharp et al., 2020); the definition and measurement of boredom however raise questions that have so far been answered in controversial ways. One of the most significant reviews (Goetz & Hall, 2014) identifies 5 types of boredom (indifferent, apathetic, calibrated, searching, and reactant), by the dimensions of valence (degree of pleasantness) and arousal (physiological activation). This concept has been challenged by some others (Danckert et al., 2018; Elpidorou, 2021) arguing that boredom is a ubiquitous state that can be defined by the perceived meaninglessness and the level of attention. The current study aims to contribute to this debate by providing new measurement results.

Contrary to boredom, interest is an "intrinsically valuable [...] engagement with an activity, object, or content" (Pekrun, 2019, p. 909). Emotional interest engages learners with an emotional connection to the content. Cognitive interest is raised by clear and easy-to-understand content (Mazer, 2017:352; Pekrun, 2019). Though boredom is more than a lack of interest, based on the above linkages, the current study examined the changes of interest, to track changes in boredom (Pekrun et al., 2014).

### *2.2.2 Coping with boredom as a learner*

Section 2.1.1 discusses some strategies that can be applied by the professionals designing instructional videos, to prevent or reduce learners' boredom. Learners nevertheless have responsibility for the management of their own emotions hindering their learning. Numerous studies examine the most effective strategies applied to successfully cope with workplace boredom. Task-related imagination, refocusing attention on task, changing task complexity, increasing task engagement and gamification are some of these strategies (Cummings et al., 2016; Nett et al., 2010). What they all have in common is that the first step is the recognition of a state of boredom; if this recognition is done, and if it is accompanied by the right strategy, the experience of boredom contributes to more effective learning.

### **2.3 Measuring boredom**

Methods applied within the current study relied on the findings of 3 methodology reviews of engagement detection (Dewan et al., 2019; D'Mello et al., 2017; Dubbaka & Gopalan, 2020; Yadegaridehkordi et al., 2019). Depending on the level of user intervention, data collection can be automatic, semi-automatic or manual (Dewan et al., 2018; D'Mello et al., 2017). By their channel, data can be textual, visual, vocal, physiological, or multimodal. Since in the context of learning, each method may include biasing factors, several studies (Mazer & Graham, 2019; Yadegaridehkordi et al., 2019) recommend a multimodal approach, e.g., incorporating data from different channels and relying on both human-assisted and automated detection (D'Mello & Kory, 2012). One of the reviews (D'Mello et al., 2017) recommends the strategy below (see Figure 1), to identify the causes of disengagement.

A first step can be to measure some selected emotions hindering student engagement. Next, it should be explored, what kind of events preceded their appearance. This can lead to the modelling of the possible triggers or antecedents of the given emotion.

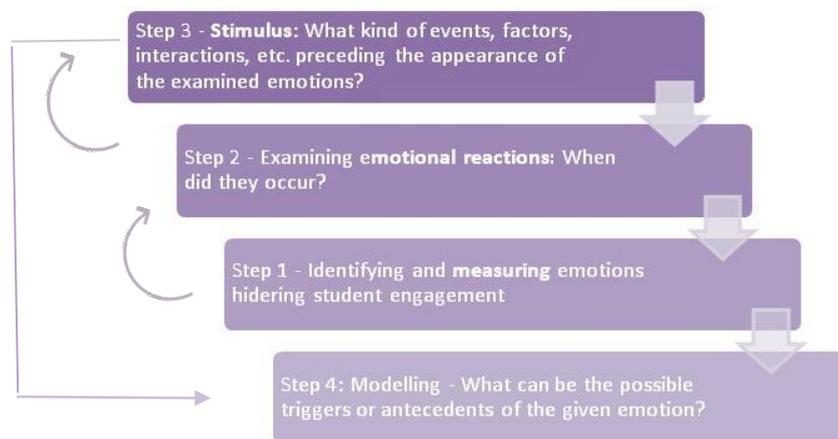

Figure 1: Building a re-engagement strategy by exploring the reasons behind disengagement (Own edited, based on D'Mello et al., 2017, pp.118)

A systematic literature review on boredom during learning (N=57) conducted by the authors revealed that though features of instructional videos and emotion detection during learning are widely studied, to the best of our knowledge, no empirical studies investigated the relationship between automatically detected emotions and the elements of the videos triggering them, as suggested by the above strategy.

### 3 Methodology

The current study applied multimodal measurements interpreted as an approach relying on both language-based and nonverbal communication (Christensen et al., 2018; Jewitt, 2014; Poria, 2016). The sample (N=25) included university students (aged 19 to 23) of Corvinus University of Budapest. Observations were implemented in individual meetings (in October 2023). The participants of the observation pursued their studies in the Communication Science BA programme, and at the time of the observation, they were enrolled in the same course, the instructor of which produced the instructional video covering a topic (virtual communication) closely related to their current curriculum. Their emotions were detected by self-report questionnaire, automated facial expression analysis during video watching, and retrospective interviews to triangulate the validity of facial analysis results. Before and after watching the video, a questionnaire assessing participants' emotional state was completed (Positive-negative Affectivity Scale, PANAS, Watson et al., 1988), to

follow current emotional state bias; the questionnaire also included the questions of Student Interest Scale (Mazer, 2013).

Numerical results of the questionnaires and of automated facial expression detection were analysed by correlation analysis and linear regression, using SPSS, Noldus FaceReader and The Observer XT. Interviews were examined by qualitative content analysis, using the constant comparative method. The 22.4-minute-long recordings (per participant) were divided into 30-second long time windows. Mean values were calculated for boredom, interest, arousal and valence for these intervals, and were compared with the characteristics of the instructional video.

## 4 Results and implications

### 4.1 Emotional states identified by facial expression analysis and self-reported emotions

Changes in the mean value of boredom and interest confirmed the asynchronous relationship between them, namely that boredom is not a lack of interest but a state influenced by other components as well, such as the low level of arousal and high level of "neutral" state (Goetz & Hall, 2014; Grafsgaard, n.d.; Kapoor et al., 2001): low interest was not always associated with high boredom and vice versa (see Figure 2).

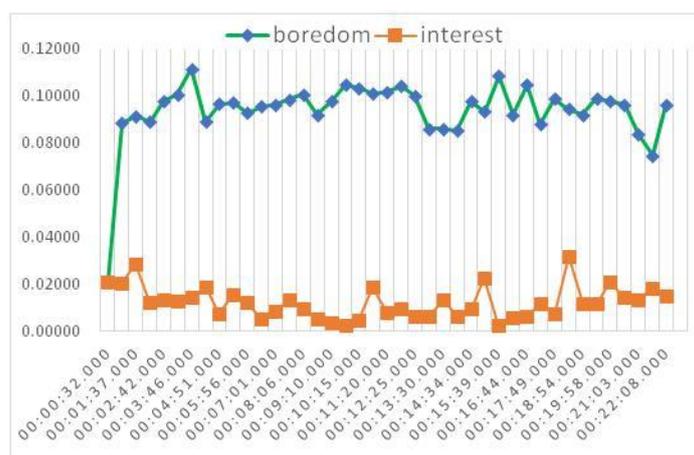

Figure 2: Changes in the mean values of boredom and interest per 30 seconds while viewing a 22-minute long video presentation (N=25), measured by facial expression analysis, in 30-second long periods.

For the synchronous and asynchronous development of boredom and interest, we examined the identifiable variables (video/presentation features, visual/topic elements, teacher behaviours, video design principles, etc.) associated with congruent (e.g., high boredom low interest - synchronous) and incongruent (both high/low) situations. The reasons behind incongruent results require further investigation, but congruent data allow clear conclusions on video-based learning contents (see Table 2).

Table 2 – Features of video followed by episodes of viewer boredom and interest

<b>Antecedents of low level of boredom &amp; high level of interest</b>	<b>Antecedents of high level of boredom &amp; low level of interest</b>
<ol style="list-style-type: none"> <li>1. appearance of the presenter's face</li> <li>2. short illustrating story with a portrait photo</li> <li>3. slide with graph supplemented by teacher's freehand drawing</li> <li>4. funny, witty closure</li> </ol>	<ol style="list-style-type: none"> <li>1. slides with black text on white background</li> <li>2. graphs with longer or small-print explanation</li> <li>3. flow chart with multiple abbreviations unknown to the viewer</li> <li>4. slide with a table displayed for 8 minutes with teacher's explanation</li> <li>5. the language of the oral explanation differs from that of the explanation on the slide</li> </ol>

Level of boredom and interest was identified as high in the case of values exceeding mean values plus half of standard deviation.

Linear regression examining the relationship between (auto-detected) emotions during and (self-reported) emotions after video viewing revealed that self-reported interest predicted positive affectivity after video watching ( $R^2=0.525$ ,  $p<0.000$ ). This confirms that positive emotional state scaffolds attention and interest in learning (Mazer, 2013).

A significant negative correlation of surprise during video watching and self-report cognitive interest ( $R=-0.502$   $p<0.001$ ) suggests that surprising elements should be used with caution, to avoid stress resulting from overly diverse stimuli.

#### **4.2 Factors and tools influencing engagement according to the student interviews**

In the semi-structured student interviews following the video watching, the first set of questions aimed to identify the factors that made the video attractive to them and the episodes that were difficult for them to follow. Next, we asked specifically about the teaching/lecturing methods used in the video (e.g., slide with text, graph, table, picture, teacher's face, story), asking which of these methods helped or hindered them the most in maintaining their attention. The results were consistent with the results of the facial analysis presented in Table 2 but also revealed additional factors, of which visual elements and examples were particularly frequently mentioned (see Table 3). Almost each student mentioned that the appearance of the teacher face increased their attention and interest. As some of them mentioned it, this positive effect is closely linked to the fact that learners like the lecturer. Student answers were analysed by constant comparative method (Glaser & Strauss, 1967). The following table (Table 3) includes the main and sub-categories set during the coding.

Table 3 - Factors increasing engagement, based on learner interviews

<b>"What did you like in the video?"</b>	<b>Number of participants mentioning it</b>
visual elements promoting understanding - table (11) - important information highlighted by on-screen annotations (12) - graphs presenting statistical data, pictures (18)	44
examples presented to illustrate concepts - stories (13) - examples (11)	24
humour, surprising, witty start and closure - humour (11) - surprising start (2) - witty, funny closure (7)	20
"the topic is interesting" - content relevant to learners and adapted to their level of knowledge	21
the appearance of the teacher's face	15
teacher's immediacy, the student's attachment to the teacher	8
casual, conversational language that is close to the target audience	4
smooth, dynamic presentation, using various tools	4

According to the interview answers, the elements mentioned the most frequently considered as attractive were linked with visual information: various graphs, figures and pictures illustrating or presenting the information increased student attention. The second group of factors mentioned by the students referred to the application of examples (shorter or longer case studies, stories, or just references to certain enterprises or brands). The immediacy, personality and warmth of the communication of the instructor were mentioned by the majority of the participants.

The elements *hindering attention* were almost entirely related to the *texts displayed on the slides*: a slide displayed for too long time (mentioned by 14 of the participants), redundancy (“it is too difficult to read the slide and listen to the instructor at the same time”) (15), mind wandering, and difficulty in understanding and following the line of thought when the video showed slides with text (16).

#### **4.3 Video design principles**

According to the authors’ coding, the video used for the current study followed 8 of the principles of instructional video design defined by the review (Fyfield et al., 2022) presented in Section 2.1.1. These were: embodiment, presenter’s face, signalling, personalisation, worked examples, multimedia, spatial contiguity, temporal contiguity. Learner answers were also coded according to these principles as well. Since in this case, we wanted to know what principles they consider important for educational videos in general, we categorised the content of their responses irrespective of whether they were reflected in their positive or negative comments (like in the case of modality and redundancy).

Table 4 – Appearance of the principles of instructional video design (Fyfield et al., 2022) in the video applied in the study

<b>Instructional video principles mentioned in the learner interviews</b>	<b>Number of mentions in student answers</b>
multimedia (graphs, figures, colours)	34
redundancy (information is presented both spoken and written) – not applied, mentioned as a challenge	29
personalization (teacher style, immediacy and positive attitude)	27
worked examples (stories, company names, facts)	24
modality (too much text on the slides) – not applied, mentioned as a challenge	23
coherence – where not applied, mentioned as a challenge	18

embodiment (appearance of the teacher's face)	15
signalling (important information highlighted by on-screen annotations)	12

## 5 Conclusions

The study offers some important insights into the factors promoting learning engagement or triggering boredom. Some factors nevertheless indicate that the findings of the study need to be interpreted cautiously: the sample included the video of one instructor. Student interviews revealed a high level of student attachment and trust in the teacher. The topic of the video in question is furthermore very popular among the members of generation Z: „Virtual communication“. In order to increase the generalisability of the results, it would therefore be necessary to examine videos produced by teachers with different teaching attitudes and used in different fields of study using similar analysis methods. Awareness that participants were being watched and their expressions were being recorded has led to an observation bias, thus the emotional state of boredom might be lower during the observations than in the course of the usual online learning activity of the students.

The results confirm the relevance of several video design principles such as multimedia, personalization, embodiment and signalling were successfully considered and reflected by the learners. The difficulties reported by them related to the role and amount of textual information provided parallelly with the audio content. The reasons behind these challenges and the solutions are summarized by the principles of coherence, modality and redundancy: learners' cognitive workload can be decreased by presenting only the essential information, providing spoken narration, rather than written text, and avoiding presenting rich textual information during narration.

## Aknowledgement

The implementation of the study presented was supported by the UNKP-22-3-II-Corvinus-121 New National Excellence Program of the Ministry for Culture and Innovation from the source of the National Research, Development and Innovation Fund.

Prince Sultan University  
P.O.Box No. 66833 Rafha Street, Riyadh 11586 Saudi Arabia

### **Abstract**

Saudi Arabia opened its doors to tourists in September 2019 and unveiled ambitious tourism plans during its G20 presidency in April 2020. The cultural heritage is remarkable, given the rich history of Saudi Arabia. With the Saudi Vision 2030 built around three themes "a vibrant society, a thriving economy, and an ambitious nation," tourism figures prominently as one of the primary sources of diversification of the Kingdom. This strategic framework aims to enrich the journeys of Makkah-bound pilgrims while in the Kingdom and establish tourist and historical sites and cultural venues to enhance the pilgrimage experience. The paper concerns one of the five pillars of Islam: the annual Islamic pilgrimage (Hajj) to the Holy City of Makkah, considered one of the most important and ancient in the world. The pilgrimage routes were religious and commercial axes that crossed the Arabian desert, favouring movement throughout the ancient world and creating a "heritage route." The research study focuses on Darb Zubaydah, the main historic Hajj pilgrimage route connecting Kufa in Iraq to Makkah in Saudi Arabia. This 1,300 km route has 13 heritage sites, four in Iraq and nine in Saudi Arabia. The Dar Zubaydah is a historical, cultural route of exceptional universal value, and since 2 January 2022, it has been included in the Saudi Heritage Tentative List of UNESCO. The research aims to promote and bring to light the cultural heritage along Darb Zubaydah by developing sustainable cultural tourism. The paper defines guidelines enhancing services near the historical sites and between one pilgrim station and another to reduce distances. Fayd Oasis, one of the most important and strategically located stations in Darb Zubaydah, has been selected as a case study for a sustainable development scenario to revitalize today's archaeological site and implement its services. The goal is to strengthen the pilgrimage route's cultural identity and historical heritage through services for tourists and pilgrims that promote Saudi cultural heritage while preserving the environment and natural resources. Defining a strategic plan to enhance this tourist axis of pilgrims is essential to promote the cultural landscape and heritage by strengthening the sense of identity towards a sustainable approach. The result of this study wants to contribute to Vision 2030

to enhance the development of tourism through the revitalization of the Islamic, Arab, and national cultural heritage of the Kingdom. It can be applied in other Hajj pilgrimage routes and on a global scale.

**Keywords** – Cultural tourism, Heritage, Pilgrimage route, Saudi Arabia, Sustainability.

**Paper type** – Academic Research Paper

## 1 Introduction

Saudi Arabia is experiencing rapid growth in hospitality and tourism due to its efforts to diversify the economy away from oil. Saudi Arabia's development into the tourism sector is part of the ambitious "Vision 2030" plan, aiming to diversify the country's economy and strengthen the Islamic identity through strategic national tourism. The National Tourism Strategy plans to increase the tourism sector's contribution to domestic product to over 10%, provide one million more job opportunities and attract 100 million annual visits by 2030 (Ministry of Tourism).

As the birthplace of Islam, many pilgrims and traders have crossed the Kingdom over the centuries to reach the Two Holy Mosques and Holy Places. In recent years, pilgrims and tourists entering the country have tripled to 8 million people. The government has launched numerous initiatives to promote urban planning processes and programs to improve tourist offers (Mazzetto, 2022). One is the Pilgrim Experience Program, launched in 2019, to support pilgrims' journey to Mecca (Makkah). The program includes implementing services, transport, and facilities to improve their hospitality. Also, the next step is to prepare historical Islamic sites to enrich their religious and cultural experience (Vision 2030).

The research highlighted in this paper wishes to be part of the Pilgrim Experience Program, aligning itself with one of the five pillars of Islam, namely the annual Islamic pilgrimage (Hajj) directed towards the Holy City of Makkah. Since Saudi Arabia is rich in Arab and Islamic historical and cultural heritage, the goal is to build a future based on the creation of a system of public services for religious and cultural tourists directed to the Holy City by creating a "heritage route," for build profitable tourism growth through sustainable strategies, but at the same time preserving national identity by considering economic, social and cultural values (Moscatelli, 2022). The transit of pilgrims is essential for the identity of the heritage and the management of a successful modern pilgrimage, as well as

ensuring the Kingdom's economic growth. The research expands the pilgrim's routes and landscape knowledge by examining sustainability and global challenges. Furthermore, it will highlight natural and cultural heritage by developing jobs and growth along pilgrim routes through developing a low-impact tourism itinerary and strengthening local traditions; this reconnects pilgrims and visitors with their environment, landscape, and culture.

## **2 The Ancient Pilgrimage Routes to Makkah: a link between Islamic cities and Saudi Arabia**

Saudi Arabia has historically been a centre for travellers, pilgrims, and merchants, as it is home to two of Islam's holiest cities, Makkah and Medina. For centuries, millions of pilgrims have made long-distance journeys to reach the city of Makkah, which has a unique character and image as a sacred land for Muslims worldwide. Every year, during the Hajj, the number of Muslims who go to the Holy City increases more due to the ease of land and air transport. The statistical data analysis (GASTAT, 2019) showed that 94% of foreign pilgrims in 2019 mostly used the air route. Only 5% arrived by land, and 1% by sea (Fig. 1). These new facilitated transport ways have made the historical pilgrimage routes obsolete, and some overlap with the new roads and highways. The roads leading to Makkah have always been vital to the religious and economic life of Arabia, extending as far as Syria, Egypt, and neighbouring countries. Given the importance of these pilgrimage routes, they require particular attention and implementation by creating cultural and sustainable itineraries.

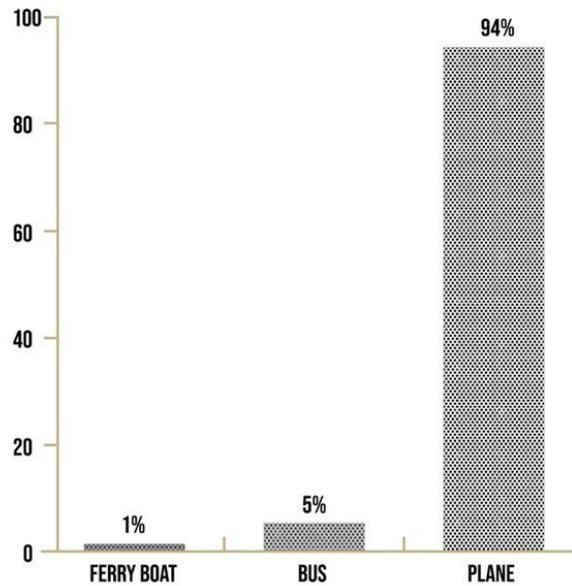

Figure 1. Foreign pilgrims in 2019 by transportation mean (Credit: Author)

## 2.1 The four main Routes of Hajj

The ancient land routes of the Hajj, from neighbouring countries to Saudi Arabia, materialized over time due to trade routes and cultural exchanges. Moreover, these deeply rooted cultural and religious traditions have constituted the most crucial material traces of Islamic civilization over the centuries.

In the past, the journey to Makkah was arduous; the pilgrims had to travel for months on caravans, horses and donkeys and cross the desert on dirt paths with extreme temperatures and avoid possible raids and other obstacles along the way. Some service stations with water wells along the routes allowed for stops during the long journey. Several primary and secondary routes lead to Makkah, but four are the most important ones (Fig. 2).

Figure 2. The most important ancient land routes of Hajj (Credit: Author)

1. The Pilgrim Road from Syria: it connected Damascus to Makkah, passing through the province of Tabuk in Saudi Arabia, and Madain Saleh (Hegra), an archaeological site in the Al-Ula area, today an important tourist destination of the Kingdom rich in cultural heritage. This route is referred to as the Ottoman or Shami (Levant) route.
2. The Pilgrim Road from Egypt: the African road used by pilgrims from Egypt, Morocco, Andalusia, Sicily and various areas of Africa. Along this route are rock carvings by pilgrims as a reminder of their Hajj journey.
3. The Pilgrim Road from Yemen: came from southern Saudi Arabia. There were three routes, one coastal, one internal and one primary, crossing the province of Asir in Arab territory until the city of Taif and then Makkah. Along the way, there were several villages where pilgrims stopped.
4. The Pilgrim Road from Iraq: connected the city of Baghdad and Kufa in Iraq to Makkah, traversing the north of the Kingdom and its centre, passing the vast and treacherous sands of the Empty Quarter, the

largest sand desert in the world, before reaching the Holy City. This ancient route is known by the name Darb Zubaydah because it takes its name from Zubaydah bint Jafar, wife of the Abbasid caliph Harun Al-Rashid, for the remarkable charitable work she has supported along the Hajj route through the construction of numerous stations, canals, wells, forts and mosques.

### **3 A strategic itinerary for a sustainable cultural tourism**

The research aims to promote and bring to light the cultural heritage along the Iraqi route, Darb Zubaydah, by developing sustainable cultural tourism.

Through a qualitative analysis of the nine sites identified by UNESCO, documentary research and field evaluations, the research method was divided into three phases (Fig. 3).

The first phase of the work involved collecting information on some important architectural landmarks and the nine archaeological sites along the Saudi route. This step considered a literature review of Darb Zubaydah and was supported by analysing cartographic, iconographic and bibliographic materials. This qualitative research identified the nine sites exploring the aspects concerning the urban history and the most important architectural resources of the landscape along the route.

A second phase of the work involved site visits along the route to detect existing conditions of the physical context: the accessibility of Darb Zubaydah, the main facilities and the archaeological sites. The field evaluation was crucial to identify the potential site to promote its cultural landscape and heritage, revitalize the area and promote services and activities for tourists and pilgrims.

A later step defines a strategic proposal to enhance this tourist axis of pilgrims, enhancing services in the sites and between one station and another to reduce distances. The research was later focused on Fayd Oasis, located halfway between Kufa and Makah. It was placed in the most strategic position of the route to develop a sustainable development scenario to revitalize today's archaeological site and implement its services.

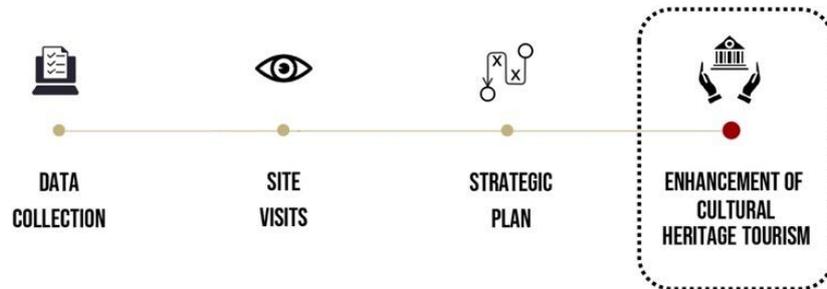

Figure 3. Research methodology (Credit: Author)

### 3.1 Phase 1. Data collection

The research focuses on the Darb Zubaydah, which hosts a cultural heritage rich in unique examples of architecture and infrastructural planning that should be preserved and valued. Due to the importance of these architectural artefacts, the Darb Zubaydah pilgrimage route was inscribed on UNESCO’s World Heritage Tentative List on 2 January 2022.

The cultural heritage and the different architectural typologies that can be encountered along the way are the results of the flow of pilgrims and traders along the Darb Zubaydah. The route includes 27 stations and 27 substations, and key elements from the Abbasid period, which materialize the 1.300 km long path linking the city of Kufa in Iraq with Makkah. The segment of Darb Zubaydah in present-day Iraq covers approximately 1/5 of the trail's total length; instead, the other part in Saudi Arabia covers 4/5. The entire route counts 13 sites, four in Iraq and nine in Saudi Arabia (Fig. 4), providing an architectural overview of this extraordinary Hajj route (UNESCO, 2022). They have been selected for their state of conservation, representativeness, and geographical position along the route.

Figure 4. Main stations and heritage sites of Darb Zubaydah route (Credit: Author)

The route was indicated by "route markers" and milestones, shelters and water systems for the benefit of pilgrims. This road has seen extensive historical and archaeological research, whether on the development of stations along the route, water structures, or milestones (Gierlichs, 2012).

A series of consecutive settlements bounded the road. Among the selected heritage sites, wells were identified in each settlement to provide adequate water for many travellers and their animals, given the heat and aridity of the region. The provision of water facilities is one of the best-studied elements of the Darb Zubayda, and the presence of mosques is another essential requirement for pilgrims (Blair and Ulrich, 2013).

### 3.2 Phase 2. Site visits

The second step of the research methodology involved site visits along the route to capture the criticality and potentiality of the road and its facilities. The author carried out the inspection personally through direct observation on-site.

During the tour, the critical points of the pilgrimage road were identified as listed below.

- Lack of access to Darb Zubaydah through secondary roads.
- Far distance between the identified heritage sites and pilgrim stations.
- Lack of roadside services.
- Lack of accommodation to host a good number of tourists.
- Scarcity of religious places between one city and another.
- Lack of night lighting along the route.
- Lack of archaeological sites promotion to tourism.
- Shortage of protection of archaeological sites.
- Lack of information and explanation of archaeological sites.

### *3.2.1 The archaeological site of Fayd*

Then, the attention has focused on the city of Fayd, considered the major oasis city along the pilgrimage road from Baghdad. It is the most prominent landmark in the city of "Fayd" and the largest palace on the Hajj route (Fig. 5). The author considers it a case study station to implement the services around the site by promoting its heritage and cultural landscape. The researcher conducted site visits and photographic surveys of the archaeological area to verify the current state of the site and its related services.

*Figure 5. Fayd archaeological site: satellite photo of the area (Credit: Bing Maps)*

The city of Fayd is the most significant archaeological and historical site located 120 kilometres southeast of Hail and 1.5 km north of the present modern town of Fayd. It is the oldest settlement in the Arabian Peninsula, 1300 years ago, and covers an area approximately 1.5 km long by 1.5 km wide (Ibrahim et al., 2021). The oasis of Fayd, in the early period of the Abbasid Caliphate and even before

the Islamic era, was considered the most important and strategically located along the Darb Zubaydah route. Furthermore, it was the main station for pilgrims, as it was used to supply food and water. Pilgrims and merchants converged on this oasis for more than five centuries.

There are records dating back to the 13th century, where Fayd is described as a fortified city with double walls of black basalt, a large fortress consisting of several floors with a tower in each corner, a mosque dating back to the early Islamic era, and wells for the water supply (UNESCO, 2022). To date, the ruins of the Kharash Palace, the old houses, the mill for grinding cereals, and the wells are visible. The fort's walls have recently been rebuilt to give an idea of what the site was like. To the south of the fort, between the two walls, excavations have brought to light a series of rooms belonging to the homes and perhaps to the shops of the people of the Fayd oasis (Fig. 6) built around a central road (Fig. 7). Furthermore, an area with ovens used by the population was found to the south. The remains of the ancient mosque used by the inhabitants of Fayd and the pilgrims and merchants who visited it are also visible. The primary water sources were two large water cisterns, still visible today: a tank located north of the village and one to the southeast (Egal, 2017).

*Figure 6. Fayd fortress: residential rooms and commercial spaces (Credit: Author)*

*Figure 7. Fayd fortress: ruins of the houses built along a central road (Credit: Author)*

As for services, before entering the archaeological site, visitors go through the Fayd Museum, which contains the finds of the ancient fortress and its surroundings. There are no outstanding services around. A petrol station with a mosque without architectural value is visible on the other side of the road.

Therefore, it is necessary to identify a strategy to implement the services, activities, and various hospitality options around the sites of most significant interest to bring greater tourism to these areas of particular cultural landscape and heritage interest.

### **3.3 Phase 3. Strategic plan**

The paper defines a strategic plan to implement tourism along the Darb Zubaydah pilgrimage route and enhance the nine heritage sites and monuments to highlight and strengthen the cultural identity of these places. The strategy adopted involved a first phase which dealt with finding guidelines for large-scale planning relating to the accessibility and implementation of the activities to be established along the pilgrimage route. Later, the next step focused on enhancing the archaeological site of Fayd, defining guiding principles for creating public and reception spaces with equipped service infrastructures. The aim is to make the Darb Zubaydah an economic engine and a first-rate cultural itinerary, offering boundless artistic and natural riches.

### *3.3.1 Planning strategy to enhance cultural heritage tourism along the Darb Zubaydah*

It is necessary to review the stages, itineraries, kilometres and routes between stations that are part of the Darb Zubaydah to promote tourism along the pilgrimage route. In this way, it is possible to establish secondary roads perpendicular to the main axis to make the pilgrimage route more accessible at different points along the road to allow tourists and pilgrims to choose the most suitable itinerary for them, from the longest one to the shortest one which can concern only a few stages. The strategy is to have stages of different distances, such as short stages of 10 km or longer ones of 30 km. The kilometres can increase or decrease if the visitors choose to travel one or more of the variants of the route. The different itineraries can be covered on foot, on the camel, by bicycle, or through sustainable electric means to reach the stages faster and with less effort, in a few days or several months, especially during the winter and spring seasons, depending on the stages the tourist want to tackle and the amount of km to go. Road signs will therefore be implemented indicating the various itineraries, the km and the time to travel them depending on the modes of transport used. Furthermore, every tourist can download an app with GPS coordinates onto their phone to help them find their way on their smartphone, consulting the different possible itineraries and cultural events for each station. Smart technology will therefore be part of this strategic plan. The lighting along the road and in the archaeological sites will be implemented to be able to visit the archaeological sites at night and have a different perception of the site between day and night. The stations will become landmarks along the route, a reference point for pilgrims and tourists.

Refreshment services, collective and commercial spaces, health centres, and lodgings for pilgrims will be strengthened along the way. The tented camps, reminiscent of Bedouin tents, will host tourists in an authentic space to get closer to the local traditional culture and the desert landscape. The current petrol stations will be implemented with receptive structures, exhibitions and prayer spaces. A widespread museum could be distributed along the route as a tool for cultural infrastructure (Raffa, 2017). Particular emphasis will be given to the architectural space of the mosques, which must not be seen as a simple room, but as a socio-cultural architectural space that strengthens religious identity.

Particular focus will be given to archaeological sites that will be preserved and enhanced by implementing different activities.

The path along the Darb Zubaydah is not only meant to rediscover one's spirituality and religiosity but also a way to find oneself, a journey to be travelled alone or in a group. It is an alternative to mass tourism in the name of physical and spiritual well-being and, above all, a journey rich in history and culture to discover the rich cultural heritage of Saudi Arabia. The idea is to promote sustainable, healthier and more affordable tourism in contact with the nature of the pristine desert, crossing places of extraordinary historical and monumental beauty.

### 3.3.2 Fayd Oasis as a sustainable development scenario

Fayd Oasis has been selected as a case study as a sustainable development scenario (Fig. 8) to revitalize today's archaeological site and implement its facilities to transform this ancient site into a tourist attraction. The oasis of Fayd, located midway, will be considered, as in the past, the main pilgrimage station along the entire route. Therefore, a greater flow of people is expected, and consequently, more services and activities need to be implemented near the archaeological site.

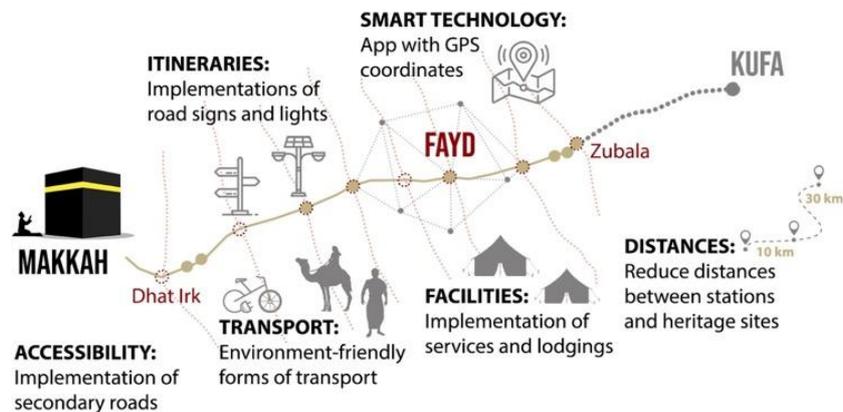

Figure 8. Enhancement of cultural heritage tourism along the Darb Zubaydah

Fayd will have to become a cultural and receptive space with various entertainment activities for pilgrims and tourists. In addition to the existing museum, other services will be added, such as additional exhibition spaces,

mosques, refreshment places, a primary healthcare centre, commercial areas, and places to rent bicycles, electric vehicles, or the traditional camel to enjoy the Bedouin experience.

The archaeological site will be preserved and enhanced by promoting tourist itineraries during the day or night to discover the fascinating history of the Fayd fortress. Qualified guides will lead tourists through the ruins of the archaeological site and the Kharash Palace. Cultural and scientific forums, exhibitions and events in the oasis of Fayd will entertain the tourists during their stopover halfway between Kufa and Makkah.

#### **4 Conclusions**

The proposed strategy wishes to enhance cultural heritage and identity in landscapes so that they are integrated into assessments of ecosystem services to inform policy-making and physical and spatial planning for the sustainable management of ecosystems and cultural landscapes. The strategic approach shows how to value natural and cultural heritage while developing jobs and growth along the pilgrimage route by developing low-impact tourism, digitalisation, accommodation of tourists and strengthening local traditions to reconnect tourists and pilgrims with their environment, landscape and cultural heritage.

This research contributes to Vision 2030 to enhance the development of tourism through the revitalization of the Islamic, Arab, and national cultural heritage of Saudi Arabia. The Darb Zubaydah pilgrim route represents an integral part of that era in Muslim civilization. Unfortunately, its archaeological features are now suffering from negligence and extinction. It is undoubtedly an infrastructural axis with archaeological sites that deserves the attention and cooperation of the United Nations Educational Scientific and Cultural Organization (UNESCO), the International Council of Monuments and Sites (ICOMOS), and the World Tourism Organization (UNWTO) promoting such destinations rich in historical heritage. This sustainable strategic plan, therefore, requires an integrated approach that can be generalized and applied in other pilgrimage routes and on a global scale.

## Acknowledgments

This research was developed in the Sustainable Architecture Lab (SA Lab) at Prince Sultan University. The author is grateful to Prince Sultan University for the support of the publication.

### Abstract

In this study, we employ topic modeling to systematically explore the platform ecosystem literature and identify emerging trends and potential avenues for future research. By leveraging computational techniques, we uncover hidden thematic structures and patterns in text data, providing valuable insights into the current state of research and pointing towards promising directions for future investigation. Our analysis draws from a comprehensive dataset of academic articles and conference proceedings revealing key themes and trends in the platform ecosystem discourse. We examine the evolving research landscape and synthesize the key findings into coherent topic clusters, illustrating the breadth and depth of the platform ecosystem literature. Our analysis highlights the interdisciplinary nature of the field, encompassing various research domains such as business models, governance, value co-creation, entrepreneurship, among others. Additionally, we identify significant research gaps and unexplored areas that warrant further attention from scholars and practitioners alike. Our study provides a robust framework for categorizing and organizing the platform ecosystem literature, enabling researchers to better understand the underlying connections and relationships between different research streams. This facilitates more efficient knowledge accumulation and dissemination, contributing to the ongoing development and maturation of the field.

**Keywords** – Platform Ecosystems, Literature Forecasting, Topic Modeling.

**Paper type** – Academic Research Paper

## 1 Introduction

Platform ecosystems have emerged as a transformative force in the global business landscape, reshaping the way organizations innovate, collaborate, and compete. These ecosystems, characterized by the interplay between various stakeholders such as platform owners, users, complementors, and third-party developers, have become a central element in modern digital economies. The rise of platform ecosystems can be attributed to the increasing digitization and interconnectedness of firms, as well as the development of cutting-edge technologies that enable seamless integration of products, services, and data. As a result, organizations are increasingly adopting platform-based business models that facilitate collaboration, co-creation, and value exchange among diverse stakeholders (Ceccagnoli et al., 2012). In a platform ecosystem, value is created not only by the platform owner but also by the participants who contribute complementary products, services, and innovations. This decentralized value creation process fosters a more dynamic and adaptable business environment, wherein organizations can rapidly respond to emerging trends, customer needs, and technological advancements. Furthermore, platform ecosystems facilitate greater access to resources and capabilities, enabling organizations to leverage the expertise, skills, and assets of a diverse set of participants. This collaborative approach to innovation and value creation helps organizations remain agile and competitive in an increasingly complex and fast-paced business landscape. As platform ecosystems continue to evolve, they are driving significant changes in the way organizations approach innovation, collaboration, and competition. Traditional competitive strategies based on individual firms' strengths and capabilities are being replaced by collaborative approaches that prioritize shared value creation and ecosystem synergies. Moreover, as platforms become increasingly central to the digital economy, organizations must develop new skills and capabilities to effectively navigate these complex and dynamic ecosystems.

From an academic point of view, as digital technologies continue to advance and integrate into every aspect of modern life, the study of platform ecosystems has become an essential area of research for scholars, practitioners, and policymakers alike. With the rapid evolution of this field, identifying future research avenues and emerging trends is crucial for staying at the forefront of knowledge and driving the development of robust and effective strategies in this domain. Topic modeling (Blei et al., 2003; Blei, 2012) offers a powerful approach

for uncovering new research opportunities and understanding the complex dynamics within the growing body of platform ecosystem literature. Topic modeling has various applications, including information retrieval, document clustering, summarization, sentiment analysis, content recommendation, and trend analysis in large text corpora. The potential of Topic modeling techniques in conducting literature reviews are illustrated in various contributions, particularly in the scientific areas of business and management (Hannigan et al., 2019; Hannigan et al., 2022) and in recent years there has been a flourishing of its applications to uncover latent topics in large sets of academic contributions (Amado et al., 2018; Chen et al., 2021; Harb and Shang, 2022).

The remainder of this paper is structured as follows: Section 2 presents the gradual broadening of the concept between the years 2001 and 2010. Section 3 details the methodology employed for the topic modeling analysis, including data collection, model implementation, and evaluation. Section 4 presents the results of our analysis while Section 5 is devoted to the labelling and interpretation of the identified topics. Section 6 offers a discussion of the results, synthesizing the findings and highlighting opportunities for interdisciplinary research and collaboration.

## **2 Theoretical Background (2001-2010)**

In order to go beyond the Authors' subjectivity in reconstructing the development of scientific thought on the subject, according to the approaches of Tranfield et al. (2003) and Markoulli et al. (2017), the most influential references, briefly discussed below, have been identified by resorting in CitNet of Van Eck and Waltman (2014) which allows to reconstruct, in chronological terms, the networks of reciprocal citations among the contributions retrieved in Web of Science (Figure 1).

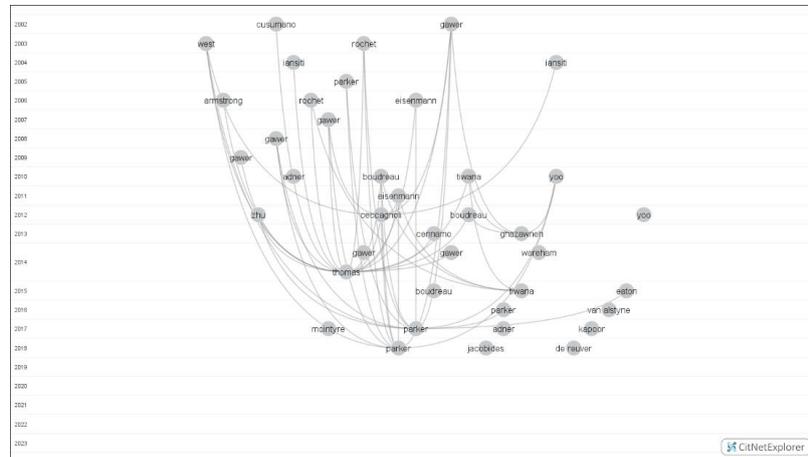

Figure 1 – Evolution of the citation network in the literature (2001-2010)

The platform ecosystem concept emerged in the early 2000s as scholars began to study the dynamics of digital platforms and their interactions with users and other stakeholders. Key contributions during this period include Gawer and Cusumano's seminal work, "Platform Leadership" (2002), that provided an early understanding of platforms as the foundation upon which complementary products and services are built. With reference to Intel, Microsoft, and Cisco, they argued that platform leaders must manage the interaction between the platform and its complementors, influencing the direction of innovation and capturing value from the ecosystem (Gawer et al., 2002). In the same period, the two-sided market characteristic of platforms was considered, to which subsequent literature would largely be dedicated (Jullien and Caillaud, 2003; Rochet and Tirole, 2003). In their seminal paper, Rochet and Tirole (2003) described platforms as intermediaries between two distinct user groups (two-sided markets) that provide each other with network benefits while Jullien and Caillaud (2003) analyze the competition among intermediation service providers in two-sided markets, addressing the "chicken and egg" problem that arises when platforms need to attract users from both sides of the market. Parallely, West (2003) drew the attention to the balance between proprietary and open-source platform strategies, as vendors experimented with hybrid approaches to combine the advantages of open-source software while retaining control and differentiation. West's work suggested the conditions under which such hybrid strategies may be preferable to purely open or purely proprietary alternatives. This work laid the groundwork for understanding platform ecosystems as a new organizational

form. As the concept of platforms matured, researchers glimpsed the broader ecosystem that encompasses the platform and its complementors: Iansiti and Levien (2004) introduced the term "platform ecosystem" and provided a framework for analyzing the relationships and interactions within these complex systems. They emphasized the importance of network effects and the role of keystone firms in shaping the overall health of the ecosystem. The concept of platform ecosystem is further developed by Moore (2006) in his exploration of the strategic implications for firms operating in these environments. He argued that platform ecosystems require a shift in the way businesses approach strategy, focusing on creating and maintaining vibrant ecosystems that generate value for all participants. With the growing dominance of digital platforms, such as Google and Apple, researchers began to explore the implications of these new platform ecosystems. Eisenmann et al. (2006) analyzed the role of "two-sided markets" in digital platform ecosystems, emphasizing the importance of cross-side network effects for platform success. In the meantime, building upon Rochet and Tirole's findings, Armstrong (2005) presented three models of two-sided markets: monopoly platforms, competing platforms where agents join a single platform, and "competitive bottlenecks" where one group joins all platforms. Armstrong's study identified key determinants of equilibrium prices, such as the magnitude of cross-group externalities, the nature of fees, and agents' platform choices. Economides and Katsamakas (2006) further explored two-sided competition between proprietary and open-source technology platforms, such as Microsoft Windows and Linux. They developed a framework to characterize optimal two-sided pricing strategies for platform firms and compared industry structures based on proprietary and open-source platforms. Their research showed that proprietary platforms might offer lower equilibrium prices, but open-source platforms provide a larger variety of applications. In the same year, Hagiu (2006) studied pricing and commitment by two-sided platforms, considering essential bottleneck inputs, the order in which buyers and sellers arrive, and the types of fees charged. Hagiu demonstrated that monopoly platforms might prefer not to commit to buyer prices at the same time they announce seller prices if they face unfavourable seller expectations. Additionally, Hagiu found that commitment affects the likelihood of exclusive equilibria but has no impact on multi-homing equilibria when they exist. Towards the end of the decade, the literature on platform ecosystems began to coalesce around a more comprehensive theoretical understanding of the phenomenon. Baldwin and Woodard (2009) proposed a

unified framework for analyzing platform ecosystems, bringing together the various strands of literature into a coherent whole. Boudreau (2010) shifted the focus to open platform strategies and innovation, studying the different impacts of granting access to a platform versus devolving control. Using data on handheld computing systems, Boudreau found that granting greater levels of access to independent hardware developers could accelerate device development rates, while giving up control of the platform had a smaller incremental effect on development. Tiwana et al. (2010) emphasized the importance of platform evolution and the coevolution of platform architecture, governance, and environmental dynamics. They presented a framework for understanding platform-based ecosystems and identified research questions that offer significant opportunities for contributing to the information systems discipline and other reference disciplines.

### **3 Materials and Methods**

#### **3.1 Data**

We conducted research using the Web of Science (WoS) database, a decision that brought several advantages. Web of Science is a comprehensive and curated platform encompassing a wide array of disciplines and sources such as peer-reviewed journals, conference proceedings, and books. Its curated content ensures that the materials included meet specific quality criteria. Another key benefit of searching in Web of Science is the citation analysis feature, which allows users to track the number of citations a work has received and identify who has cited it. This feature provides insights into the impact and influence of a publication or researcher. Furthermore, Web of Science offers advanced search options and filters, enabling a customized and refined search that leads to more relevant and targeted findings. To ensure a focused and pertinent search, we decided to exclude certain types of publications, such as Early Access articles, Editorial Material, Book Chapters, Corrections, and Book Reviews. By excluding Early Access articles, we concentrated on fully published and peer-reviewed research, which tends to be more reliable and complete. We also left out Editorial Material, allowing us to focus on original research rather than editorials, opinion pieces, and commentaries that may reflect the author's views rather than present new research.

Additionally, we chose not to include Book Chapters in our search. Although they can offer valuable insights, they may not be as current or thoroughly peer-reviewed as journal articles. Excluding Corrections allowed us to concentrate on the original research articles rather than minor updates or clarifications. Lastly, by omitting Book Reviews, we focused on finding primary research articles that directly contribute to the field, instead of critiques of published books.

### **3.2 Methodology**

Topic modeling is a natural language processing (NLP) technique used to discover and extract hidden patterns or themes (topics) from a large collection of documents. Topic modeling algorithms, such as Latent Dirichlet Allocation (LDA) (Blei et al., 2003; Blei, 2012), Probabilistic Latent Semantic Analysis (pLSA) (Hofmann, 2001), and Non-negative Matrix Factorization (NMF) (Xu et al., 2003), work by analyzing the co-occurrence of words within documents and identifying groups of words that frequently appear together. These groups of words, or topics, can then be used to describe the content of the documents. For our application we first cleaned and pre-processed the text data by removing irrelevant information such as html tags, numbers, standard stop words. We also performed stemming or lemmatization to reduce words to their root forms. We also identified the set of custom stop words (e.g.: author, paper, and others) shown in the Appendix. Subsequently, we transformed the cleaned text data into: a) a document-term matrix, where each row represents a document, and each column represents a unique term (word) in the corpus. The matrix elements contain the frequency of each term in the corresponding document; b) a topic-distribution matrix, where each row represents a document, and each column represents the topic it belongs. The matrix elements contain the frequency with which each document is present in the corresponding topic. As algorithm we chose pLDA using minemytext for analysis (Debortoli et al., 2016). The algorithm outputted a set of 20 topics, each represented as a distribution over the terms in the corpus. We analyzed the topics by looking at the terms with the highest probabilities within each topic. These terms helped us characterize and provide a general understanding of the content of each topic.

## 4 Results

Topic modeling provides:

- a Term-Topic matrix (799x20) showing the probability with which all the examined words (in our case, 798 unique words out of 18,590 in total, excluding stop words and custom stop words) are present in each topic, allowing one to infer the content of the topic and label it.
- a Topic-Distribution matrix (345x20) showing the probability with which all the examined documents are present in each topic, in a variable percentage between 0% and 100%. From this matrix, we determine the distribution of topics over the complete collection represented in the figure which demonstrates the greater or lesser attention given to each topic in literature.

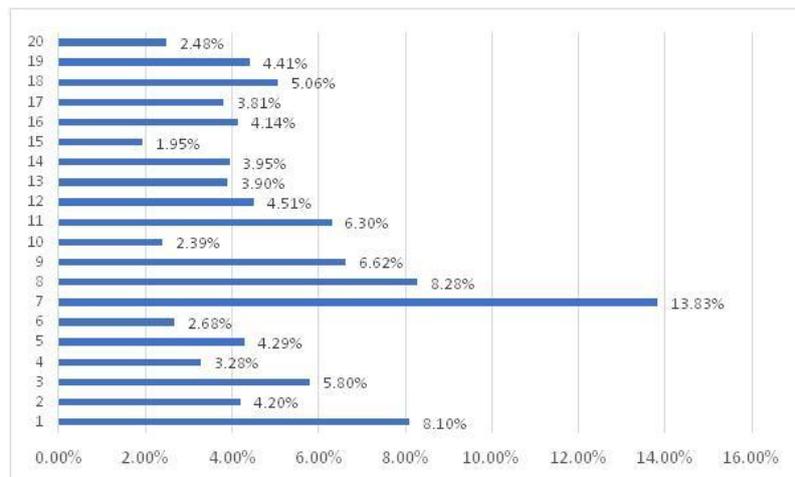

Figure 2 - Distribution of topics over the complete collection

The words characterizing each topic are listed below. Since topic modeling techniques are based on soft clustering, in which each term can belong to several topics, unlike hard clustering techniques, in which each term can belong to only one cluster, it allows to interpret the results with an understanding of the nuances and potential overlap between topics.

1. platform, ecosystem, valu, actor, activ, practic, value\_cocr, framework
2. servic, platform, ecosystem, impact, environ, concept, custom, health
3. data, platform, power, market, polici, govern, infrastructur, competit

4. economi, compani, organ, platform, role, pattern, process, compet
5. firm, platform, dimens, open, produc, content, system, effect
6. platform, evolut, carbon, chang, stage, condit, event, growth
7. platform, ecosystem, strategi, market, develop, particip, case, challeng
8. innov, develop, ecosystem, platform, industri, model, relationship, theori
9. system, model, technolog, data, platform, inform, manag, tool
10. project, campaign, divers, scenario, medium, place, polici, student
11. platform, govern, aspect, theori, attent, cost, concept, work

19. platform, consum, market, valu, invest, model, user, manufactur
20. busi, ecosystem, enterpris, internet, mechan, process, crossborder\_ecommerc, chain

## 5 Labelling topics

The labeling of the topics was conducted using a comprehensive, collaborative approach involving multiple stages. Initially, each author independently examined the data generated from the analysis, which included the bundle of words with their respective percentages and the 10 articles that the machine had attributed to each topic. Based on this information, each author formulated their own interpretation and suggested a potential label for the topic. Once individual assessments were completed, the authors convened in groups to discuss and compare their proposed labels. These group discussions facilitated the exchange of perspectives, as authors shared their rationale for their suggested labels and considered alternative interpretations. The aim of these discussions was to

achieve a consensus on the most appropriate label for each topic, taking into account the various viewpoints presented. In cases where conflicts arose or disagreements persisted, the authors worked collaboratively to reach a mutual agreement. This often involved further examination of the data, considering additional context, or refining the label to better capture the essence of the topic. Through this iterative process, the authors were able to develop a set of agreed-upon labels for each topic. The final list of labels, representing the collective understanding and agreement of all authors, is presented below. These labels serve as a comprehensive and accurate representation of the topics identified through the analysis, reflecting the collaborative effort and rigorous methodology employed throughout the labelling process.

1. Value Co-creation in Business-to-Business Platform Ecosystems
2. Service Platforms: Ecosystems, Impact, and Customer-Centric Approaches
3. Data, Platform Governance, and Market Power in Policy Context
4. Platform Companies: Roles, Patterns, and Processes in the Economy
5. Platform Dimensions: Openness, Content, and System in Firms' Production
6. Platform Evolution: Carbon Changes, Stages, and Environmental Events
7. Platform Ecosystem Strategies: Market Development
8. Innovation in Platform Ecosystems: Industry Models and Relationship Dynamics
9. Technology and Data Management: Models and Systems in Digital Platforms
10. Project Scenarios: Diverse Campaigns, Media, and Policy in Practice
11. Platform Governance: Theoretical Aspects, Attention, and Cost Concepts
12. Business Model Transformation: Industrial Ecosystems and Platform Networks
13. Product Strategies: Platform Market Entry, Firm Dynamics, and Seller Competition
14. Knowledge and Technology: Software Communities, IoT Development, and Collaboration
15. Control and Quality: Governance Mechanisms, Partner Modes, and Access Offerings

16. Complementor Dynamics: Ecosystem Governance, Platform Power, and Resource Management
17. Entrepreneurship in App Development: User Attention and Market Importance
18. Platform App Development: Performance Effects, Mechanisms, and Competition
19. Consumer Value in Platform Markets: Investment Models and User Perspectives
20. Business Ecosystems in Enterprise Internet: Mechanisms, Processes, and Cross-Border E-commerce

The contributions most closely related to the themes of value creation and co-creation (Topic #1) have explored various aspects of value co-creation and engagement: Hein et al. (2019) discuss the importance of collaboration and resource sharing among platform owners, complementors, and end-users to create value in B2B platform ecosystems concluding that trust, commitment, and shared goals play a crucial role in ensuring the ecosystem's longevity and effectiveness while Benz et al. (2021) provide a deeper understanding of actor engagement in value co-creation, emphasizing the dynamic nature of engagement and the need for platform owners to adapt their strategies accordingly. They argue that the degree and quality of actor engagement drive value creation in these ecosystems. Meijerink and Keegan (2019) proposed a new framework for human resource management in the gig economy, emphasizing the need to balance the interests of platform owners, workers, and clients. They argue that platform owners should focus on managing the ecosystem through governance mechanisms while workers and clients should engage in co-creating value and fostering a sense of belonging and commitment. The interplay of strategies and platform ecosystem can be found in Topic #7: in reverse chronological order Kretschmer et al. (2022) produce a fascinating tale about platform ecosystems as meta-organizations. They recognized that these ecosystems consisted of a diverse array of actors, from producers and consumers to complementors and intermediaries. As these actors interacted within the ecosystem, they shaped the rules, norms, and practices that governed its operations. The researchers found that understanding these dynamics could provide valuable insights for platform strategies. Just before, Cenamor and Frishammar (2021) spun their own story on openness in platform ecosystems. They focused on innovation strategies for complementary products and how the

degree of openness could have profound implications for these products' success. They discovered that striking the right balance between openness and control was critical to ensuring both innovation and stability within the ecosystem. Traveling further back in time, Basole and Karla (2011) embarked on a journey to uncover the evolution of mobile platform ecosystem structure and strategy. They examined the way these ecosystems had transformed over time, as well as the strategic decisions that influenced their development. Through their exploration, they found that ecosystem structure and strategy evolved in response to shifts in technology, market demands, and competitive forces.

## **6 Discussions**

Regarding the distribution of topics over the complete collection of documents examined, although all the topics revealed by the analysis play significant roles in understanding platform ecosystems, Topics #7, #8, #1 appear in the literature with greater frequency. The prominence of these topics is indeed crucial for several reasons. Topic #7 drives growth and expansion in new markets, enabling platform companies to reach a broader user base and capitalize on untapped opportunities. By leveraging network effects, platforms can attract more users and partners, creating a virtuous cycle of value creation. Second, market development strategies often involve continuous innovation, which keeps the platform competitive and relevant. This can include the development of new products or services, as well as improvements to existing offerings, ensuring that the platform can meet the evolving needs of its users and partners. Finally, effective market development strategies can foster customer engagement, satisfaction, and loyalty. By understanding and catering to customer needs, platform companies can deliver a seamless user experience that enhances the overall value proposition of the platform, leading to increased customer retention and long-term success. Innovation (Topic #8) plays a prominent role in platform ecosystems, particularly as it relates to industry-specific models and relationship dynamics. Industry models can serve as blueprints for platform development and growth, offering valuable insights into best practices, trends, and competitive landscapes. By understanding these models, platform companies can adapt and tailor their strategies to suit the unique characteristics of their target industries. Moreover, relationship dynamics within platform ecosystems can significantly impact the pace and direction of innovation. Collaborative relationships between

platform stakeholders, such as users, partners, and complementors, can foster a conducive environment for knowledge sharing and co-creation. Such collaboration can lead to the development of new products, services, and technologies, as well as improvements to existing offerings. By nurturing these relationships, platform companies can effectively harness the collective expertise and creativity of their ecosystem to drive innovation and growth. Value co-creation (Topic #1) is a key aspect of business-to-business (B2B) platform ecosystems, as it highlights the importance of collaboration and joint efforts among various stakeholders in the value chain. The prominence of value co-creation in B2B platform ecosystems can be attributed to several factors. First, B2B platform ecosystems often involve complex interactions among numerous stakeholders, each with their expertise, resources, and capabilities. By engaging in value co-creation, these stakeholders can leverage their unique strengths and knowledge to develop mutually beneficial solutions. Second, value co-creation can lead to increased efficiency and effectiveness in the ecosystem. By working together, stakeholders can identify synergies, streamline processes, and reduce redundancies, ultimately leading to better outcomes for all parties involved. Finally, value co-creation fosters innovation and competitiveness, as stakeholders can collaborate to develop new products, services, and business models that address the evolving needs of the market. This can give B2B platform ecosystems a competitive edge and drive long-term success.

Regarding the topics less present in the literature (#15, #10, #20 they are less present in the literature mainly because they focus on more specific aspects of platform ecosystems: Topic 15 (Control and Quality: Governance Mechanisms, Partner Modes, and Access Offerings) discusses governance mechanisms and partner modes in platform ecosystems, which are narrower aspects of the broader platform governance topic. This topic tends to be covered in more specialized literature, as it is more relevant to platform practitioners and experts who are interested in the detailed implementation of governance structures. Topic 10 (Project Scenarios: Diverse Campaigns, Media, and Policy in Practice) concentrates on specific cases and practical examples of platform projects. While these practical insights are essential for understanding the real-world implications of platform strategies, they may not be as widely discussed in academic literature, which often emphasizes theoretical foundations and broader principles. Topic 20 (Business Ecosystems in Enterprise Internet: Mechanisms, Processes, and Cross-Border E-commerce) addresses business ecosystems in the context of enterprise

internet and cross-border e-commerce. This topic is narrower in scope compared to other topics that discuss more general platform ecosystem concepts. Additionally, the rapid pace of change in the e-commerce landscape might lead to a scarcity of long-term studies and comprehensive analyses in this area.

### Abstract

This research work is part of the emerging paradigm outlined using phygital approaches for the experimentation of innovative forms of use of the *Cultural Heritage*. The conceptual framework outlined is the field of investigation in which the cultural-based experiences that combine the proposition of physical and digital value in a national and international area are explored from a managerial point of view. The research objective is pursued through a qualitative approach that aims to provide a theoretical understanding and explanation of the phygital phenomenon in the cultural sector. The innovativeness of the proposal is expressed in the comparative analysis of the selected cases, with the purpose of identifying best in class and prospects for improvement. The research's findings highlight that the phygital formula can take on different characteristics depending on the

technologies used and the purpose to be achieved and can be a useful tool for the co-creation of cultural value.

**Keywords:** Phygital, Cultural Heritage, Digital Technologies, Value Co-creation

## **1 Introduction**

In a glocal scenario where organizations are called to offer value on a global and local scale, the use of the most modern and innovative technologies is a driving force for organizations. In the cultural and creative context, the emerging needs of the subjects see an integration of their actions with other stakeholders, through digital communities of the community without spatial barriers, in an increasingly hyper-connected world, thus requiring management capable of associating the functions of cultural heritage to the development of quality visitor experiences (Bec et al., 2019). In this direction, modern digital technologies are an indispensable tool for designing cultural itineraries capable of providing dynamic approaches to cultural-based fruition (Sfodera et al., 2020). The management of a systemic approach for the enhancement and use of cultural experiences based on intelligent digital and virtual systems is expressed in the activation of value co-creation processes (Kelly et al., 2017) that allows new forms of interaction and collaboration between the various stakeholders and in particular between value-creating organizations and customers in the development processes of new products and services (Füller et al. , 2009) based on culture. This research work aims to explore a range of selected case studies that have implemented the phygital approach to create and co-create cultural and participatory value with all the stakeholders involved.

## **2 Literature review**

### ***2.1 The use of innovative technologies in the cultural and creative sector***

In a society daily overexposed to the use of technologies, scholars and practitioners are called to deal with rapid social, cultural, and environmental changes. In this direction, technological innovations imply a paradigm shift in the design of value creation processes that organizations convey to their stakeholders.

In the cultural and creative sector, cultural organizations are paying increasing attention to the challenges and pressures arising from the environment in which they are placed, consistent with the complexity of the hypercompetition of the contemporary scenario. In this direction, the use of the most innovative technologies plays a fundamental role in ensuring innovation and authenticity in shaping value for its stakeholders (Chung et al., 2015), implying the need for adequate tools and capabilities (Sfodera et al., 2020). In the same way, the innovative technological component also has a considerable impact on the user experience, intervening in the pre visit, during visit and post visit of visitors. The interplay between the use of innovative technologies and the proposition of cultural value is the subject of numerous studies related to the managerial field (Antoniou & Lepouras, 2010, Russo-Spena et al., 2021). The potential through which innovative technologies intervene in the processes of creating cultural value, including preserving, enhancing, inform, educate visitors to the cultural experience, and provide opportunities for visitors to interact proactively with the cultural organization. The managerial literature reveals wide attention to the use of innovative technologies for the involvement of its stakeholders through the design of proactive and interactive processes that follow the logic and dynamics of multidirectional interaction between the organization and the different stakeholders that gravitate in its orbit. A clear example of this is the emphasis placed by scholars on the increasing application of Augmented Reality in cultural contexts (Do et al., 2020), on a par with Virtual Reality (Williams & Hobson, 1995). In reference to the design of structured fruitive experiences on the components of augmented and virtual reality, it is interesting to note the evolution about the perception that cultural management has had of their use. Despite the initial hostility due to the interpretation of these tools as potential alternatives to museum visits (Guttentag, 2010), recent studies reveal an increasing use of these technologies by cultural organizations in line with the attractiveness and multidimensionality on which they are based, able to effectively involve visitors (Passebois-Ducros, 2019).

The managerial literature reveals important contributions also in reference to the planning of exclusively virtual fruitive experiences in the forms of Virtual Tours (Caspani et al., 2017), able to reach audiences distant from the cultural value by type, origin and preferences. Further output related to the use of innovative technologies in the creation of cultural value is the definition of strategic and operational trajectories in digital environments, with particular attention to the

use of social media. Recent studies reveal that social media are particularly influential in the relationship between users and subjects related to culture (Vassiliadis & Belenioti, 2017; Liang & Martin, 2021; Maniou, 2021). Digital environments represented by social media and technology platforms are a powerful tool to support cultural management. The benefits of developing and implementing technology driven projects such as digitalization and virtualization are in fact multiple.

The use of innovative technologies provides complex information about the target achieved, allows you to profile it and also to intercept the socio-demographic and behavioral characteristics of users (Gargiulo & Carignani, 2022).

As evidenced by the proposed contributions, the literature on the dialogue between contemporary needs and the management of cultural heritage highlights the role-played using technology in the creation of innovative cultural experiences, as well as in the level of competitiveness of the organizations that use it and the territories in which they are located (Greco, 2022; Russo-Spena et al., 2022).

## ***2.2 The role of phygital formula in shaping cultural value***

The ability of digital technologies to overcome physical environments by projecting complex systems of intuition and involvement in a web of physical and digital contexts (Mele & Russo-Spena, 2021) reflect a novel architecture of the interactions between the value-creating enterprise and the target audience/consumers to whom the value is destined. It is within this paradigm that fits the phygital approach, whose conceptualization responds to a link between the digital functions and the physical experience of the customer and vice versa (Batat, 2020). The interest of the scientific community towards this emerging phenomenon is remarkable (Debono, 2021; Mele et al., 2021; Greco, 2022; Mieli, 2022) and highlights the opportunities that the phygital approach represents for organizations that choose to apply it.

The declinations to which this conceptualization opens are complex and multiple, and reflect the social, cultural and economic changes that have recently occurred on the national and international scene (Mieli, 2022).

In the cultural and creative sector the emerging hybrid logics of visit and relationship with the public of is able to transform define new scenarios of protection, conservation, and cultural enhancement (Carignani et al., 2023). The

design of visit experiences based on the dialogue between physical and virtual environment involves a growing number of actors and stakeholders (Sahasranamam & Soundararajan, 2021; Del Vacchio et al., 2020) even less sensitive to art and culture, such as young adults, tending to activate online and offline interactions during the visit and enjoyment of the cultural experience (Combes, 2009; Mele et al, 2021). The key to understanding the structures of the phygital formula and the superstructures through which this formula can attract and engaging current and potential audience of visitors lies in the strong involvement that is active. This approach, in fact, through the logic of involvement on which it is structured (Lee et al., 2018; Bec et al., 2019; Little et al., 2020), reflects an effective response to the need to value with innovation the tourist experience (Ballina et al., 2019) and cultural. Recent studies show that the enjoyment of phygital experiences is associated with asset values such as immediacy, immersion, and interaction (Taheri et al., 2019). In this direction, the result of the overlap between physical experiences and virtual or digital dimensions is a fruitive experience characterized by its uniqueness, rarity, and memorability (Johnson & Barlow, 2021). Furthermore, the results that can be achieved using this approach, from a management point of view, consists of elevating the quality of the cultural experience because each stakeholder involved generates, collectively, a value greater than the sum of the value created by each if single (Pera et al., 2016).

As evidenced above, the literature focused on the emerging phygital paradigm highlights an intrinsic link capable of canceling the distances between the physical experience of fruition and the use of the functionalities given by technological innovations (Virgo et al., 2019, Batat, 2020).

### **3 Methodology**

To investigate the promising connection between cultural industries and phygital technologies, the authors adopt a qualitative approach (Dubois & Gadde, 2002) and, considering the purpose of the present contribution, five cultural enterprises are analyzed following the case approach of multiple study (Ying, 2013). The authors also made use of secondary sources such as interviews, website content, social media pages, and industry reports (Creswell & Creswell, 2017).

The five selected cases are the Ara Pacis Museum, the National Archaeological Museum of Naples (MANN), the Australian Center for the Moving Image (ACMI), the Jean Paul Getty Museum and the Tate Modern in London. These subjects all pertain to the cultural sector although they present different characteristics linked to size, collection, and geographical location. Furthermore, the choice fell on these subjects also for the type of activity they share in the approach to digital technologies and, as it will be seen, to technologies that exploit a phygital approach, thus presenting some differences and similarities.

#### **4 Findings**

The phygital approach makes it possible to build a holistic experience where the tangible and intangible dimensions of cultural heritage merge. Nevertheless, a phygital cultural ecosystem cannot present univocal elements due to the large number of technologies that can be implemented and the different aims that can be achieved.

The projects carried out by the five organizations analyzed make use of different technologies to enrich the visitor experience and to propose a new and interactive way of learning, contributing to the co-creation of value.

At the end of the section, a summary table is proposed to make the main activities of each selected cultural institution more intuitive, including the best in class with which they exploit the opportunities arising from the phygital approach.

The Ara Pacis Museum is a museum built around the Ara Pacis in Rome, With the project *L'Ara com'Era*, citizens and tourists can enjoy an innovative experience thanks to the combination of different technologies and the creation of virtual worlds in which both real characters and computer-generated reconstructions are inserted. Using special AR visors (Samsung GearVR) and the camera of the devices inserted in them, virtual and real elements merge directly into the visitors' field of vision (arapacis.it). The virtual content appears to the visitor as anchored to the real objects, contributing to the effectiveness and immersiveness of the entire experience, approaching new and younger target groups and creating added value for the audience.

National Archaeological Museum of Naples (MANN) is an international player with the mission of preserving and enhancing ancient artifacts from Egyptian, Greek, and Roman culture. The museum uses immersive technologies for many of

its temporary exhibitions to make the visit more dynamic and to propose new interactive learning models. One example is the Nuragica exhibition, which included an immersive tour entirely dedicated to the archaeology of Sardinia and specially designed to bring it closer to a wider audience.

The ACMI is the Australian national museum of cinema, television, video games and art and has the history of the moving image as its main theme. It has developed an innovative multi-platform model whereby customers can engage with the museum and enjoy the exhibitions in different forms and contexts. Thanks to a new experience operating system (XOS) and appropriate storytelling, the museum can offer an integrated journey that extends and enriches the visitor's experience, making it highly accessible and more multi-faceted.

The Getty Museum is divided into two locations (Getty Center and Getty Villa), both in Los Angeles, one of which (Getty Villa), in Malibu, mainly houses works of ancient art. During the pandemic caused by Covid-19, the museum promoted a challenge on its social channels that encouraged users to reinterpret one or more masterpieces housed at the Getty. Through this challenge the museum showed a virtual complement to its physicality and an effective marketing tool to increase its brand awareness. Thanks to this initiative, the museum has made users prosumers, because they are both users and creators of content, and was able to promote its vast artistic heritage.

The Tate Modern is in London and is part of the complex of the four Tate museums and is focused on modern art, with a very high number of visitors who qualify it as the most visited modern art museum in the world. The museum is at the forefront of the use of new technologies that can provide the viewer with new keys to understanding the works on display. The use of artificial intelligence is adopted in various exhibitions to make works of art sensitive to stimuli from visitors so that they can react to their surroundings and create interactions with the public. Tate Modern therefore can offer a visiting experience in which digital technology is an inherent component, allowing the viewer to become a protagonist of the artwork.

Table 1. Phygital projects best in class carried out by cultural institutions

Country	Name	Main Activity	Phygital projects
Italy	Ara Pacis Museum	Protect, preserve, and enhance the monument of the Ara Pacis through its musealisation.	Implementation of AR, VR and 3D technology to recreate the monument as it was in antiquity.
Italy	Archaeological National Museum of Naples (MANN)	Develop and disseminate knowledge through the conservation and enhancement of ancient artifacts.	Design of an immersive tour using Virtual Reality to create a chronological and multisensory journey in which works of art seem to come alive.
Australia	Australian Centre of the Moving Image (ACMI)	Celebrate and enhance the moving image and its profound impact as it transports, challenges, and entertains people of all ages and backgrounds, right across the globe.	Implementation of a multiplatform model powered by a new experience operating system (XOS) that offers a deeply integrated journey and enriches the visit.
California	Getty Museum	Inspire curiosity about and understanding of the visual arts by collecting, conserving, exhibiting, and interpreting works of art of outstanding quality and historical importance.	Use of social media to invite virtual visitors to reinterpret and perform the great masterpieces of art history during the lockdown caused by the Covid-19 pandemic.
United Kingdom	Tate Modern	Share and celebrate the artwork collection to deepen understanding of its importance and promote it to the world.	Use of Artificial Intelligence (AI) in an art installation to make the works receptive to sensory stimuli in the space and to the warmth of visitors' bodies.

Source: Author's elaboration

## 5 Implications

The originality of the contribution lies in the comparative analysis proposed among the selected case studies, of which it is intended to intercept best practices and prospects for improvement of an emerging phenomenon in the management literature of the cultural sector.

From a theoretical point of view, this paper contributes to the debate on the application of the phygital approach in the cultural sector. The literature review highlights that interest in phygital practices is on the rise, although the empirical cases are still lacking. From a managerial point of view, the present study highlights how the fusion of the physical and digital environment is of great relevance for cultural enterprises as it participates in the generation of new value propositions for the different types of stakeholders involved. In particular, the impact that the phygital formula can have on customers is pointed out, to understand how it can be integrated at the management level for the enhancement of cultural heritage.

## 6 Conclusions

This work wants to be the starting point for an ever-greater study of cultural dynamics using a phygital approach. If on the one hand the budgets of the institutions still seem to be ill-suited to these investments, on the other these technologies are becoming increasingly accessible to cultural subjects. The Covid-19 pandemic has certainly contributed to speeding up these processes. If the cultural sector is therefore extremely lively and open to new technologies, however, the core of personnel remains, often not very specialized in interacting with these tools. In this sense, the advent of the Metaverse could be another factor in the strong development of new technologies, increasing more and more the phygital approach, and facilitating the formation of real cultural communities, capable of making these institutions live not only as simple places, venues for art collections, but as actors capable of uniting and supporting the creation of new and shared values.

## **Abstract**

Immersive multimedia exhibitions – which are based on digital images, light effects, and soundtracks – are developing in most of museums worldwide to enhance the customer experience. However, not all visitors such as disabled people can enjoy them. Previous studies that have so far examined the accessibility and inclusion of disabled people in museums are very few. This research aims to investigate how I4.0 can guarantee inclusiveness and accessibility of disabled people in immersive multimedia exhibitions. In this purpose, a single case study engaged in good practice was performed by examining an immersive multimedia exhibition in Italy. This study provides specific aspects and solutions devoted to more inclusiveness and accessibility that could serve as a starting point for designing future immersive multimedia exhibitions. The results of this research have theoretical and practical implications.

**Keywords** – Technology, Inclusiveness, Customer experience, Museum, Immersive exhibitions

**Paper type** – Academic Research Paper

## **1 Introduction**

Most of museums are re-inventing their experiential offering to broaden their attractiveness (e.g., Batat, 2020). Technologies are adopted to enhance the customer experience (e.g., Neuhofer et al., 2014) such as interactive devices and websites, social media, mobile applications, as well as augmented and virtual reality (e.g., Bird et al., 2022; Trunfio et al., 2022). Also, multimedia technologies such as museum exhibitions and, especially, immersive multimedia exhibitions are developing in museums to enhance the visitors' experience (e.g., Luo, 2020) by creating an interactive experience to disseminate knowledge and culture. They are based on digital images, light effects, and soundtracks that are projected and spread in a physical space where the visitor moves.

These exhibitions provide unique and memorable experiences for their visitors. However, not all customers can enjoy them such as disabled people because the space, installations, and the employed technology do not meet their specific needs.

Previous studies that have so far examined the accessibility and inclusion of disabled people in museums are very few (e.g., Devile and Kastenholtz, 2018; Loureiro et al., 2019; Vaz, 2020). Only few academic contributions are starting to investigate the adoption of immersive technologies in this research field (e.g.,

Devile and Kastenholz, 2018; Loureiro et al., 2019). Thus, further research is needed about issues related to inclusiveness and accessibility because millions of people worldwide are temporarily or permanently impaired. Thus, the following research question emerges: How can I4.0 guarantee inclusiveness and accessibility of disabled people in immersive multimedia exhibitions?

This study aims to answer this question by exploring a single case study engaged in good practice. Especially, it takes in account an immersive multimedia exhibition in Italy by aiming to examine specific aspects and solutions devoted to more inclusiveness and accessibility that could serve as a starting point for designing future immersive multimedia exhibitions.

The structure of the paper is as follows. After presenting the theoretical background, the method is described, as well as the results are analysed and discussed. The study concludes with implications, limitations, and future research lines.

## **2 Theoretical background**

Digital, visual and information technologies are transforming all service experiences (Bogicevic et al., 2019). Technologies such as the Internet of Things, near-field communication and artificial intelligence are assisting the service industry to create unique and memorable digital experiences. In this perspective, technology is not a mere tool, but an integral part of the organization in creating a compelling customer experience. In this regard, Frochot and Batat (2013) argued the importance of engaging multiple senses to provide atmospheres that deliver an immersive experience involving feelings and senses. Different physical elements can help to produce atmospheres. For example, the Guinness Storehouse, a former Guinness brewery, has been transformed into a visitor attraction interpreting the history and production of Irish heritage. Innovative interactive technologies offer visitors the chance to smell, touch, see and taste the beer, creating a unique experience through interaction with the environment, named 'landscape of experience' or 'experiencescape' (O'Dell, 2005; Prahalad and Ramaswamy, 2004; Mossberg, 2007). It includes functional spaces enabling the interaction among different stakeholders and capturing the totality of how experiences are produced and consumed in a meaningful whole. It takes an endless number of forms and can manifest itself in cultural expressions such as song, dance, music, and art (O'Dell, 2007). For instance, many former

manufacturing sites in cities have been converted into art galleries or exhibition and entertainment centers, with new aesthetical components and their initial functions replaced by new ones (e.g., Xie, 2015).

Previous studies that have so far examined the accessibility and inclusion of disabled people in museums are very few. For example, Vaz (2020) proposed a framework that combines sensory, intellectual, and physical access into the pre-visit, on-site visit, and post-visit phases of interaction with cultural institutions to promote a sense of autonomy across these people. Furthermore, scholars and practitioners should pay more attention to the role of technology (e.g., Freeman et al., 2016) and, even more, to the adoption of immersive technologies in this research field. In this last regard, Loureiro and colleagues (2019) argued the importance of reducing the negative impacts of tourism using immersive technologies by investing in alternative accessible experiences such as virtual museum experiences. Accordingly, as Devile and Kastenholz (2018) claimed, more inclusive approaches to museums can be provided to promote individual and social well-being. Indeed, the International Council of Museums (ICOM) established that museums invest in safeguarding and communicating their collections to the audience and performing social functions that are the core of their existence. Therefore, further theoretical and empirical research is needed about issues related to inclusiveness and accessibility, which can concern millions of people worldwide because of temporary or permanent impairments during their lifetime.

### **3 Method**

In methodological terms, an explorative study was conducted, by employing a single case study (Corbin and Strauss, 2015) as research approach because it enables in-depth study of a contemporary phenomenon in its real-life context (Yin, 2017). In this regard, the immersive experience of Van Gogh at the Church of San Potito in Naples was considered as case study.

This multimedia immersive exhibition proposes the Dutch painter's flair lives again through an impressive multimedia experience, ready to enchant visitors of all ages once again. An exciting journey for its modern form of technological expression and surprising originality, capable of attracting and involving a heterogeneous audience, from art enthusiasts to young students. "The Immersive Experience" offers people a more unique than rare opportunity: that of literally

inhabiting Van Gogh's works, observing them one by one from a privileged perspective. Indeed, from a multiple perspective: the heart of the exhibition is in fact represented by a room in which 350 masterpieces by the Dutch artist are projected on a loop.

The case study adopted for the analysis allowed in-depth examination about how technologies can allow disabled people to participate to – and receive – an immersive experience. In addition, it provides scholars and practitioners with theoretical understanding of this phenomenon that can be useful for other cases (Yin, 2017) and inspire new ideas (Siggelkow, 2007).

In terms of data collection, an in-depth interview to exhibition managers was performed to propose solutions devoted to more inclusiveness and accessibility that could serve as a starting point for designing future multimedia immersive exhibitions. This method enabled to obtain many ideas and impressions about the topic under investigation by understanding individuals' perceptions and attitudes toward a phenomenon (e.g., Krueger and Casey, 2000). Informants were chosen for their knowledgeability in the topic under investigation as well as their availability to participate to the interviews. The interview guide was designed based on the main themes of the research question. Two interviews were conducted in March 2023. They were conducted by following a conversation with purpose approach, which allows interviewers to vary the detail of the answers, as well as the order of the questions. According to the interpretivist approach, the interview can be seen as a "socially constructed event" (Caruana et al., 2014, p. 120) in which the researcher/interviewer acts as an expert facilitator who stimulates the respondents. The interviews have been undertaken to learn about how the activity of immersive experience is created and specific aspects devoted to more inclusiveness and accessibility. The interviews were digitally recorded, later transcribed, and then checked for accuracy. The recording of the interview made it easier to focus on the interview content and the verbal prompts and thus enables the transcriptionist to generate "verbatim transcript" of the interview. The exhibition's website was used as further source of data collection. All the information that were collected were joined to create the dataset that was used during the next analysis phase.

In terms of data analysis, a series of iterative coding and analysis were conducted by three authors independently to triangulate the initial results. This approach was aimed at reducing the subjective interpretations of the researchers

(Flick, 2000). These independent analyses were then compared collectively to identify the major themes emerged from the interviews.

As a result, narrative constructs about the main topics of the study emerge and are in the following section proposed. This study represents the first step of an on-going research.

## **4 Results**

The main findings emerged from the interviews are related to three themes: a) experiential aspects of immersive exhibition, b) the role of technology in terms of customer experience enhancement, and c) immersive exhibition devoted to inclusiveness and accessibility.

### **4.1 Experiential aspects of immersive exhibition**

The exhibition is immersive as it brings the visitor inside the paintings and life of the painter, as one of interviewees said:

*"It is the Church itself that becomes the protagonist, comes to life, imbued with the greatness of a genius without time, space or borders. Everything comes alive: the walls, the floor, the doorposts, the arches, the faces of the enraptured witnesses of a unique spectacle. A soundtrack always perfectly in tune with the images as they flow by, contributes to the incomparable atmosphere."*

Compared to the exhibition already presented in Belfast, Madrid, Dublin, Atlanta and Washington, the Neapolitan exhibition is particular for some aspects of the exhibition itself that are not found in the other exhibitions, such as the attention to the part of Parisian life lived by Van Gogh, when he goes to Paris to live with his brother Theo. These years are the most prolific but, at the same time, they are also the years that lead him to mental collapse. In fact, inside the Neapolitan exhibition there is a reconstruction of the asylum of Saint Paul, where the painter voluntarily decides to be hospitalized. He went from a missionary lifestyle, working in mines in Belgium to evangelize miners and farmers, to a bohemian life in Paris where he was introduced into the circle of the greatest artists of the time.

The experience is a total immersion in the world of Van Gogh. The exhibition is much larger, as great attention has also been given to the didactic part, because before arriving at the immersive room there are a series of corridors and panels

that trace the life and works, by giving attention to the Parisian period. One of the interviewees explained that the rooms are placed on two levels:

*"The first is dedicated to the period in which Van Gogh decided to create a community of painters, and this is due to the fact that the painter seeing a yellow house falls in love with it and believes that yellow is the color of happiness and sees in that house a reference point for painters who could find themselves there and paint together. Then, inside the exhibition there is the reconstruction of the bedroom (which is mainly used as a place for selfies) in Arles to let the visitor enter the picture and immerse himself in the work and life of the painter. Much attention is also devoted to the Japanese period of Van Gogh, who is credited with having opened the doors of European painting to Japanese. So, you can see a choice of more saturated colors and not brighter.*

*At the second level, one can watch a five-minute documentary that sheds further light on the painting techniques used by the great Dutchman."*

The other interviewee added as follows:

*"The inscriptions, quotations, a warm and welcoming narrator's voice hurl the spectator into the dreamlike universe of a character who was as misunderstood, even despised in life as he is admired, sometimes idolized now."*

Other rooms, less evocative but equally interesting, offer patrons the chance to admire the Flemish artist's most representative paintings. In yet another one, young and old can try their hand at creating and coloring works to take back with them as a souvenir of their visit.

#### **4.2 The role of technology in terms of customer experience enhancement**

In the multimedia immersive exhibition of Van Gogh in Naples several technologies play a crucial role. The technology is based on the latest generation projectors, which enable to see high resolution images, and on the use of the Dolby Surround system, as one of the interviewee argued:

*"Inside the exhibition, the audio is distributed in the room in the same way, so that it is always the same, regardless of point of the room in which the visitor places. In other terms, no points are with louder or lower sound."*

In order to create immersive experience, music is fundamental, as the other interviewee explained:

*"The music is very important. In this regard, the musician Thomas Dorsan C., looking at the paintings, has specifically composed multiple music for the exhibition. The music, produced for each painting, contains the notes that the musician felt most similar to the painting taken as an object."*

In addition to video mapping, a virtual reality section enables the visitor, wearing the latest generation oculus, to see through Van Gogh's eyes, intent on observing the world and drawing inspiration from the landscapes most familiar to him for his works. Through virtual reality, it is possible to enter right into the mind of the author, trying to imagine at least for a fleeting instant the effect he would make. In the following excerpt of the interview, another specificity of the Neapolitan exhibition emerges to create immersion:

*"A latest generation technology is used to project a 10-minute film, which allows the visitor to experience the most total immersion. Compared, for example, with Monet's experiential exhibition, which inside the oculus gives the visitor the opportunity only to admire the landscapes, Van Gogh's Neapolitan exhibition is based on a detailed reconstruction of the painter's feelings while he was painting. This reconstruction was possible thanks to the testimony provided by the correspondence that the painter exchanged with his brother. In particular, it was possible to choose the letters in which the painter expressed his feelings and transform them into a form of narration that visitors listen to while participating in the film thanks to virtual reality, which describes the picture or his life. A very detailed philological work has therefore been done."*

#### **4.3 Experiential aspects of immersive exhibition**

Van Gogh Experience interacts with the observer, takes him by the hand and invites him to enter the painting. Despite this, this exhibition is designed as immersive for all, disabled people included, such as visitors with impaired vision, hearing, and mobility, as one of the interviewees told:

*"Groups of blind people visited the exhibition, but they were able to listen to the music, which, as anticipated, is intended to represent the individual works. In addition, some of the exhibition's escorts had the task of explaining the images. Thanks to music and explanations, visitors with impaired vision can have feelings and emotions."*

*Visitors with impaired hearing also visited the exhibition. They had the opportunity to observe and immerse themselves in the exhibition."*

For people with disabilities, a special protocol is followed in order to go beyond their disability to enable these visitors to enjoy the immersive exhibition. In particular, one of the interviewees spoken as follows:

*"Since at the entrance of the exhibition there are stairs, we have provided a different entrance for people with disabilities. Unfortunately, architectural barriers cannot be overcome in order not to damage a historic site such as the Church of San Potito in Naples. Although visitors with disabilities enter through a different entrance, they are then accompanied to the beginning of the exhibition so that they can follow the same path as other visitors."*

In this regard, this further reflection was added:

*"Surely the exhibition is enjoyable but obviously depends on the disability that affects different people, because the exhibition, for a total immersion of the visitor, needs the mixture of images and music. Given that the immersion creates excitements, also people with disabilities can have feelings and emotions."*

In order to make further immersive this exhibition, the managers told their intention of add olfactory and tactile experiences in addition to those visual and auditory, so as to have a 360 per cent immersion of the visitor and, especially, make more inclusive the immersive exhibitions for people with disabilities, through the stimulation of the other senses. In this regard, technology will be once again extremely important:

*"The technologies that could be used are electrodes or electro stimulators, room perfumers within the ventilation system, or sensors that release a certain scent upon arrival of the visitor."*

## **5 Discussion, implications, and conclusions**

In line with previous studies (e.g., Frochot and Batat, 2013; Bogicevic et al., 2019; Luo, 2020), the case examined highlights how immersive multimedia exhibitions enhance the visitors' experience by creating an interactive experience that is aimed at disseminating knowledge and culture. In this regard, experiencescape and technology play a crucial role.

The interactions that each visitor can create with the environment are multiple. As some scholars argued in literature (e.g., O'Dell, 2005; Prahalad and

Ramaswamy, 2004; Mossberg, 2007), the design of experiencescape enables visitors to be experientially captured in a meaningful whole. Images, lights, colours, and sounds are specifically designed to create a unique experience.

In addition, the results presented emphasize the role of technologies such as digital images, light effects, and soundtracks to create the immersion effect, because they involve feelings and engage multiple senses, as the interviewees told. The findings empirically support previous studies (e.g., Freeman et al., 2016) that emphasize the importance of paying more attention to the role and adoption of immersive technologies in this research field. This aspect is currently developed using virtual reality, thus it is in line with some recent studies (e.g., Trunfio et al., 2022).

In particular, this case enables to outline how some specific aspects and solutions related to the experiencescape design and use of technologies are devoted to more inclusiveness and accessibility. As previous research discussed (e.g., Vaz, 2020), disabled people enjoy immersive experience when they have sensory, intellectual, and physical access into the on-site visit. The results proposed highlight a significant form of attention and care towards this market segment that can equally benefit from some experiential aspects that are the subject of the exhibition provided, if it is carefully designed. In line with studies of Devile and Kastenholz (2018), the case described is an example of inclusion because it promotes individual and social well-being.

This study provides relevant theoretical and practical implications. From the theoretical point of view, this study contributes to open debate about inclusiveness and accessibility in museums, which are still very scarce in literature. This research provides practical evidence that the integration of digital images, light effects, and soundtracks during the multimedia immersive exhibitions can be designed for all visitors, visitors with impaired vision, hearing, and mobility included. In addition, this research extends previous studies about inclusiveness and accessibility in museums and exhibitions (Devile and Kastenholz, 2018), by showing that disabled people can enjoy immersive experience. Especially, in line with past studies (e.g., O'Dell, 2005; Prahalad and Ramaswamy, 2004; Mossberg, 2007; Freeman et al., 2016), this research theoretically supports the importance of experiencescape and technology to enhance visitors' experience with and without disability. Given that the disability does not enable to fully enjoy experience, different elements can be designed to stimulate important emotions in the visitors with disability as physical (e.g., specific access to the exhibition free of

architectural barriers), and social (e.g., storytelling to tell what other visitors can see) elements.

From the practical point of view, this research highlights that the proper type of design technologies can potentially offer visitors a more immersive visit. Our findings suggest that increasing immersive scenes can effectively improve visitors' perceived virtual presence and ease the processing of mental images. Practitioners should pay special attention to using this unique digital AR resource to design a small set of virtual features that are compatible with many products to enhance visitor experiences.

Innovative technologies such as AR can use a digital display to make images more concrete and realistic, which could be compelling. The implementation of new technologies should not only be accompanied by guidance, such as contextual cues to transport tourists to the appropriate environment for optimal understanding of the information, but should also leave room for inclusion and accessibility, to enable even people with disabilities to get a full immersive experience. Although the arts have been acknowledged as a means of cultural transmission, connection and sustainability within particular cultural groups, they have also been recognised as a place for cultural convergence in which different cultural groups and practices come together (Gibson and Connell, 2012). McHenry (2011, p. 42) found that the arts attract "diverse segments of the community" and "bring out many more people".

In order to improve the inclusivity and accessibility aspects of the exhibition, locations must be chosen where there are no architectural barriers, whereas at the Church of San Potito, being a historical site, it was not possible to overcome the architectural barriers, and therefore a different entrance was set up for people with disabilities. Although they enter through a different entrance, they are then accompanied to the beginning of the exhibition so that they can follow the same route as the others, but this is a substantial difference especially in terms of time spent. It is important that disabled people do not feel themselves different or uncomfortable about their disability. In other words, it is important that they are treated like other visitors, so it is advisable not to create different exhibition routes, but as in the case examined, there was only the possibility to establish an alternative route that remain for the visitor with disabilities to overcome the physical barrier, so as to enjoy the exhibition like other visitors.

This study has several limitations that can represent future research opportunities. First, the analysis is based on an in-depth investigation of only one

case of a multimedia immersive exhibition located in Italy. Future studies could expand the analysis to include other multimedia immersive exhibitions in Italy and abroad to detect best practices in the inclusiveness and accessibility perspective. In this regard, an empirical survey with in-depth semi-structured interviews to managers worldwide could be conducted and interesting comparisons could be gathered up with reference to similarities and differences across countries and in relation to different segments of disabled people.

## Needing Less to Have More: Sustainability and the Aesthetics of Restraint

---

Clemens Kerschbaum

Institute for Data, Process and Knowledge Management  
Vienna University of Economics and Business  
Welthandelsplatz 1, 1020 Wien, Austria

### Abstract

The Global Wealth Report of 2022 reveals that we are wealthier, healthier, and living longer than ever before. However, this doesn't necessarily seem to equate to success as a society. The prevailing view in the western business world is that companies must generate high returns and great profits, which requires precise management and planning based on rational, explicit information and 'profound' knowledge. This view is being increasingly questioned by researchers and practitioners who argue that more is not always better. Instead, an 'aesthetic of the right measure' is needed to achieve long-term sustainability.

This position paper explores the idea of *the right measure* that may also include a shift of what we consider desirable in an organizational context. In the light of current movements towards 'Spiritual Knowledge Management' and 'Responsible Knowledge Management', the field of Knowledge Management may need to shift more towards knowledge creation for the greater good. This requires developing a tacit understanding of the meaning of sustainability and a shift in what is considered to be 'working beautifully' from something technically rational to something sustainable and organic.

Presumably, the only way for a company to achieve sustainability in the long run is to change the premises by which it operates away from the culture of 'more is better' towards what I coin as an 'aesthetic of the right measure'.

Ultimately, being a sustainable company needs to become as aspirational as being a financially successful company is today. This involves a shift of the aesthetic image that we have of success as being mainly drawn to financial wealth. Instead, the aesthetics of restraint involve finding pleasure in needing less. The paper suggests that this shift towards sustainability and organic growth is based on a positive aesthetic image of sustainability and requires a change in decision-making methodology and a strong sense of the organization's true purpose.

**Keywords** – Organizational Aesthetics, Sustainability, Restraint, Responsible Knowledge Management

**Paper type** – Academic Research Paper

## 1 Introduction

Introducing the notion of aesthetics and an aesthetic understanding of the world to the field of Knowledge Management (KM), I would – in line with Antonio Strati's nontraditional approach to describe the aesthetic understanding of organizational life (Strati, 1992) – also like to start this paper off by giving the reader an idea of potential *'flavors'* of the aesthetics of sustainability. Strati argues, that an aesthetic understanding is an epistemological metaphor, which diverges from analytical descriptions commonly applied to study organizations. However, by means of an aesthetic approach, it becomes possible to show a reader the *"complexity, ambiguity, subtlety and pervasiveness in organizational routine and the richness and plausibility of the knowledge generated by examination of the aesthetic experience"*(Strati, 1992 p. 596).

In other words, this approach allows us to convey knowledge differently than through regular analytic and descriptive means of expression (Taylor & Hansen, 2005). It also allows for subjective interpretations of meaning. This is to be illustrated through the following two stories. The first is fictitious, while the second one originates in practice.

If you are familiar with the works of the German author Heinrich Böll, you probably already know the first story of the fisherman and the tourist:

A tourist wakes up a poorly dressed fisherman who is sleeping in his boat in a harbor on the coast of Western Europe, as he takes pictures of him. The tourist is very polite and asks the fisherman about his catch of the day and why he is not out fishing at sea. He also asks the fisherman if he is not well since he is not working despite the ideal weather.

The fisherman says that, despite the excellent conditions, he would not go out again since he went fishing early in the morning and is already satisfied with his catch for the day, which would even be enough to live from for several days.

The tourist cannot understand why the fisherman does not want to increase the frequency of his trips and enthusiastically describes what the fisherman could achieve if he would only work diligently. He could soon buy an engine for his boat, then a second boat, then employ more fishermen, and eventually own a whole fishing fleet. Then he could open a restaurant, export the catch to other towns and then, then he could retire and finally constantly sit calmly in the harbor and doze, just to go fishing every now and then. The fisherman, after having listened to the tourists explications finally pats the tourist on the shoulder and

replies: "this is exactly what I'm doing every day. I sit calmly at the harbor and doze.", leaving the tourist pensive, at loss for an answer – even a bit envious (Böll, 1994).

The story was Böll's satirical reaction to the German economic miracle (*Wirtschaftswunder*) after World War II, which was characterized by the ideals of hard work and economic success. Instead of following this narrative, the story illustrates how someone without great wealth can lead a pleasant, contented, and happy life just as well as opposed to a life of constant work. Böll expresses criticism of the all-encompassing materialism that goes hand in hand with the pursuit of success and social advancement. At the end of the story, the tourist, who initially presents himself as the successful character, is left with the question of whether he actually works just to not have to work one day or whether work could be a fulfilling part of life. From an aesthetics perspective, we have probably observed it for ourselves while reading the story that it has elicited meaning which a rational description would not have been able to convey. Plus, there might be a number of other things we might reasonably conclude about the situation and the characters involved that come from our intuition and imaginative powers (Strati, 1992). We can essentially put ourselves in the shoes of the two characters and empathize with their worldviews.

The second story that I would like to present is more tied to reality and concerns the renown outdoor brand Patagonia. The company is famous for its radical orientation towards sustainability, despite being a profitable multi-national, billion dollar enterprise. Again, we will first look at a short story – in this case a statement from Yvon Chouinard, the founder of Patagonia, before discussing the implications that arise:

*"I've been a businessman for almost fifty years. It's as difficult for me to say those words as it is for someone to admit being an alcoholic or a lawyer. I've never respected the profession. It's business that has to take the majority of the blame for being the enemy of nature, for destroying native cultures, for taking from the poor and giving to the rich, and for poisoning the earth with the effluent from its factories. Yet business can produce food, cure disease, control population, employ people, and generally enrich our lives. And it can do these good things and make a profit without losing its soul. [...] Like many people who had their formative years in the sixties in America, I grew up with disdain for big corporations and their lackey governments. The typical young Republican's dream of making more*

*money than his parents or of starting a business, growing it as fast as possible, taking it public, and retiring to the golf courses of Leisure World has never appealed to me. My values are a result of living a life close to nature and being passionately involved in doing what some people would call risky sports. My wife, Malinda, and I and the other contrarian employees of Patagonia have taken lessons learned from these sports and our alternative lifestyle and applied them to running a company. My company, Patagonia, Inc., is an experiment. It exists to put into action those recommendations that all the doomsday books on the health of our home planet say we must do immediately to avoid the certain destruction of nature and collapse of our civilization. Despite near-universal consensus among scientists that we are on the brink of an environmental collapse, our society lacks the will to take action. We're collectively paralyzed by apathy, inertia, or lack of imagination. Patagonia exists to challenge conventional wisdom and present a new style of responsible business. We believe the accepted model of capitalism that necessitates endless growth and deserves the blame for the destruction of nature must be displaced. Patagonia and its thousand employees have the means and the will to prove to the rest of the business world that doing the right thing makes for good and profitable business."(Chouinard, 2006)*

The presented excerpt stems from the introduction to Chouinard's memoirs about Chouinard Equipment (the predecessor of Patagonia) and Patagonia, titled 'Let my people go surfing'. And again, after reading just one paragraph on its history and values, we probably know far more about the company and the lives of its members than we would have known from a purely mechanistic description of facts. Even more so, this account provides a snippet of knowledge, which is possible to be extended through the readers intuition and imagination (Strati, 1992).

Now, after those two examples have hopefully given the reader an idea of the advantages that an aesthetic approach to organizational life can have in terms of the knowledge conveyed, we can progress to a more technical-rational analysis and discussion of the main argument that will be presented in the next sections.

## 2 Revisiting the Goals of Knowledge Management?

The aim of knowledge management has always been to make companies more efficient, productive or innovative by managing the available knowledge resources as best as possible. This is believed to lead to competitive advantage (Alavi & Leidner, 2001; Spender, 1996), a view that builds on Penrose resource-based view of the firm (Penrose, 2009).

Much of what has been said, follows the premise of western management ideals that businesses must generate high returns and great profits for their owners and which requires precise management and planning on the basis of rational, explicit information and 'profound' knowledge. This attitude can be well summarized by the quote that "the business of business is business" (Duska, 1997). To this end, Knowledge Management serves as an important tool to facilitate these desired outcomes in an economy that relies heavily on knowledge and intangible assets (Drucker, 2017).

However, in the last years, both researchers and practitioners have started to question this idea of 'technical rationality', the focus on explicit data, information and knowledge, that are part of the predominant managerial metamyth as Adams & Ingersoll (1990) coined it.

In academia this trend towards more sustainable business practices is represented, amongst others, by an ever growing body of literature on sustainability (Olawumi & Chan, 2018) and a relatively recent uptake of the idea that organizations should be built around their true purpose (e.g. Gast et al., 2020; George et al., 2021; Malnight et al., 2019).

In practice we see similar trends that manifest in new approaches to organizing (e.g. Laloux, 2014; Robertson, 2015) or emphasizing sustainability (e.g. Chouinard, 2006)

Paying closer attention, there can be at least two distinct points of critique identified towards established positions of the mentioned predominant metamyth. The first is concerned with the methodology and basis of decision making and the type of knowledge required therefore. In order to get along well in modern-day complex environments, often referred to as VUCA (volatile, uncertain, complex, ambiguous), it has been argued, that other knowledge apart from analytical, rational knowledge and explicit data is required (Bennett & Lemoine, 2014; Nonaka & Takeuchi, 2019, 2021; Scharmer, 2009; Senge et al.,

2004). Ideas of flexibility and a strong sense for the organizations true purpose are said to be amongst the key drivers for success these days.

The other point of critique is related to the reasons for and effects of doing business as we know it (Chouinard, 2006; Laloux, 2014). It has become evident that unbridled capitalism can have severe effects on the planet. And while we have our hands full trying to get climate change under control, we witness signs of growing dissatisfaction amongst the workforce that has been fueled by the pandemic. Many people perceive their jobs as meaningless peaking in developments like the anti-work movement in the U.S. , where millions of people voluntarily left their jobs (O'Connor, 2022).

Hence, we might subsequently ask whether the initial goal of KM is still adequate in a world, where we basically have unlimited access to explicit knowledge and information through the means of powerful search engines and the rise of AI technologies. Should we not rather reconsider the view that KM is (only) about the most efficient systems that let us save, access and distribute mechanistic knowledge, in favor of a view that draws even more on knowledge of the organization and itself? Instead of managing knowledge about something (particular domain knowledge), we might need to manage knowledge about ourselves i.e. our purpose, values, beliefs or (higher) goals that we aspire.

This idea has already sparked flames in the KM community as can be seen in recent publications on *Spiritual Knowledge* (Bolisani & Bratianu, 2018) and the respective idea of *Spiritual Knowledge Management* (Kaiser, 2023) as well as in the notion of *Responsible Knowledge Management* (Durst, 2021).

Still, it is important to note here that by no means I argue that traditional KM has become obsolete, yet I suggest that it can be enhanced with a new facet that has become relevant over the last two decades. In that, I argue in accordance with Durst (2021) that the aim of KM has to shift towards knowledge creation for a greater good.

### **3 Introducing Organizational Aesthetics to the field of KM**

Having mentioned sustainability, responsibility and spirituality in the realm of KM, this inevitably sets out the question, how ideas that relate to those concepts may be best integrated into an organization or the organizational knowledge base respectively. And while there may be a variety of viable options, I would like to draw attention to a big concept that may do good service as a foundation for

further theorizing. The concept I am referring to is aesthetics, in particular organizational aesthetics that describes the understanding of organizational life on the basis of sensorial perception and the meaning that they elicit in us (Baldessarelli et al., 2022; Strati, 1999; Taylor & Hansen, 2005). As such the concept allows for the consideration of individual and subjective perceptions of the organization that are central to the enactment of an organization's purpose (Kaiser, 2023). Furthermore, aesthetics can build a connection to a system (a sense of 'belonging to') (Ramirez, 1991; Taylor & Hansen, 2005), serve as criteria for judgement (Guillen, 1997; Taylor & Hansen, 2005) and is ultimately part of the epistemic process as all other forms of knowing depend on and grow out of aesthetic experiences (Dewey, 1958; Gagliardi, 2006; Taylor & Hansen, 2005).

Regarding the aspect of aesthetics as part of the epistemic process, scholars of KM may recognize some familiarity with Polanyi's idea of *tacit knowledge*, that builds on the same principle of direct personal experience as a means to acquire new knowledge (Taylor & Hansen, 2005). And obviously, just as tacit knowledge, aesthetics is omnipresent in every human encounter with organizations (Strati, 1999).

#### **4 Sustainability and the Aesthetics of Restraint**

To illustrate the potential role of aesthetics for the field of KM, I will draw to the example of sustainability for two reasons. First, it is a very neat and illustrative example, because it poses a big problem for society that has yet to be solved – we know that something has to change, however it seems that hardly anybody is acting, still. Where if not in such an environment could a scientific discipline such as KM earn its laurels, if successful in initiating change. As a remark I need to clarify that I will for the purposes of this argument, refer to sustainability only in terms of ecological sustainability. The argument could, however, also be extended to a wider definition of sustainability but for the sake of clarity it is easier to stick to a narrower definition for now. The second reason is that sustainability requires a change not only in our behavior now, but will require a change in our value system as a society sooner or later. As humans use up far more resources than earth can naturally regenerate<sup>1</sup>, the only realistic option so far is to consume less of those resources.

---

<sup>1</sup> As according to Global Footprint Network < <https://www.overshootday.org/about-earth-overshoot-day/> > (last retrieved April, 10<sup>th</sup> 2023).

However, who is going to cut down on something? Who is going to reduce, while others continue as before? An issue that reminds of the classical tragedy of the commons. But is it really?

The answer, can be yes. Yes, if we presume that all individuals seek to maximize their wealth, prospects, mobility or status in form of material goods. Yes, if they follow the prevailing norm of western societies and all societies that aspire to these ideals.

But, what if – and now we can refer back to the story of our fisherman in the introduction – what if we assume that there could be different ideals and values that people find worth aspiring. Maybe the metamyth that we follow currently is not an immutable dogma. When we think back to Böll's concluding remark that the tourist leaves the harbor, thinking that the fisherman has got a point, we grasp a hint of a different worldview that has its own appeal. Then there could actually be a way out of our presumed tragedy of commons. But underlying to that escape is a different frame of reference, a different measurement of what is good – a different aesthetic. We could call it the *aesthetic of restraint*. But actually it is not only the aesthetic of restraint but also an aesthetic of freedom, composure and adequacy. There could be many more words to describe the aesthetic frame of reference that underlies the fisherman's lifestyle, yet we probably cannot make it explicit in all its complexity anyways – and we arguably need not, because we already understood it when reading through the short story in the beginning. What we can describe, however, are the effects of the changed aesthetics we encounter now. What we see is that the frame of reference of what is considered worthwhile pursuing has changed – this is the element of aesthetics as *criteria for judgement* (Taylor & Hansen, 2005).

Shrivastava & Mitroff (1984) have argued that people in organizations act upon shared frames of reference. Thus, in order to change how people act, one has to address the organizations frame of reference and shared meaning. With regards to sustainability, Shrivastava et al., (2017) have developed the notion of aesthetic rationality as completing the predominant paradigm of instrumental rationality to create more aesthetically sustainable organizations.

My argument goes further in that it emphasizes the possibility of almost a total shift away from the premise that companies exist to grow and earn money but rather to first and foremost serve some purpose for its stakeholders or society. This more radical approach follows the second introductory example, the one of Patagonia.

Again, from the short anecdote, we have gotten an idea of the prevalent aesthetics at Patagonia. If Patagonia truly exists to *challenge conventional wisdom and present a new style of responsible business* we indeed have a completely different value system in place. Therein, actions that would, for example, support maximized shareholder value, would not fit and be met with disgust, a feeling that results from aesthetic perception. Hence, what we see at Patagonia is more than an aesthetics-enhanced instrumental rationality but a different overall aesthetic that underlies their approach to business.

Concluding this section, we can state that aesthetics provide a frame of reference for the evaluation of corporate actions alongside the purpose of an organization. Not only does it influence decision-making in the short term but it changes what organizations members consider good or bad, thus potentially leading to a change of the organizations overall behavior.

## 5 Conclusion

Aesthetics, from an epistemological view is akin to tacit knowledge. Both require direct sensory experience to develop, are highly subjective and almost impossible to capture or make explicit. Yet it has been convincingly argued by authors from both realms that aesthetics and tacit knowledge play a vital role for organizing. As Barnard put it *"the essential aspect of the process [of organizing] is the sensing of the organization as a whole" that "transcends the capacity of merely intellectual methods"* (Barnard, 1938 p.235). Thus, KM will probably not be able to 'manage' the aesthetics of an organization in a mechanistic sense. However, knowing that organizational aesthetics not only contains an integral part of an organizations value system, but is also a driving force to strive towards the realization of those values can teach us about the importance of recognizing and valuing subjective experiences and sensory perceptions as a means of understanding and improving organizational performance. Organizations should hence strive to foster experience of all sorts for its members.

With regards to sustainability this could mean to have people interact with their environment as much as possible and to include all senses in the process. Just as we could understand complex aesthetics from two simple stories, people might recognize the aesthetics of sustainability if they only feel the meaning of the concept themselves instead of just reading or hearing about it.

In order to make sustainable businesses happen, people ought to develop a tacit-aesthetic understanding of the meaning of sustainability that ultimately in the future, being a sustainable company becomes as aspirational as being a successful company is today. In (Adams & Ingersoll's (1990) terms, this would represent a change of the managerial metamyth, or, from an aesthetics perspective, it would represent a shift in what is considered to be 'working beautifully' from something technically rational (White, 1996) to something sustainable and organic. Finding pleasure in needing less – the aesthetics of restraint.

### **Abstract**

This paper is an initial study concerning the role of women in firms in supporting circular bioeconomy practices. Moreover, circular bioeconomy could generate economic opportunities for women, boosting female and green entrepreneurship. The objective of the research is twofold. On the one hand the study investigates whether women-led firms adopt more circular economy practices than men-led businesses. On the other hand, the research investigates whether the circular bioeconomy could generate economic opportunities for women by encouraging female entrepreneurship. To achieve the proposed objectives, a bibliometric analysis and a systematic literature review have been conducted. The results are overall consistent with the research questions. Female entrepreneurs as well as female directors or female employees plays a critical role in achieving sustainable economy and sustainable development, also in social and environmental dimensions. At the same time, the growth of the service sector, stimulated by the transition to a circular economy and bioeconomy, could provide more opportunities for female employment.

**Keywords:** Circular economy – Bioeconomy – Circular bioeconomy - Women led firms – Female

**Paper type** – Academic Research Paper

## 1 Introduction

Many studies have investigated the link between the presence of women in top echelon positions and sustainable practices of firms (Bannò, Filippi, Trento, 2021) and some of these highlight a positive relationship between the presence of female directors and sustainable activities (Beji et al., 2020; Rehman et al., 2020; Saheed Olanrewaju et al., 2020). Women show, compared to men, a greater sensitivity and propensity to promote sustainable growth.

This consideration led us to investigate whether a link also exists between circular bioeconomy practices and the presence of women in the firm.

Circular bioeconomy is necessary for sustainable growth as it allows societies to change the way they design and produce as well as the patterns of consumption promoting regenerative economic cycles. Circular bioeconomy is crucial to achieve the EU Green Deal objectives, the UN Sustainable Development Goals, the Paris Agreement about climate change, and post-COVID-19 economic transformation (Hadley Kershaw et al., 2021).

New technologies that fuse the physical, digital and biological ones (artificial intelligence, robotics, blockchain, Internet of Things, bioelectrochemical engineering, etc.) can be useful for enabling circular business models and could provide solutions to circular economy transformation (Chauhan et al., 2022).

Circular bioeconomy can be defined as more than circular economy and bioeconomy alone: «the circular bioeconomy focuses on the sustainable, resource-efficient valorization of biomass in integrated, multi-output production chains (e.g. biorefineries) while also making use of residues and wastes and optimizing the value of biomass over time via cascading» (Stegmann et al., 2020, p. 5).

In this context, this paper is an initial study concerning the role of women in firms in supporting circular bioeconomy practices. Moreover, circular bioeconomy could generate economic opportunities for women, boosting female and green entrepreneurship (OECD, 2021). Thus the objective of the research is twofold. On the one hand the study investigates whether women-led firms adopt more circular economy practices than men-led businesses. On the other hand, the research investigates whether the circular bioeconomy could generate economic opportunities for women by encouraging female entrepreneurship.

The study is organized as follow. After this introduction, paragraph 2 focuses, on the one hand, on the analysis of some definitions useful for the present

research, and on the other hand, on the development of research questions. Paragraph 3 explains the research methodology. Particularly, to achieve the proposed objectives, a systematic literature review has been conducted. Subsequently the results of the analysis are presented and discussed. Finally, the conclusions illustrate implications, limits and future developments of the research.

## **2 Background and Research Questions Development**

Circular bioeconomy could be interpreted as the sum of or the intersection between the two concepts of circular economy and bioeconomy. Actually, the relationship among circular bioeconomy, circular economy and bioeconomy is complex and not sufficiently defined.

Circular Economy is a new business model for firms and industries to reduce their environmental impact: «a circular economy reduces material use, redesigns materials, products, and services to be less resource intensive, and recaptures “waste” as a resource to manufacture new materials and products» (EPA, United States Environmental Protection Agency, <https://www.epa.gov/recyclingstrategy/what-circular-economy#EPA>).

The bioeconomy is the renewable component of the circular economy, an economy in which everything is a resource, including waste. According to the definition of the European Commission, «the bioeconomy means using renewable biological resources from land and sea, like crops, forests, fish, animals and micro-organisms to produce food, materials and energy» (European Commission, [https://research-and-innovation.ec.europa.eu/research-area/environment/bioeconomy\\_en](https://research-and-innovation.ec.europa.eu/research-area/environment/bioeconomy_en)).

Circular bioeconomy can be interpreted as a more efficient resource management of bio-based renewable resources by integrating circular economy principles into the bioeconomy (D'Amato et al., 2018). The circular bioeconomy is a framework to reduce the dependence on natural resources; transform manufacturing; promote sustainable production of renewable resources from land, fisheries, and aquaculture; and promote their conversion into various bio-based products and bioenergy while growing new jobs and industries (European Commission, 2013).

With reference to the concepts of circular economy, bioeconomy and circular bioeconomy, Tan and Lamers (2021) highlight that a substantial confusion exists

around the conceptual definitions of circular bioeconomy and the boundaries with the concepts of circular economy and bioeconomy are not clearly defined.

However, circular economy, bioeconomy and circular bioeconomy undoubtedly play a fundamental role to resolve sustainability challenges.

An important contribution in stimulating firms to manage their social responsibilities and sustainable practices (Yasser et al., 2017) is provided by the women operating in firms. Women, also due to their gender characteristics, are generally more sensitive to issues of social responsibility and environmental sustainability (Burkhardt, Nguyen, Poincelot, 2020).

In the light of these considerations, the present study examines the link between presence of women in the firms and adoption of actions of: 1) circular economy; 2) bioeconomy; 3) circular bioeconomy. The first research question is the following.

*RQ1: Does the presence of women in the firms (as entrepreneurs, managers, members of board of directors) stimulate the adoption of circular economy, bioeconomy or circular bioeconomy practices?*

Moreover, circular bioeconomy could generate economic opportunities for women, boosting female and green entrepreneurship (OECD, 2021). Therefore, the second research question is the following.

*RQ2: Could circular economy, bioeconomy and circular bioeconomy circular bioeconomy boost female green entrepreneurship?*

### **3 Methodology and Documents Selection**

To achieve the proposed objectives, a systematic literature review was conducted. The research methodology has involved four phases.

In the first phase, documents have been extracted from Web of Science database. Documents have been extracted using specific keywords as follow:

1. (circular econom\* or bioeconom\* or circular bioeconomy\* or environmental sustainab\*) AND (women or female or gender) AND (entrepreneur\* or manage\*);
2. (circular econom\* or bioeconom\* or bio-economy\*) AND (women or female or gender);
3. (circular econom\* or bioeconom\* or bio-economy\*) AND (women or female or gender) AND (entrepreneur\*).

The results have been refined by language (English), Web of Science categories, citation topics. A total of 396 documents were identified. Then, duplicates have been removed (22).

The process has been adjusted before actually selecting the final sample. However, it was preferred not to excessively limit the number of articles to be manually screened in order to avoid eliminating documents potentially consistent with the purpose of the research. Indeed, limiting the sample too greatly, is a warning flag that affects both the depth and rigor of the review, and it could have serious effects on its results and contributions (Snyder, 2019).

In the second phase, the extracted papers have been screened by reading the title, the authors key words, the WoS keywords and abstracts to ensure consistency with the research questions. A total of 42 documents have been selected and sought for retrieval. After deleting the (3) documents not retrieved, 39 articles have been included in literature review.

The process of selection of the documents are summarized in PRISMA flow diagram (Page et al., 2021) as illustrated in Fig. 1.

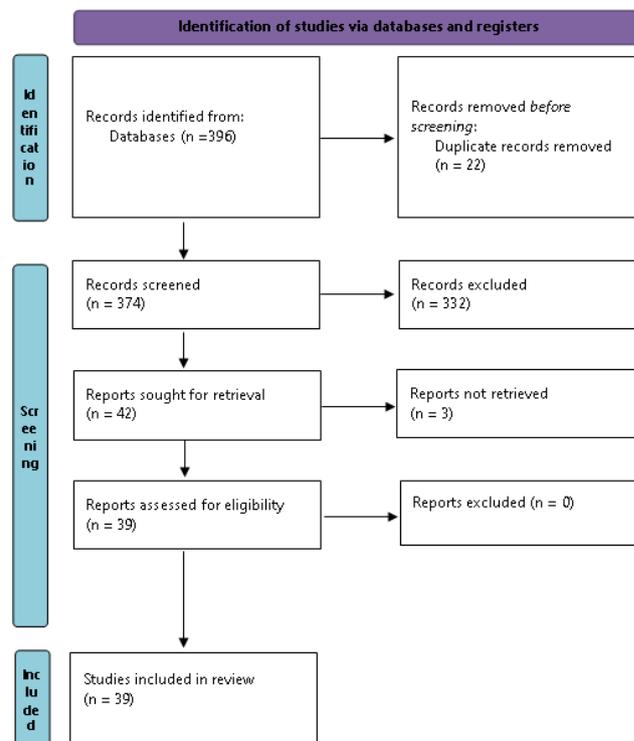

Fig. 1 - PRISMA 2020 flow diagram (Source: Our Elaboration from Page et al. (2021))

In the third phase, a bibliometric analysis on the 39 selected papers has been conducted using Biblioshiny software (Aria and Cuccurullo, 2017).

The fourth phase has been dedicated to systematic review of the selected papers. The systematic literature review has been conducted manually by the authors. The 39 papers have been analyzed in order to highlight, for each paper, results, topic, adopted methodology, investigated firms, geographical area of investigation.

Analysis and results of these last two phases are presented in the next paragraph.

## 4 Analysis, Results and Discussion

### 4.1 Bibliometric analysis

The study, through bibliometric analysis, examines keywords; documents and source types; conceptual structure; emerging trends (Donthu et al., 2021).

#### 4.1.1 Documents and sources

The number of documents analyzed is 39 (36 articles and 3 reviews). Although no period restrictions were inserted during the extraction of the documents from the Web of Science, the documents selected manually for the final analysis were published between 2017 and 2023. The Journals in which the papers are published are 23 and the 133 authors have dealt with these topics (Tab. 1).

Tab. 1 – Documents and sources: main information

<b>Description</b>	<b>Results</b>
Documents	39
Sources (Journals, Books, etc.)	23
Keywords Plus (ID)	174
Author's Keywords (DE)	187
Period	2017 - 2023
Average citations per documents	27,49
Authors	133
Author Appearances	133
Authors of single-authored documents	3

Authors of multi-authored documents	130
Single-authored documents	3
Documents per Author	0,293

<b>Document types</b>	
ARTICLE	36
REVIEW	3

Most cited journals on the topics are: Journal of Business Ethics; Journal of Cleaner Production; Corporate Social Responsibility and Environmental Management; Business Strategy and The Environment (Fig. 2).

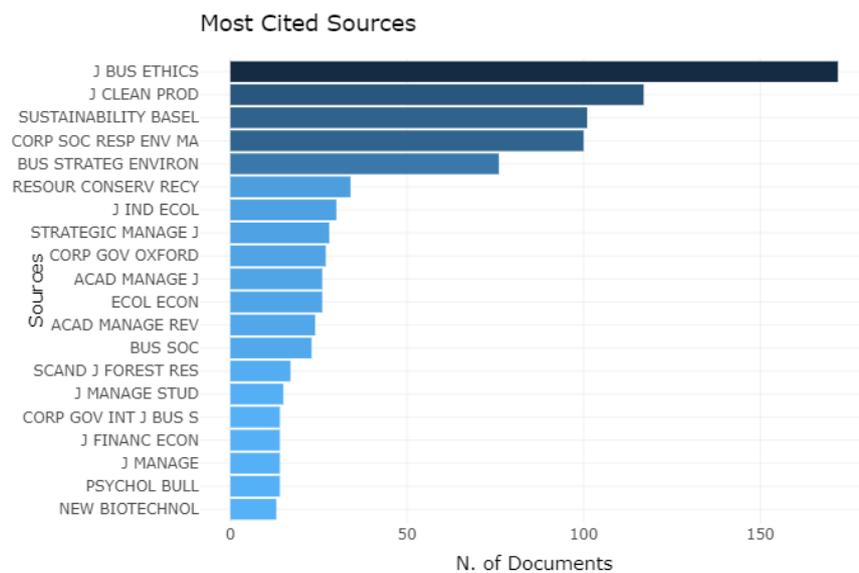

Fig. 2 – Most cited Sources

#### 4.1.2 Keywords

Table 2 shows most frequent words in the abstracts and Figure 3 presents the authors' keywords dynamics: the words "circular economy" and "bioeconomy" appear in dataset with increasing frequency over the years.

Tab. 2 – Most frequent words in the abstracts

Words	Occurrences
gender	64
environmental	61
social	48
circular	45
sustainable	43
female	38
study	38
women	38

management	29
csr	27
business	26
board	25
diversity	21
economic	21
role	21
waste	21

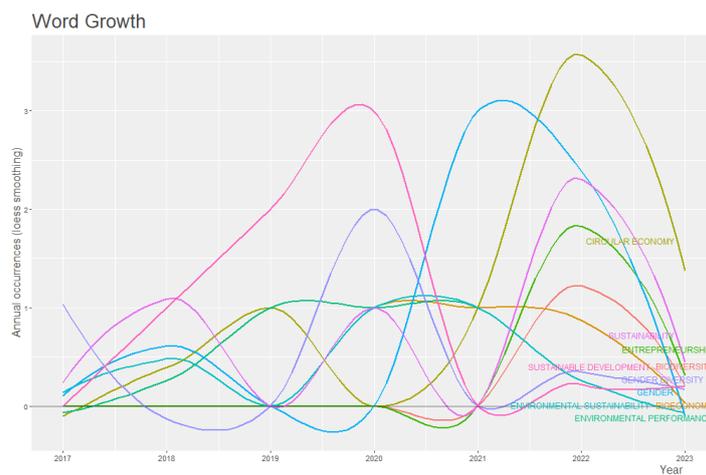

Fig. 3 - Authors' keywords dynamics

#### 4.1.3 Conceptual structure and emergent trend

The analysis of the conceptual structure allows us to identify two clusters (Fig. 4). One (in blue) investigates the links between gender diversity and environmental sustainability. The other (in red) which deals with the themes of the bioeconomy, the circular economy and the circular bioeconomy with those of gender and digitization. In particular, the link between female entrepreneurship, digital transformation and the circular bioeconomy deserves further investigation.

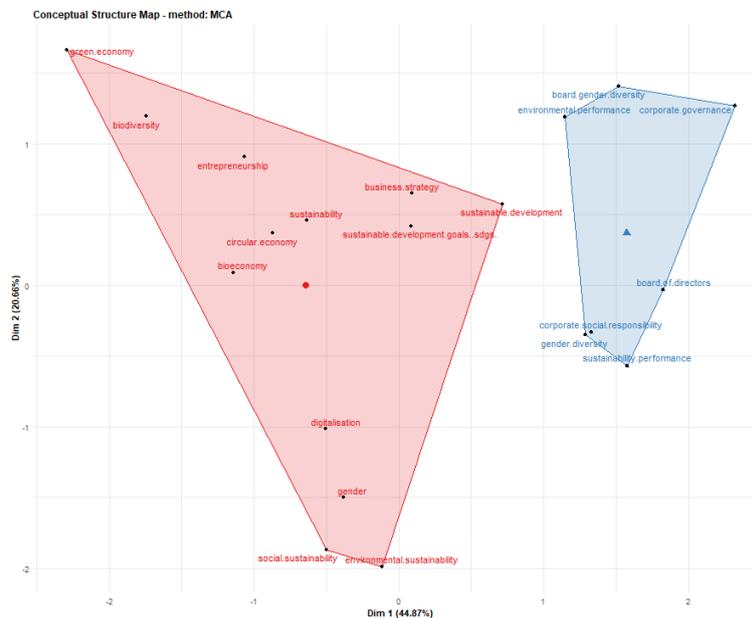

Fig. 4 – Conceptual structure

In this respect, the word “digitalisation” does not appear among most cited keywords and this could indicate the literature gap on the subject that has not adequately investigated the relationship between women-led firms, digitalization, and circular bioeconomy. At the same time, the words “circular bioeconomy” rarely appear together and this also indicates the need to explore both the topic of circular bioeconomy and the link between women-led firms and circular bioeconomy.

## **4.2 Systematic literature review**

The content analysis of the papers has been conducted manually by the authors in order to: 1) identify any factors for which female entrepreneurs promote circular bioeconomy and sustainable practices (and the adoption of suitable technological innovations) more than male entrepreneurs; 2) understand whether and why the circular bioeconomy generate economic opportunities for women.

The evidences of the studies have been summarized and data synthesis is shown in Table 1.

The first research question (*Does the presence of women in the firms (as entrepreneurs, managers, members of board of directors) stimulate the adoption of circular economy, bioeconomy or circular bioeconomy practices?*) is addressed by most of the studies analysed.

Internal values, such as cultural factors and gender characteristics, make women more sensitive to issues of sustainability and reduction of environmental impact also through the adoption of circular economy and bioeconomy practices through reuse, recycling, reduction of waste production.

The results of most of papers included in this literature review confirm that women play a significant role in adoption of circular economy or for improving environmental performance by contributing to reduce the environmental impact of firms. These evidences are confirmed in studies that involved:

- different sectors: banking industry (Ali et al., 2022; Galletta et al., 2022), tourism (Vila-Vazquez et al., 2023), primary sector (Barrero-Amortegui and Maldonado, 2021);
- different regions or countries: China (Elmagrhi et al., 2019); Spain (Martinez et al., 2019); France (Burkhardt et al., 2020); Australia (Galbreath and Tisch, 2020), etc.

20 22	DIACONASUDE;BOSTAN I;CAUTISANU C;CHIRIAC I	International Journal of Environmental Research and Public Health	Article	Quantitative	Europe	Countries (bioeconomy value added indicator)	Circular economy/Bioeconomy/Circular bioeconomy	The study "finds that investment in human development along with innovation, the growing role of women and sound public governance have a positive effect on the transition towards a durable and resilient bioeconomy at the European level. This naturally implies that a combination of social and technological innovation can ensure the rise of a sustainable bioeconomy".

The second research question (*Could circular economy, bioeconomy and circular bioeconomy circular bioeconomy boost female green entrepreneurship?*) is addressed by Pla-Julian and Guevara (2019): their paper shows that circular economy offers potential challenges and even opportunities for improving gender equality while creating business opportunities or contributing to the achievement of SDGs. Wiebe et al. (2019) found that circular economy/bioeconomy provides more opportunities for high-skilled and female workers.

Instead, El Wali et al. (2021) found that circular model fails to promote gender equality.

## **5 Conclusions**

The evidences of the present study, even though it is an initial study, are consistent with the research questions.

Female entrepreneurs as well as female directors or female employees plays a critical role in achieving sustainable economy and sustainable development, also in social and environmental dimensions (Al-Qahtani et al., 2022).

At the same time, the growth of the service sector, stimulated by the transition to a circular economy and bioeconomy, could provide more opportunities for female employment (Wiebe et al., 2019).

### *Limits*

The study, also because in the initial phase, has limits both with regard to the bibliometric analysis and with regard to the systematic analysis of the documents.

The bibliometric analysis is conducted on a limited number of papers and to make the analysis more accurate it will be necessary to expand the bibliographic datasets.

The systematic analysis also requires further study also expanding the number of documents analyzed with the inclusion of "grey" literature such as policy and industry reports identified from websites and citing searching.

### *Theoretical and Practical implication*

The study highlights: 1) the role of women in promoting circular economy practices and in achieving the sustainable development goals set at both national (PNRR) and international levels; 2) the importance of move towards a more circular economy also for encouraging gender equality.

Digital technologies (such as artificial intelligence, blockchain, internet of things and cloud computing) can facilitate the transition to circular economy and bioeconomy and overcome obstacles that stand in the way of the large-scale deployment of green entrepreneurship (Barteková and Börkey, 2022).

#### *Gap and future developments*

Results of the study are useful to identify gaps in literature on the topic and direct the future studies for filling the gap. In this respect, the word “digitalisation” does not appear among most cited keywords and this could indicate the literature gap on the subject that has not adequately investigated the relationship between women-led firms, digitalization, and circular bioeconomy. At the same time, the words “circular bioeconomy” rarely appear together and this also indicates the need to explore both the topic of circular bioeconomy and the link between women-led firms and circular bioeconomy.

### Abstract

The healthcare industry faces various challenges, and Lean management and Six Sigma initiatives are gaining attention for their ability to improve performance by reducing defects, waiting time, and costs while increasing patient satisfaction. Strategic Knowledge Management (SKM) is essential for the success of Lean and Six Sigma initiatives in healthcare organizations. SKM focuses on arranging knowledge resources and competencies to bridge the knowledge gap between required and existing know-how in the organization, enhancing people's skills and assets. This study aims to explore the relationship between Lean management and SKM approach to knowledge management in healthcare organizations. The study uses regression analysis to investigate the role of SKM in achieving Organizational Performance Improvement. The findings enrich the debate in the literature on the use of a strategic knowledge-based approach to continuous

improvement and provide a comprehensive framework for healthcare facility managers to promote knowledge sharing as a core asset within organizations.

**Keywords** – Healthcare, Organizational Performance, Lean Six Sigma, Strategic Knowledge Management

**Paper type** – Academic Research Paper

## 1 Introduction

Healthcare is a service industry that deals with complex tasks and challenges, and its responses often lie in employing new organizational models geared toward innovation, quality, cost reduction, and achieving patient satisfaction. Among them, Lean management and Six Sigma initiatives are receiving particular attention for their systemic approach to criticalities and their capabilities to enable the organization to produce knowledge (Vlachos et al., 2019), value-in-use, and acquire a culture of continuous improvement (Antony et al., 2019). The literature supports the idea that integrating the Lean and Six Sigma approaches in Healthcare Organizations leads to improved performance by increasing patient care toward satisfaction and loyalty (Ahmed, 2019; Ahmed et al., 2019). Both the Lean and Six Sigma methods ensure the performance of the healthcare organization by reducing defects and variations, waiting time and costs, and improving service delivery. Furthermore, Lean and Six Sigma techniques are likely to generate a significant change in the way health professionals conceive their organizational life, to innovate health services by acting in an unprecedented and proactive way.

Nevertheless, to produce significant effects that last over time and, conversely, do not fail (Rosa et al., 2021), these implementations should be considered not as individual initiatives but as a strategic approach that is part of organizational culture. Uncoincidentally, failures occur when organizations do not foster a strategic vision in their processes (Marolla et al., 2021).

In this sense, Strategic Knowledge Management (SKM) acts as a key player in ensuring Lean and Six Sigma success in organizations (Aramoon et al., 2020) as well as in achieving a consistent improvement in performance. Strategic Knowledge Management is conceived as the field of Knowledge Management, which mainly refers to the activities embodied in the organization to achieve, implement, and distribute knowledge for strategy formulation and support

decision-making (Cabrilo & Dams, 2018). It constitutes a comprehensive method that the organization uses to arrange its knowledge resources and competencies according to the intellectual needs of the strategy. Inter-alia helps bridge the knowledge gap between the required and existing know-how in the organization and enhances people's skills and assets (Al-Tit et al., 2022). SKM has a special focus on HRM since manpower is the greatest and most precious asset of the organization and assumes a core value in both Lean and Six Sigma initiatives. Hence, SKM refers to an organization's structures and processes that help improve organizational performance.

Therefore, this study aims to explore the relationship between the implementation of Lean Management and the SKM approach to knowledge management. To this end, a sample of Italian healthcare professionals was employed to investigate, through regression analysis, the role of SKM in leading Lean and Six Sigma initiatives to achieve Organizational Performance Improvement in healthcare organizations. The effort of this study is, on the one hand, to enrich the debate in the literature on the use of a strategic knowledge-based approach to continuous improvement and organizational change. On the other hand, it provides a comprehensive framework for healthcare facility managers regarding the importance of promoting knowledge sharing as a core asset within organizations.

## **2 Theoretical background**

Strategic knowledge management (SKM) refers to the overall strategy, aims, and objectives of an organization. It refers to the procedures and infrastructure that companies use to acquire, develop, and exchange information to formulate strategies and make strategic choices (Ferreira et al., 2020).

In healthcare, transferring and employing knowledge across organizations enables professionals to make better-informed decisions and avoid costly mistakes. Furthermore, SKM may promote cooperation and collaboration among healthcare practitioners by increasing information-sharing and applying best practices (Illanes, 2019). To Rego et al. (2023), SKM may increase the efficiency and efficacy of healthcare delivery. Scholars have stressed the need to cultivate a culture of continuous improvement and foster information exchange among healthcare practitioners and organizations (Alrhabbi et al., 2022). This may be achieved through training for healthcare staff as well as employing knowledge

management innovations such as electronic medical records and databases that enhance systematic knowledge dissemination aimed at improving patient care, process efficiency, and cost savings (Abbate et al., 2022). To this end, a variety of quality management techniques are being employed in healthcare, particularly Lean Management and Lean Six Sigma.

Lean Management is a streamlined method that increases organizational income, decreases costs, and enhances patient satisfaction by eliminating inefficient processes (Rizan et al., 2020). The Lean method is simpler, more efficient, and cost-effective, and it offers users appropriate service quality. This technique focuses on improving the process speed by decreasing lead time and waste, as well as providing a way to evaluate and reduce costs and increase process efficiency. .

Lean Six Sigma, on the other hand, is a data-driven process improvement strategy that blends statistical analysis with lean principles to reduce defects and process variations (Black & Revere, 2006). LSS's aim is to improve process quality and efficiency, while lowering costs and increasing customer satisfaction.

Therefore, the connection between LSS implementation and Organizational Performance Improvement is evident but only if all organizational levels are involved in broad-based change, as individual initiatives may not be sufficient. Individual LSS initiatives within an organization have no significant effect on Organizational Performance Improvement (Aramoon et al., 2020). By contrast, the implementation of LSS initiatives can lead to improved organizational performance when a strategic approach to knowledge sharing is employed within the organization. In other words, once institutionalized and supported by SKM processes, LSS projects can become best practices that enhance organizational efficacy and contribute to Organizational Performance Improvement. In fact, the literature supports both the positive effect of LSS on SKM (Rejikumar et al., 2020) and Organizational Performance Improvement (Al Ahababi et al., 2019). Accordingly, this article discusses the role of SKM in relation to LSS and Organizational Performance Improvement.

### **3 Methodology and results**

This study included personnel from public healthcare institutions (physicians, nurses, administrative employees, hospital pharmacists, and health and social workers) in the Puglia Region (Italy). The data for this study were collected using

Google Forms. A total of 186 responses were provided. Incomplete questions were not identified. The sample comprised a small majority of females (56%). Less than half of the respondents had professional experience of 1-5 years (10,92%) and 6-10 years (28,71%), whereas the vast majority (60,3%) were in the highly advanced professional age group.

For Organizational Performance Improvement, six items from Masa'deh et al. (2016), on a Likert scale of 1-5, were employed to find consistency (CR= 0.9; AVE=0.7; Cronbach's alpha = 0.8). The Lean Six Sigma scale, adapted from Ahmed et al. (2018a), comprises nine items (CR= 0.7, AVE= 0.5, Cronbach's alpha = 0.7). To measure Strategic Knowledge Management, López-Nicolás and Meroño-Cerdán 's(2011) items (n = 8) were adapted ((CR= 0.8; AVE=0.6; Cronbach's alpha = 0.7).

SPSS AMOS-24 software was used to perform structural equation modeling (SEM). The results are summarized in Table 1 and show that LSS has no significant effect on organizational performance. Nevertheless a statistically significant and positive direct effect was found between LSS and SKM, indicating a proven relationship between Lean Management methodologies and Strategic Knowledge Management. Additionally, a statistically significant and highly positive relationship was found between SKM and Organizational Performance Improvement, confirming that organizational-level information sharing positively affects healthcare organization performance.

Furthermore, the analysis shows a positive mediation effect of Strategic Knowledge Management on the relationship between Lean Six-Sigma and Organizational Performance Improvement. The data show that the beta coefficient for the relationship between SKM and the LSS-OPI route is 0.459, with a standard deviation of 0.05, lower limit of 0.025, and upper bound of 0.087. This suggests that the relationship is statistically significant, and that SKM plays a critical role in enhancing performance through the LSS approach.

Table 1. Regression analysis results

Effect	Corrected Bootstrap (95% confidence interval)	Path	$\beta$ -value	S.D.
Direct		LSS->OPI	-0.012	0.8
Direct		LSS->SKM	0.320**	0.05
Direct		SKM->OPI	0.678**	0.1
Indirect (Mediation)	Lower 0.025 Upper 0.087	LSS->SKM->OPI	0.459**	0.05

#### 4 Discussions and conclusions

This study confirms the importance of Strategic Knowledge Management (SKM) in enhancing the potential of Lean Six Sigma (LSS) to enhance Organizational Performance Improvement in healthcare. The study finds that there is no statistically significant direct effect between LSS and OPI. As suggested by Sony et al. (2019), one reason LSS projects may fail is that the available knowledge is of poor quality, as LSS relies on accurate data for process improvement. Inaccurate or unreliable data can lead to worthless results and fail to produce substantial improvements.

Nevertheless, the study confirms that there is a direct positive effect between LSS and SKM, and between SKM and OPI. Consistent with Roza-Rojas et al. (2019), this study emphasizes the importance of sharing information and data for successful LSS implementation, and suggests that healthcare organizations should still share knowledge over time to spread the effect of change-based methodologies. Strategic Knowledge Management also positively affects Organizational Performance Improvement, as Aramoon et al. (2020) point out, observing that healthcare managers may improve organizational performance and patient service delivery through a knowledge exchange system that involves different functional units and teams. According to Zaim et al. (2019), knowledge sharing is an essential organizational activity that can enhance organizational knowledge capabilities and ultimately lead to better quality and performance.

Furthermore, SKM acts as a mediator between the LSS and OPI. A strategic approach to knowledge sharing involving SKM is imperative for improving the performance of healthcare organizations. Lean Six Sigma (LSS) initiatives can improve organizational performance in healthcare by leveraging strategic-level knowledge sharing and institutionalizing practices at the organizational level. This

can help overcome limitations related to scope and data shortages, which may otherwise hinder the success of such initiatives.

The integration of knowledge management into the deployment of Lean Six Sigma in healthcare organizations provides several opportunities. First, it improves the efficiency of the LSS implementation process by making critical information available to all the stakeholders. This reduces the time and resources spent on information searches, and allows teams to focus on refining systems and providing high-quality patient care. Second, knowledge management ensures that LSS initiatives are built on accurate and up-to-date data, which minimizes the possibility of failures, and guarantees that changes are made in the most effective and efficient manner. Finally, incorporating knowledge management into LSS ensures that the benefits of LSS initiatives persist. By collecting and sharing the lessons learned from each project, organizations can continue to build on their achievements and prevent duplication and waste.

This study emphasizes the compelling need for a holistic perspective that leverages Strategic Knowledge Management to enhance organizational performance through Lean Six Sigma. It can contribute to the ongoing debate in the literature on knowledge and organizational performance in healthcare, which involves many complex interactions.

Overall, this study aims to enhance our understanding of how LSS initiatives can be implemented effectively in healthcare settings to achieve optimal performance outcomes.

## Abstract

Digital transformation changed the way of doing business. In recent years, the fashion industry has undergone a profound change. The climate of uncertainty, the challenges related to the VUCA context, and ethical and environmental issues necessitated implementing digital strategies and increasing sustainability and social responsibility oriented. Creating new and solid links with online Millennials communities sensitive to sustainability is also essential. The priorities are less advertising bombardment to induce purchase and more conversations to build trust, setting up environments of interactions (Noci, 2011). The year 2022 has been marked by the profound participation of many fashion houses, luxury but also fast fashion, in Metaverse, that have not only made agreements to be present within it but have also contributed to its development. They have implemented a presence in the Metaverse as part of their marketing strategies not to lose a competitive advantage. At the same time, new and exciting start-ups have sprung up to a new and flourishing area of business.

This paper aims to understand whether the Metaverse in the fashion industry can be regarded as a new and additional e-commerce platform or if it can be considered a new sustainable business model based on innovative interactions between its stakeholders.

**Keywords** – Metaverse, digital fashion, new technologies, knowledge

**Paper type** – Academic Research Paper

## 1 Introduction

Digital transformation has dramatically changed the way we do business. The climate of uncertainty caused by the Covid 19 pandemic, the challenges related to environments characterized by increasing levels of volatility, complexity, and ambiguity, as well as ethical and environmental issues, have led to implementing digital strategies that have developed in different directions and ways.

In this context, an increasing sustainability and socially responsible approach is needed with the advantage of delivering significant benefits to businesses, society, and the environment (Camilleri, 2017) and creating new and solid links with online communities, especially of Millennials and GenZ, whose perception around luxury has changed in the direction of an ever-greater awareness of sustainability. (Giachino, et al. 2021).

Therefore, it is necessary to acquire new knowledge and skills and a new "digital" entrepreneurship (Nambisan, 2017). Entrepreneurship research has always investigated the relationship with digital technologies to understand how they can influence entrepreneurial initiatives (Weking et al., 2023).

Looking at the link between fashion and technology, it is possible to see distant roots; the realization of fabrics and clothes gave rise to the first industrial revolution in the eighteenth century in Europe. *"It was precisely the textile industrial reproduction that made fashion possible as a form of technical reproducibility"* (Calefato, 2016, p102).

Analyzing fashion, its changes, and evolutions means understanding the future: *"Each season carries within itself in the latest creations some secret signal of future things. Those who learn to read them could not only know in advance something about the new artistic currents but also the new codes, wars, and revolutions"* (Benjamin, 2010, pp 68).

In this combination of technology, entrepreneurship, and future, not analyzed as a whole, this article is developed that aims to understand how digital fashion within the "Metaverse" platforms can constitute not only a new distribution channel but an element of vision and change in the way of interacting between the different stakeholders of the company, especially between users and entrepreneurs.

Specifically, the purpose of the paper is to answer the following research question, whether the metaverse can be considered a new and additional business platform in the fashion sector or whether it is to be considered an

innovative way for companies to communicate with their stakeholders, primarily consumers.

## 2 Theoretical backgrounds

The metaverse is a new concept that exploded following the rebranding of Facebook in Meta (Rospigliosi, 2021; Lopez-Diez, 2021), as can be understood through the Google trends indices, in which the term "metaverse" in the world reached 100 only in January 2022, while the search for the time in previous years is almost zero.<sup>1</sup>

According to Matthew Ball, the metaverse can be defined as "a network of maximum scalability and interoperability of 3D virtual worlds redirected in real-time, which can be experienced synchronously and persistently by an effectively unlimited number of users with an individual sense of presence within them, and which guarantee data continuity, related to identity, history, rights, objects, communication, and payments" (Ball, 2022, p.55).

The metaverse has also aroused interest for business purposes; the integration of various forms of technology, such as blockchain, artificial intelligence, machine learning, NFT, could represent an advantageous business model (Periyasami, Periyasamy, 2022), considering that forecasts estimate that 25% of people will spend at least one hour a day in the metaverse by 2026 (Gartner, 2022).

In Italy, Cosenza (2022) created an observatory with an organized mapping of the metaverses existing so far, considering the following parameters: the three-dimensionality of the environments; the shareability of spaces simultaneously by several users; sociality; with identity based on freely movable avatars and with the ability to interact with others and with the environment.

The business opportunities are linked to the purchase of virtual shops and immersive e-commerce, of land and digital real estate, of art, clothes, and accessories in Non-Fungible Token (NFT) wearable by avatars, but also all 'use of classrooms and virtual offices, to business opportunities regarding marketing related to the sponsorship of spaces within the metaverse (billboards, streets, places); but also to participate in social and virtual events such as concerts, meetings, and fairs, to organize events for one's community (Grillo, 2022). The metaverse is expected to become a trillion-dollar market within a decade (Weking

---

<sup>1</sup> Data available on <https://trends.google.it/trends/explore?date=all&q=metaverse>

et al., 2023). Specifically, McKinsey says it has the potential to generate up to \$5 trillion in value by 2030 (Elmasry et al., 2022).

The growth of interest around the metaverse in the fashion sector has also led to increased brands. In fact, for the user, entering a metaverse means creating their avatar and exploring digital environments by connecting with other users, creating a more immersive high-intensity experience (McLuhan, 2015). 94% of users in 2022 customized their avatars. Many fashion brands have seized an economic opportunity in this and have implemented various strategies to enter the metaverse. The “fashion in the metaverse” question is still embryonic but represents an up-and-coming field of investigation (Grillo and Bonomi, 2022).

Breiter and Siegfried (2022) first attempted to explore consumer expectations and attitudes in the fashion industry in the metaverse. According to their study, consumers must still be ready for the metaverse. However, some are willing to pay to purchase digital clothes and accessories.

Jang and Kim (2023) investigated the effects of such avatar customization on game metaverse platforms in fashion education processes. The possibilities related to customization and immersive interaction are joined by more practical reasons associated with the possibility of working within a forum that can influence the pre-existing business models in the fashion sector, allowing companies to sell, ship and collect payments safely, engaging customers and improving sustainability and reducing waste (Periyasami and Periyasamy, 2022). Engaging customers in the metaverse through immersive experiences is a crucial data collection element. One example is the 2000s-inspired Y2K aesthetic. Mainly spread by the TikTok social platform, it invaded the Roblox marketplaces to be launched on the high fashion catwalks (Parkinson, 2021).

The theme of artificial intelligence in fashion in the metaverse is confirmed by the study by Mu et al. (2023), who explores how fashion smarts help fashion houses create products in line with the styles emerging from their communities. Compared to real-world data, fashion intelligence applications in the metaverse can generate accurate predictions and help retailers characterize market trends.

### **3 Methodology**

This study is still exploratory and a part of more extensive work investigating the link between fashion and the metaverse.

To try to answer the research question, the activities carried out by fashion houses on different platforms were observed with a qualitative methodology, because it was considered more appropriate for an exploratory study. An ethnographic analysis was carried out, with a participatory observation (Corbetta, 2014) on the metaverse platforms of Roblox, Zepeto, The Sandbox, Minecraft, Decentraland, and among online communities. The media were chosen based on the ease of access through PC or smartphone, and the observations were organized and encoded in a file from which it was possible to elaborate a map of the brands in the metaverse.

Subsequently, we verified which fashion brands carry out activities for the world giving life to a native market, and which instead use the metaverse to support the sale of IRL products.

### 3.1 Data Collection and Analysis

From the participatory observation of the metaverse platforms, a map has been developed that offers an initial overview of the brands present.

Fig 1 – Mapping fashion houses in the metaverse (Source: Authors' elaboration)

We analyzed twelve brands: Adidas, Bulgari, Burberry, Dolce & Gabbana, Forever 21, Gucci, H&M, Nike, Tommy Hilfiger, Prada, Ralph Lauren, and Shein.

Observing the positioning on the metaverse platforms of fashion companies, three business models have been identified as follows: brands present in the

metaverse for the sale of physical products (A1); brands present in the metaverse to sell digital products for avatars (A2), and luxury digital twins or exclusive products in NFT (A3).

Tab 1 - Summary of observed business models (Source: Authors' elaboration)

<b>A1</b> Brands in the metaverse to sell physical products.	H&M, Lacoste, Burberry.
<b>A2</b> Brand in the metaverse to sell digital products for avatars	Adidas, Gucci, Shein, Nike, Ralph Lauren, Prada, Forever 21, Tommy Hilfiger, Bulgari.
<b>A3</b> Brands in the metaverse to sell luxury digital twins or exclusive products in NFT.	Dolce & Gabbana, Bulgari, Prada, Gucci.

Brands in the metaverse A1 stay for selling products in IRL. According to this model, platforms lend themselves to being an essential narrative territory (Camacho, 2022) to improve awareness around the brand while maintaining a touchpoint within a digital space that could prove promising. This is the case, for example, of Lacoste, which created a virtual store that offers an immersive experience for buying products in IRL.<sup>1</sup>

The collaboration between Burberry and Minecraft includes the game "Burberry: Freedom to go beyond" and a capsule collection in the real world inspired by the style of the play. Burberry also offers the opportunity for avatars wearing the brand's garments to complete a series of challenges, such as a maze covered with Burberry's signature plaid pattern, in four worlds designed in collaboration with Minecraft Blockception map creators.<sup>2</sup> The gaming experience is aimed at selling Trench Coats, logo sweatshirts, hoodies, hats and scarves from Burberry's website, in an operation that the brand has described as a bridge between the digital and physical worlds.<sup>3</sup>

H&M has instead abandoned the initial project of the shop in the metaverse of Ceek (Özkaynar, 2022) launching at the end of 2022 Loooptopia on Roblox, a gaming experience in which players foul-mouthed elements that allow them to dress up avatars and participate in fashion shows, however without offering an experience of buying digital clothes or accessories<sup>4</sup>. The game is part of a wider project of recycling clothes and discarded fabrics in a green-friendly perspective that the Swedish company has decided to adopt. Each store of the chain is

<sup>1</sup> <https://www.lacoste.com/gb/virtual-store.html>

<sup>2</sup> <https://us.burberry.com/c/collaborations/minecraft-burberry-partnership/>

<sup>3</sup> <https://it.burberry.com/c/collaborazioni/collaborazione-burberry-minecraft/>

<sup>4</sup> <https://www.roblox.com/games/11700520283/Loooptopia>

equipped with containers in which it is possible to give the fabrics. The Stuttgart store has a "Loop" - hence the name of the game - in which materials are inserted to be shredded and spun.<sup>1</sup> The Swedish company then launched an IRL collection for the fall winter 2022 season inspired by the aesthetics of the metaverse and seven a series of ARFs that can be used from the H&M App and created in collaboration with the Institute of Digital Fashion in London.

Model A2 aggregates the brands in the metaverse for the sale of digital products intended for avatars. Ralph Lauren offers a prime example of collaborating with several metaverse platforms (Roblox and Zepeto) to build a narrative universe and sell digital clothes and accessories. The American brand created an immersive Christmas-themed gaming experience on Roblox that allowed players to explore the Ralph Lauren universe in a limited time of two weeks and purchase an exclusive collection. Even if the game is idle, you can still purchase digital clothes and accessories on the marketplace<sup>2</sup>. Ralph Lauren is also present on Zepeto (Seon, et al., 2022) with an immersive experience set in New York where you can open and buy digital objects.

Tommy Hilfinger is present on Roblox with an immersive gaming experience in a futuristic New York where you can watch fashion shows and unlock branded digital accessories<sup>3</sup>; the shopping experience continues in the Roblox shopping area where there are clothes and accessories to customize avatars. The brand is also present on Decentraland's Metaverse platform as a partner of the second edition of Metaverse Fashion Week<sup>4</sup>.

Adidas focuses on multichannel positioning itself on different metaverse platforms, offering immersive experiences on Zepeto, Minecraft and the Sandbox. It is also present on Decentraland as a partner of the MVFW. It has created a collection of digital clothes in NFT called Virtual Gear acqüstabiland on the Open Sea Marketplace<sup>5</sup> in Ethereum cryptocurrencies<sup>6</sup>. Nike replicates Adidas' multi-channel approach by targeting the metaverses of Roblox and Zepeto, creating immersive gaming experiences to play and buy clothing and accessories for their

avatars. Nikeland on Roblox was created in September of 2021 and the last update was on March 16, 2023,<sup>1</sup>.

The Forever 21 brand is present on Roblox with the immersive universe Shop City, a game in which you can build your personalized store, create your style with exclusive clothing and make-up<sup>2</sup>. On the Roblox marketplace you can buy digital clothes whose success has led the Los Angeles company to create a physical collection inspired by the digital one. An interesting case is the branded digital cap that can be purchased at 60 Robux on Roblox and has become an inevitable accessory on the Forever 21 ecommerce site at the price of 14 euros<sup>3</sup>.

Gucci is among the most innovative brands in Web 3.0. In 2021 she joined Roblox, creating the virtual world Gucci Town, a space<sup>4</sup> minigames, a café and a shopping space where players can buy Gucci virtual equipment for avatars to wear. In 2022 it purchased the virtual lands on The Sandbox giving way to the new metaverse project "Vault", a space where from 27 October to 9 November 2022 it was possible to visit the concept store and live game experiences where you can win and perform missions to unlock a lottery and win land on TheSandbox or NFT<sup>5</sup>. On Zepeto is present with Gucci Garden<sup>6</sup>, even here, you can play and unlock elements to dress your avatar.

The fast fashion brand Shein is present on Roblox in collaboration with the Swedish fintech Klarna. The immersive universe "Shein x Klarna Wonderland", presents itself as an expansion in the digital environment of those same experiences lived in the physical environment with the opening of<sup>7</sup> pop-up stores that Shein has implemented, in association with Klarna, in the cities of London, Paris and Barcelona. A showroom model<sup>8</sup> without in-store goods in which to live experiences, such as live music, free offer of ice cream, coffee or hot chocolate; Shein's Wonderland on Roblox recreate same physical experiences with the possibility of accessing the SheinForAll building, the Shein store where you can buy clothes and accessories for our avatar.

The A3 model aggregates brands whose presence in the metaverse represents an opportunity to create and sell exclusive luxury digital products or twins of

physical products in NFT (Periyasami and Periyasami, 2022). NFTs lend themselves to luxury due to their exclusivity, helping brands stay relevant (Kirjavainen, 2022). An example is Dolce & Gabbana which with the NFT collection Genesis (Segura, 2022) showed the powerful combination of NFT, tangible fashion and the luxury brand experience linked to the purchase of NFT. Each NFT metaverse purchased was matched with an original signed sketch, a private tour of the atelier and an exclusive invitation to Dolce and Gabbana's IRL show (Kirjavainen, 2022). The entire collection was auctioned for the sum of 1885.73 ETH, equal to about six million dollars (Crescenti, 2021).

The Zeta generation is increasingly involved in the creative and development process of digital products; they are consumers of products but also co-creators of garments (Särmäkari and Vänskä, 2020). An example is The Fabricant (Särmäkari, 2021), which has created a Studio platform where users can create digital clothing. Nike launched SWOOSH, a web-enabled platform<sup>3</sup> that supports athletes and the future of sport by creating a new community and inclusive digital experience, and a hub for Nike virtual creations.<sup>12</sup>

In 2021, in collaboration with the director and digital artist Refik Anadol, Bulgari created a multisensory experience of the iconic snake in Milan with the support of artificial intelligence, narrating and enhancing its nature and transformation. The exhibition *Serpenti Metamorphosis* has become an independent NFT (Castriota, 2022).<sup>3</sup> Prada has launched the Prada Crypted space, a space dedicated to NFTs on Prada.com that connects fashion, art and Web3 and where every first Thursday of the month a limited-edition physical object and its digital twin in NFT is released. The link between art and fashion is also realized in Gucci with the Vault project<sup>4</sup>, a space to buy artworks in NFT made by different artists.

#### **4 Discussion and conclusions**

This work aimed to understand what the role of the metaverse could be in the fashion industry, whether it could represent an additional distribution platform or rather a new way to communicate with its stakeholders, especially customers.

The. After an analysis of the existing literature, an exploratory study tried to fill the gap found by reviewing the brands that make exclusive products for the metaverse giving life to a native market and those that use the metaverse as a platform to support sales in IRL.

Since the processing of the information collected, three different ways of participating in the metaverse have been classified. For some brands, the metaverse is declined as an interaction tool in which they build their reputation. At the same time, through immersive or gaming experiences, they ask for feedback from consumers, and finalize the sale of physical products. The second model includes brands that have created a new business area with the sale of digital products. The same digital products at the same time can activate reverse processes, orienting the realization of physical twins, with cases in which the success of digital products has inspired the physical clothing collection (Cimermanaite, 2022), highlighting another fundamental aspect concerning the presence of fashion houses in the metaverse, the function of testing collections before the production of physical collections (Särmäkari and Vänskä, 2020), but also to intercept styles and trends within online communities according to a grassroots process (Jenkins, 2014). Thanks to the data collection achievable with Fashion Intelligence (Mu et al, 2023), it is possible, in fact, to extract important data to help designers create products in line with the preferences that emerge in online communities.

In this sense, it is possible to hypothesize that the Metaverse is part of the broader framework of a change in the way of interacting and expressing one's identity, which can be realized thanks to the purchase of clothes and digital accessories on the metaverse platforms Zepeto, Minecraft and Roblox; the demand for virtual fashion in fact grows, as Gen Z spends more and more time in immersive social spaces socializing, creating and expressing themselves (Parkinson's., 2021)

The third model examined the luxury brands Dolce&Gabbana, Bulgari and Prada that intend to maintain their exclusivity with the sale of NFT (Simmel 2005; Veblen 2017) in the digital market opening up to the new opportunities that the new native luxury market offers through the sale of exclusive NFT clothes and which shows important margins for growth and maturation (White et al., 2022). NFTs allow you to perceive belonging to a group thanks to a model that gives life to an ecosystem that creates a narrative around the released digital object (Kaczynski, 2021), with a roadmap that offers buyers access to the product,

exclusive activities and experiences - the case of the Genesis collection by Dolce & Gabbana has been reported - giving life to real communities, further strengthening the sense of belonging and making consumption more desirable (Kirjavainer, 2022).

The main implication of the study is that overall, the three business models analyzed have important common elements. First of all, the Metaverse lends itself to being an important narrative territory (Camacho, 2022) for businesses and consumers and of new interaction between stakeholders, capable of giving life to a new entrepreneurship to prepare and companies for new challenges in the fashion and luxury sector (Alexander, and Bellandi, 2022) . Secondly, it is a space of interaction to create value within online communities, through gaming experiences; sale of NFT; gaming experiences related to selling digital clothes for avatars.

Storytelling and interaction are key elements of metaverse platforms capable of preparing companies for new consumers: GenZers are increasingly involved in the creative process and development of digital products, as co-creators of garments. Collaborative fashion, offering the possibility of living a participatory experience, is also an important tool for collecting data on styles and trends (Mu, 2023) reinforcing the hypothesis that the metaverse represents a new interaction model.

The sale of NFT is geared towards strengthening the community around the brand; the creation of immersive worlds in which companies can spread their values while offering users an experience in which to play and buy digital objects; The co-creation of digital clothes on metaverse platforms or within the media of digital fashion houses, reveal that the metaverse is much more than a shopping space for fashion but a territory within which actors and online communities give life to a new and lively model of interaction, a model that necessarily requires new knowledge and new skills to give life to the business of the future.

The main limitations of the study lie in the exploratory nature itself, but we are convinced that it can be a stimulus to continue to deepen the emerged strands, to develop ever-new knowledge of fashion enterprises to bring to life the business of the future.

### **Abstract**

The proposal discusses methods and techniques that reduce the environmental impact of buildings over the lifecycle with the objectives of adaptive reuse of cultural heritage buildings. To achieve this goal, an integrated approach to design is used, which involves the analysis of questions, strategies, and actions in a complex system applied to a case

study located in Sardinia, Italy. This place is the military battery of Capo d'Orso, once the avant-garde of military technology, today abandoned fossil trapped in millenary granites. Awakening these places, no longer as spaces dedicated to war, but as places full of history and open to new futures is essential. The new function, resulting from careful analysis of the heritage and the surrounding context, required the integration of new additional volumes. Three founding actions guided the project: Integrate, Optimize, and Build. The restoration project presented in the paper was shaped by crucial matters that cannot be overlooked, including energy and water saving, seamless integration between new and existing structures, the economic feasibility of construction, and efficient utilization of resources. These were the fundamental aspects that formed the backbone of the project. This paper describes in particular the process of integration and optimization of the structure of an added volume necessary for the re-functionalization of the area. The addition is located on top of the underlying historical vaults of pre-existence. Given the great testimonial value of the historic vaults, the design intention was to preserve and protect them. The work describes a multi-objective optimization approach which had evaluated different design alternatives according to constraints given by the context and the pre-established objectives, in order to optimize the structural element as much as possible meeting all the requirements: structural efficiency, visual permeability, lightness, low environmental impact, the possibility of assembly on a particular site hard to access. The study also shows methods to compare different technologies, configurations, and materials, starting from a structural scheme allowing the significant span and developing a finite element model for each configuration to evaluate structural performances. Moreover, the design process made use of prefabricated technologies, dry solutions, and modularity to allow easier construction on a site hostile to traditional mechanisms. Eventually, the solution to the initial problem it's been able to achieve sustainability, comfort, and respect for the pre-existence without compromising on performance.

**Paper type** – Academic Research Paper

## 1 Introduction and background issues

Today the construction industry covers a crucial role in human well-being as well as in environmental impact. The subsequent manufacture, use, and disposal of buildings for shelter are conducted on a massive scale, causing significant consumption of natural resources and wastes. This demand makes the construction industry the largest consumer of resources globally (WEF, 2016). Furthermore, the building industry's greenhouse gas (GHG) emissions have risen steadily. The International Energy Agency noted that there was a 45% increase in building-related emissions since 1990 (IEA 2017). Furthermore, in 2020 a study

was conducted by the Weizmann Institute of Science on the material production of human activities compared to the overall natural biomass of the planet. It emerged that in the year 2020, the anthropogenic mass, which has recently doubled roughly every 20 years, surpassed the global living biomass, of which a large part is implied in buildings and infrastructures.

These facts make managing the environmental impacts of buildings critical to achieving a sustainable economy and limiting global human impact. The management of complex design systems has to face more and more ambitious standards of sustainability and quality of the buildings.

One of the sustainable strategies to be pursued is to transform a linear product supply chain into a circular one in order to capture the environmental benefits of adaptive reuse. In general, with Circular Economy, we mean production and consumption processes that require the minimum overall natural resource extraction and environmental impact by extending the use of materials and reducing the consumption and waste of both materials and energy. Just dealing with a refurbishment and reuse project of an abandoned area is already a first step of a circular building thinking approach. In this sense, the need is to recognize the existence of abandoned significant cultural heritage resources and their potential role in sustainable development, firstly in reversing land use spread. Moreover, taking into account the obsolescence of a built complex and its functions, it is fundamental to consider in the design process the entire life cycle of the building, from the choice of raw materials up to the end of life and the dismantling of it. In this sense, the choice of technologies that allow disassembly is crucial to guarantee a certain level of resilience for the building.

## **2 Complex integrated systems approach**

With the increasing complexity of the construction sector and the ambitious environmental, social, and economic performances required by today's goals, it is important to orient the design focus not only on the results but also on the process to gain them. In this sense, methods capable of optimizing the resources used without compromising a project's comfort and quality levels are increasingly needed.

Literature and previous works demonstrate several environmental advantages of restoring existing buildings over new construction, especially for architecture related to the culture and identity of a place (Pittau et al., 2019). Restoring a

building is a process that goes beyond the simple technological and technical adaptation necessary to achieve better performance. Restoration is a recognition of an intrinsic value to architecture that deserves to be passed on. Nevertheless, this value can be considered historical, testimonial, economic, or technological value. Managing the complexity resulting from pre-existence is therefore a challenging process with no single best solution.

This research aims to investigate a methodology that can demonstrate how high-quality architectural construction can be compatible with sustainability. Throughout this process, sustainability will be approached from a holistic perspective, taking into account environmental, economic, and social factors. For those reasons, the work pays particular attention to the method and the working process, going to deepen fundamental issues to intervene in a delicate and sensitive context.

### **3 Methodology**

#### **3.1 Case study**

The paper presents the integrated optimization process for the rehabilitation of the former military battery at Capo d'Orso. The Capo d'Orso military complex is one of the hundreds of military architectures in northern Sardinia, near Palau (SS). It allowed maritime control of the La Maddalena archipelago since 1887. One of the intrinsic characteristics of the Capo d'Orso area is its complexity, given by the architectural articulation, the location, the fragility of the context, and the precarious state of conservation. Knowing how to control these factors is complex, as to maintain a coherent thought with the project objectives during the entire duration of the design process.

The paper focuses on the construction of an addition, resulting from a larger restoration project, which aims to give a new function to the entire abandoned complex. The challenges coming from the addition are several. First of all, the project aims to ensure complete 360-degree visibility of the Maddalena archipelago as the only observation point within the area. The addition is assumed partly on the artificial embankment and partly to cover the historic vaults below, once used as ammunition storage. Given their great testimonial value, the design intention is to preserve the vaults, avoiding the addition's structure from bearing down on the vaults (Fig. 1). To ensure this, the addition's

new structure has to overcome 28 meters of span between the two embankments.

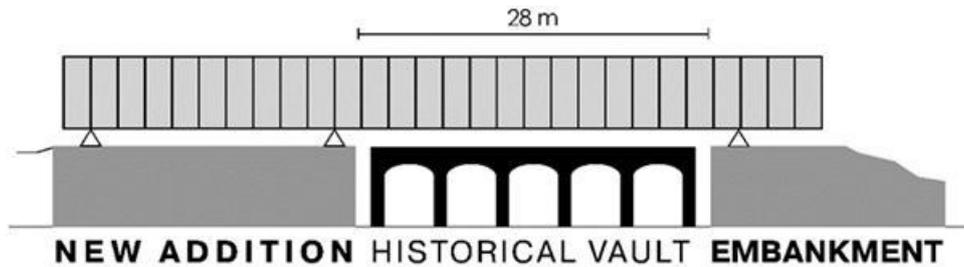

Figure 1 Schematic representation of the project addition on the historical vaults with the desired structural supports' position.

It is important to emphasize that the architectural constraints included two major limitations. On one hand, maintaining the maximum visual permeability of the addition as the only place where it is possible to enjoy the view. On the other hand, the impossibility of expanding the addition beyond the limits of the geometrical footprint, as no additional bodies could be provided. As a result, visually impactful structures or structures outside the footprint were to be excluded to support the addition. Moreover, the use of mostly low-impact or negative climate materials was a goal of the design process.

### 3.2 Multi-objective analysis

From these premises, it is clear the necessity to focus on several objectives simultaneously to find the design solution that satisfies them. Thus, the approach used involves a multi-objective process that allows different design alternatives to be evaluated according to the set objectives and constraints given by the context. The strategy aims to optimize the structural element as much as possible to simultaneously meet the requirements of structural efficiency, visual permeability, lightweight, low environmental impact, and construction site logistic (Fig. 2).

Figure 2 Design objectives taken into account.

To address the potential trade-off between the different objectives, we first proceeded by defining structural configurations capable of meeting the needs of the project. Each configuration was analyzed by considering different materials. Then each configuration was subjected to FEM, LCA, visual comfort, and cost analysis.

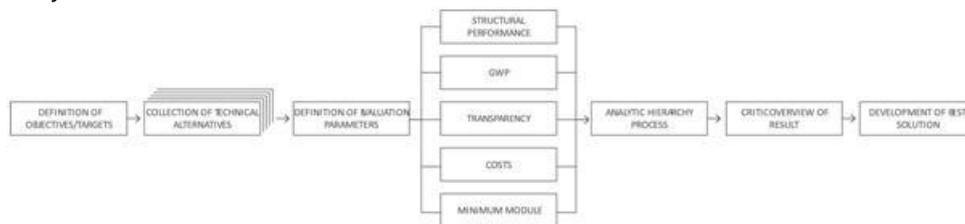

Figure 2 Multi-objective analysis steps.

One of the greatest difficulties when evaluating technical solutions is to ensure that they respect the architectural concept without distorting the design. Consequently, it is important to use an analytical evaluation tool that does not stop at evaluating only the structural performance. To meet these requirements, the Analytic Hierarchy Process (Uzun et al., 2021) was used, a multi-criteria evaluation process that allows different alternatives to be evaluated in relation to different criteria. The advantage of this method consists in being able to assign a weight to each criterion in order to consider the actual impact on the project. Thanks to this methodology, therefore, it is possible to evaluate the different alternatives analytically but without the risk of neglecting the actual importance that each parameter exerts on the design concept.

As previously mentioned, different structural configurations were evaluated, each of them realized with different materials. In order to make an optimal choice, it was important to define the parameters with which to evaluate each configuration. The definition of the evaluation parameters, therefore, was fundamental in defining the impact of the studied solution (Fig. 4).

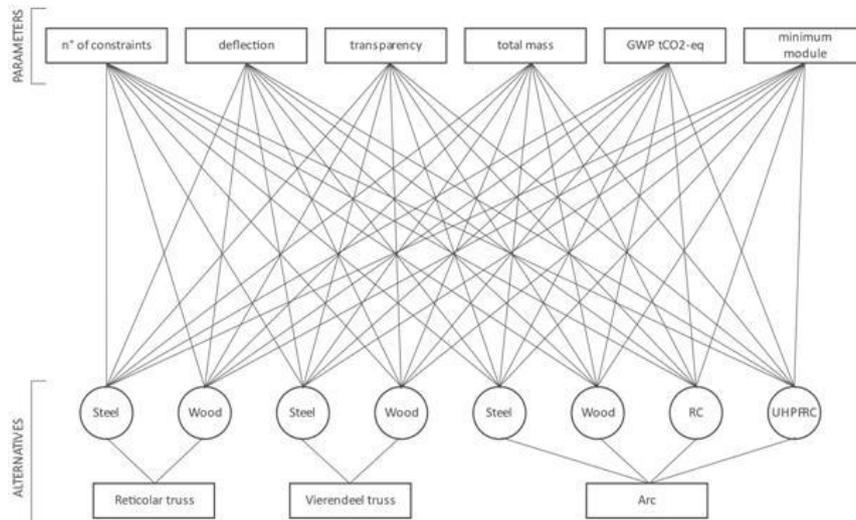

Figure 4 Different Alternatives and Correlations

The parameters used to classify the design solutions were:

- No. of supports on the bunkers, to limit the impact of the structure on the vaults below.
- Arrow, to evaluate the maximum arrow of the different systems from the preliminary stages.
- Transparency, to ensure visual permeability from the inside of the addition to the outside. Transparency is evaluated in percentage as the ratio of the transparent part to the whole wall surface.
- Structural mass, to evaluate the overall mass of the structure so as not to overstress the historical building and simplify the logistic of the construction site. Moreover, reducing the use of materials helps limit the environmental impact of the structure.
- Global Warming Potential (GWP), to identify and compare the impacts of different design solutions on global warming and energy resource use. For this purpose, the system boundaries for the analysis are from cradle to grave, considering the entire life cycle of the material, up to the end of life.
- Minimum module, given the difficulty of accessing the construction site located on the top of an impervious promontory, accessible only by a 4 meters width road. The minimum module is meant the smallest decomposable element of the structure.

- Cost, evaluating the cost of each available alternative. This parameter refers to the net cost of the raw material used to build the structure.

Below the prices used:

- Steel 700€/ton
- Wood 600€/m<sup>3</sup>
- Ordinary concrete 180€/m<sup>3</sup>
- UHPFRC 1500€/m<sup>3</sup>

## 4 Results

### 4.1 Structural systems

The first type of structure considered is the Neville reticular girder, which consists of horizontal and oblique rods connected to each other at the nodes by moment-locking hinges. The external forces in this scheme are applied at the nodes and only axial forces act in the rods, thus, being tensioned or compressed, but not inflected (Fig. 5).

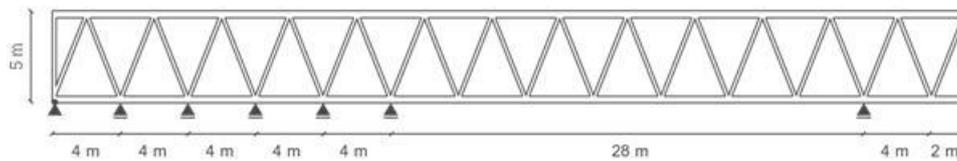

Figure 3 Neville reticular girder system

This solution was chosen as a starting point as the most commonly used to cover large spans, e.g. in the case of large infrastructures such as bridges, with limited weight and material usage. Another type analyzed is the Vierendeel beam, consisting of two continuous horizontal beams and a series of vertical uprights (Fig. 6).

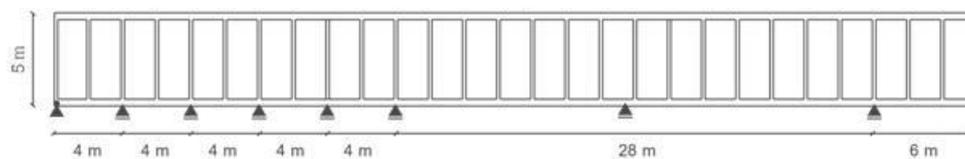

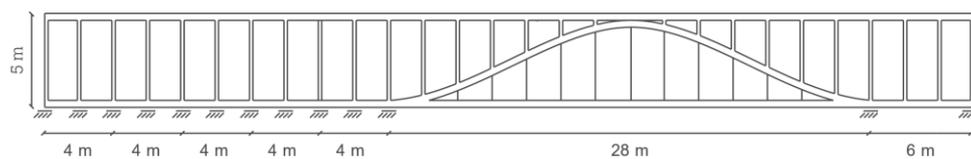

Figure 6 Vierendeel system.

In this vertical rod scheme, the constraints are rigid, represented by joints that can transmit the bending moment. In this case, the members are subjected not only to compressive and tensile stresses but also to bending ones. This solution is equally applied to cover large spans, although it requires a greater use of material than the previous one, resulting in an increase in the total weight of the structure.

During the first phase of comparing structural solutions, it emerged that each structural system fulfills a single parameter. In fact, although several structural alternatives were found to be structurally valuable, none of them satisfied all the objectives. Consequently, it was decided to change the approach and find another solution to be compared. Thus, a topological optimization problem was set up to achieve an efficient shape. Through this approach, we achieve the most efficient form given the boundary conditions, which was found in the arc (Section 4.2 Topological optimization).

*Figure 7 Arch system obtained by the topological optimization.*

In order to compare the different technical solutions, we applied the Analytic Hierarchy Process. First, the values obtained were sized by dividing each result by the maximum value obtained in the case where the parameter positively affects the result (as in the case of transparency, where the larger the value, the better the technical solution). In the case where the smaller the value, the better the solution (as in the case of deflection), the individual data set was divided by the minimum of the values.

Table 1 Dimensional results.

	n° of constraints	Deflection [%]	Transparency [%]	Total mass [kg]	GWP tCO <sub>2eq</sub>	Minimum module [m]	Cost [€]
<b>Vierendeel - steel</b>	1	0.07%	70%	134868	103605	8	94407

<b>Arch - UHPFRC</b>	0	0.08%	69%	126590	45515	6	60763
Max	1	0.14%	71%	351046	103605	12	133500
Min	0	0.04%	52%	71339	25548	6	44822

At this point, the values of each parameter are compared in a range from 0 (worst) to 1 (best). As mentioned above, however, not all parameters are intended to be given equal importance. GWP, structural mass, and transparency were given more importance. To take this into account, a weight between 0 and 1 is assigned to each parameter and the sum of all weights constitutes one unit. Consequently, having 7 parameters in total, an equally distributed weight results in 0.1428 for each parameter. The determination of the score on the basis of which to draw up the ranking is made according to the following formula:

$$V_{ranking} = \sum V_{adim,i} \times W_i$$

$V_{ranking}$  = final score used to rank the solutions

$V_{adim,i}$  = dimensionless value of each parameter

$W_i$  = weight value assigned to each parameter

In the first instance, an equal weight was assigned to each parameter in order to understand what the ranking is under standard conditions without considering the different design importance of the various parameters.

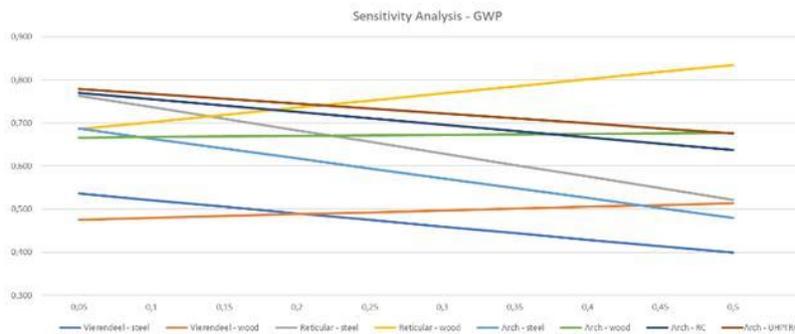

Table 2 Result - Dimensionless data with parameters' same weight.

	n° of constraints	Deflection [%]	Transparency [%]	Total mass [kg]	GWP tCO <sub>2eq</sub>	Minimum module [m]	Cost [€]	Rating
<b>WEIGHT</b>	0.143	0.143	0.143	0.143	0.143	0.143	0.143	
<b>Vierendeel - steel</b>	-	0.572	0.982	0.529	0.247	0.750	0.475	0.508
<b>Vierendeel - wood</b>	-	0.279	0.792	0.815	0.557	0.600	0.342	0.484
<b>Reticular - steel</b>	1	1.000	0.963	0.543	0.253	0.750	0.487	0.714
<b>Reticular - wood</b>	1	0.343	0.787	0.802	1.000	0.750	0.336	0.717
<b>Arch - steel</b>	1	0.740	1.000	0.537	0.250	0.500	0.482	0.644
<b>Arch - wood</b>	1	0.335	0.736	1.000	0.690	0.500	0.419	0.669
<b>Arch - RC</b>	1	0.569	0.939	0.203	0.490	1.000	1.000	0.743
<b>Arch - UHPFRC</b>	1	0.481	0.965	0.564	0.561	1.000	0.738	0.758

As can be seen from the ranking obtained, the arch solutions in RC and UHPFR together with the reticular girder solutions are those with the highest scores. This result is justified by the fact that they are solutions that overall perform well in most of the parameters. At this stage, we see that the UHPFRC arch is the best solution.

#### 4.2 Sensitivity analysis

In order to assess the impact of each parameter on the final rating, a sensitivity analysis was carried out. The objective is to understand the evolution of the rating when one of the parameters varies. In particular, the evolution relative to GWP, transparency, and total mass was analyzed. By varying the parameter between 0.05 and 0.5 and keeping the other values constant, it is therefore possible to investigate the threshold beyond which one solution becomes better than another. Below are the results obtained where the x-axis is the weight assigned, while different lines are the structural systems analyzed to read the relative ranking score for each one. From the graphs, it can be seen how the score associated with GWP increases, the wooden structures manage to increase their overall ranking while the others tend to decrease. As far as transparency is concerned, as the weight increases, all the structures improve their final rating, with the steel Vierendeel solution growing more. Finally, with respect to mass, the rating increases proportionally as the weight of the RC arch and steel, Vierendeel wood and steel solutions increases. From this analysis, it is, therefore, possible to understand which parameter positively or negatively influences each solution.

By plotting the scores obtained for each structure on a radar graph, it is possible to make a further comparison between the different alternatives, so that it is very easy to identify the parameters for which each structure performs best. It is interesting to note that the UHPFRC arch solution has a graph that ranks in the middle of the results, however, through the multi-objective evaluation system illustrated, it is clear that it is the solution that best maximizes the different requirements within the design intent.

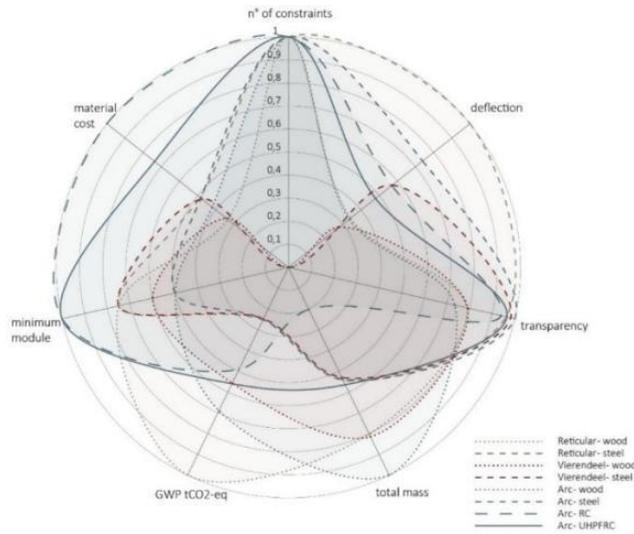

Figure 8 Radar graph of results obtained for the eight solutions.

After this first quick assessment, different weights can be assigned to each parameter. As anticipated, high weight was assigned to GWP, transparency and less visual impact, and total mass to minimize loads. Below are the results obtained.

Table 3 Result - Dimensionless data with different parameters' weight.

	n° of constraints	Deflection [%]	Transparency [%]	Total mass [kg]	GWP tCO <sub>2eq</sub>	Minimum module [m]	Cost [€]	Rating
<b>WEIGHT</b>	0.05	0.1	0.25	0.15	0.2	0.15	0.1	
<b>Vierendeel - steel</b>	0.000	0.572	0.982	0.529	0.247	0.750	0.475	0.591
<b>Vierendeel - wood</b>	0.000	0.279	0.792	0.815	0.557	0.600	0.342	0.584
<b>Reticular - steel</b>	1.000	1.000	0.963	0.543	0.253	0.750	0.487	0.684
<b>Reticular - wood</b>	1.000	0.343	0.787	0.802	1.000	0.750	0.336	0.747
<b>Arch - steel</b>	1.000	0.740	1.000	0.537	0.250	0.500	0.482	0.628
<b>Arch - wood</b>	1.000	0.335	0.736	1.000	0.690	0.500	0.419	0.672
<b>Arch - RC</b>	1.000	0.569	0.939	0.203	0.490	1.000	1.000	0.720
<b>Arch - UHPFRC</b>	1.000	0.481	0.965	0.564	0.561	1.000	0.738	0.760

#### 4.3 Topological optimization

In this section, we show the process followed to achieve the arc shape. As mentioned before, to achieve a lightweight and visually permeable structure, a topological optimization problem was set up. Topological optimization refers to

a process that, given specific boundary conditions, allows the reduction, redefinition, and distribution of material connections to achieve an efficient shape. It was decided to employ a topological optimization process because, unlike shape optimization, it allows a completely new structural scheme to be found rather than defining the optimal dimensions of a predefined model. This procedure, therefore, allowed us to find the most efficient shape given the boundary conditions.

By optimizing the structural element, it is also possible to minimize the material used and consequently reduce the GWP (Block, 2020), employing the available resources more efficiently.

During the topological optimization process, it was necessary to define boundary conditions such as:

- - Elastic modulus of the material
- - Poisson's modulus
- - External constraints
- - Actions acting on the system

*Figure 4 Scheme of topological optimization objectives*

In addition, it is important to establish the objective of the optimization process by means of a function and a constraint (Duriez et al. 2022). In the case under study, the optimization was aimed at finding the form that could maximize the structural stiffness (defined as a function) and minimize the volume (defined as a constraint). Using the Abaqus CAE software, all parameters were set and through 25 iterations it was possible to obtain the shape that combines maximum stiffness and minimum volume. The approach behind the optimization process is to achieve structural performance without adding material to the structure but by

finding the most efficient shape. The search for the best-performing structural scheme means finding configurations that reduce internal stresses by actually increasing the potential of the material used (Block, 2020). Following the design phase, as with the previous analyses, different materials were evaluated to assess how well they met the initial requirements.

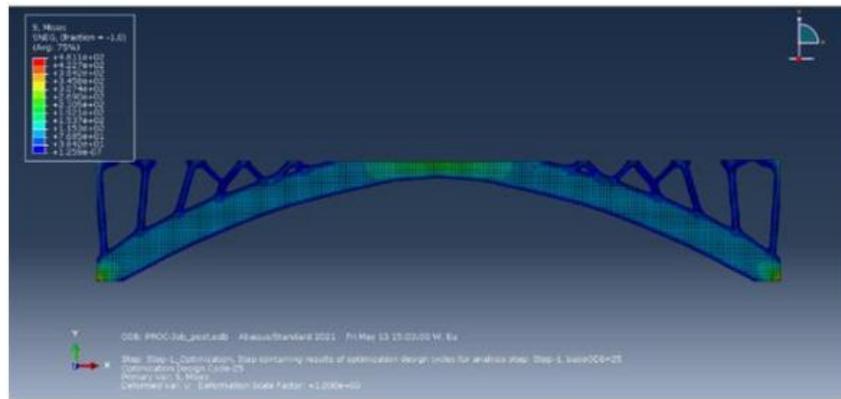

Figure 13 Result of topological optimization and internal stresses.

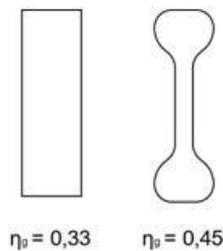

Through topological optimization, a suitable form was then found to fit the context and pre-set constraints. As can be seen from Figures 9-10, the result obtained is based on an arch and struts capable of collecting the upper loads. This form was used as a new starting point for the design of the structure, which made the arch its characteristic element.

The optimization process did not just stop at topology. In fact, if the identified structural scheme allows for maximum stiffness, it is also important to define the sections that compose it to optimize the amount of material used. To evaluate the efficiency of the sections, the geometric performance index  $\eta_g$  was used. This parameter expresses through a coefficient the efficiency of the section, varies between 0.33 (rectangular section) and 1 (ideal section) and is defined as:

$$\eta_g = \frac{W_s}{A_c \times y_i}$$

Where  $W_s$  represents the modulus of resistance,  $A_c$  is the cross-sectional area, and  $y_i$  is the distance from the center of gravity. Through this parameter, several sections were evaluated. Thanks to the prefabrication and properties of UHPFRC, it is possible to design ad hoc sections. In the design of the section, it was

intended to maximize the inertia in the direction of deflection without minimizing it in the other direction. In fact, since these elements are subject to both bending and compression, it was desired to avoid a principle of buckling in the lateral direction. As can be seen from the values, the section chosen allows for a better geometric performance than the classic rectangular section (+36%) while saving material, thus maximizing inertia in the direction of inflection without reducing it excessively in the other direction.

*Figure 5 Beam sections compared.*

As in the previous cases, in order to analyze this solution from several points of view, different materials with which the arch can be constructed are taken into consideration. In this case, in addition to steel and timber, reinforced concrete and high-performance fiber-reinforced post-tensioned concrete (UHPFRC) were also considered. The choice of analyzing the behavior of these types of concrete is due to the introduction of the arch into the structure. It performs an important structural function and, working in compression, concrete is an optimal solution due to its high compressive strength. These configurations were also modeled using RFEM software and analyzed using static LCA analysis to obtain data for comparison.

## **5 Conclusions**

The construction sector increasingly becomes a complex field in which to operate, having to take into account many factors. When it comes to the refurbishment of the built heritage, this complexity increases, also having to take into account the constraints that the pre-existence imposes on the project, given the desire to restore it. The following contribution showed how accepting the challenge of working on the pre-existence proves to be an opportunity to trigger

a process of optimizing solutions starting from the limits, constraints, and objectives that the project aims to achieve. Thanks to an in-depth analysis of the context and the pre-existence, a refurbishment project was gained to give new value to the military battery of Capo d'Orso and to allow it to take advantage of the landscape of this area, affecting the historical elements as less as possible. A multi-objective analysis made it possible to systematize the goals of the project. Different solutions (structural systems and materials) were analyzed to assess how much they impact different factors related to architectural value, environmental impact, cost, and construction site. Thanks to assigning different weights to those objectives, we were able to quantitatively assess the solutions and choose the most suitable according to the design will.

### Abstract

In view of a necessary sustainable organizational turnaround, this research aims to reflect on the aspect of social sustainability, which is often given little weight in corporate sustainability programs. The research focuses on one of the most crucial nodes in social sustainability, the gender gap. Through the Gender equality global report & ranking 2023, were highlighted the progress made and the critical issues still to be resolved in terms of corporate gender equality policies

The future developments of the research include interviews aimed at all the HR of companies according to the Mosaic Business Model.

**Keywords** – Gender gap, social sustainability, knowledge management, diversity management, broken rung

**Paper type** – Academic Research Paper

### 1 Introduction

*"Pas de retraité, sur une planète brûlée. Retraite, climat, même combat!"* shout the streets of Paris. The millennials and the Parisian Generation Zeta, protesting against the pension reform proposed by the Macron government, remind us, to the rhythm of Techno, that there is no environmental sustainability without social justice. The popular opposition in the streets of Paris and again the wave of resignations, which started in America and forcefully swept through Europe as

well, represent the symptomatology of a sick production system that is turning in on itself; a system that can only survive by taking the path of sustainability.

This 'Great Refusal' (Marcuse, 1967) makes it clear, however, that environmental and organizational social sustainability must be inextricably linked within the meshes of a new business model, in which there can be no creation of value if, in addition to economic performance, its impact on the environmental and social context of the reference is not considered. The paper starts and defines itself in light of the economic-managerial paradigm that dominated the world before the advent of the concept of sustainability.

The meager environmental and social sustainability implemented by human beings to date is now an unshakable certainty. The individual has exploited ecosystems and produced an alteration of the balance of nature, which has been supplanted by artificial balances (Bravo, 2009). Intensive exploitation has enabled industrialization, generating progress whose harmful effects have been underestimated for a very long time (Sabellotti and Sabellotti, 2009). The opposite has been the gradual emergence of the new paradigm of sustainability, which has radically penetrated the operational logic of government bodies, international organizations, and private and public sector institutions: organizational strategies today must include sustainability objectives and these must be interdependent with financial ones.

Add to this the imminent European political objectives of the ecological transition, to be concluded by 2030 (Green Deal-2030/2050) and, in terms of social gender equity, the achievement of 40% female presence in the Boards of Directors of all European listed companies by 2026. (Woman on board- 2026)

This paper focuses on the gender gap, an aspect of the corporate social sustainability dimension, noting the critical issues, which persist to date, for its total overcoming. (Heisig and Kannan, 2020).

## **2 Theoretical framework**

Increasingly companies are incorporating environmental sustainability objectives into their strategic plans in order to reduce their impact on ecosystems through 'green practices'. (Martinez et al., 2022). Undoubtedly numerous evidences attest that sustainability strategies increase financial performance in the long run (Eccles et al., 2013; Arayakarnkul, 2022). However, the efforts made in the direction of environmental sustainability still do not match those of social

sustainability, as Istat notes, in the Italian context. (Permanent Business Censuses, 2020) Yet a proper orientation toward organizational sustainability would require a holistic approach combining development, economic performance, social and environmental sustainability (Vota, 2020). On the other hand, giving due weight to the development of organizational social sustainability would offer significant benefits on employee turnover and the meaning of work (Guerci et al., 2019) strongly compromised the latter given the wave of large resignations recently witnessed. Undoubtedly, considering that the reasons behind the aforementioned resignations are not materialistic in nature, but ethical, relational and cultural, in order to regain the engagement of the resigning employees, that of social sustainability, a concept that encompasses the aforementioned aspects, would seem to be the only viable path (Kuzior et al., 2022). 2022; Criado, 2021, Gherardi, 1995). Although there is no lack of gender approaches to organizational studies (Calàs and Smirchic, 1999) one of the areas that suffer most from "gender blindness" is knowledge management (Heising and Kannan 2020); rethinking it from a gender perspective seems necessary, in the direction of implementing social sustainability.

The paper starts from a conceptual foundation, that of sustainability, as a tool not only to improve the distortions created by modern capitalist economic systems, but also as an opportunity for the creation of value and greater competitiveness within organizations and beyond.

This concept, which is the subject of European and international regulations, is increasingly being discussed, especially in the context of business ethics, in the direction of moving away from a type of business dominated only by profit, in the face of the need to push the business world towards progress and a sustainable future.

The importance of the gender gap as an influencing element of organizational structures has also been studied by Hofstede (1991) who identified four dimensions of diversity: power distance, uncertainty avoidance, individualism/collectivism, and masculinity/femininity.

According to Hofstede, masculinity/femininity refers to the emphasis on work-related rather than personal goals.

According to Hofstede's definition (1991), societies in which masculinity prevails define gender roles more rigidly than societies in which femininity prevails.

The most significant and alarming fact that the paper intends to reflect on and investigate, as a priority, concerns the masculinity/femininity dimension that emerges from Hofstede's research.

He argues that biological factors based on gender also influence culture and the division of roles, which is then reflected in society. The more the roles are differentiated, the more society will display characteristics that can be called masculine. Conversely, the more interchangeable the roles, the more feminine characteristics society will display. In the former, the man must impose himself and show that he is the strongest, while in the latter, the roles will be less differentiated (Zifaro, 2010).

From a corporate point of view, it can be said that a country's masculinity index indicates the degree to which it accepts its right to interfere in the private lives of its staff. In countries characterized by femininity, there is an inclination on the part of workers towards small companies and a rejection of any interference by the latter in their private lives. It is also noted that in countries characterized by a masculine culture, individuals are skeptical of others, showing an intrinsic aversion to work.

In such countries, as opposed to those considered feminine, employees generally prefer an increase in salary to a reduction in working time.

The reasons why a state exhibits masculine rather than feminine characteristics are mainly to be found in history in that they are maintained throughout the generational transition, with no tendency in modern nations to converge sharply on one or the other form.

The degree of masculinity profoundly affects the form of humanization of work, i.e. the term humanization is interpreted in the light of the meaning given to the word human. In masculine cultures, it is important to be recognized, to have a career and to fulfill oneself. In contrast, in a society with a feminine culture, the aim will be to establish real cooperation between workers.

It is possible to identify different ways in which culture influences organizations and those who live and work in them. In order to overcome this inequality, numerous European attempts have been made to push national policies in the direction of gender equality, so that they encourage gender equality in both the work and family context, with the aim of breaking down gender stereotypes and sources of inequality.

In this regard, let us recall the document, published by the European Union in 2021, A Union of Equality: The Strategy for Gender Equality 2020-2025, which sets out key objectives and actions to achieve gender equality by 2025.

Currently, women in managerial positions in Italy account for about 27% (Istat) of the total. The glass ceiling, or glass ceiling - the obstacles that women workers encounter in their careers to reach top positions - is still a widespread phenomenon.

In managerial positions, gender differences in income are highest, at around 23% (Istat).

No less negligible is the phenomenon of the sticky floor - sticky floor - used to illuminate the vertical segregation in which women are forced into medium-low and, consequently, lower-paid positions (UNI/PDR, 2022).

All this presents a discouraging picture, yet many studies note that gender equality is a driver of economic growth and development (Profeta, 2020).

No less important then, to point out that more inclusive companies generate higher value.

Several studies and company case studies have noted the positive correlation between the presence of women in top positions and company performance (McKinsey & Company, 2020.).

In particular, the positive effect of gender quotas- which led to an increase in the number of women in decision-making positions- was found in terms of economic and social benefits on companies (Ferrero et al, 2018).

In particular, the positive effect of gender quotas-which led to an increase in the number of women in decision-making positions in terms of economic, as well as social, benefits on companies was found (Ferrero et al, 2018).

### **3 Research question**

The paper focuses on the gender gap, an aspect of the corporate social sustainability dimension, noting the critical issues, which persist to date, for its full realization.

In 2021, the World Economic Forum declared that no country in the world has fully closed the gender gap, only Iceland, Norway, Finland and Sweden have reached eighty percent of the target.

For this reason, we want to investigate the importance of a sustainable organizational form, defining its essential features with the aim, starting from the

published ranking of the 100 companies where gender equality has been achieved, to investigate the activities implemented by the Italian companies present in order to answer the following research question:

*How in the Italian companies ranked in the Equileap-global-report 2023 does the relationship between environmental and social sustainability contribute to a holistic organizational transformation in the light of gender equity?*

#### **4 Methodology**

Starting from Hofstede's reflections, the research was structured in two steps.

The first step of the research involves the analysis of the Equileap-global-report 2023, published in March, which ranks the best companies in terms of gender equality; then, in a second step, we want to investigate what actions have been put in place to achieve the result of gender equality in order to understand how sustainable development, which has also manifested itself through gender equality, has been implemented.

Indeed, sustainable development is not possible without full gender mainstreaming, nor is full gender equity possible without a rethinking of the impact of every business choice.

The analysis will be qualitative by conducting interviews with the HR of the companies using as a guide the "Mosaic Business Model"<sup>1</sup> oriented to enhance vision, value system, internal relations and external relations, so that a qualitative comparison can be made to identify best practices.

The methodology used is that of the case study because it is the most suitable and most effective for seeking answers to questions of "how" and "why" (Yin, 1994), when research is aimed at exploring articulated and complex phenomena within particular contexts.

#### **5 Search results: The first step**

The ranking of the world's 100 best companies for gender equality in 2023, according to data compiled by the international organization Equileap, published on 1 March 2023 (Gender equality global report & ranking 2023) by the

---

<sup>1</sup> For the "Mosaic Business Model" see De Toni A. F., Barbaro A., *Visione evolutiva. Un viaggio tra uomini e organizzazioni, gestione strategico e complessità*, ETAS, 2010, p. 202-204 and De Toni A. F., Rullani E., *Uomini 4.0: Ritorno al Futuro. Creating value by exploring complexity*, Franco Angeli, 2018, p. 124-125.

international organization Equileap provides data and insights on gender equality of companies listed in the major stock exchange indices.

Equileap is the leading organization providing in-depth data and information on Gender Equality in business, focusing on the social aspects of gender equality policies and practices.

Equileap's research examined the gender equality (equality between men and women) levels of almost 3,787 companies in 23 markets.

This method involves analysis using 19 criteria inspired by United Nation woman's empowerment principles. The first scorecard concerns the area of gender balance in leadership and workforce: the gender balance in the board of directions, among executives and on the executive board, and in senior management is taken into account with respect to the gender balance of the entire workforce, with a view to the advancement and career opportunities.

The second scorecard, on the other hand, pays attention to equal pay and work-life balance: the gender pay gap, the presence of a living wage for all workers, parental leave programs are analyzed and the presence of the flexible work option is noted.

The third area concerns the company policies put in place to promote gender equality, with particular regard to measures taken to ensure equal access to training and career advancement, regardless of gender, measures to ensure non-discriminatory recruitment, anti-violence programs, sexual abuse and harassment, including verbal and psychological, measures to ensure the safety of employees in the workplace, on their way to and from work and the safety of suppliers in the workplace, guarantees to protect human rights, a commitment to reducing social risks in the supply chain and the promotion of ethical sourcing and diversity, and the implementation of internal ethical compliance complaint systems.

The fourth scorecard covers the area of commitment, transparency and accountability and assesses the commitment to the principles of United Nation women's empowerment and the promotion of an independent and body-certified gender internal audit system recognized by Equileap. The last area of assessment takes into account gender disputes detected by Equileap itself and occurring within companies, i.e. incidents involving sexual harassment and gender discrimination.

The Report, in its 6th edition, reports data from 3,787 listed companies worldwide for 2023 using a unique and comprehensive methodology called the Gender Equality Scorecard™.

The global average score of the 3,787 companies increased from 34% in 2021 and 37% in 2022 to 41% this year.

Here is the complete ranking of the 100 best companies for gender equality.

The Italian companies in the ranking are Enel (in 45th place), Unicredit (in 72nd place), Eni (in 79th place) and Hera (in 82nd place).

It emerges from the ranking that the best markets for gender equality in companies are France, Spain, Italy, Norway, the United Kingdom and Australia; in contrast, the United States, Japan and Hong Kong have the lowest average scores globally. The markets with the highest scores for gender equality are France (55%), Spain (54%) and Italy (53%), tied with Norway (53%). They are closely followed by the United Kingdom (52%) and Australia (50%).

To understand the concreteness of the goals achieved and highlighted by the report, it is also worth observing the major criticalities, at a micro-structural level, detected by the research, regarding the gender gap.

The study shows that with respect to some key criteria, progress is still slow, e.g. with regard to the pay gap, it is worth noting that less than 1% of companies have completely closed the pay gap. The vast majority (78%) of companies globally have not published any information on the pay gap between male and female employees. Furthermore, only 28 companies globally, out of 3,787 companies, have closed the pay gap, 9 more than in 2022. All of these companies have an average unadjusted pay gap of +/-3% affecting all employees.

As far as top management is concerned, women in top positions are still very rare. A minority of 6% of global companies have a female CEO, 15% have a female CFO and 8% have a female chairman of the board. Looking at representation from top to bottom, women make up 28% of board members, 20% of executives, 26% of senior management and 38% of the total workforce. Gender balance within a company is rare, with only 18 companies globally achieving 40-60% women at all levels (board, senior management, management and workforce).

Other critical issues emerge in relation to the transparency of gender equality data: Only 22% of companies globally publish their gender pay gap (up from 17% in 2022 and 15% in 2021), Transparency is a step towards closing the pay gap, and disparities in transparency between countries remain huge: 98% of Spanish companies publish their gender pay data, compared to only 12% of US companies.

Globally, 40 per cent of companies have not published a policy against sexual harassment; however, there is a gradual improvement in this area compared to the last two years (47 per cent had not published it in 2022 and 51 per cent in 2021). It is worth noting that the researchers noted that a key factor in the good performance in the markets surveyed is the presence of national laws requiring

the disclosure of gender equality data, such laws greatly increase corporate transparency.

In France, for example, there are mandatory quotas for female representation on the board of directors (40 percent) and among managers (must reach 30 percent by 2027, 40 percent by 2030), and data on the pay gap must be reported to the government. In Spain, companies must report paying gaps and have extensive gender equality plans.

Last but not least is the huge gender gap that plagues the technology sector at all levels. It is the worst-performing sector in the dataset and is still held back by pervasive gender discrimination. More than half of the women in the sector report having experienced some form of sexism in the workplace in the last year.

The presence of the 'broken rung' continues to hinder women, to the extent that promotions of women to management positions occur at almost half the rate of men. Although Deloitte estimates that gender equality in the said industry has improved by 6.9% since 2019, however, this increase in female representation in the industry alone is not enough to eradicate the sexist culture present in the tech industry, an area still felt to be an 'old boys' club'. Ultimately, the Equileap research results show an improvement within the technology sector, but a deterioration in performance compared to other sectors that are improving at a faster pace.

"Gender equality global report & ranking 2023" compiled by Equileap

## **6 The Second step and future developments**

From the month of September, interviews will be carried out with the HR of the Italian companies in the ranking using the "Mosaic Business Model"[1] in order to investigate how sustainable development, including gender equality, has been implemented.

From the analysis and comparison of the results of the interviews, it will be possible to expand on best practices that, although they cannot be generalized, can be used as a reference for the implementation of actions in the field of gender equality.

### **Abstract**

This paper aims to investigate which are the relationships between Italian agri-food companies, governed by women, sustainability and social media. The aim of this paper is to analyse how agri-food companies are sustainable and if disclose their way of being sustainable through social media. In addition, this paper aims to investigate what economic benefits Italian agri-food companies that convey sustainability through social media receive. This work is supported by a qualitative methodology based on a case study. The results of any studies have begun to show that there is a close connection between agribusinesses and sustainability. Furthermore, SMEs are not only tied to tradition, but also to innovation; it was also found that the positive effects, produced by the diffusion of new information technologies, produced improvements in efficiency, product quality, environmental sustainability and new communication channels; all of these are important factors that can influence business relationships. It was also possible to see that through the use of social media, agri-food companies were able to communicate their commitment to sustainability to a large audience. Communicating a company's level of sustainability, also in the agri-food sector, through social media can bring economic benefits. This paper aims to expand the literature on the topic of sustainable agri-food companies in Italy, with a special focus on the use of social media in women's businesses.

**Keywords** – Agri-food, sustainability, social media, gender, SMEs

## 1 Introduction

This paper aims to investigate which are the relationships between Italian agri-food companies, governed by women, sustainability and social media (Dadi et al., 2021, Friedrich et al., 2012, Cosentino et al. 2021 ). Thus, the aim of this paper is to analyse how agri-food companies are sustainable and if disclose their way of being sustainable through social media. In addition, this paper is directed to investigate what economic benefits Italian agri-food companies that convey sustainability through social media receive.

This work is supported by a qualitative methodology based on a case study. This methodology allows the description of the meaning of actions and events in the social world, which researchers interpret. It is used mainly when multiple variables are observed, so many data sources are needed, hopefully triangulable, and benefits from the previous development of theoretical propositions that guide data collection and analysis (Yin, 2009). The description of the case is based on semi-structured interview. The information collected using semi-structured interviews is interpreted through qualitative inductive content analysis. There are many established forms of interview methods utilized to gather insights into a variety of phenomenon, such as focus group and in-depth interviewing. The family of qualitative interviews encompasses ways of questioning that "differ in the degree of emphasis on culture, in the choice of arena or boundaries of the study, and in the specific forms of information that are sought" (Rubin and Rubin, 1995, p. 19). The interview method is the art of questioning and interpreting the answers. Interviews were conducted with woman chosen from those who are members of the association "Le donne del vino". "Le donne del vino " is a nonprofit association that promote wine culture and the role of woman in the wine production chain and society as a whole.

The results of any studies have begun to show that there is a close connection between agribusinesses and sustainability. Furthermore, SMEs are not only tied to tradition, but also to innovation; it was also found that the positive effects, produced by the diffusion of new information technologies, produced improvements in efficiency, product quality, environmental sustainability, and new communication channels; all of these are important factors that can influence business relationships. It was also possible to see that using social media, agri-food companies were able to communicate their commitment to sustainability to a large audience. Consequently, communicating a company's level of sustainability, also in the agri-food sector, through social media can bring economic benefits.

This paper aims to expand the literature on the topic of sustainable agri-food companies in Italy, with a special focus on the use of social media in women's businesses. This study therefore highlights how all those new technologies, such as social media, succeed in improving the economic results of companies. It also highlights how the use of social media to communicate the sustainability of a company serves to improve the environmental conditions within which the company operates.

## **2 Literature**

In the last decade, agri-food sector has experienced an exponential growth. The agri-food sector contributes to food safety, to fill gaps in supply and demand, to improve traceability and product quality (Dadi et al., 2021). Indeed, due to widespread discontent food organizations have been called to adopt more sustainable practices by government, stakeholders, consumers and the world at large (Kumar et al., 2022; Friedrich et al., 2012; Troise et al., 2021). The only way for the agri-food sector to achieve the sustainable development goals (SDGs) is represented by the application of the so-called "sustainable development" (Spanaki et al., 2022; Kumar et al., 2022). Cosentino et al. (2021) analysed, about small and medium-sized enterprises (SMEs) belonging to the agri-food sector, the link between technological innovation (IT), relational capital (RC) and intangible value for the environment. Through qualitative research methodology they found a positive link between tradition and innovation in the agri-food sector, which in turn produces positive effects on corporate sustainability. Namagembe (2021) always focusing on the SMEs of agri-food sector, investigated the influence of environmental standards set on the choice by farmers to adopt sustainable practices, i.e. environmentally friendly. Actually, knowledge of environmental issues has prompted farmers to adopt practices that are environmentally friendly. According to Namagembe (2021), the impact of consumer knowledge on his behavior in the agri-food context has also been analyzed in other studies, demonstrating that there is a difference between those who do not know agri-food products and those who are wrong (Torres-Ruiz et al., 2022).

Cavallo et al. (2022) focused on a strategic Agri-Food Plan of Rome above all to try to understand if the Covid-19 pandemic had changed priorities in the sector, considering food strategies and sustainability. The analysis of consumer behavior on the choice of food and drink after the Covid-19 pandemic also involved other studies (Ben Hassen et al., 2022; Cordeiro et al., 2021).

Other studies (Mangla et al., 2022; Annosi et al., 2022; Bartoli et al., 2022; Rialti et al., 2022) concern how individuals and their social contexts can influence the agri-food sector and especially if the diffusion of technology. In fact, technology plays a central role in guaranteeing sustainable development in the agri-food sector because it makes the use of resources more efficient and eco-friendlier for the population. In this case, the introduction of 4.0 technologies leads to talk of a type of business defined as Agritech or Agri-Food 4.0 (Rialti et al., 2022; Spanachi et al., 2022; Dadi et al., 2021)

Kocollari et al. (2022) have verified whether the dimensions of the social capital (bridging, bonding and linking) contribute to improve crowdfunding campaigns by comparing the agri-food, cultural and technological sectors. The results show that the number of financiers involved in the agri-food sector is certainly greater than in cultural and technological projects. Moreover, several studies have focused on agri-food companies that use crowdfunding platforms (Cillo et al., 2019; Testa et al., 2019; Troise et al., 2021).

In this context, social media networks become more and more popular and their analysis also helps to understand how people deal with environmental issues (Pilař et al., 2018). Simeone and Scarpato (2020) through a survey conducted on 162 people in Campania, Benevento (Italy) attempted to examine the link between the information coming from social networks and the food choices of consumers. The result is that the information is linked to food consumption choices that are not sustainable from an environmental point of view. Simeone and Russo (2017) created a theoretical model using game theory to model the strategic use of social media by food companies. Subsequently, an online survey was sent to 722 Italian food consumers. What emerges is that when social media become influential, consumers being more informed are more concerned about the quality of the food; those who instead use the mass media, having less information, prefer simply cheap products. Van der Merwe et al. (2022) screened 223 South African female consumers and workers via social media to test the focus on food labels based on prior knowledge, marketing, and family choices. The result has been a strong dependence of marketing factors on the use of food labels.

Thus, the research questions are the following:

*RQ1:How much, do agri-food companies, convey that they are sustainable through social media?*

*RQ2:What benefits, in terms of economic outcomes, do social media outreach of corporate sustainability bring?*

### **3 Methodology**

We decided to use the qualitative methodology based on a case study (Yin, 2009, Paoloni et al., 2021a; Tyskbo, 2019; Modaffari et al., 2019). The case study has the characteristic that it can serve those researchers who want to examine a phenomenon related even only to its context (Yin, 1984). Using the case study methodology, researchers can describe actions and events in the social world (Covaleski and Dirsmith, 1990).

This type of research has been defined as ethnographic (Paoloni et al., 2020; Easterbrook, Singer, Storey, & Damian, 2008) as it focuses - through field observations - on cultural practices. In particular, the present research concerns an ethnographic exploratory single case study (Paoloni et al., 2020) as it analyzes a specific association "Le donne del vino" and investigate the relationships between sustainability and social media.

For the development of this study, we obtained data through individual and semi-structured interviews. Semi-structured interviews were conducted (Gupta et al., 2019; Dearnley, 2005; Runeson & Höst, 2009; Horvát & Szabò, 2019) to guarantee both the interviewees and the interviewer the opportunity to express themselves more freely (Corbetta, 1999; Dunn, 2005; Runeson & Höst, 2009; Paoloni et al., 2020). Therefore, the researcher has a written list of questions to ask on the main topics of interest but there are no closed answers as occurs in the structured interview, so as to elicit spontaneous answers from the respondent (Whitehead, 2005).

To understand the state of the art regarding the topics of sustainability, agrifood and social media, the authors firstly performed a search on Scopus searching for the results that came up if we put in the keywords "Sustainability", "Agrifood", "Social Media". We limited it to publications in English, written in the years from 2012 to 2022, regarding the area "Business, Management and Accounting". We obtained 69 articles, of which, however, we considered 54 articles to be essential after a subsequent skimming.

### **3.1 Research process**

We decided to interview women entrepreneurs belonging to the association "Le Donne del Vino". We sent an e-mail to 21 the women entrepreneurs in the association as far as the Lazio region is concerned proposing an interview. We conducted an interview with seven women entrepreneurs answering to our request, subdivided mainly into three macro subjects. We used the semi-structured interviewed method (Annex 1).

The topics covered in the macro groups were as follows:

- Introductionary information;
- Sustainability;
- Social Media.

The first macro-group dealt with general information concerning firstly the personal information of the female entrepreneur interviewed, such as her age, schooling or previous work experience; secondly, we focused on the company, so we started with general information such as the name of the company, when it was founded or how many employees are employed; then we got to more specific information such as the legal form of the company, the management form, who makes decisions, how roles are divided in the company, how employees are hired or whether there is a female majority working in the company.

In the second macro group, we dealt with the topic of sustainability in agrifood companies. In this second macro group the women entrepreneurs were asked all those questions concerning the concept of sustainability applied to their realities; The initial questions in this group started with finding out whether the concept of sustainability was important to them and their company. Based on the answers received, we then went on to find out how the concept of sustainability was felt in their company, and then we asked them whether they had made investments so that their company would follow sustainability standards and whether they had struggled to find the funds.

The third macro group of questions we asked the female entrepreneurs interviewed concerned social media. In fact, over the last few years, social media have found great space not only in the daily lives of all people, but also in the lives of companies; they have become powerful vehicles of communication and tools through which the company can reach the end consumer more quickly and directly. In this last group of questions, we started by asking if social media were used in their companies; we then asked about the content of what was shared by them; after these initial introductory questions on the subject, we asked if they

had any benefits from using social media (such as attracting new customers to the company); we concluded this last macro group by asking if social media were in any way valued in the balance sheet.

#### **4 Findings and Discussion**

In order to answer the research questions, we have grouped together in to the following tables the results we obtained from the interviews we conducted with the seven women entrepreneurs belonging to the association 'Le Donne del Vino'. The answers were grouped into three macro groups:

- Introductory information;
- Sustainability;
- Social Media.

The table 1 shows that the average age of women entrepreneurs is over fifty; there are three out of seven women over fifty, two women between thirty and forty, and only one woman under thirty and one woman between thirty and forty.

The women interviewed work in companies that are at least 30 years old, 70% of the companies were founded before 1989, while 30% between 2004 and 2012. All the enterprises are family businesses and that therefore the female entrepreneurs are at their first work experience, except for one female entrepreneur who is at her second experience in entrepreneurship, as she had previous experience in a marble company.

We highlight how almost all of the companies are female-dominated, as six out of seven companies are female-dominated, the interviewees noted how women can be more suitable and precise for work in the wine sector, they also pointed out how they find greater flexibility and elasticity during refresher courses in pruning.

Table 1

<b>Introductory information</b>	Age	"Under 30" (Entrepreneur 2). "Between 30 and 40 years old" ((Entrepreneur 6 and 7). "Between 40 and 50 years old" (Entrepreneur 3). "Over 50 years old" (Entrepreneur 1,4 and 5).
	When the company was founded	"The company was founded around the 1920s" (Entrepreneur 1 and 3). " The company was founded around the 1950s" (Entrepreneur 4 and 5). "The company was founded in 1989" (Entrepreneur 2). "The company was founded in 2004" (Entrepreneur 7). "The company was founded in 2012" (Entrepreneur 6).
	Course of study	"I'm graduated" (Entrepreneur 1,3 and 6). "I have a hotel diploma" (Entrepreneur 2 and 7). "I have a technical diploma" (Entrepreneur 4). " I have a diploma from the classical high school" (Entrepreneur 5).
	Previous entrepreneurial activities	"I had previous experience in a marble company" (Entrepreneur 1). "I have no previous experience, because it was a family business and I started working here straight away" (Entrepreneur 2,3,4,5,6 and 7).
	Female majority	"Yes there is a female majority in the company" (Entrepreneur 1,2,3,4,5 and 6). "No there isn't a female majority in the company" (Entrepreneur 7).

With regard to the second macro group we analysed, i.e. the one dealing with sustainability issues, we noted how the concept of sustainability is relevant by all the female entrepreneurs interviewed, as they believe that in this historical period it is an element on which all stakeholders pay a lot of attention (Table 2).

Thus, the concept of sustainability is widely shared within the companies surveyed; despite this, many of the female entrepreneurs interviewed pointed out various difficulties in making their companies more sustainable. The issue that they highlighted most is an economic one: it is well known that making a company sustainable has very high costs and does not give the same amount of products, hence it follows that small companies are not able to sustain large expenses with regard to sustainability.

Additionally, we extrapolated from this second macro group that all of the businesswomen pointed out that customers in recent years have placed great importance on the concept of sustainability and how this can influence sales and how the company is viewed externally. As a company that follows all sustainability requirements and produces has a greater chance of selling and expanding its market than one that does not.

Table 2

<b>Sustainability</b>	Sustainability in agrifood world	“Sustainability is very important in the agrifood world and green certification is a key part of it” (Entrepreneur 1 and 3). “Sustainability is key, because farms consume the most water” (Entrepreneur 2). “Sustainability is important not only for the environment but also for the entrepreneur to sell more products” (Entrepreneur 4). “Sustainability is important but not so easy to achieve” (Entrepreneur 5). “Sustainability is important” (Entrepreneur 6 and 7).
	Concept of sustainability in the company	“The concept of sustainability is widespread in the company and shared with all employees” (Entrepreneur 1, 3,4,6 and 7). “The concept of sustainability is seen as a goal to be achieved every day” (Entrepreneur 2). “The concept of sustainability is important because it is linked to the healthiness of the territory” (Entrepreneur 5).
	Major difficulties	“I didn’t find any, because being a family business the concept of sustainability and related investments had already been made” (Entrepreneur 1 and 3). “The greatest difficulties were in finding the funds to invest in sustainability” (Entrepreneur 2 and 7). “I found the greatest difficulties in interpreting the new data through applications” (Entrepreneur 4). “The greatest difficulties were found in the higher costs that have to be incurred to achieve a sustainable style of business, as equipment considered sustainable or packaging costs more” (Entrepreneur 5 and 6).
	Customers and sustainability	“Customers in recent years have shifted a lot of their attention to checking that a company is sustainable and therefore respects the environment; it has become a factor in selling more so it is important to communicate the company’s sustainability to the outside world” (Entrepreneur 1,3,4,5,6 and 7). “Customers attach a lot of importance to the concept of sustainability but I believe that there is a lack of correct information about it” (Entrepreneur 2).

Finally, in the last group, i.e. the one where social media is included, it is retrieved that social media is used by all female entrepreneurs (Table 3). All the female entrepreneurs interviewed pointed out that during the last few years they have used social media more, mainly to advertise their company. The use of social media in recent years by the women entrepreneurs interviewed has led them to be able to make their products and their company known to a larger audience of customers. In addition, using social media, they were able to sponsor their events at a much lower cost. The interviews thus show that all the women interviewed have found many benefits in using social media, but that they are unable to quantify the benefit, let alone value it in the balance sheet. This suggests that

future research could be done on how to value the use of social media in the balance sheet.

Table 3

<b>Social Media</b>	Mostly used	"Instagram and Facebook are the most used social media in the company" (Entrepreneur 1,2,3,4,5,6 and 7). "In addition to instagram and facebook we also use LinkedIn, Twitter and TikTok" (Entrepreneur 2). "In addition to instagram and facebook we also use Wechat for orders in China" (Entrepreneur 3). "In addition to instagram and facebook we also use YouTube" (Entrepreneur 7).
	What is share	"We share company images and publicise events" (Entrepreneur 1 and 2). "We share updates to raise product awareness" (Entrepreneur 3). "We share events, new wine releases and general information about our company" (Entrepreneur 4). "We share the life of the vineyard and the most important moments of the company" (Entrepreneur 5 and 6). "We share processing, bottling, the vineyard, promotions and events" (Entrepreneur 7).
	Benefits received	"I find many benefits from using social media such as visibility, but I cannot quantify the benefits economically" (Entrepreneur 1,3,4 and 6). "The benefits a company receives from using social media are many, but the most obvious one is that it attracts many customers and thus we see economic benefits in terms of turnover" (Entrepreneur 2,5 and 7).
	Is valorized in budget	"I do not believe that social media are valued in the budget" (Entrepreneur 1 and 5). "No social media are not valued in the balance sheet" (Entrepreneur 2,3,4,6 and 7).

## 5 Conclusions, limitations and future research

The aim of this paper was to highlight the existence of a link between agribusinesses and sustainability; secondly, we demonstrated the connection of agribusinesses with innovative concepts such as social media and how their use influences business life. We used the case study methodology to achieve research aims and answering research questions. Our results showed how sustainability is a strong theme in agrifood companies and how social media is an integral part of business life in agrifood companies.

We contributed to main literature (Spanaki et al., 2022, Annosi et al., 2022, Rialti et al., 2022) providing interesting results in the fields. Thus, theoretical and practical implications are several in analysing our evidence. However, this paper has several limitations among which the limited number of interviews in the context of the association and the use of one methodology. Future research is directed to fourthly discuss evidence trying to delete main limitations.

Additionally, future research is directed to compare several organizations in order to validate our results.

## Annex 1

### 1st Group : Introductory questions:

- What's your name?
- How old are you?
- What is your marital status?
- Do you have children?
- What was your educational background and what degree do you have?
- Have you had previous entrepreneurial experience?
- What is your previous work experience?
- Why and how did you choose to become an entrepreneur?
- What is the name of your company?
- Describe what your company does?
- When was your company founded?
- Why did you decide to approach the world of agrifood?
- What is the location of your activity?
- How many employees does your company boast?
- Under what legal form was it established? Why?
- What is your role in the company?
- What motivated you to acquire or start this company?
- What are the objectives pursued by company?
- What are your personal goals to pursue through your entrepreneurial activity?
- Did you find it difficult to raise funds? If so, which ones? Are these difficulties related to the fact that it is a women's company?
- Is there a female majority working in the company?
- Why is there a female majority in the company?
- Do you think it is easier to found a female company? If yes, why?
- How are staff selected?
- How are roles and tasks distributed in the company?
- How are decisions made within your company?
- How is corporate performance measured?
- What is the management style adopted by you?
- How did you find out about the existence of the association "Le Donne del Vino"?
- Why did you decide to join the association?

### 2nd Group : Sustainability

- The concept of sustainability is very important nowadays, do you think it is also important in the world of agrifood?
- How is the concept of sustainability perceived within the company?
- How much and in what way do you think the external environmental (understood as the cultural and political context) influences business dynamics? What opportunities? What threats?
- Do you have any precautions in the relation to sustainability in your company?
- What kind of research was carried out (in relation to sustainability)? What kind of investments were made in this project (in term of sustainability)?
- What are the major difficulties encountered in the start-up phase of business and the implementation of innovative elements (referring to sustainability)?
- Do you think your customers attach a lot of importance to the sustainability measures you take?

**3rd Group : Social Media**

- Do you have social media dedicated to your company? If yes, what are they? If not, why did you decide not to use them?
- Why do you use social media?
- Which social media do you use the most and why?
- What do you share most through social media?
- Do you use social media to promote your company?
- Do you use social media to let customers know about your commitment to sustainability?
- Have you found benefits from using social media, both in general terms and with regard to sustainability?
- Is the social media tool somehow valorised within the budget?

### Abstract

The 2022 Global gender gap report reveals an impressive figure: total gender equality will be achieved in 132 years (WEF). The discouraging figure reveals not only how far the goal is still, but also how the efforts made aren't enough. The Italian situation doesn't seem particularly comforting, the Gender Index estimates place Italy well below the European average. The gender mainstreaming approach, spread by the European Union and applied in every gender equality strategy, has taught us the problem is not only to "increase" the number of women in a series of processes, but to modify them to give space to the involvement of both women and men. Initiatives specifically aimed at women aren't enough to bring about major changes, as they, often, restrict to the developing female adaptive strategy within structures sized for man. The world of work and organizational structures offer an interesting window from which to observe the systematic nature of the phenomenon. Talking about an «institutionalized prejudice, doesn't seem wrong, because it is clear that jobs are not always gender-neutral spaces.

However, Italian public and corporate policies seem, fortunately, to move in the opposite direction. The Gender Equality Certification for companies, introduced by the PNRR, seems to reveal the intention to make structural changes to the organizational world. This national certification system is designed to accompany and encourages companies to adopt appropriate policies to reduce the gender gap in all the most "critical" area (UNI/PRR, 2022).

**Keywords** – Gender equity, gender politics, PNRR, inequalities

**Paper type** – Practical Paper

## 1 Introduction

The 2022 Global gender gap report reveals an impressive figure: total gender equality will be achieved in 132 years (WEF). The discouraging figure reveals not only how far the goal is still, but also how the efforts made aren't enough.

The Italian situation doesn't seem particularly comforting. The nation has positioned itself at the 63rd position in the world. Infact, the Gender Index estimates place Italy well below the European average.

The gender mainstreaming approach, spread by the European Union and applied in every gender equality strategy, has taught us the problem is not only« to "increase" the number of women in a series of processes, but to modify them to give space to the involvement of both women and men» (Guida al Mainstreaming di Genere, EU)

Initiatives specifically aimed at women aren't enough to bring about major changes, as they, often, restrict to the developing female adaptive strategy within structures sized for man. (Criado, 2021)

The world of work and organizational structures offer an interesting window from which to observe the systematic nature of the phenomenon.

A paradoxical but significant situation for the purposes of theme comes from female researchers in Alaska, regarding work clothes, all tailored to male anatomy: «Last week, I peed on myself for the sake of the Alaska climate change study. Gender barriers in science don't always take an obvious form, and they get especially perilous in below-zero temperatures.[...] On a Thursday morning I put on my jacket and walked outside my cabin armed with a pink rubber funnel that claims it "allows you to pee while standing up. It's neat. It's discrete. It's Hygienic." What could go wrong?[...] I followed the directions that came with the pink rubber funnel, willed myself to relax enough to pee while standing up, and let go. A golden trickle came out of the funnel—but it mostly ran over my hand, down my legs and into my socks.» (Coehn, 2017). This testimony, authentic and raw, notes the difficulty of researchers in adapting to work clothes, not designed for them, because created with a flap with the zip that forces them to take off the coverall completely to fulfill their physiological needs, in cases where there isn't an indoor toilet, and to disperse heat. The funnel solution represents one of those adaptive strategies designed, once again, on the measurement of the male body. The resolution proposed, in fact, was to equip researchers with "surrogate penises".

Talking about an «institutionalized prejudice» (Criado, 2021), doesn't seem wrong, because it is clear that jobs are not always gender-neutral spaces.

## 2 Theoretical framework

It has been noted that theoretical and operational reflections in the organisational sphere continue to manifest themselves according to patterns that can be traced back to 'classical' approaches, even though important conceptual and operational transformations are increasingly emerging among modern and post-modern approaches to knowledge. (Masters)

Observing phenomena from a broader, 'detached' perspective allows us to highlight and understand further elements for investigating the roots or concomitant causes of phenomena, the effects and conditions of which we know mainly from empirical evidence (Sahal 1976).

The environmental change underway, which the scholar Giannessi had described in a far-sighted manner, involves the combination of factors, the system of operations and the composition of internal and external forces; it is now characterised by constantly accelerating dynamics, even sudden changes in perspectives that impose more attentive and conscious methods of research and intervention (Giannessi 1970). This new, constantly evolving scenario forces one to rethink the logics that had settled down over time, not only internally within the structure but also in relation to linearity, absolute rationality, and the possibility of 'controlling' parts of the system.

The interrelationships change, moving from the world of predictability to the probabilistic world, where the economy cannot disregard a broad spectrum of qualitative aspects, with unimaginable effects on organisation (Padroni 1987). In this context, the

the systems of measures traditionally used to understand corporate values and culture. Understanding the dynamism of markets and the environment allows a better view of the elements influencing strategic dynamics (Padroni 2007) that are capable of systemically orienting the behaviour of individuals (Salvioni, Franzoni 2009). With the passage of time, new aspects have emerged that were not sufficiently considered in the past, such as the 'value' of people as individuals characterised by skills and uniqueness.

In the theory of complexity, although it covers different areas, and in the absence of a single unifying vision, it is possible to detect some significant principles common to the generality of natural systems, not forgetting that a methodology also represents a way of thinking (Mitleton-Kelly 1997). Complex systems, unlike 'simple' systems, for which a reductionist description applies, which analyses complex reality by dividing it into individual components which, taken in isolation, would not make it possible to clarify how they function

together, require systemic or synergetic approaches and a new 'common sense' consisting of reading and understanding, in real time, causes effects and interactions (Lissack, Ross, Petzinger 1999).

Complexity can be traced back to a system comprising dynamic aspects that can be open and dispersed, consisting of interconnected elements (Fuller, Moran 1999). In the postmodern view, reality would not be "something that is given to us, but something that we continually create, we weave in communicating it" (Rifkin 2000).

From all this it is safe to say that different organisational models emerge due to the fact that the accentuation of dynamics linked to phenomena such as competitiveness and innovation in the context of generalised structural changes contributes to the growth of complexity (Adinolfi 1999).

Alongside the more traditional category of 'progressive' innovation, marked by an upward process of improvement, initiatives are identified that are capable of changing scenarios, fuelling new development and cost-effectiveness over time (Christensen, Raynor 2004).

The focus on the aspects of complexity, understood as a constellation of shared beliefs and as a set of theories of a scientific community, with applications also in the organisational sphere, makes it possible to approach traditional organisational visions in a different way, in which the overcoming of the gender gap represents an example.

The more traditional approaches are incapable of 'handling' situations in which there are strong demands for change and adaptation at every level of the hierarchical scale, including responsibility, empowerment, the role of leaders, overcoming the gender gap and the demand for flexibility in structures (Dolan, Garcia, Diegoli, Auerbach 2000).

The logic of complexity emphasises a broader 'valorisation' of people (Amietta 1998; Padroni 2000) and in order to determine the value attributed to human capital, it is important to orient ourselves towards a prospective dimension, considering monetary and non-monetary aspects that can affect levels of effectiveness and efficiency (Zanda, Lacchini, Orecchio 1993).

In turbulent environments, conditions of self-organisation are important, related to the ability of internal members to freely assume modes of decision-making and behaviour consistent with a mix of shared values (Dolan, Garcia, Diegoli, Auerbach 2000).

According to Padroni, the organisation presents itself as a cognitive system, made up of people who enter into relations with a market-environment trying to

influence value systems and cultures (Gratton 2000), marked by progressive heterogeneity.

It is possible to recall that culture within organisations has a dual function: on the one hand, it integrates the members of the organisation so that they know how to relate to one another and, on the other, it helps the organisation adapt to the external environment.

In the first case, members develop a collective identity by learning how to work effectively, adopting behaviour that is as good and harmonious as possible; in the second case, external adaptation refers to how the organisation achieves its goals and relates to external entities.

Organisational culture can help direct the activities of employees towards the achievement of certain goals and can help the organisation itself respond more quickly to the needs of customers or the moves of competitors.

Corporate values can affect the behaviour of individuals as they represent the general criteria or guiding principles by which people distinguish desirable from undesirable behaviour, events, situations and outcomes.

It can be argued that an organisation's culture performs an internal integration function, in the sense that it helps develop a collective identity, a cultural cohesion, whereby the greater the consensus on the importance attached to specific values, the stronger the culture itself.

A strong culture encourages adaptation and change and can help improve organisational performance by stimulating and motivating interesting individuals.

Culture has an important role to play in creating an organisational climate where learning processes are possible by fostering employee loyalty to the company.

Precisely in support of this aspect, we have insights from the results of a Deloitte survey in which they highlight the factors that contribute to employee retention in an organisation. The main ones are:

- Corporate commitment to climate change;
- Commitment to fight hunger and social exclusion;
- Sustainable development;
- Diversity, equity and inclusion widely understood;
- Personalisation in career planning and development;
- Broad learning and development opportunities.

Similar results are also found in research conducted by Innovation Center ProLearning and researchers at the University of Krakow on employees' work expectations:

- A good working atmosphere;
- Being treated with respect;
- Good development opportunities at work;
- Self-fulfilment;
- Corporate values and ethics;
- Trust.

Again, a study conducted by Zenjobs, finds that young German professionals have the following job expectations:

- Strong company values;
- Commitment to diversity, equity and inclusion;
- Sustainable development and environmental protection. Sustainability and Corporate Social Responsibility must, today, be two sides of the same coin, interconnected aspects on which a new business model must be based, within which there can be no creation of value if, in addition to economic performance, its impact on the environmental and social context of reference is not considered.

The gradual emergence of the new paradigm of organisational sustainability responds to the aforementioned need; this latter concept has radically penetrated the operational logic of government bodies, international organisations, and private and public sector institutions.

Organisational sustainability, however, must not neglect the social aspect that this concept encompasses, and gender sustainability is one of its many facets.

The United Nations Women's Turning Promise Into Action report illuminates the issue, stating that sustainable development is not possible without gender equality, as women are disproportionately affected by most, if not all, of the challenges highlighted in the UN's list of seventeen SDGs. One only has to focus on Goal 8 of the 2030 Agenda and recall that, as a result of the Covid-19 pandemic, twice as many women as men lost their jobs in Italy.

Given the relevance of the gender issue, it seems, therefore, crucial to illuminate the critical connection between gender, social equity and environmental impact, in order to arrive at a holistic vision of sustainable development.

### **3 A quantitative analysis on gender equity**

Eurostat notes that European women earn about 16% less than men. In Italy, the difference is 10%, but the figure is misleading, since, given the low employment rate in Italy, there is a selection in the labour market whereby only

the most educated women with higher incomes work. Moreover, in 2018, 32.4 per cent of employed Italian women (15-64 years, Istat) work part-time in contrast to only 8 per cent among men and again according to Istat, 60 per cent of part-time work is involuntary (UNI/PDR, 2022)

Looking then at the individual employment sectors, certainly the industrial and construction sectors are male-dominated, while the instruction, healthcare, catering and artistic activity sectors are equally represented. It turns out, however, that women are employed in the least remunerative sectors, which widens the gender gap in terms of income. The latter gap is also a consequence of the fact that women scarcely hold positions of responsibility and/or managerial positions:

Women in managerial positions in Italy are about 27% (Istat) of the total. The glass ceiling - the obstacles that working women encounter in their career to reach top positions - is still a widespread phenomenon. In managerial positions, gender differences in terms of income are highest, at around 23% (Istat). No less important is the metaphor of the sticky floor - sticky floor - used to make us reflect on the vertical segregation in which women are forced into medium-low and, consequently, lower-paid positions. (UNI/PDR, 2022)

In light of this, it is not surprising that the Covid-19 pandemic has widened this gap. If the financial crisis of 2008 has been dubbed Man cession, given the drastic reduction in male employment, compared to the high number of women who decided to enter the labour market at that time, the economic shock generated by the pandemic has led to talk of a she-cession, given the numbers of women leaving the labour market, in the midst of the pandemic crisis (UNI/PDR, 2022).

The evidence so far points to a discouraging picture, yet many studies note that gender equality is a driver of economic growth and development (Profeta, 2020) No less important then, to point out that more inclusive companies generate higher value.

There is a positive correlation between the presence of women in top positions and corporate performance.

Significant studies conducted in Italy have revealed the positive effect of gender quotas - which have led to an increase in the number of women in decision-making positions - in terms of economic, as well as social, benefits for companies.

Significant European attempts have been undertaken to push national policies in the direction of gender equality, so that they encourage gender equality in both the work and family context, with the aim of breaking down gender stereotypes and sources of inequality.

#### **4 Research question**

Driving this research work is an awareness of the enormous gender bias that lurks, historically, in organisational structures, social structures, culture, institutions, values and beliefs. One certainty follows: no effective performance or outcome will be achieved unless we act upstream, starting with our competencies, which are shaped by and reflect the system in which they are acquired. (Spencer and Spencer, 1993).

Starting from these reflections, the paper sets itself the task of conducting a survey on what tools are currently available to Italian companies for a greater valorisation, inclusion of human resources within the company and, in particular, of gender, and the main advantages generated by gender certification and on the motivations that drive companies to become certified.

#### **5 A tool for businesses: advantages and drivers**

To answer the research question, we can reflect starting with the document, published by the European Union in 2021, A Union of Equality: The Strategy for Gender Equality 2020-2025.

This sets out key targets and actions to achieve gender equality by 2025 with specific measures to ensure greater gender mainstreaming by 'systematically including a gender perspective at every stage of policy development in all EU policy areas, both internal and external'.

This is combined with the concept of gender mainstreaming, theorised by the European Union, as a process to better understand the causes of gender inequality and identify the most appropriate strategies to combat them. Such processes must be aimed at analysing and verifying the gender impact on each policy undertaken, in order to radically rethink the structures and practices of society, as well as the relationships between men and women and their roles.

Sometimes, initiatives specifically aimed at women are not enough on their own to bring about major changes. The mainstreaming approach questions these policies and the way resources are allocated. And it recognises the correlation between women's relative disadvantages and men's relative advantages. If workplaces are not gender-neutral, any organisation can be far from being considered socially sustainable.

This is why an instrument is needed to facilitate the overcoming of gender inequalities.

A first tool that can be used is the 'Gender Equality Certification System' as an intervention of the National Plan for Recovery and Resilience (PNRR) under the auspices of the Department for Equal Opportunities of the Presidency of the Council of Ministers, aimed at accompanying and incentivising enterprises to adopt adequate policies to reduce the gender gap in all the most critical areas for women's professional growth.

The introduction of a Gender Equality Certification System is part of Mission 5 'Inclusion and Cohesion', Component 1 'Active Labour Policies and Employment Support' of the National Plan for Recovery and Resilience (PNRR) and aims to promote greater inclusion of women in the labour market: an essential tool for improving social and territorial cohesion and of fundamental importance for the economic growth of our country.

Introduced by the PNRR and governed by Law No. 162 of 2021 (Gribaudo Law) and Law No. 234 of 2021 (Budget Law 2022), the Gender Equality Certification System also aims to ensure a higher quality of women's work, promoting transparency on work processes in companies, reducing the 'gender pay gap' (which indicates the difference between the average annual salary received by women and that received by men), increasing opportunities for growth in companies and protecting maternity.

The introduction of this new certification system in our country is facilitated with contributions from the PNRR's Next Generation EU funding for small and medium-sized enterprises and micro-businesses, intended both for technical assistance and accompanying services for certification, and for covering the costs of certification.

The introduction of the Gender Equality Certification System implements the National Strategy for Gender Equality 2021-2026, which aims to achieve, by 2026, a five-point increase in the ranking of the Gender Equality Index drawn up by the European Institute for Gender Equality (EIGE), which currently sees Italy in 14th place among EU countries.

The Gender Equality Certification System envisages the achievement of the following targets and objectives:

- target M5C1-12 Entry into force of the Gender Equality Certification System and related incentive mechanisms for companies by December 2022
- Target M5C1-13 Obtaining gender equality certification by at least 800 enterprises, of which at least 450 are micro, small and medium-sized enterprises by June 2026

- Target M5C1-14 Attainment of gender equality certification by at least 1,000 enterprises accompanied in the certification process through technical assistance provided by contracted consultancy bodies by June 2026.

Pursuant to Article 5, paragraph 2 of Law No. 162 of 5 November 2021 (Gribaudo Law), private companies that are in possession of gender equality certification in application of UNI/PdR 125:2022 practice issued by an accredited certification body are granted an exemption from the payment of a percentage of the total social security contributions to be paid by the employer for the year 2022. Specifically, EUR 50 million are allocated for 2022 and the exemption is determined to be no more than 1 per cent and up to a maximum of EUR 50,000 per year for each company. Article 1, Paragraph 138 of Law No. 234 of 30 December 2021 allocated additional funds to finance the measure when fully operational, providing for 50 million euros starting from 2023.

In addition, again pursuant to the Gribaudo Law (Article 5, paragraph 3), companies that, as of 31 December of the year preceding the reference year, are in possession of gender equality certification in application of UNI/PdR 125:2022 practice, issued by an accredited certification body, are recognised a bonus score for the assessment of project proposals, by national and regional European fund-holding authorities, for the purpose of granting State aid to co-finance the investments made.

Finally, Decree-Law No. 36 of 30 April 2022, on 'Further Urgent Measures for the Implementation of the National Recovery and Resilience Plan', Article 34, introduced in the 'Public Contracts Code', respectively in Articles No. 93 and No. 95 of Legislative Decree No. 50 of 2016, a decrease in the guarantee provided for the participation of certified companies in tender procedures, as well as the possibility for contracting authorities to establish reward systems linked to the possession of gender certification.

The reference practice UNI/PdR 125:2022, published on 16 March 2022 by UNI - Ente italiano di normazione, was developed in order to define criteria, technical prescriptions and functional elements for the certification of gender equality in enterprises.

The UNI/PdR 125:2022 practice envisages the adoption of specific indicators, Key Performance Indicators (KPIs), in relation to 6 assessment areas for the different variables that distinguish an inclusive and gender-equal organisation:

- Culture and strategy
- Governance

- Processes Human Resources
- Opportunities for growth and inclusion of women in the company
- Pay equity by gender
- Protection of parenthood and work-life balance

The culture and strategy area measures the organisation's adherence to the principles and objectives of inclusion, gender equality and attention to gender diversity, so that they are consistent with its vision, goals and values.

The governance area detects the company's maturity in governance: it shall define the appropriate organisational safeguards and encourage the presence of the minority gender in the organisation's policy and control bodies, as well as initiate processes to identify and resolve any cases of non-inclusion.

The Human Resource processes area is aimed at measuring the degree of maturity of the main HR processes, relating to the different steps that characterise the life cycle of a resource in the organisation and which should be based on the principles of inclusion and respect for diversity.

The area of opportunities for growth and inclusion of women in the company detects the company's maturity in relation to gender-neutral access, internal career and growth prospects and their acceleration.

The area of pay equity by gender aims at detecting the degree of maturity of organisations in relation to the pay differential in total reward logic, i.e. also considering non-monetary remuneration, such as welfare and well-being systems.

The area pertaining to the protection of parenthood and work-life balance records the maturity of the company in terms of policies to support parenthood and in relation to the adoption of procedures that simplify and benefit the presence of women with sons and daughters of pre-school age.

Each area is marked by a percentage weight, totalling 100, which contributes to measuring the organisation's current level and against which improvement over time is measured. Each indicator is associated with a score, the attainment or non-attainment of which is weighted by the weight of the assessment area: a minimum total score of 60% is required to determine the organisation's access to certification.

Certification is valid for three years and is subject to annual monitoring.

A first fundamental aspect to be noted for the certification process, in view of a real paradigm shift, is the need to integrate the principles of gender equality and respect for diversity into corporate objectives. It will therefore be important for companies to set precise objectives for each work phase of women within the

organisation, to measure the projects implemented in a standardised way and to certify the results achieved.

Companies will therefore have to commit themselves to incorporating the principles of gender equality, articulated over the entire career path and life stages of female workers, from recruitment to retirement, with the aim not only of increasing the presence of women in the workplace but also of ensuring equal career opportunities, up to the most important top positions, equal economic treatment, work-life balance conditions appropriate to the different life stages and proactive in rebalancing family loads between men and women, as well as a work environment that rejects stereotypes, discrimination, all forms of physical, verbal and digital abuse and instead proposes a culture of diversity and inclusion (UNI/PDR, 2022)

The ultimate goal is to overcome the stereotyped vision of roles, activate the resource of female talent and iron out the criticalities specific to the Italian enterprise, in terms of pay and career, parenting and family care, management bias and management processes.

A strategic and fundamentally important role is played by the measurement of the effectiveness of the actions undertaken by organisations in the field of gender equality and integration through the application of the KPIs belonging to the 6 areas envisaged.

In order to acquire the certification, in fact, each company will have to meet specific performance indicators in six different areas: culture and strategy, governance, HR processes, opportunities for growth and inclusion of women in the company, gender pay equity, protection of parenthood and work-life balance.

Organisations that decide to adopt a corporate gender equality policy, marked by the enhancement and protection of diversity and equal opportunities in the work context, must define an action plan for the implementation of this policy, starting from the setting up of a management model that guarantees the maintenance of the requirements defined and implemented consistently over time and provides for the measurement of the progress of the results, through the preparation of the above-mentioned KPIs to be accounted for in the management system documents

## **6 Future developments**

The purpose of this paper is to conduct a preliminary investigation on the dissemination, among Italian companies, of gender certification and a mapping according to the methodology of cluster analysis.

The research questions to be answered with the mapping of Italian companies are:

- How widespread is gender certification among Italian companies?
- Which sectors and geographical areas are the most sensitive?
- What are the reasons for a company to become certified?

In this way, we will be able to map with greater precision the companies that have certified themselves in order to understand whether the cultural change implemented to overcome the gender gap has brought results within organisational structures.

### Abstract

This academic article discusses the potential of smart working as a social sustainability tool for achieving gender equality in organisations. With the rise of telecommuting and remote work due to technological advancements, companies must adopt a dynamic, innovative mindset open to sudden changes and challenges. Sustainable open innovation is a crucial aspect of fostering sustainability in business operations. Smart working is a recent phenomenon that has gained significant momentum during the Covid-19 pandemic, attributed to its decisive contribution to environmental sustainability. The article explores how smart working can contribute to social sustainability, particularly in the context of gender equality. The research question is whether smart working can become a social sustainability tool for companies to achieve gender equality. The paper aims to explore this issue using resource dependency theory as a key to interpretation. The article employs the case study methodology, which is most suitable for exploring the impacts of gender equity on corporate sustainability. The research highlights the need for more cohesive and consistent literature on the advantages and disadvantages of smart working from an employee perspective. The study indicates that smart working is associated with higher employee participation in company life, higher performance, and greater organisational effectiveness. The paper concludes that trends in remote working will continue after the pandemic and that smart working could be an opportunity for lasting behavioural change to strengthen the positive impact on the environment while achieving gender equality.

**Keywords** – Smart Working, social sustainability, gender inclusion, diversity management, New Organization

**Nature of proposed paper** - Practical Paper

## **1 Literature review**

### **1.1 Gender Gap**

Data from the Gender Gap Global Report (2019) and the ISTAT survey (2019) report that while in Europe 20% of women of working age are unemployed, in Italy 32.6% are. The survey mentions, among the reasons, the difficulty in reconciling family life and work commitments and, as a solution, the preference for part-time contracts, flexible working hours and, especially since it has been regulated, smart working. Creating a more inclusive work culture - but also social conditions that are less hostile to the employment of women with disabilities - is, therefore, a necessary prerequisite for moving towards a fairer future. With smart working, the path towards this can be made easier. The diffusion and ease of access to technological tools is changing the systems of communication and interaction of people and between them and different living contexts, favouring social inclusion.

Recent studies demonstrated that SW has empowered subject that were excluded from working space. The transfer of practices and processes to the cloud, the sharing of documents via the web or apps, greater collaboration in online activities, has led to a shift from the physical space of the workplace to a virtual space that makes the scheduling of activities more flexible and makes the working environment more inclusive. This shift has made smartworking an inclusive tool for individuals normally excluded or marginalised in the world of work, improving the employment of people with disabilities (Samant Raja, 2016; Calvani, 2017; Ravicchio, Repetto and Trentin, 2015). A specific part of the research project 'Ready Women - New opportunities of employment for social inclusion of women with disabilities', financed with funds from the Erasmus+ Programme, Key Action - Cooperation for innovation and the exchange of good practices, Action - KA204, Strategic Partnerships for adult education, was dedicated to the exploration of the use and perceptions related to smart working by women with organic-sensory disabilities.

The development of specific smart working programmes could balance gender and organisational imbalances, provided, however, that the necessary requirements and conditions to implement them are grasped ( Doria E. 2021; Zappalà 2017). The Global Gender Gap 2020, in its 14th edition, points to the ICT sector as the one where the great challenge to close the economic gender gap will be played out.

## 2 Smart working

Smart working (SW) and/or telework, as an organizational practice in the pre-COVID phase (Giraldi L. & Zifaro M., 2022), has become an inescapable strategy to cope with the pandemic emergency. Italian Ministry of Labour and Social Policies report that the smart working mode involved, as of May 2020, 1 million 800 thousand workers compared to 570 thousand in 2019. Smart working refers to a conception of work activity centred on the flexibility and autonomy of the worker rather than on predefined roles and tasks, following an “a-spatial” concept. SW has been identified as an evolution of traditional organisational models, emphasising the need for a competent and flexible workforce that can quickly adapt to new opportunities and market circumstances (Moduli, 2013).

SW is characterised by spatial and temporal flexibility enabled by technological tools that allow workers to perform tasks optimally, which requires rethinking spaces and modes of interaction (Kim & Oh, 2015). The implementation of SW involves the identification of innovative strategic and organisational practices, policies, structures, processes, methodologies, and tools by the organisation itself, requiring a culture change guided by effective leadership, leading to higher performance, increased productivity, and job satisfaction (Iannotta & Meret, 2020; Cuel et al., 2020; Dossena & Mochi, 2020; Viceconte, 2020).

The Smart Worker is an individual who works with information and communication technologies, influencing not only decision-making processes but also the content of work tasks (Moore T., 2020). In this regard, the Smart Worker represents the human component within the Industry 4.0 model (Meindl et al., 2021) and must develop new competencies, including behavioural skills such as time management, the ability to collaborate effectively in virtual teams, self-discipline, proactivity, multitasking, and adaptability (Bednar & Welch, 2019; Dossena & Mochi, 2020; Gangai M., 2018; Richter et al., 2018). Additionally, the Smart Worker must possess or acquire specific knowledge and communication and social skills to interact effectively with geographically dispersed members of the organisation (Bolisani et al., 2020; Park & Han, 2019). The shift from the traditional workplace to the post-pandemic worksphere is part of a de-structured idea of the office that represents a new ecosystem composed by physical and virtual spaces, but also of experiential relationships, linked by an increasingly high-performance technological infrastructure (Pelloni, 2020).

However, the implementation of SW also presents challenges related to social and spatial isolation and a constant availability culture, which could intensify work efforts. Thus, Smart Workers must develop a conscious and reasonable approach

to managing their work commitments and balancing their interests (Taskin & Devos, 2005). Ultimately, the responsibility for achieving work-life balance lies with the individual, who can give significance to new work modalities and develop new trajectories for balancing work and personal life (Doria C., 2021).

With technological advancements, many tasks can be performed remotely or through automation, allowing more flexibility in location and time. This has led to increased telecommuting and remote work and the development of new industries and job roles. Technology has also led to work changes, emphasising digital communication and collaboration tools (Brynjolfsson & McAfee, 2014).

Chesbrough (2003) suggests that companies adopt their business model to open innovation to cope with the increased costs required for the in-house development of new technologies and the shortening of the product life cycle. In this context, organisations must equip themselves with a dynamic, innovative mindset, open to the sudden changes and challenges that the world requires. Companies must ensure they have the right tools to continue creating value. The Covid-19 pandemic has made organisations realise more than ever the importance of Digitisation, a concept already recurring with the spread of Industry 4.0 (Ntasis, 2021).

Smart working was the new way of working for companies during the Covid pandemic (Galanti et al., 2021) and has been attributed to a solid contribution to environmental sustainability (Jain & Singh, 2021). Innovation plays a crucial role in fostering a higher level of sustainability in business operations. Innovations such as smart working that contribute to sustainability are called Sustainable Open Innovation (Battisti & Stoneman, 2010).

### **3 ICT and gender**

A point of attention is about the fact that Italy still ranks 25th among the twenty-eight EU Member States as it has, compared to the average, very low levels of both basic and advanced digital skills, which is linked to the still small number of ICT graduates. Only 1 % of Italian graduates have a degree in ICT disciplines and female ICT specialists account for 1% of the total number of female workers. Consequently, the digitisation of businesses in Italy remains moderate, as does the use of digital public services. A warning to this effect was issued by the OECD in its *Skills Outlook 2019 report*. Globally, only 12% of women are involved in the cloud, 15% are women in engineers working with Big Data and 26% are involved with AI (artificial intelligence). The European Union's Women in Digital Scoreboard report confirms this trend. The ratio of ICT specialists is one

woman to six men who earn almost 20% less than her male counterpart. An essential step, therefore, for SW deployment is the reduction of the digital gender gap, which is among the priorities of the European Commission's Strategy for Gender Equality 2020-2025 as well as the Digital Education Action Plan 2021-2027.

In Italy, the Smart Working Observatory of the School of Management of the Politecnico of Milano has been monitoring SW data since 2012, according to which during 2019 the number of smart-workers grew compared to the previous year to reach a 1050% increase in 2020, reaching 6.58 million workers (97% of private companies, 94% of public administrations and 58% of small and medium-sized enterprises).

About SW, an interesting approach is that of *diversity management* (DM), that promotes an inclusive working environment, which values and protects each of its employees equally by providing resources to learn from, connect with and respect individual differences. In Europe, the American DM logic has been translated into the definition of Diversity Charters aimed at building, at the institutional level, a common reference framework for diversity policies, but also for inclusion and combating inequalities (De Vita 2011; Zifaro 2020).

#### **4 Sustainability**

SW includes different goals of 2030 Agenda such as SDG 5 - Achieving gender equality and SDG 11 - Make cities and human settlements inclusive, safe, resilient and sustainable. Economic changes, increasing public awareness, and stricter environmental regulations have driven businesses to adopt more sustainable practices (Lozano et al., 2018).

Sustainability has become a key factor in corporate decision-making, and companies are increasingly adopting sustainable innovation strategies to reduce their environmental impact (Horbach et al., 2017). Smart working was the new way of working for companies during the Covid pandemic (Galanti et al., 2021) and has been attributed to a solid contribution to environmental sustainability (Jain & Singh, 2021). Significant strengths of SW are the lower short- and long-term impact on the environmental pollution problem. Innovation plays a crucial role in fostering a higher level of sustainability in business operations. Innovations such as smart working that contribute to sustainability are therefore called Sustainable Open Innovation (Battisti & Stoneman, 2010).

In order to achieve sustainable innovation, businesses can implement various strategies such as eco-design, sustainable production, and waste reduction

(Camarinha-Matos et al., 2018). Additionally, companies can collaborate with external partners such as suppliers, customers, and universities to develop sustainable solutions (Horbach et al., 2017). The benefits of sustainable innovation are numerous and can lead to increased profitability, improved reputation, and a better relationship with stakeholders (Lozano et al., 2018). As such, companies that adopt sustainable innovation strategies can gain a competitive advantage in the market (Horbach et al., 2017).

Overall, sustainability has become a critical issue for businesses, and sustainable innovation is increasingly seen as an effective strategy for reducing environmental impact while increasing profitability. Smart working is just one example of a sustainable innovation that has gained traction in recent years and has the potential to shape the future of work.

As emphasised by several sources, SW contributes significantly to sustainability in all its dimensions, making it an even more exciting approach (Jain & Singh, 2021). Concerning environmental sustainability, the primary advantage is the reduction of commutes for work purposes, which has apparent positive effects on urban pollution. Adopting SW as a "smart" way of organising work also helps reduce everyone's ecological footprint and minimises energy consumption related to workflows and daily office transactions. Furthermore, optimising the use of devices without compromising security or privacy reduces the amount of hardware that will need to be disposed of and recycled in the following years (Galanti et al., 2021). The implications for economic and social sustainability are equally important. The reduction in commuting has effects on the decrease of costs borne by workers and on the recovery of time available, both of which can be reinvested for personal and family needs. From the corporate perspective, reducing the number of people who show up in the office daily optimises space and saves on utilities (Battisti & Stoneman, 2010).

In conclusion, the role of SW in fostering sustainability in business operations is significant. Thus, companies should consider adopting SW to promote sustainability while also obtaining the benefits of increased efficiency and flexibility (Jain & Singh, 2021).

With technological advancements, many tasks can be performed remotely or through automation, allowing more flexibility in location and time. This has led to increased telecommuting and remote work and the development of new industries and job roles. Technology has also led to work changes, emphasising digital communication and collaboration tools.

Chesbrough (2003) suggests that companies adopt their business model to open innovation to cope with the increased costs required for the in-house development of new technologies and the shortening of the product life cycle.

In this context, organisations must equip themselves with a dynamic, innovative mindset, open to the sudden changes and challenges that the world requires. Companies must ensure they have the right tools to continue creating value. The Covid-19 pandemic has made organisations realise more than ever the importance of Digitisation, a concept already recurring with the spread of Industry 4.0 (Ntasis, 2021).

Smart working was the new way of working for companies during the Covid pandemic (Galanti et al., 2021) and has been attributed to a solid contribution to environmental sustainability.

## **5 Innovation**

Innovation plays a crucial role in fostering a higher level of sustainability in business operations. Innovations such as smart working that contribute to sustainability are called Sustainable Open Innovation (Battisti & Stoneman, 2010). Economic changes, increasing complexity and severe environmental problems force companies to change and modify their knowledge management and working methods (Butera, 2020).

Regarding sustainability, especially in the organisational sphere, the environmental aspect is often mainly considered while neglecting the social one. Knowledge plays a crucial role in promoting a higher level of sustainability in business operations. Innovations such as smart working contribute to social sustainability (Carbonara & Pellegrino, 2021). It can be argued that sustainable development is not possible without a systemic and holistic view that also considers gender equality.

Smart working, a relatively recent phenomenon that has spread powerfully, especially with the Covid-19 pandemic, could, in the not-too-distant future, become the new way of working to help achieve full gender equality (Bapuji et al., 2021). It is, therefore, necessary to investigate the correlation between smart working and gender to understand whether it can become a social sustainability tool available to companies for the proper management of knowledge management (Aust et al., 2020).

## 6 Research

This article attempts to answer the research questions:

*Can smart working in the wake of the Codiv19 pandemic become a social sustainability tool available to companies to achieve gender equality?*

As a relatively recent phenomenon, there has yet to be much pre-pandemic research on smart working practices and their impact on employee performance and satisfaction. Furthermore, recent literature needs to be more cohesive and consistent on the advantages and disadvantages of smart working (Torre & Sarti, 2019). There is neither much pre-pandemic research on how smart working can become a tool for gender sustainability. Furthermore, recent literature needs to be more cohesive and consistent on the advantages and disadvantages of smart working from an employee perspective.

Studies indicate that smart working is associated with higher employee participation in company life, higher performance, and greater organisational effectiveness (Martin & MacDonnell, 2012).

These aspects are a matter of interest not only in the academic and business worlds. Companies could be incentivised to introduce this way of working in their organisation, not only to meet the needs of employees but also to achieve strategic results in organisational arrangements and gender equality management, as well as to have benefits of environmental and social sustainability a reduction in costs for society.

According to Garanti et al. (2021), trends in remote working will continue after the pandemic and reach sustainable development that facilitates the achievement of gender equality.

With smart working, technological and social systems come together to co-create new value. Doria E. (2021) sees smart working not only as an opportunity for lasting behavioural change to strengthen the positive impact on the environment, where employees feel they are proactively participating in sustainability.

## 7 Gender equality & social sustainability

The paper aims to explore the specific issue of social sustainability and to understand how efforts to date in gender equality can be facilitated by smart working using Resource Dependency Theory as a key to interpretation. Resource Dependency Theory and Collaborative Innovation considers a firm an open system that depends on contingencies in the business environment, recognizing

the influence of contextual constraints and conditions. This theoretical perspective is helpful for understanding collaborative innovation in enterprises (Gao, Wong, & Lai, 2023).

## **8 Methodology**

The methodology employed in this paper is that of the case study because it is the most suitable for exploring the impacts of gender equity on corporate sustainability and was chosen. A case study is a suitable tool when research aims at exploring certain phenomena within contexts by seeking answers to "how" and "why" questions (Yin, 1994).

The potential of SW as an effective diversity management tool has been highlighted, as its use can support workers with special needs, such as maternity, care of young children or dependent elderly, or illness, as well as permanent needs, such as disability or severe illnesses of oneself or a family member, contributing to creating adequate organisational and professional conditions tailored to them (Samant Raja, 2016; Ravicchio et al., 2015a, 2015b). In this perspective, SW allows the pursuit of reconciliation goals and meets the need to introduce organisational innovations (changing how each work relates to its structure) to improve productivity and efficiency.

However, it is also essential to consider the risks that SW aggravates difficult situations resulting from an unfair distribution of domestic and care work or possible social isolation, as it is not suitable for promoting inclusion and active participation in the work environment as a social and community space (Gentilini & Filosa, 2019).

Despite the limits related to the digital divide and deskilling, SW can act as an instrument of age diversity management, positively intervening in the impact of age on attitudes, behaviours, and performance by rethinking work organisation, training and development, rewarding, and knowledge management (Assolombarda, 2014).

The perception of the quality of work is strongly influenced by the age variable, especially in an era where the workforce in Italy is characterised by a slow generational turnover, mainly in the public sector, where agile work can help reconcile new needs related to the family sphere (the care of elderly and/or sick people) and professional life (the management of the more significant physiological difficulties related to ageing) (Angeletti, 2020).

If shared and built with the "elderly" worker, SW can be considered as a preventive response to the search for work well-being and a form of fight against

age-based discrimination, avoiding early retirement or forced exits from the labour market that increase the risk of depression and cognitive decline (Harper, 2011, pp. 219-231). To ensure that SW qualifies as the optimal solution for workers with disabilities and special needs, targeted interventions must be implemented to reduce risks, such as choices of work reorganisation with attention to sensitive aspects such as the definition of suitable work schedules and conditions (e.g., exemption from night work, provision of suitable private environments), creation of appropriate digital software and hardware infrastructures, promotion and implementation of continuous training aimed primarily at combating digital illiteracy and favouring social inclusion, and definition and application of precautionary and support measures in compliance with the regulatory framework related to health and safety in agile work (Gentilini & Filosa, 2019).

## **9 Conclusion**

Smart Working (SW) has emerged as an alternative to traditional organizational models in recent years. SW is characterized by spatial and temporal flexibility enabled by technological tools that allow workers to perform tasks optimally. This model emphasizes the need for competent, flexible workers who can quickly adapt to new opportunities and market circumstances (Ferreira et al., 2020). Implementing SW involves identifying innovative strategic and organizational practices, policies, structures, processes, methodologies, and tools by the organization itself, requiring a culture change guided by effective leadership (Pereira et al., 2020).

Studies have shown that adopting SW can lead to higher performance, increased productivity, and job satisfaction (Ferreira et al., 2020; Pereira et al., 2020). However, the implementation of SW also presents challenges related to social and spatial isolation and a constant availability culture, which could intensify work efforts (Cacciotti et al., 2021). Smart Workers must develop new competencies, including behavioural skills such as time management, collaboration in virtual teams, self-discipline, proactivity, multitasking, and adaptability (Pereira et al., 2020).

With technological advancements, many tasks can be performed remotely or through automation, allowing more flexibility in location and time. Smart working was the new way of working for companies during the Covid pandemic and has been attributed to a solid contribution to environmental sustainability (Makovi et al., 2021). Innovation plays a crucial role in fostering a higher level of sustainability

in business operations. Innovations such as smart working that contribute to sustainability are called Sustainable Open Innovation (SOI) (Cheng et al., 2020). Overall, sustainability has become a critical issue for businesses, and sustainable innovation is increasingly seen as an effective strategy for reducing environmental impact while increasing profitability (Cheng et al., 2020). Smart working is just one example of a sustainable innovation that has gained traction in recent years and has the potential to shape the future of work.

### Abstract

This job has the finality to study the existing relationship between the cultural dimension of the board of directors, like sex and age, and its impact on firm value. It is important to stop and focus on the reason why these two parameters are so important to creation of value inside companies.

The board of directors is the centre where major business decisions are made. The future success or failure of the company depends on the decisions that are made today by directors. The idea of the future companies comes from the board of directors. From here we understand the importance of a deep reading of the mechanisms that govern this organization.

If we analyse the etymological sense of the term "value", we consider everything that is worthy of being taken into account: economic benefits but not only them.

In recent years corporate culture has shown to be a discriminating factor when the economic crisis led companies to exercise resilience actions. The covid-19 first and the international unrest then questioned the way of doing business. The market scenarios, in which companies operate, have changed. One element that made the difference was the mental flexibility of administrators. During these years the company culture has made a difference.

The present work aims to analyse how much the cultural dimension of the boards of directors affects the creation of business value. Particular attention will be paid to Italian companies.

In this article we provide to a review of the most significant papers and texts of the academic research dedicated to the study of human capital-intensive firms. In the field of human capital, the analysis is limited to the culture of women's enterprise. The database that was used for the search is Scopus.

A particular aspect of the cultural dimension that is being studies is the percentage of women sitting on company boards. Specifically, we want to study the correlation, if any, between the value of the company and the percentage of women present in its boards of

directors. We will examine what are the distinguishing characteristics of female management too.

Deepening the scientific literature on the subject of corporate culture and value creation, we want to quantify the value created by the companies under consideration.

The goal is to understand if there is a correlation between the percentage of women on the boards and business success, Primary sources and secondary ones will be used in the study.

The analysis was conducted in order to offer a new key to reading these phenomena.

**Keywords** – Cultural dimension, Firm performance, Decision-making process

**Paper type** – Academic Research Paper

## 1 Introduction

Although there is still a long way to go, more and more women are managing to reach the top management. For these reasons it is interesting to analyse what are the main characteristics that it is easy to find within the companies where women sit on the board of directors.

Since the 1970s some authors, mainly of Anglo-American (Schrier, 1975) origin, have begun to conduct research into gender in management and organizations (Paoloni and Demartini, 2016). However, these initial researches saw women in business as something unnatural because their place was at home as mothers and wives (Paoloni and Demartini, 2016). In fact, it took several years to see women reach successful job positions.

Even today, unfortunately, some studies show that there are gender stereotypes yet according to which the role of women in companies must be supportive and not leadership (Claus *et al.*, 2013). Breaking down this wall of prejudice is not easy but small progress is being made in society. Clearly this does not apply to all countries in the world. For example, there are some countries, such as Russia, where regulatory advocacy for women on boards is non-existent. Accordingly, the steps forward to be taken are still many.

In this paper, the characteristics of women enterprises are examined with particular attention to the contribution that women on company boards make to value creation. The field of investigation is represented by the Italian market.

The purpose of the article is to make a bibliographic review that moves in two directions:

1. The literature on "human capital";
2. The literature on the figure of women in top corporate decision-making positions.

A photograph of what is the female corporate reality in Italy today is also given. Taking up the data provided by Unioncamere, Study Center Guglielmo Tagliacarne and Si.Camera's work will develop a comment on the quantitative results of women's businesses.

## **2 Methodology**

In this article we provide to a review of the most significant papers and texts of the academic research dedicated to the study of human capital-intensive firms.

The key elements that have been taken into account are:

- Mappings;
- Categorization;
- Reporting;
- Disclosure;
- Valuations.

From a temporal point of view, the survey is limited to articles published between 1970 and 2022.

In the context of human capital, particular attention is paid to the figure of women on the boards of directors.

The database that was used for the search is Scopus. The data collection phase is about the following steps:

1. Topic choice: the selection of articles started by entering keywords in the Scopus search engine. They were: "human capital" and "female business".
2. Subject area selection: only items within the subject "Business, Management and Accounting" area were chosen.
3. Year of publication: we preferred the most recently publisher articles. Especially on the subject of "female business", all articles prior to 2008 were discarded. This has greatly narrowed the number of sources.
4. Language: the sources used in this article are all written in English or Italian.

Figure one shows the dispersion graph where the two variables are: the date of publication and the number of articles selected. From our sample it can be seen that the attention of scientists on the subject has grown in the last decade. This bodes well for future research.

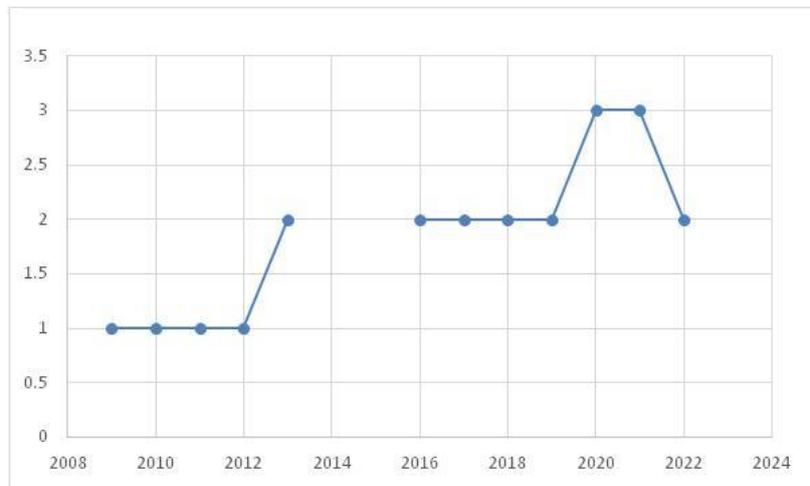

Figure 1. Number of articles published about female business by year  
 Source: personal processing, April 2023

As for the literature on "human capital", we have noticed a positive scientific production in the twenty years from 1970 to 1990. These articles are interesting as they present the pillars for research on human capital that was carried out in the following years.

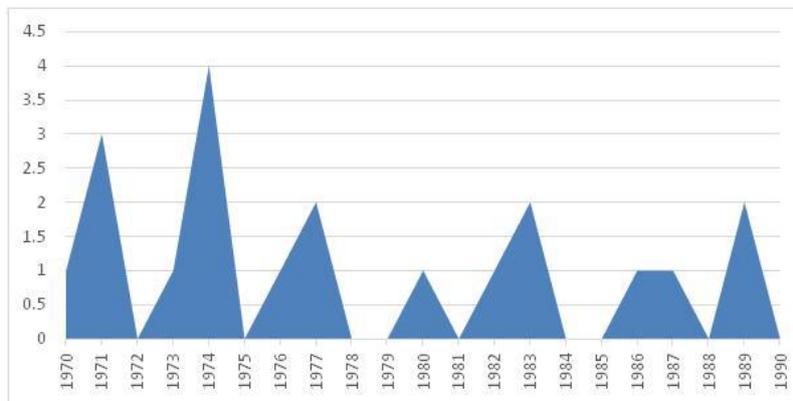

Figure 2: Literature on "human capital", 1970-1990.

### **3 Literature review**

#### ***3.1 The peculiar characteristics of women enterprises and the value of human capital***

The value of a company is strongly influenced by the human capital or human asset that operates within it. According to the Oxford English Dictionary, human capital can be defined as “the skills the labour force possesses and is regarded as asset”.

As early as 1897 Irving Fisher used the term “human capital” and but did not become a serious part of the economists’ lingua franca until the late 1950s (Goldin, 2016).

Human capital-intensive firms (HCIFs) are small or large innovative firms “built on specific human capital which is defined as the skills, knowledge and competencies that produce value only within the firm in which it has been accumulated” (Loufrani- Fedida, 2019).

Women enterprises have a cooperative vision of business and relationships are important between people. In fact, some studies show that women are more empathic than males (Li *et al.*, 2022; Eagly and Sczesny, 2009) and this helps to create a network of relationships. The market players with which companies’ interface are many and the relationship they have with them is called relational capital. Specifically, the stakeholders with which businesses interface are customers, suppliers, financial institutions and other (Mitchell *et al.*, 1997).

The relational capital is a key factor to create value because helps businesses gain a competitive advantage in the market (Cesarani *et al.*, 2017; Stewart, 1998).

In addition, some research shows that men who have a managerial role in the company are more likely to justify unethical behaviour related to business than women are (Chen *et al.*, 2016).

Inside the non-profit sector in United State of America, women are 45% of the chief executive officers (Claus *et al.*, 2013).

#### ***3.2 The creation of business value***

The board composition has a key function and it is vital to effectiveness, which in turn directly or indirectly determinates firm performance (Dodd and Zheng, 2022; Hermalin and Weisbach, 1991; Kiel and Nicholson, 2003; Vefas and Vlittis, 2019).

The board of directors is the place where the supreme strong-willing power is expressed and the underlying addresses of business management are determined (Zanda, 2007).

It has been proven that proclamations of female board appointments affect the market value of the firm making it increase (Campbell and Minguez Vera, 2010). Contrary, there are other studies that show that the positive correlation among female board representation and firm performance is not significant (Kim *et al.*, 2020).

Some studies show that the presence on the board of directors of companies of both men and women is a positive element. In fact, board gender diversity produces a lower pay gap between women and men working in enterprise and improvements in stock price informativeness (Carter *et al.*, 2017; Gul *et al.*, 2011). This leads to an increase of firm value (Greene *et al.*, 2020). Besides board gender diversity enables more effective problem solving (Li *et al.*, 2022).

#### **4 The cultural dimension of Italian companies**

The Italian industrial fabric is characterized by the presence of small and medium-sized enterprises, often of a family nature, supported by an entrepreneurial culture frequently not oriented towards growth (Galeotti *et al.*, 2013; Giacomelli and Trento, 2005).

Italian companies are generally small businesses where an important component is relational capital. This term refers to the set of relationships that a company has with its stakeholders like employees, customers, suppliers, banks (Cesarani *et al.*, 2017). Relational capital is a value driver (Cosentino and Paoloni, 2021).

In 1934 Maria Magnetti was the first woman to be elected to a board of directors in Italy (Guglielmetti, 2012; Gamba and Goldstein, 2009). She was elected in the Paramatti.

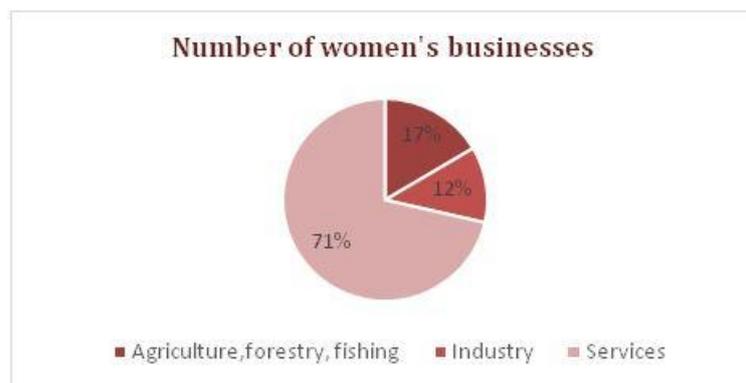

According to a study conducted by Gamba and Goldstein, there were less women in boards in Italy than in other OECD countries, like France, Germany and United States. From the data collection it can be seen that while in 1962 there were only 13 women (0.6%) on the boards of directors, in 2007 they became 291 (6.7%) (Drago *et al.*, 2012). This shows that the trend is growing but the development has taken a long time and still today there is a lot to do.

A study conducted by Paoloni and Modaffari shows that in Italy there are 554 female startups where "the arithmetic average among the women present in the

company's share capital and the percentage of chair ownership in the administrative body exceeds 66%" (Paoloni and Modaffari, 2018).

How do you read in the V Unioncamere Report on female entrepreneurship presented in July 2022, in Italy there are more than one million women's businesses, equal to 22% of a total of 6 million companies active in the national territory. Women entrepreneurs in Italy are now younger and especially more attentive to the socio-environmental impact of their businesses. According to the 2017 Asvis Report, the lack of adequate social services to support women and an insufficient support to motherhood and paternity cause 30% of mothers who have a job to interrupt it at the birth of the son.

As Table 3 shows, most female businesses operate in the service sector (71%). However, it is worth highlighting that in the industry, in 2021 (compared to 2020) there is an increase in female enterprises of more than 600 units compared to a sharp decrease in non-female enterprises (Unioncamere - Study Center Guglielmo Tagliacarne - Si.Camera "V National Report on women's entrepreneurship").

*Figure 3 Women's entrepreneurship sectors in Italy*  
*Reference: Unioncamere - Study Center Guglielmo Tagliacarne - Si.Camera (2022) "V National Report on women's entrepreneurship".*

Relative to size, 96.7% of women's businesses have a micro size, 3.1% have a small size and 0.3% medium-large (Unioncamere - Study Center Guglielmo Tagliacarne - Si.Camera).

From a geographical viewpoint, the data provided by the Fifth National Report by Unioncamere, Study Center Guglielmo Tagliacarne and Si.Camera, show that the area where there is a greater concentration of women's businesses is southern Italy. The high rate of female unemployment in those territories could be one of the reasons why young women create new entrepreneurial projects from scratch.

However, beyond the trend, in 2021 Lombardy is the Region of Italy with the largest number of female companies representing more than 36% of the national total.

The recent pandemic crisis that has invested Italy among the many countries has also shown that although small, female businesses are very strong. The attitude to change, the ability to promote new initiatives and the ability to have initiated, consolidated, and managed solid formal relationships with institutional stakeholders are skills of female manager that make businesses more resilient (Cosentino and Paoloni, 2021).

## **5 Conclusions and further research topics**

In a globalised market like the one in which companies operate today, the cultural dimension of the board of directors plays a central role. The future success of business depends on the choices that managers take today. For these reasons it is very interesting and current to deepen these issues. A further effect of globalisation is the presence of people from different nationalities and with different cultures on the same board of directors (Dodd and Zheng, 2022).

The culture is defined as "the collective programming of the mind which distinguishes the members of one human group from another" (Baatour and Ben Saada, 2022; Hofstede, 1980).

The purpose of this work is to provide a review of the most significant papers and texts of the academic research dedicated to the study of human capital-intensive firms (HCIFs) in relation to a series of analysis drivers that are explained below in the period 1970-2022.

In the field of human capital, the analysis is limited to the culture of women's enterprise.

On the basis of the following analysis and the identification of the keywords of the research, the most significant contributions were identified in relation to some paths which are identified below:

- Mappings;
- Categorization;
- Reporting;
- Disclosure;
- Valuations.

An attempt has been made to find a driver of a transversal nature in the context of identifying a path aimed at "explaining" the process of value creation

through human capital understood as seed financing of the broader concept of intellectual capital.

The theme of valorisation and non-financial Disclosure encompass the meaning and purpose of the informative value of human capital in terms of the competitive advantage of companies with a high cognitive intensity.

The issue therefore arises of identifying value drivers that must be appropriately valued also in relation to the contents of the non-financial disclosure.

The drivers of value from the qualitative analysis that emerge are those related to the development of human resources, the risk rate of innovation policies and the contribution of human capital to the rate of development of company size and value.

In particular, the theme of external networking emerges clearly as a tool for sharing knowledge to create additional and incremental knowledge.

The theme of the internal network also appears to be of vital importance, for which the result is expressed as a result of the processes of transfer of knowledge and corporate culture that feed the conditions of business continuity.

Two aspects emerged from the bibliographical and empirical research on the female enterprise:

1. A considerable increase in scientific production on the subject from the current century;
2. An uphill trend on the development of women's businesses in Italy.

This work is just a first step on a research stand that presents interesting food for thought.

In conclusion, it is possible to believe that gender research can lead to the identification of the presence of some transversal drivers which in the literature can allow the qualification of the relationship that exists between the cultural dimension and gender policies in high-performing enterprises cognitive intensity.

The analysis of the literature allows us to identify five transversal drivers whose presence leads to the creation of value within a cultural dimension

The next research steps are on the appreciation of a multivariate linear regression on non-financial disclosure topics and firm performance to investigate how the fine transversal driver can increase financial performance and improve the book and the market value of the firm highly based on knowledge and manager reputation.

### **Abstract**

Blockchain is recognised as a useful key digital technology in Industrial Internet of Things environments. It provides a means for the protection, traceability and security of industrial data. Blockchain is defined as an immutable digital ledger technology, based on a distributed and decentralized infrastructure that facilitates the management of data and transactions by leveraging on encrypted and trusted mechanisms. Despite it was introduced in 2009, it seems to be still immature. Indeed, some few applications have been experimented since 2019. Therefore, it is interesting to explore the knowledge boundaries of such technology for a secure data management and for ensuring the sustainability of industrial business models. Based on a systematic literature review and a bibliometric analysis, this study aims to identify the most important implications of the blockchain adoption with regard the protection and traceability of data in industry. The results of the analysis show the identification of seven clusters, as potential future research directions. The study provides both theoretical and practical implications. It extends the body of the literature by suggesting potential opportunities in industry and within an emerging technological field. Also, it supports managers to identify and plan accurate strategies for strengthening the sustainability of their business, by leveraging on the development of novel knowledge for a secure management of their assets.

**Keywords** – Blockchain, Data protection, IIoT, Bibliometric analysis, Research directions

## **1 Introduction**

The Industrial Internet of Things (IIoT) era - also known as Industry 4.0 - is characterised by multiple emerging technologies, including Blockchain (Corallo et al., 2022). It gains significant importance from both scholars and practitioners in terms of applicability and benefits for the business (Joshi et al., 2022). Indeed, the blockchain can be defined as an immutable digital ledger technology, based on a distributed and decentralized infrastructure, that facilitates the management of data and transactions by leveraging on encrypted and trusted mechanisms (Bhujade et al., 2021; Damoska Sekuloska and Erceg, 2022). It has attracted considerable attention for its ability to provide security, privacy and traceability of systems, as well as data, within industrial contexts (Leal et al., 2021). In fact, a strong relationship exists between blockchain and data protection and traceability in industry (Liang et al., 2019). According to (Gartner, 2023), the business value generated by such technology will grow rapidly, reaching \$176 billion by 2025 and \$3.1 trillion by 2030. However, despite the blockchain is promising in terms of immutability, reliability, complete transparency, anonymity, integrity and security of transactions, without involving any third-party organizations (Yli-Huumo et al., 2016), unlike other digital technologies, it seems to be still immature (Radanović and Likić, 2018). Compared to centralised models, the decentralised architectures that characterise the blockchain technology (BCT) have the potential to dramatically expand the scalability of existing industrial internet solutions, while ensuring the security and privacy of network participants (Sahoo, 2019). Few studies have been provided in the literature that focus on the role of blockchain and its implications for data protection and traceability in industrial contexts. For instance, (Joshi et al., 2022) described the BCT without detailing its components or offering any suggestions about existing security solutions. Also, (Alladi et al., 2019) focused on defining different blockchain applications within Industry 4.0, but overlooking the technological impacts. In addition, (Andoni et al., 2019; Zoughalian et al., 2022) explored some applications in specific target areas, but their studies lack of generalizability.

It is crucial to understand the implications of blockchain adoption for a secure data management and for ensuring the sustainability of industrial business models. It is therefore insightful to intersect such fields in order to identify their knowledge boundaries (Tranfield et al., 2003). Considering such issues, based on a

systematic literature review and a bibliometric analysis, this study aims to identify the most important emerging research directions related to the application of BCT in industry with regard to data protection and traceability, in order to reflect on and understand the most important intersection points and implications. In particular, this study aims to provide an answer to the following research question: What are the implications of applying BCT for industrial data protection and traceability? In order to answer this research question, a network analysis and graphical investigation of the textual data with the aim of creating a co-occurrence map is carried out, using the Scopus scientific database and the VOSviewer bibliometric analysis software.

The results of the analysis show the identification of seven clusters (i.e., secure digital industry, secure data management, protection mechanisms, decentralised and distributed architecture, security as a service, resilient security solutions, data manipulation techniques) as potential research directions for understanding the implications of BCT in the area of data protection and traceability.

The study provides both theoretical and practical implications. It extends the knowledge boundaries through the formulation of potential future research directions in industry and within an emerging technological field. Also, it supports managers in understanding useful strategies for strengthening the sustainability of their business, by planning the use of BCT and leveraging on the development of novel knowledge for a secure management of their business assets.

The remainder of this paper is organized as follows. Section 2 provides a literature overview about BCT and its applications for industrial data protection and traceability. Section 3 describes the methodology adopted by researchers and section 4 highlights the results of the exploratory study. Finally, section 5 concludes the paper by discussing key findings and research limitations.

## **2 Background**

### ***2.1 BCT applications***

Blockchain technology was initially introduced in 2009 to enable the use of digital currency (Bitcoin) through a dedicated platform, but was soon implemented in many other applications, including those related to the industrial world and, specifically, the manufacturing industry (Mohamed and Al-Jaroodi, 2019).

The blockchain is a distributed and ever-growing list (or chain) of concatenated data records, called blocks, which are protected through the use of cryptographic

algorithms (Zyskind et al., 2015). Two key elements underlying the effectiveness of such a list can be distinguished. The first element is related to the consensus required between the participating entities when adding a block; the second element depends on the links that are created between one block and the next, which make it difficult to change any block once it has been added to the list. In this context, an entity represents any actor involved in a transaction that needs to be validated and recorded; it can be a person, a group of people, an organization or a computing component (e.g., robot, intelligent device, sensor, control device). On the other hand, a transaction is a record of the activity that is performed (whether financial, commercial, industrial or system-related); whereas, the list is a protected online register where certain transactions agreed upon and performed between different entities are recorded. Finally, the blocks, which store transactions, are usually timestamped, encrypted and replicated across multiple sites, and cannot be altered. This makes the security architecture underlying the blockchain robust and ensures data integrity and privacy (Bodkhe et al., 2020).

The structure of the BCT is divided into five layers (Guo et al., 2020; Yin et al., 2021). The *data layer* is the lowest layer of the blockchain architecture; it is used to store data and ensure their security. Specifically, this layer decrypts data in a decentralized manner with common algorithms and technologies (e.g., the hash algorithm and asymmetric cryptography). The *network layer* is instead a Peer-to-peer (P2P) network, where each node stores all transaction records in the form of a blockchain. This network uses distributed storage technology and each node stores a copy of the complete data. Furthermore, the *consensus layer* hosts the consensus mechanism necessary to enable the management of blockchain data by all participating nodes. Currently, the mainstream consensus algorithm mainly includes Proof of Work (PoW), Proof of Stake (PoS), Delegated Proof of Stake (DPoS), Practical Byzantine Fault Tolerance (PBFT) (Andoni et al., 2019). Another layer is the *contract layer*, which contains various types of smart contracts (SC), consisting of different types of script code and algorithms (Pan et al., 2022). Finally, there is the most superficial state, which contains the *applications layer*, in which practical applications of blockchain, such as those related to the financial or health industry, are found.

Blockchain applications are often characterised by the need for disintermediation and decentralization (Uddin et al., 2021). According to (Tan et al., 2021), disintermediation is "the power of removing intermediaries in the distribution network"; while, (Carmo Farinha et al., 2015) define decentralization as "the process of redefining and redistributing responsibilities, functions, and

decision-making power within an organization so that stakeholder participation is more equitable and all power is not delegated to a central authority". Since blockchain can guarantee reliable transactions between two unknown parties, eliminating the involvement of third parties, a large number of applications of this technology can be found in various sectors. In addition to the well-known financial field of application, another use of BCT is in asset management, which allows the history of assets to be tracked and their details to be stored efficiently (Thakker et al., 2021). BCT is also used in the healthcare sector for processing confidential medical data (Zhu et al., 2020). Furthermore, a strong expansion of the application of BCT has occurred in the pharmaceutical sector. Specifically, in this area, its application is aimed at drug supply chain management, drug quality assurance, and prevention of drug counterfeiting (Zoughalian et al., 2022). BCT is also widely used in the energy sector, mainly to secure distributed power grids (otherwise easily hacked by malicious users) (Wei et al., 2020). Moreover, the application of BCT is rapidly spreading in the food safety sector. Through its use, food chains are being tracked, verifying the origin of the product, its quality and that it reaches the recipient directly (Damoska Sekuloska and Erceg, 2022). Blockchain is also being discussed in the government sector, where this technology could make services more efficient and transparent. Through the authentication of access, in fact, it will make it possible to request documents in real time, without undergoing bureaucratic procedures (Lahbib et al., 2021). A further area where the use of blockchain is growing strongly is the technology sector. Here, its use enables device access control and efficient data management (Qi et al., 2021). Furthermore, applications of BCT are known in the context of smart manufacturing, i.e. in the field of product lifecycle management (PLM). In this context, the implementation of BCT enables increased data security and traceability, automated transactions and decentralised consensus (Chen et al., 2022). Finally, the study conducted by (Alladi et al., 2019) mentions the drone, education, copyright, taxi, agriculture, and e-commerce and retail services sectors as new fields of application for BCT.

## ***2.2 BCT for industrial data protection and traceability***

Since the first implementation of blockchain as a public ledger for cryptocurrencies, BCT has evolved to create immutable systems that meet several criteria, such as reliability, anonymity, transparency, traceability and, in general, a high level of security (Golosova and Romanovs, 2018; Baygin et al., 2019). Thanks to these properties, blockchain has become an implementable technology in the

context of Industrial Internet of Things and in particular in the field of the smart manufacturing (Yu et al., 2021). In fact, the blockchain is a distributed, traceable and tamper-proof ledger (Bhujade et al., 2021). In particular, its nodes share data and jointly maintain the ledger, as well as using consensus mechanisms to ensure data consistency. On the other hand, the encryption techniques used by the blockchain ensure secure data sharing between authorized users. Moreover, blockchain is more performant than cloud platforms and databases in general, in terms of tamper-proofing, privacy protection, and temporal ordering (Cheng et al., 2019). In fact, the immutability and traceability features of the blockchain enable it to guarantee the secure storage of data.

In the context of IIoT and in the specific field of smart manufacturing, a certain number of blockchain-based frameworks have been defined to ensure the security and traceability of industrial data. The Compressed and Private Data Sharing (CPDS) framework, proposed by (Qi et al., 2021), allows for data authentication, data access control, and a high level of data management efficiency. Three industrial entities operate within the CPDS, namely: industrial participants, who process products and send product data to the blockchain; third-party users, who read product data from the blockchain; and access control managers, who define access policies to product data and assign keys to users. Moreover, (Lahbib et al., 2021) propose the privacy-preserving distributed access management framework (PDAMF), which utilises the Ethereum blockchain platform for the management and utilisation of shared resources between collaborating parties and resource access permissions. In particular, the PDAMF ensures: i) untraceability, whereby it is impossible to trace who requests access and under what conditions such access is granted; ii) unlinkability, which makes it impossible to prove that transactions are sent from a specific sender or to prove the sender's real identity; and iii) confidentiality policies, whereby sensitive access control policies are to be disclosed only to authorised parties.

On the other hand, referring to the specific area of smart manufacturing, the framework proposed by (Chen et al., 2022) is applied in the context of PLM to address the challenges of multi-party data management and data security. This framework considers the application of blockchain in four different PLM scenarios, such as: (i) product design, (ii) product manufacturing, (iii) product utilisation and (iv) product recycling. Furthermore, (Lin et al., 2021) developed a blockchain-based life cycle assessment (BC-LCA) framework, in which blockchain technology is implemented to secure and transmit inventory data from suppliers to manufacturers. Specifically, with the BC-LCA framework, more specific data can be

collected along the supply chain in real time, while improving the availability, accuracy, privacy and automatic updating of inventory data. Finally, (Ugochukwu et al., 2022) proposed a blockchain-based framework for an efficient logistics management system (named BFSELMS). The aim of BFSELMS is to provide secure transactions between supply chain actors through the integration of smart contracts into IoT systems. This framework aims to support for IoT devices, privacy and security for customer and product information, and efficiency in the execution of logistics processes.

### **3 Methodology**

To understand the implications of using the BCT for industrial data protection and traceability, it is useful to combine these fields of interest. Indeed, the paper aims to identify the knowledge boundaries (Tranfield et al., 2003) between BCT and industrial data protection and traceability, in the attempt to provide an answer to the aforementioned research question: What are the implications of applying BCT for industrial data protection and traceability?

A systematic literature review (SLR) has been considered as the reference methodology for collecting the sample of data. The SLR is a relevant process applied in different research areas, such as the innovation management research (Snyder, 2019). It can be defined as a transparent, scientific and replicable process that allows for the identification, highlighting and evaluation of several sources of information in order to catalogue and compare the results in a structured way (Bell et al., 2022; Corallo et al., 2023). It needs an iterative process with multiple steps and, therefore, a structured methodology is recommended. On the other hand, a bibliometric analysis has been carried out to analyse such data sample and provide an exploratory understanding of these emerging fields. Indeed, the bibliometric analysis is recognised as a fundamental methodology for exploring research of any disciplines and areas and highlight their nature (Donthu et al., 2021).

As also suggested by (Corallo et al., 2019; Del Vecchio and Menegoli, 2023), three main phases comprised the reference methodology of this study: i) definition of search schema and data sample; ii) preliminary analysis of the sample; iii) data analysis. Figure 6 details steps and sub-steps of the methodology.

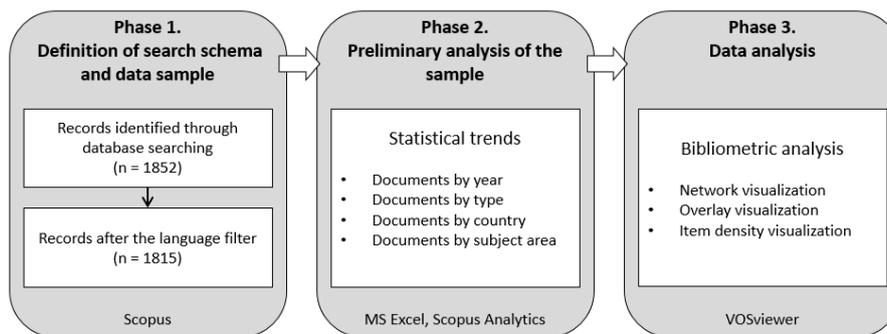

Figure 6. Steps of the research methodology

### 3.1 Definition of search schema and data sample

In line with the objective of this study and considering the SLR procedure (Corallo et al., 2023), the following keywords were selected for the investigation of the fields of interest:

- "Blockchain", "Block chain", "BCT", "Decentralized database", "Distributed ledger", "DLT", "Smart contract", "Consensus algorithm";
- "Data security", "Data protection", "Privacy", "Data insurance", "Information security", "Security of data", "Protection of data";
- "Traceability", "Trac\* data", "Traceability links", "Traceability systems";
- "Industrial Internet of Things", "IIoT", "Industrial Internet", "Industry 4.0", "Smart factory", "Smart Manufacturing".

The selection of these keywords comes from the consideration of similar concepts and synonyms observed in the theoretical background. In particular, while the first group of keywords refers to the BCT, the second one includes the concept of data protection, the third one encompasses key terms related to data traceability, and the last one contextualises the investigation in the industrial sector. Specifically, a combination of these keywords has been implemented by using accurate mathematical logical connectives (Boolean operators). Also, to build a homogeneous data sample useful for the following bibliometric analysis, the language filter has been used to considered only contributions written in English. Below, the designed query:

("Blockchain" OR "Block chain" OR "BCT" OR "Decentralized database" OR "Distributed ledger" OR "DLT" OR "Smart contract" OR "Consensus algorithm") AND ("Industrial Internet of Things" OR "IIoT" OR "Industrial Internet" OR "Industry 4.0" OR "Smart factory" OR "Smart Manufacturing") AND ("Data security" OR "Data protection" OR "Privacy" OR "Data insurance" OR "Information security" OR "Security of data" OR "Protection of data") AND ("Traceability" OR

"Trac\* data" OR "Traceability links" OR "Traceability systems") AND ( LIMIT-TO ( LANGUAGE,"English" ) )

Papers containing such terms in their title, abstract and keywords, have been searched (in April 2023) into Scopus ([www.scopus.com](http://www.scopus.com)), an important electronic scientific database, recommended as a robust source of data.

According to the selection criteria (

Table 1), the initial sample of 1852 papers was refined up to 1815, due to the language filter. The results have been exported in csv and txt files, storing all the information necessary to provide next analysis (e.g., title, authors, affiliation, abstract, keywords).

Table 1. Selection criteria

Criteria	Motivation
The paper must contain the selected keywords.	Because this study aims to investigate the intersection points of the fields of interest.
The paper must be written in English.	Because the bibliometric analysis is facilitated if a homogeneous set of terms refers to the same language.

### **3.2 Preliminary analysis of the sample**

The second step of the methodology focused on analysing the statistical trends of the literature contributions. MS Excel and Scopus Analytics have been used for the analysis of the sample.

Figure 7 shows the trend in quantity of papers published over the years. As expected, it is interesting to observe that the conjunction of the BCT field with data protection and traceability starts to be significant only in the last years. Indeed, an increasing attention of both academics and practitioners can be proven only from 2019, with an approximated tax of production grown of 280%. Indeed, as also confirmed in the literature (Radanović and Likić, 2018), BCT resulted to be still immature before 2018 and some applications appeared only recently.

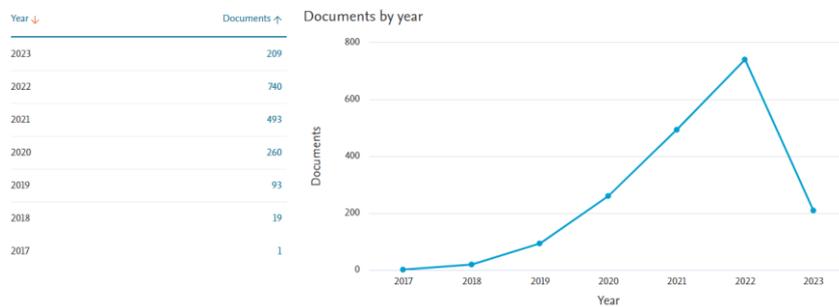

Figure 7. Publishing trend of papers over the years

In addition, according to Scopus classification, out of 1815 documents, 63.1% represents journal articles, 16% are conference articles, 14.5% are review and 5.1% are book chapters (Figure 8).

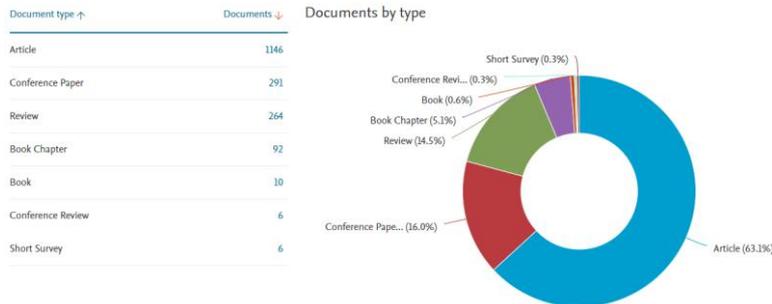

Figure 8. Document types distribution

The interest towards these fields and their relationship comes from all over the world (Figure 9). In fact, the top five countries that provided such studies are: China (528 papers), India (385), United States (194), United Kingdom (169), Australia (138). Italy appears at the seventh position with 78 papers. This view can be also interpreted as the diffusion trend of the interest in many different economies.

Figure 9. Distribution of papers around the globe

Finally, Figure 10 shows that there are several research areas that addressed the attention on BCT for data protection and traceability. Particularly, the most important areas are represented by technical sources: "computer science" (30.2%), "engineering" (22.3%), "business, management and accounting" (8.1%), "decision sciences" (6.8%), "mathematics" (4.7%).

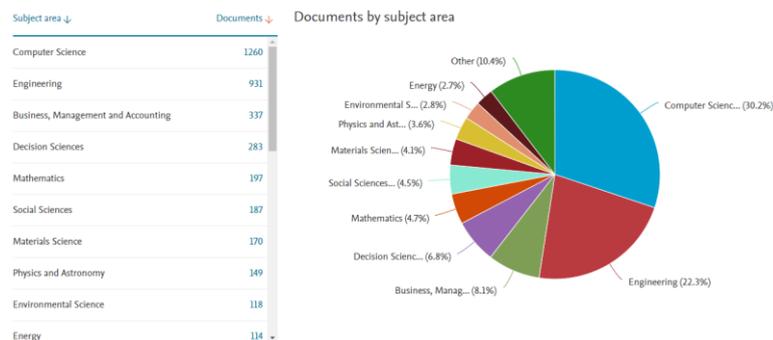

Figure 10. Distribution of papers around the globe

### 3.3 Data analysis

The third and last phase of the methodology focused on analysing the total amount of 1815 documents by carrying out a bibliometric analysis. This approach has been applied over the time in many research studies, such as business strategy (Kumar et al., 2021) and business management (Ellegaard and Wallin, 2015). Such analysis is useful for a macro assessment of the most relevant topics related to the research fields, thus helping, in this study, in defining the boundaries of knowledge of BCT and data protection and traceability. Therefore, the bibliometric analysis has been applied to: i) understand the most recurrent topics that surround the fields of analysis; ii) identify their relationships; iii) underline emerging topics and trends over the time. A network analysis and graphical investigation on text data have been carried out in order to create a co-occurrence map by using VOSviewer software. Such tool focuses on the graphical representation of bibliometric terms, functionally useful for displaying large maps in an easy-to-interpret way (Hu et al., 2019; van Oorschot et al., 2018). The analysis has been conducted following the suggestions provided by (Donthu et al., 2021; Fahimnia et al., 2015).

The analysis has been based on counting the recurring terms in "title" and "abstract" with a minimal frequency of 10. Out of 9087 terms, 297 meet the threshold. The following section shows a qualitative analysis.

#### 4 BCT and Industrial Data Protection and Traceability: Implications as Future Research Directions

To analyse whether the BCT has implications on data protection and traceability, the bibliometric analysis revealed a useful tool for a general understanding. Particularly, the bibliometric analysis allowed for carrying out a network analysis based on term co-occurrence. As suggested by (Sternitzke and Bergmann, 2009), it is probable that documents that refer to many common documents deal with a similar theme and, contrarily to other techniques, such as co-citation analysis that connects articles based on the received citations, term co-occurrence aims at identifying the research front, that is, the historic trends.

The bibliometric analysis returned the co-occurrence map illustrated in Figure 11, which encompasses seven clusters of terms. Each recurring term identifies a node of the network that can be in relationship not only with other nodes of the same cluster, but also with those of other clusters. The node size is the mirror of the occurrence of the term, so, the larger the nodes, the more frequent the terms in the pool of analysis. Moreover, the centrality of the nodes is representative of the relevance for the cluster and for the overall network as well. The link between two nodes means that those terms are included in the same article, and the thickness is proportional to the number of times they are used.

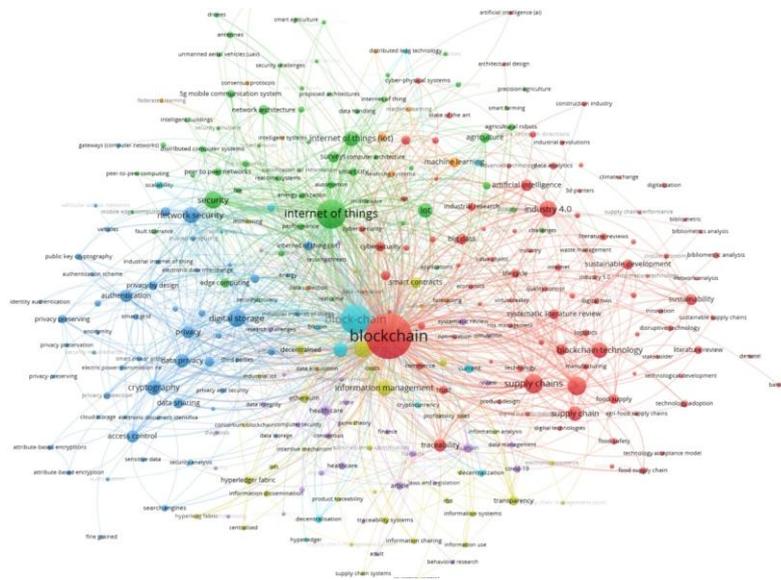

Figure 11. Network visualization

The co-occurrence analysis highlighted seven clusters, which are identified by different colours:

- Cluster 1 (red) is composed of 93 terms (e.g., blockchain, cybersecurity, artificial intelligence, big data, data analytics, virtual reality, digital twin, cyber physical systems, Industry 4.0, Industry 5.0, smart manufacturing, supply chain management, traceability, sustainability, trust, security of data) referred to the “secure digital industry” topic, in which the BCT is an enabler of the digital transformation in modern industrial contexts for data security and traceability.
- Cluster 2 (green) is composed of 58 terms (e.g., Internet of Things, security, quality of service, edge computing, network architecture, distributed computer systems, fog computing, automation, peer-to-peer network, data handling, data transfer, integration) referred to the “secure data management” topic, as the need to manage data, from its acquisition to storage and use, in a secure way.
- Cluster 3 (blue) is composed of 53 terms (e.g., digital storage, network security, authentication, authorization, hush functions, cryptography, privacy by design, data security, data sharing, access control, trusted computing, security systems) referred to the “protection mechanisms” topic, as actions for empowering privacy preserving and cybersecurity mechanisms in industrial contexts.
- Cluster 4 (yellow) is composed of 36 terms (e.g., information management, decentralised, hyperledger fabric, ethereum, smart contracts, information systems, traceability systems, product traceability, interoperability, profitability, transparency) referred to the “decentralised and distributed architecture” topic, as a functional feature for secure management of transactions between multiple nodes in a network.
- Cluster 5 (purple) is composed of 31 terms (e.g., computer security, algorithm, data integrity, confidentiality, centralized systems, information services, consensus, information security, data management) referred to the “security as a service” topic, as the configuration of digital services of security for industrial users.
- Cluster 6 (light blue) is composed of 13 terms (e.g., scalability, hyperledger, distributed ledger, decentralization, consensus algorithm) referred to the “resilient security solutions” topic, as flexible and robust systems for assisting industrial users in ensuring data security.

- Cluster 7 (orange) is composed of 13 terms (e.g., data acquisition, data collection, data integration, data mining, deep learning, federated learning, forecasting, intelligent systems, learning algorithms, machine learning) referred to the “data manipulation techniques” topic, as a set of procedures to handle industrial data in blockchain-based architectures.

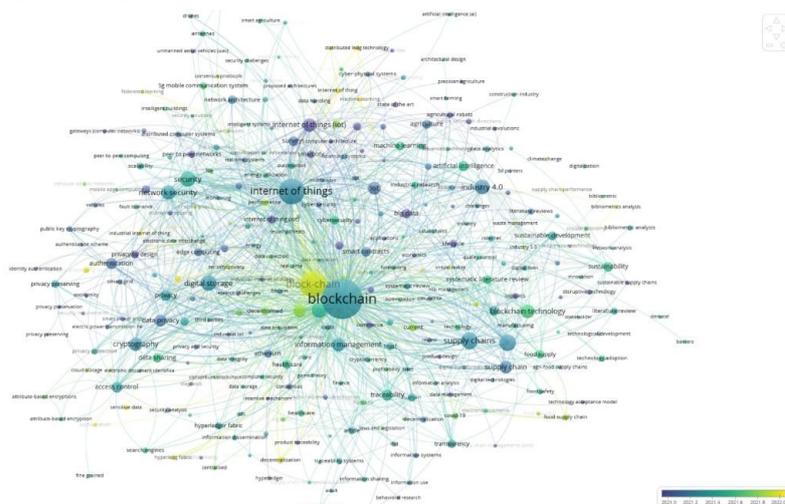

Figure 12. Overlay visualization

Furthermore, Figure 12 shows the overlay visualization of the term co-occurrence. It represents the same network map visualization, but within the temporal dimension, through the use of different colours (as shown in the colour bar in the bottom right corner of the figure). The colour represents the average year in which the terms appear. While older terms are in blue, recent terms are in yellow, and terms in the middle are in green. To observe a significant difference of colours, the temporal range of reference spans from 2021 to 2022. Indeed, before and after such years, no relevant differences could be observed. It is interesting to note that, most recently, the following main terms appear: block-chain, decentralisation, hyperledger fabric, authorization, sensitive data, authentication, industrial internet of things, machine learning, cloud computing, accident prevention, virtual reality, supply chain performance. On the contrary, older terms include: privacy by design, big data, lifecycle, embedded systems, internet of things, logistics, security of data, commerce, consensus, architecture, diagnosis. In the middle, it is possible to find these terms: digital storage, privacy, cryptography, network security, information management, data handling, data

sharing, sustainability, artificial intelligence, scalability, transparency, trust, security.

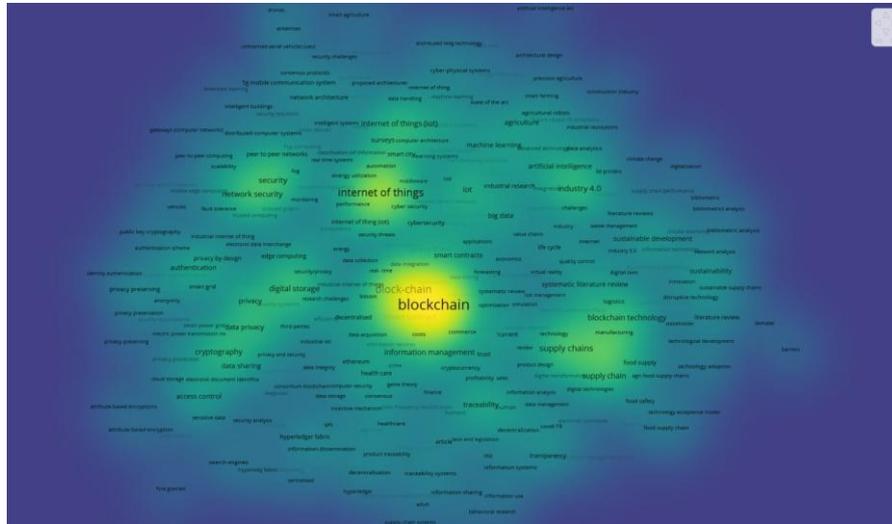

Figure 13. Item density visualization

Finally, in Figure 13, items are represented by their label, similarly to the network visualization and the overlay visualization. However, the area around each terms has a colour that indicates the density of items at that point. By default, colours range from blue to green to yellow. The larger the number of items in the neighbourhood of a point and the higher the weights of the neighbouring items, the closer the colour of the point is to yellow. On the contrary, the smaller the number of items in the neighbourhood of a point and the lower the weights of the neighbouring items, the closer the colour of the point is to blue.

As shown in the figure, the most relevant term that concentrates the most representative items density is "blockchain". Other important terms are: internet of things, security, network security, supply chains, privacy, digital storage.

## 5 Discussion and Conclusions

Using a transparent and objective procedure, the bibliometric analysis revealed the distribution structure of the literature on the key fields of BCT and industrial data protection and traceability. In particular, the following seven key topics have been identified as potential research directions useful for understanding the implications of BCT in the area of data protection and traceability: secure digital industry, secure data management, protection mechanisms, decentralised and

distributed architecture, security as a service, resilient security solutions, data manipulation techniques. These topics demonstrate an effective relationship of BCT for a secure management and traceability of industrial data. They suggest how the blockchain has become, over the years and the development of increasingly high-performance industrial applications, a key technology capable of enabling secure, traceable and tamper-proof transactions. This makes it possible not only to securely manage the enormous amount of data that characterize the IoT paradigm-based industrial environments (from the data collection phase to their transmission, storage and use), but also to deploy resilient security solutions that respond effectively to cyber threats, preserving the security of critical industrial assets while ensuring business continuity. These suggestions contribute in extending the corporate knowledge for the development of more sustainable business models.

The study, therefore, with the aim of guiding studies in the literature in the area of blockchain as a technology guaranteeing the security and traceability of industrial data, provides promising directions for future research. However, the study has some limitations that offer academics some suggestions for future investigations. In particular, the bibliometric analysis appears to be preliminary, relying on the Scopus database; in the future, further investigation could include the analysis of scientific articles from other sources such as Web of Science and PubMed. Furthermore, the interpretation of the resulting clusters could be distorted by the subjectivity and background of the researchers; therefore, in the future, content analysis could be implemented as a complementary method to improve the quality of the research and reveal other insights.

# Towards Sustainable Rural Development and Organisation

---

Mauro Romanelli

University of Naples Parthenope  
Department of Business and Economics  
Via G. Parisi, 13 80132 Napoli, Italy

## Abstract

Sustainable rural development helps to improve the quality of rural environment communities, and relies on promoting multifunctional agriculture and driving rural business and entrepreneurship, structuring hybrid organisations that combine and reconcile market and social aspects as sources and visions leading to creating economic, social and public value within rural areas and communities. The aim of this study is to elucidate that driving sustainable rural development supports hybrid organisations that are driving value creation processes within rural areas and communities. Rural resources are emerging as a social and economic asset and value to be preserved for future generations. Rural resources shape the strategy and organisation of rural enterprises and communities. Rural development and multi-functionality in agriculture contribute to reconciling and combining business orientation, territorial identity, social value creation and benefits for communities, addressing strategic and organisational choices of rural entrepreneurs. Rural development policies contribute to driving and shaping the sustainability of European farm sector and rural areas, by retaining long-term strategic objectives with regards to the competitiveness of agriculture, ensuring sustainable management of natural resources and climate action and the balanced territorial development of rural areas. European institutions promote rural development in order to benefit rural enterprises and communities, exerting influence on the organisational and strategic choices of enterprises towards sustainability by following a hybrid pathway to value creation and organisation.

**Keywords** – Agriculture, EU framework, Hybrid organisations, Rural development, Sustainability

**Paper type** – Academic Research Paper

## 1 Introduction

Rural resources are becoming a fundamental support to start initiatives and sustain efforts to drive economic development and social growth in rural areas and communities, emerging as a value to orient cultural, strategic, market and organisational choices that rural enterprises and farms have to adopt in agriculture as an opportunity to revitalise rural territories and areas because rural areas contribute to sustainable and smart, productive and healthy growth (European Committee of the Regions, 2017). Investing for enhancing rural resources supports rural development as a paradigm that is leading to wealthy rural communities and driving value creation. Rural development is emerging as a new paradigm in which the agriculture is at the interface between actual and potential rural and non-rural activities for constructing viable rural livelihoods (Ellis and Biggs, 2001). As a fundamental activity in rural areas and interface between community and the environment, the agriculture tends to be considered as a multifunctional activity when it has one or several functions in addition to its primary role. Promoting multifunctional agriculture supports sustainable rural development, leading to structuring hybrid rural organisations and businesses that combine and reconcile business and market aspects. Hybrid organisations tend to incorporate and reconcile competing elements drawn from different institutional logics (Pache and Santos, 2013) in order to secure endorsement from field-level actors managing heterogeneity of logics for ensuring the organisational functioning and reinforcing organisational actions (Besharov and Smith, 2014). Creating economic, social and public value in rural areas benefits businesses, people and communities in the rural landscape. Sustainable development in rural communities relies on enhancing rural resource as a kind of capital asset to be invested to benefit local communities by providing opportunities and facilities to improve the quality of rural environment (Garrod, Wornell and Youell, 2008).

The aim of this study is to elucidate that driving sustainable rural development helps to create hybrid organisations leading to value creation within rural areas and communities. The study relies on archival and qualitative data drawn by review of literature on the role of rural economies and entrepreneurship in order to sustain economic growth and development of rural communities. The European frameworks and guidelines governing the design of rural development and agriculture's policies are presented and analysed. The paper is structured as follows. After the introduction, the role of hybrid organisations is presented coherently with the rise of rural development that is encouraging a culture of

sustainability. In the third paragraph, the European Union framework concerning policies sustaining rural development in recent times is presented. In the fourth paragraph, some considerations on proceeding towards a sustainable rural development is elucidated. Finally, discussion and conclusions are outlined.

## **2 Hybrid organisations and rural development**

As a fundamental activity in rural areas and interface between community and the environment, agriculture is considered as a multifunctional activity when it has one or several functions in addition to its primary role. Since the Cork declaration in 1996 that refers to multi-functionality in agriculture as activity shaping the landscape, providing environmental benefits for land management, natural resource conservation and biodiversity preservation (Garrod, Wornell and Youell, 2008), the farmers tend to hold a responsibility as the stewards of the natural resources in countryside, and contribute to socio-economic viability of rural areas, shaping the landscape and providing environmental benefits with regards to land conservation and sustainable management of renewable natural resources and preservation of biodiversity. Multi-functionality of agriculture refers to new farm-related activities and new markets as expression of new relations between agriculture, society, cities and countryside to drive for maintenance of rural landscapes and reinforcing rural economies as part of the social fabric of the countryside (Oecd, 2001). Multifunctional agriculture contributes to producing environmental effects in terms of landscape and open space amenities, enhancing of biodiversity, contrast to pollution, food security and safety, rural economic viability (Knickel, Renting and Douwe van der Ploeg, 2004).

Multi-functionality in agriculture emphasises economic, social and environmental functions assigned to agriculture as a provider of rural environmental goods, cultural heritage, environmental conservation in order to contribute to revitalising the viability of rural areas and providing environmental values conserving agro-ecological systems (Van Huylenbroeck, Vandermeulen, Mettepenningen and Verspecht, 2007). Promoting growth in rural areas relies on combining market and social aspects by doing business for creating economic, social and public value as a source for driving the growth of rural economies and leading to sustainable rural development. Rural resource is becoming increasingly subject to pressures arising from an ever wider range of economic, social, political and environmental influences. Developing innovative ways of doing business that align profit and social impact is leading to hybrids as organisations that bridge commercial and economic activities with addressing social problems by adopting

a social or environmental mission. Social business hybrids are facing the challenge of aligning the activities that generate profit (as value captured by the organisation for its owners) with the activities that generate impact as the value created by organisation for society in terms of environmental and social benefits. Hybrid organisations tend to innovate by reconciling competing expectations promoting the coherence between value capture and value creation (Santos, Pache and Birkholz, 2015). Hybrid organisations incorporate and reconcile competing elements drawn from different institutional logics (Pache and Santos, 2013) to secure endorsement from field-level actors managing heterogeneity of logics for ensuring the organisational functioning and reinforcing organisational actions (Besharov and Smith, 2014). Hybrid organising seems to be related to activities, structures, processes and meanings by which organisations tend to combine aspects of multiple organisational forms (Battilana and Lee, 2014). Rural developments concern with the reconfiguration of rural resources in terms of land, nature, eco-systems, animals, plants, town-countryside relations and networks to be reshaped and recombined. Rural development requires to create new products and services associated to new markets concerning cost reduction through new technological trajectories and the production of specific knowledge bases.

### **3 The European framework for promoting rural development**

Promoting rural development was emerging as a relevant policy in the European Union. According to the first formal statement of rural policy European rural areas tend to be centers of renewable energy production and contribute to driving biodiversity preservation and protecting environmental resources (Commission of the European Communities, 1988). Following the Cork Declaration (1996) (Commission of the European Communities, 1996) preserving and improving the quality of rural environment should be integrated into all policies that relate to rural development sustaining the quality and amenity of rural landscapes by valorising natural resources, biodiversity and cultural identity coherently with a multi-disciplinary and multi-sector approach. Recently, planning the future of European rural development was emerging as a priority in the development of strategy enhancing both the quality and growth of rural economies. In the article 4 of the EU Regulation No 1305/2013 three **long-term overarching strategic objectives** for EU rural development policy in the 2014-2020 period were identified: fostering the competitiveness of agriculture; ensuring the sustainable management of natural resources, and climate action;

achieving a balanced territorial development of rural economies and communities including the creation and maintenance of employment. These objectives are translated into six European Union priorities for rural development: fostering knowledge transfer and innovation in agriculture, forestry and rural areas: by fostering innovation, cooperation and the development of the knowledge base in rural areas; by strengthening the links between agriculture, food production and forestry and research and innovation for improved environmental management; by fostering lifelong learning and vocational training in the agricultural and forestry sectors; enhancing the viability/competitiveness of all types of agriculture, and promoting innovative farm technologies and sustainable forest management: by improving the economic performance of all farms and facilitating farm restructuring and modernization increasing market participation and orientation as agricultural diversification; by facilitating the entry of skilled farmers and generational renewal; promoting food chain organisation, animal welfare and risk management in agriculture by improving competitiveness of primary producers by better integrating them into the agrifood chain by supporting farm risk prevention and management; restoring, preserving and enhancing ecosystems related to agriculture and forestry by enhancing biodiversity and improving water management, preventing soil erosion and improving soil management; promoting resource efficiency and supporting the shift toward a low-carbon and climate-resilient economy in the agriculture, food and forestry sectors; promoting social inclusion, poverty reduction and economic development in rural areas by facilitating diversification and creation of small enterprises and job creation, fostering local development in rural areas, enhancing the accessibility and use of information and communication technologies in rural areas. Member States will have to build their Rural Development Plans based upon at least four of the six common EU priorities.

According to the Cork 2.0 Declaration (2016) innovative, integrated and inclusive rural and agricultural policies in the European Union should follow some policy orientations: promoting rural prosperity in terms of innovative and inclusive solutions by fostering policies built on the identity and dynamism of rural areas, by promoting diversification and fostering entrepreneurship and employment for the wealth of rural communities and the resilience of farms; strengthening rural value chains by promoting policies reflecting emerging business opportunities for agriculture and forestry, and rural enterprises related to circular and green economies sustaining quality of products and healthy food; investing in rural viability and vitality by policies promoting rural quality of life

and meeting the aspiration of rural youth strengthening and aligning the development of rural and urban areas; preserving the rural environment by sustaining the land management as driver of the interface between citizens and the environment encouraging the delivery of environmental public goods like the preservation of natural and cultural heritage in terms of habitats of flora and fauna, landscape amenities depending on good functioning and social and economic development of farming and forestry systems; managing natural resources by developing innovative, science-based solutions allowing for producing more with less as to make available the use and employment of other resources for future generations; encouraging climate action by promoting the introduction and use of renewable energy and leading farmers and foresters to provide climate services implementing adaptive strategies; boosting knowledge and innovation focusing on social innovation, learning, education and vocational training, sustaining networking and cooperation, fostering access to sources of knowledge and technology for developing the needed skills, building closer relationships between knowledge providers, civil society and public authorities; enhancing rural governance relying on the effectiveness of regional and local governments and community-based groups; advancing policy delivery and simplification to build the trust of stakeholders; improving performance and accountability relying on credible monitoring and evaluation systems.

The Common agricultural policy (CAP) is about food, the environment and the countryside. The CAP is a partnership between society and agriculture that ensures a stable supply of food, safeguards farmers' income, protects the environment and keeps rural areas vibrant. The CAP 2023-27 focuses on a new way of working. It is a modernized policy, with a strong emphasis on results and performances. It focuses on ten specific objectives, linked to common EU goals for social, environmental, and economic sustainability in agriculture and rural areas. The CAP 2023-27 is built around ten key objectives, and focuses on social, environmental and economic goals: to increase competitiveness and contribute to food value; support initiatives and actions for managing climate change; to provide environmental care; to preserve landscapes and biodiversity; to support generational renewal; to drive vibrant rural areas; to protect food and health quality; to foster knowledge and innovation; to ensure a fair income for farmers. These objectives are the basis upon which EU countries designed their CAP Strategic Plans.

#### **4 Towards sustainable rural development**

Rural areas and resources provide an added value and potential for creativity and innovation, and contribute to driving sustainable growth (European Committee of the Regions, 2017). In the post-industrial stage of rurality, the preservation of the environment, security and quality of food are becoming the main priorities of policy agenda; there is an integration between economic activities, integration within territory between natural and social aspects, integration between local and global markets. The agriculture plays an autonomous and relevant role not merely accessory to manufacturing and services activities. Rurality becomes as a synonym of diversity as opposite to the homogeneity of urban societies and slack of bio-diversity, landscape, historical and heritage asset, tradition and values related to agriculture, and natural assets (Sotte, 2008). Sustaining rural development helps to maintain and revitalise rural economies and communities by creating and consolidating new linkages between agriculture and society, and providing a new set of responses to the income squeeze, opening up to new multifunctional enterprises and networks bridging rural and urban realities (Douwe van der Ploeg and Roep, 2003). Sustainability in agriculture concerns ecological, economic and social perspectives. In a sustainable agriculture there is qualitative and quantitative continuity in the use of resources that enables a dynamic character in the agriculture that is able to adapt to land use and changing needs of population, is based on the equilibrium between human activities, knowledge, technology and food production resources without causing degradation or pollution (Farshad and Zink, 1991). Promoting innovation systems helps to achieve sustainability in rural development and contributes to realigning agricultural and societal goals by fostering sustainable use of natural resources and competitiveness, creation of public goods and looking for new markets (Knickel, Brunori and Rand, 2009).

Sustainable development in the rural context relies on re-conceptualising rural resources as 'countryside capital' re-casting the rural resource as a kind of capital asset that can be invested in and from which a stream of benefits may be drawn. Investing in countryside capital may benefit the local community by providing opportunities, and facilities as to help to improve the quality of the rural environment and communities. Public institutions should promote, encourage, and support the sustainable development of rural entrepreneurship encouraging territories and communities to participate and benefit from entrepreneurial opportunities in rural areas (Garrod, Wornell and Youell, 2008). With regards to defining and implementing a transition strategy for promoting sustainable rural

development it is necessary to reduce the negative socio-environmental impacts of productive activities; broaden the participation of family farming in all kinds of markets; promote new forms of natural resource use; increase the overall productivity of the economy and well-being; revitalize and strengthen the endogenous local base of national economies, diversifying the productive profile of the country's territories. The final goal of all development strategies is related to both social and productive changes able to reduce external dependence in order to facilitate sustainability (CELAC, 2017).

## **5 Conclusions**

Rural development and multi-functionality in agriculture should help to reconcile and combine business orientation, territorial identity, social value creation and benefits for communities in order to drive and address strategic and organisational choices of rural entrepreneurs. Rural development policies contribute to sustaining an approach to sustainability of EU farm sector and rural areas retaining long-term strategic objectives in terms of competitiveness of agriculture, ensuring sustainable management of natural resources and climate action and the balanced territorial development of rural areas. European rural development policies lead new entrepreneurial ventures to structuring as hybrid organisations managing multiple and different logics that combine commercial, profit and social dimensions by following different trajectories of development concerning alternative policy paradigms for agriculture, rural areas and countryside.

The key implications of this study are theoretical, managerial and concern policy choices. As organisations achieving sustainable development, rural enterprises and farms in agriculture tend to assume strategic choices and organisational shapes coherently with the aim to behave as hybrid organisations. As organisations following a pathway towards hybrid structure, rural enterprises tend to adopt fitting organisational arrangements and design paying attention to maintaining strategic coherence between business activities and social commitment in order to enhance the wealth of rural areas and provide benefits to rural communities. With regards to policy aspects, European institutions tend to promote and encourage rural development as a key strategy and source to benefit rural enterprises and communities exerting influence on the organisational and strategic choices of enterprises that are oriented to proceed towards sustainability by following a hybrid pathway. It is necessary that rural enterprises could assume and interiorize a culture of sustainability as a driver of

value creation in rural areas and environments and guiding norm of organisational choices and behaviours. European regulations and guidelines contribute to designing a cultural pathway leading to both strategic and organisational change by encouraging the adoption of business models that support the orientation to design of hybrid structures. Promoting sustainable rural development and encouraging a culture of sustainability in agriculture and rural areas should help to rediscover the potential of rural areas for economic and social growth as to drive rural communities to create sustainable value. Further research perspectives imply to investigate how farms in agriculture are developing an approach to sustainability by following a hybrid pathway to designing structure and select a business model for value creation in rural areas.

### Abstract

Social and regulatory pressures and competitiveness are increasingly encouraging companies to invest in diversity to manage differences in the workplace. In service industries such as hospitality, tourism, and transport, the relationships and interface between customer and service are critical (Singal, 2014).

According to this approach in aviation companies, the subject of this study, diversity management takes on even greater importance than in other industries (Steven et al., 2004).

The commercial aviation industry is a high-tech service industry, extremely competitive and sensitive to the customer-employee relationship, since it is obviously a service that is consumed at the same time it is delivered (Appelbaum, Fewster, 2004).

It appears known from the literature that diversity management plays a significant role in the organization's outcomes (Lorbiecki, Jack, 2000). This study seeks, in fact, to provide a brief review of the history of diversity management in organizations, aiming to identify how, from the business side, diversity management is perceived and considered and which strategies have been implemented, or are in the planning stages, that may prove useful.

In order to analyze the intangible aspects of airline and how attention to diversity can become an element of competitive advantage, a qualitative research methodology using a multiple case study was chosen in the paper, through an unstructured questionnaire interview. Specifically, direct interviews with three management figures in the aviation industry were chosen as the source of information collection.

This first explanatory research confirms that the best combination of differences and, thus, the management of human resources enable the enhancement of diversity in organizations, with performance level benefits.

Therefore, through the interview some strategies in aviation industry in order to sustain diversity management are highlighted.

The limitation concerns the number of pilot cases observed (three) Future lines of research will be focused on the study of other company to acquire more data on the topic.

**Keywords** - Diversity management, performance, aviation

## **1 Introduction**

By definition, aviation exhibits a multicultural aspect of employment. Employees not only provide services to an international range of passengers, but also work, in many cases with multicultural colleagues. It therefore appears necessary for them to adapt to new cultures and societies with which they deal on a daily basis.

In the aviation industry, considering the diverse profile of the passengers being carried, companies have always tried and still try to design their products according to the different needs of their customers, in order to bridge the diversity gap that might emerge in the course of their experience, and become competitive in a highly challenging market (Lorenzoni, Lewis, 2004).

An airline with a well-trained and qualified management team can create a feeling of belonging within the staff community, which in turn is able to bond with colleagues and customers. All this allows any airline to differentiate itself among its competitors (Doumi et al., 2020).

Belonging, trust, and inclusion are then values to be promoted in transportation organizations as excellent characteristics not only of managerial management but also of customer service.

Transport services, in fact, by their nature represent something intangible albeit based on the use of tangible means of delivery. A comfortable seat, a good meal on board, a choice of many movies in the entertainment system are certainly elements that make the customer evaluate a trip positively, but how everything is offered, delivered and managed by the staff create an added value for passengers. The delivery of the transportation service, the customer satisfaction and quality therefore also depend on the actions of the staff which is an uncontrollable factor (Evans et al., 2003).

In addition, we should highlight that service providers are different from each other, and even the same provider may be different depending on the day, time or hour.

In this then, management has a kind of responsibility to provide service delivery standards that meet customer expectations, being able only to intervene in personnel management.

Taking into consideration the reality aforementioned, airlines are seeking to become more competitive in the marketplace; this is where the combination of staff well-being and service excellence comes in.

Within this framework, this paper focuses on the role of diversity in the airline industry and its role in supporting staff's sense of belonging and well-being, exploring how diversity can be a strategic management tool for maintaining a positive and supportive work environment (Duomi et al., 2020).

The aviation industry still suffers from a lack of diversity, especially in Europe.
