Research on diversity in the airline industry is still in its early stages, and this is especially true for qualitative studies.

Therefore, this article addresses the issue of diversity perceptions and diversity management within aviation companies in Italy, following the methodological principles of qualitative social research.

The objective of the paper is therefore to understand the perception of diversity in civil aviation in Italy. In fact, considering the benefit of diversity management in an industry where a potential shortage of personnel often looms, it is in the interest of operators to have access to a pool of employees, well included in the organizations, as diverse as possible, which allows them to satisfy the interest of customers.

The analysis then focuses on how diversity management is known and applied in the industry being researched and what are some elements of diversity that can be worked on.

In summary, the objective of the research is thus to answer the following questions:

*RQ1. What threads of diversity management can be related to aviation?*

*RQ2. How can diversity management be applied, in response to the most obvious elements of diversity?*

To answer the first question, a review of the literature, which is still not very structured in the aviation sector, was conducted, and to answer the second research question, interviews were conducted with three Italian airline management figures. From such qualitative research, suggestions are then drawn on possible strategies to be applied.

The research contributes to extending the literature on diversity management as it relates to transport organizations and the final implications are vast and pervasive.

The paper is structured as follows: section 2 addresses the literature review and performs an analysis on the diversity issue in civil aviation. section 3 presents the

research methodology, section 4 describes and discusses the case studies and identify the discussions; finally, section 5 identify conclusions, limitations and possible lines of future research.

## **2 Literature review**

When developing research on diversity, we cannot disregard an evolution of the literature, which shows how the characteristics of the articles have changed, i.e., their provenance, the methodology used and the departments involved (Paoloni, Demartini, 2016).

Many researchers have tackled the topic of human resource management and the majority of them believe that it is one of the key elements in making companies competitive; people make a difference in terms of competitiveness and business results when their development and enhancement is nurtured (Garbellano, Tesio, 2010).

Therefore, the issue of human resources plays a central and predominant role in any industry; special attention must be paid to how to manage them optimally, not only professionally but also personally.

Managing the skilled workforce better by integrating backgrounds, cultures and skills into heterogeneous, higher-performing organizations enables companies to achieve competitive advantages and results, particularly in companies, such as those in air transportation, where there is a strong relationship between human resources and customers (de Andreis et al., 2022).

From a managerial point of view, therefore, it appears necessary to thoroughly understand the role of the customer, both as a user of a good or service and as a vehicle of information regarding his or her experience with the organization. The analysis of customer demand and satisfaction appears complex, since these are driven by subjective, psychological and/or social factors (Tsiotsou, Ratten, 2010).

The ability of companies to meet these needs defines the level of customer satisfaction, which in turn will determine the retention rate and contribute to the development of spontaneous advertising processes by customers.

Therefore, among the most important challenges for the aviation industry is the development of staff competence and professionalism and their ability to make the customer experience exciting and memorable (Bharwani, Jauhari, 2010).

Human resource management is defined as an integrated system of complex and interconnected activities and tasks aimed at ensuring the development of human potential (planning, attraction and recruitment, selection, disposition); the retention of human resources (health and safety, organizational culture, employee

loyalty, employee services) the ability to motivate and reward people (monitoring and evaluating work efficiency, motivation, rewards, benefits) and, finally, investment in training and professional development (education and training, human resource development, career advancement, management) (Bahtijarević-Šiber, 2014).

Thus, the purpose of human resource management, in highly competitive industries such as air transport, is to ensure a competent and quality workforce through the creation of a stimulating work environment; in fact, employee satisfaction will be the key element for the success of the organization, increasing its competitiveness (Belias et al., 2017; Barney, 2001).

In industries such as transportation and tourism, human capital and its strategic management are the key elements in improving an organization's resources and thus represent a source of sustainable competitive advantage (Pasban, Nojedeh, 2016). In fact, human resources are responsible for the quality of the consumer experience, and their knowledge and skills become crucial for customer satisfaction and loyalty, as well as for the perception of the service itself and, consequently, for the image of the companies (Bozzato et al., 2021), since it is, precisely in aviation, that the contact between human resources and customers, i.e., the time during which the customer is physically present in the system compared to the total production time, plays a determined role in creating a competitive advantage.

It is necessary to promote the process of "humanization of resources" through which management considers the "person" before the "professional," using policies enhancing employees' satisfaction and creating a motivational climate in the work environment. It follows that human resources, as a fundamental part of the organizational environment, can act as a competitive advantage if used to the extent that best suits the company (de Andreis, et al., 2022).

Having defined the importance of human resources in aviation and the proper ways to manage them, it is necessary to highlight that not all people are the same and, therefore, each person requires a different approach. A culture has developed over the years, leading to identify people's roles and skills based on certain personal characteristics, such as age, gender, nationality, etc. People all have personal characteristics that distinguish them, but these must be separated from professional skills. In fact, only the latter make people suitable or unsuitable for certain roles.

Sociocultural and economic transformations, liberalization of the economy, the process of globalization, and changes in customer needs have substantially

increased the diversity of the workforce, forcing organizations to make their workforce more varied, innovative, and competitive (Cook, Glass, 2009). An innovative workforce can be ensured by hiring talented individuals from diverse backgrounds to deliver better products and services to customers and companies (Salau et al., 2018).

Thus, human resource enhancement involves understanding and properly managing diversity, which is a positive distinguishing feature and can be an important managerial tool to gain competitive advantage.

Diversity has been defined in various ways, but it is commonly believed to exist at two levels: surface-level diversity and deep-level diversity.

Surface-level diversity has primary dimensions such as gender, race, age, and sexual orientation and secondary dimensions such as education, marital status, work experience, and functional background (Mok, 2002; Van Knippenberg, Dijksterhuis, 2000); deep-level diversity generally refers to cognitive diversity, a variable that is not immediately apparent and, therefore, is difficult to measure (McMahon, 2011).

Primary dimensions play a predominant role in diversity and performance management because they remain largely constant over time and determine how an organization relates to diversity in terms of employment, promotion, employment benefits, and company-wide delivery practices. Each individual possesses unique knowledge that organizations must recognize for their holistic development; therefore, diversity management plays a huge role in knowledge sharing and overall organizational development (Yadav, Lenka, 2020).

Several studies have also discussed the relationship between diversity and organizational performance. To understand and manage the dynamics of workforce diversity, researchers have explored the outcomes of diversity at the individual (Flynn et al., 2001; Ancona, Caldwell D F, 1999), group (Schippers et al., 2003; Leslie, 2017) and organizational (Richard, Johnson, 2001; Armstrong et al., 2010) levels.

Specifically, companies benefit from diversity in several ways (Singal, 2014, Hansen, 2003). Firstly, diversity broadens the pool of potential candidates and suppliers, leading to a larger resource base, higher quality, and lower costs (Niederle et al., 2013). Secondly, diversity in the workplace often increases individual performance and emphasizes individual-company identification, increasing productivity and job satisfaction and reducing voluntary turnover and recruitment and training costs (McKay et al., 2009). In addition, it is important to

note that higher job satisfaction improves the quality of employee-customer interaction (Koys, 2001).

Among the benefits, it should also be pointed out that a diverse workforce also provides access to new networks and expands sources of information (Williams, O'Reilly, 1998). Thus, a diverse workforce brings diversity of thought that promotes a creative and innovative environment (Bantel, Jackson, 1989), and finally, a better cultural congruence between service staff and customers that improves consumer experience and satisfaction.

In order to implement a "building a diverse environment" program that works, it is necessary to provide specific diversity training to managers and traditional employees, in order to make everyone aware of the opportunities presented by this paradigm shift.

The literature is thus divided between those who highlight the positive influence of diversity management on organizational performance and those who emphasize its negative aspects (Yadav, Lenka, 2020). Analyzing what has been described above, it can be said that numerous studies have been conducted on the subject; many of them show that diversity is an important characteristic for organizations and that the discriminating factor between a positive or negative impact on business performance is precisely the organization's ability to manage people.

It now appears necessary to explore further the concept of diversity and the different declinations in which it exists, as it is a broad and complex topic (Grin, 2003).

Diversity can be analyzed with an objective or subjective criterion. The objective one makes the concept of diversity coincide with that of minority, recognizing a subject as different if he or she belongs to a minority group compared to the majority of society (Moscovici, Faucheux 1972), while the subjective one sees diversity arising not from an objective reality of things but from the ways in which observers view it (Gergen, 1994).

According to this approach, diversity is therefore not objectifiable since there is no value system, a benchmark, a "normality", as opposed to which one can to define someone or something as "different."

Each individual, in fact, has a different perception of things and a different conception of the world.

Highlighting the presence of diversity, however, regardless of context, means for individuals, and consequently for organizations, to implicitly recognizing that there are no standards of any kind, and consequently acknowledging that every

relationship, situation, and condition must be treated and handled in a way that is precisely "different" from another.

Especially in the case of human relationships, even within organizational contexts, there is not a universal approach, since human beings in their attitudes and behavior are the symbol of diversity.

As previously described, diversity can refer to gender, race, social status, ideology, religious orientation and numerous other variables. Some diversity is part of the innate heritage of the individual and cannot be changed, while others refer to elements acquired over time (Loden, 1995). Identifying the various diversities in a Gardenswartz and Rowe (2003) identified the various diversities in a business context were, theorizing a decidedly comprehensive model that describes four levels of diversity. This model explains not only the division into levels but the complexity of the interconnection between them in describing the reality of companies in diversity management.

The central level of the model is represented by *personality* or *inner level* and considers the set of values and beliefs driving individual behaviors, characterized by both genetic and sociocultural basis; consequently, in the organizations, these aspects influence the member's choices, actions and overall performance. The second level is the *internal dimension* or *core dimension* which groups specificities such as gender, nationality, sexual and religious orientation, age, mental and physical abilities and derive from hereditary or group-specific conditions, that are independent of the individual's will and therefore cannot be the cause of different treatment between individuals, hence the subject of anti-discrimination regulations. We can then identify the third level with the *external dimension*, to which characteristics, such as income, geographic location, personal and recreational habits, family status, belong; these are determined mainly by family and personal conditions, which can be modified over time in a partial way by the individual's actions. In this case, protective actions aim at the pursuit of equal treatment among individuals, such as supporting people born in disadvantaged areas or in degraded families. Finally, the last is that of the *organizational dimension*, which identifies aspects independently defined by the organization (roles, responsibilities and relationships within the company) and implicitly generate differentiations since belonging to a company function or performing a task can lead to certain discriminations, as, for example, in the case access to training, part-time, career progression or smart-working (Gardenswartz, Rowe, 2003). The existence of various diversities is justified by the degree of pervasiveness of the differences: in the innermost levels in fact, we can find the

diversities closely related to the person and those characteristics that are immutable; in the outermost levels are those characters that are more influenced by the external environment and consequently more mutable than the previous ones.

It is important to emphasize that the model highlights how the condition of each individual is the result of multiple aspects that the model itself identifies and that the company must take into account their evolution, which changes individual needs, expectations and goals by placing the psychological contract between company and worker in continuous evolution.

Diversity in group membership can have both advantages and disadvantages for group and organizational performance (Knouse, Dansby, 1999). Thus, the challenge for organizations is therefore to be able to identify, manage, and enhance those differences that make each individual unique, creating systems that can eliminate the discrimination inherent in organizational and relational management processes.

To this end, the creation of a primarily cultural system capable of governing this challenge represents a distinctive and competitive element in a context in which both the exogenous perspective (external environment) and the endogenous perspective (corporate strategies) represent important levers for the implementation of diversity management actions.

In the business context, the issue to be resolved concerns the management of those diversities that by nature are not modifiable, making it necessary to identify the best ways of managing them for the benefit of the employees and of the entire organization (Kochan et al., 2003).

The presence of different identity groups in a work context has as its consequence the emergence of discrimination, a condition that does not benefit the company and that can be handled through human resource management models.

Having described the importance and necessity of diversity management, we must then consider how companies can apply it.

The company that decides to enforce diversity management must initially start with a detailed and accurate internal analysis of personnel.

Each organization has its own structure and composition and this implies that each organization is facing with different situations and issues. The company carries on a culture and values, the so-called "organizational culture," which inevitably affects the company's performance and the personality of the members (Parrotta et al, 2012).

Often and often adopting diversity management involves having to make a radical change within the organizational structure in the strict sense, which leads to having to face certain risks in exchange for obtaining various benefits.

Applying diversity management can be decidedly easy in newly founded and established, as it seeks to prevent a concrete issue that might arise in the future; unlike this application is more complex, slow and tortuous in the case of historic companies, or otherwise of less recent foundation, since it is more likely that an organizational culture has become more firmly rooted in them.

Another characteristic that must be taken into account when making the decision to implement diversity management is to understand what type of management is needed. In fact, it should be specified that here, too, there is not a unique type of diversity management, but rather there are different kinds based on to the diversity found in the company. For example, a long-lived company that has been in business for many years and has employed workers for several generations may have to deal with the problem of seniority, as a result of a high presence of particularly adult and older employees. In contrast a newly founded company might see many young people employed internally, not encountering a seniority management problem as much as, for example, a difficulty in managing the multi-ethnicity of the workforce.

That being said, we can move to analyze diversity management in aviation, where companies are both historical and relatively new, and try to understand what the main diversity management issues are and what strategies might be put in place.

In service industries such as hospitality, tourism and aviation, the relationships and interface between customer and service are critical, considering that the influence of organizational culture is strategic in the way services are delivered and consequently for company satisfaction and corporate image. According to this approach in aviation companies, the subject of this is study, diversity management takes on even greater importance than in other industries, playing a significant role in the organization's outcomes.

The commercial aviation industry is a high-tech service industry, extremely competitive and sensitive to the customer-employee relationship, since it is obviously a service that is consumed at the same time it is delivered.

### **3 Methodology**

To understand, therefore, the main levers on which diversity management is operating in aviation in Italy, we used a qualitative research methodology, through a multiple case (Yin, 2014).

Specifically, we interviewed, between February and March 2023, three management figures in the aviation industry in Italy, between as the source of information collection, using open-ended questionnaire, administered in a flexible form and integrated according to the specific characteristics of the individual interviewees.

### **4 Case studies: analysis and discussion**

The case studies observed involved three Italian air transport companies with different company histories, one young, one historical and one resulting from several company mergers.

Briefly respondents, narrating the personnel management difficulties they face, highlight how the main points of disagreement concern the management of gender differences, age differences, cultural differences, while and they have not encountered issues regarding disability, having dedicated inclusive policies to it according to legal standards.

Getting more specific about the pilot cases. the first interview is about an airline that operates scheduled and charter flights founded last year (Airline A), the second has inherited the network, staff and aircraft from a historical airline (Airline B) and the third one third, recently out of operation, stemmed from a historic company operating on the national network that had merged first with a charter company and later with a large international airline (Airline C).

Before tracing what actions on management's part were put in place to reduce, it is necessary to understand how diversity affected the three realities differently, describing what emerges in the interviews and contextualizing the diversity issues previously outlined.

In the three cases, as well as in other airline companies in Europe and around the world (de Andreis, 2023), the issue of gender difference presented itself extensively.

In the investigated realities, there is a historical trend that female employment is significantly lower than male employment, especially when it comes to top management roles. The second issue detected concerns the ageing, relating to diversity from the point of view of seniority in the mosaic of personnel; there are

in fact newly hired workers who are young or older, and workers who are less recent hires who are also young or older. The third important aspect is the cultural aspect, arising from current trends that have seen society in all Western countries becoming increasingly multiethnic, encompassing cultures from all parts of the world.

According to the survey, all three companies state they have engaged in diversity management, although there is no a diversity management figure and all policies are implemented by general human resource management. The first problem concerning gender diversity is indicated as the greatest by the three realities; in company A age difference, indicated as the second problem in airline B and as the third in airline C, and cultural differences are scarcely present, while culture difference seems to affect only company C.

It follows that the diversity issues are a strongly influenced by the culture and the history of the organizations.

For the respondent the first actions to reduce diversity belong to the recruitment stage, when removing hiring biases appears necessary, since often people unintentionally select those who they feel similar to.

A second possible measure highlighted in the interviews is the raising awareness of the need to increase diversity, since making the topic a regular conversation helps foster a culture of inclusion.

A further action relates to leadership, responsible for skills in staff creation and management, which should pave the way for greater inclusion, both by supporting openness and tolerance and by ensuring diversity in the company's most important workplaces. In addition, programs also can help members with different backgrounds and levels get to know each other, have different perspectives, bridge the gap, and encourage inclusion.

The three interviewees were then asked to better explain how the highlighted diversity factors were impacting business reality and what actions they had and were implementing.

About ageing Airline B confirms that among recently hired employees there can be a problem of a lack of professionalism; on the contrary among older employees professionalism is present but the problem concerns its fading as time goes by or is due to the difficulty of accepting organizational changes or novelty.

Seniority then, in some cases, emerges as an organizational problem, especially because it is used, principally in the past, as an operational management criterion in assigning shifts, vacations, qualification changes etc.

Associated with different age, different skills and competencies are developed; older people lose some skills in a process called de-professionalization but in return acquire more capabilities: they will be less suited to jobs that involve more fatigue but more appropriate for organizational jobs, since over time they develop a strong sense of respect for colleagues, a greater sense of responsibility and a marked tendency to respect hierarchy. On the other hand, younger workers have greater creativity, propensity for innovation and novelty, and familiarity with computer systems.

It is therefore up to management, to capture all the skills that distinguish workers and decide, in relation to their age, how to relate to them, finding them the best place in the business context to derive the maximum benefit.

The concrete intervention suggested toward aging therefore focuses on the proper management of aged and older workers as opposed to younger workers. In fact, for younger workers, job specialization courses can be introduced for the tasks they perform to increase the degree of professionalism. On the opposite side, efforts are made to manage those who are older, creating a more inclusive and suitable work environment for them.

Regarding seniority, Airline B suggests a more meritocratic approach, derived from internal assessments and productivity indexes.

The management of former Airline C, which saw two already very different companies merge with a third non-Italian company, becoming a complex, multiethnic entity with very different cultures. Here, too, managing diversity from a managerial and organizational perspective took time and required training and awareness-raising among staff.

The goal of the actions has been to enable staff to be in a smooth working environment that allows them to bring out their potential, undoubtedly guaranteeing the company greater efficiency on the part of human capital. The organization says that it has taken diversity into account by encouraging activities that facilitate inclusion, believing that employees, free to themselves in every point of view, will have a different conception of their jobs the environment in which they operate, will face their duties with a different psychological condition, being more efficient and more productive.

Finally, the three airlines responded regarding gender diversity, mainly agreeing that the female component is, as in general in the industry (de Andreis, 2023), strongly underrepresented; in line with the global data showing that less than 5% of CEOs, less than 10 percent of pilots and fewer than 13% of top executives are women in the global airline industry. Additionally, they state that

the areas with the largest gaps include technical operations and leadership positions (Lutte, Morrison, 2022).

After analyzed the main aspects of diversity, respondents, through guided questions, were asked to give their opinion on diversity and business performance.

To structure these questions that would help in the understandings of the aforementioned pair, some hypotheses of a research conducted among employees (around 400) of European airlines were used (Duomi et al., 2020). Questions were then prepared on these hypotheses to measure the validity from a managerial point of view.

The first hypothesis, about the relationship between employment status and the ability to manage different customers, with benefit in the perception of service offered, that exposed a link between occupational status (full/partial time, causal, contract) and handling diverse customers, was rejected. The three managers interviewed also confirm that employment status does not affect performance, indeed in cases This result confirms that employees with different professional backgrounds and experiences may have a variety of attitudes in their work environment (Indoria et al., 2017) regardless of the form of contracting.

The second hypothesis, about a link between tenure/experience in a company and handling diverse customers, was not supported. Again, managers interviewed confirmed that it is not the experience in the role but the problem solving skills that fronts alternative solutions to a competitive business environment (Cletus et al.).

The third hypothesis used concerns the existence of a relationship between the personal experiences in the airline and the daily interaction with other colleagues and customers. This hypothesis was confirmed, deriving mainly from the rights and responsibilities of both parties. Managers interviewed also confirm that when diversity appears to be respected it has the potential to unite and promote collective strengths, improving performance and productivity.

It thus appears from such reflections that contractual status does not affect relationships with other colleagues and clients, as does tenure and experience in the role. On the opposite, in the daily experience, when diversity appears to be observed, shared and respected appears to be an asset to the organization.

Finishing the interviews, opinion was asked about diversity management and possible areas of intervention. The respondents showed that all three companies are aware that being able to better interpret the diversity and distinctiveness of

their people has a real advantage in the professional scenario of the present and of the immediate future.

In addition, the same assert that dealing with diversity stems from external factors, namely those that relate to the context in which the company is embedded, such as demographic changes, socio-political or legal drivers global economic trends, technological innovations, pressure from external stakeholders etc., and from internal factors, that are part of the organization, i.e. the heterogeneity of the staff, organizational culture and values, strategy and mission, , and economic and image benefits etc. (Ibrahim, Harrison, 2022).

Finally, the three managers interviewed were asked what strategies might prove useful in implementing diversity.

The trees agreed on acting at the grassroots, that is, as mentioned, by selecting resources from diverse backgrounds, considering this action as a functional element of organizational change.

Further step is to formulate a company vision and mission that also considers the issue of diversity. This step should involve management and key stakeholders, focusing on the strengths and weaknesses, threats and opportunities that the contingent scenario presents to the company.

It would then be necessary to work, after observing and analyzing the organization's internal environment, on strategy, sharing and highlighting the way in which the principles of diversity management are to be applied.

Respondents were then further asked to reflect on *diversity audits*, a process of reading diversity in the company. Although never applied, all three respondents, would find it useful to observe management and members' attitudes on diversity, to analyze organizational culture more pointedly, identifying areas for intervention.

## **5 Conclusions and limitations**

Inclusion and enhancement of diversity are good ethical business practices, even the aviation industry, as seen, can benefit from increasing diversity.

Opportunities for growth abound in the areas of diversity, equity and inclusion. A diverse group of managers and employees can offer the company different perspectives on various areas and create a more inclusive culture and diversity and inclusiveness could also increase customer relations.

As seen, there is still a limited specific literature on civil aviation and diversity management, but, in concrete terms, diversity management policies can manifest themselves in a variety of ways. Of course, we should not assume that there is a

one-size-fits-all strategy: diversity management must be strongly contextualized according to the context of the organization, both from an external and internal factors perspective.

Diversity management activities must therefore integrate diversity ideas and practices into the managerial and learning processes within a company and its work environment.

The use of case studies then showed which diversity factors are most evident in civil aviation in Italy.

While the research shows some limitations, and as future areas of research it would be interesting to broaden the focus to other international realities, it is interesting to note that principally elements of diversity relate to gender, age and cultural differences.

Although the figure of the diversity manager does not exist yet in the reality investigated. At the human resource management level, these professional figures know the importance of this aspect of management, understanding its areas of intervention and possible benefits.

In fact, the people interviewed are aware of how inclusion passes through enabling group members to be and do together, working on concrete answers to real problems, inventing and discovering solutions that become object and experience of learning.

Interventions on diversity develop through organizational culture. It is precisely in the processes of group composition, enhancement of singularities and connection, that the company can act those criteria of inclusion (or exclusion) that substantiate its culture and constitute fundamental opportunities to act in daily practice the processes of breaking down physical, architectural, social and cultural barriers (Christian et al., 2006; James, 2004)

Above all, organizational change, like any change, needs for its success a plan of action, a medium- to long-term vision, a design that allows, day by day, to guide and indicate the actions capable of sustaining and strengthening it (Esty et al., 2000; Kollen, 2019).

If, therefore, we want to effectively change the organizational sphere and with it the cultural progress of which diversity management is both the origin and the result, it is essential that this process involves all company personnel and be pervasive in organizational practices and values, be based on practices and processes that support it, and be carried out through concrete, visible and collectively participated actions (Lorbiecki, Jack, 2000).

### **Abstract**

Defining the pillars of sustainable development, the 2030 Agenda recalls inequality and valuing diversity as an asset. Diversity management can be defined as a managerial approach pursuing an active and conscious development of a forward-looking, value-oriented strategic and communicative managerial process of accepting differences and using some differences and similarities as a potential of the organization, a process that creates added value to the enterprise. However, a lack of literature emerges regarding the studies on “behind the line” themes, which represent the key factors for the companies operating into the audiovisual industry. Especially, one of these regards soft power meaning the use and persuasion to change minds and influence behavior. In this stream fits in the present research aiming to analyse how women’s leadership can support audiovisual companies in reaching sustainable development.

Qualitative face to face surveys methodology supports the paper, analysing 16 in-depth interviews. The interviews were conducted mainly with key figures of several audiovisual companies such as TV producers, production managers, directors of public and private TV networks, and heads of audiovisive archives.

The positive role of female leadership in the audiovisual industry is confirmed. From executive appointments to new recognition paradigms, inclusion is on the 2022 agenda of the audiovisual world. A growing presence of roles and productions of female filmmakers is confirmed, although the gap between men and women is still very wide. Several insights

emerge from the study of soft power topics, linking them directly to themes like training, innovation, responsibility, and change that emerge from the interviews.

The present study has several theoretical and practical implications. From theoretical perspective, it enriches the literature on gender study fields. Also, several aspects of the company's sustainable development and diversity management have been treated. From practical perspective, the present research points out the main features in terms of soft skills that female leadership must fulfil in order to achieve sustainable development for the company.

The main limitation of the research could be recognised to the number of interviews conducted. The future lines of research aim to expand the survey, also considering international entities. This perspective will help the authors in identifying the main characteristics of women managers that could allow the audiovisual companies in reaching the best outcome format for the market. Moreover, extending the analysis could promote the generalisation of the main findings of the research.

**Keywords** – women, leadership, diversity management in audio-visual companies, soft power, sustainability

**Paper type** – Academic Research Paper

## 1 Introduction

Women-led powers in audiovisual companies are increasingly making their mark in the industry. Recent data (Brand Finance, 2021) confirms that companies aiming to better manage their international brands must strategically bid on young people and women leaders.

Women leaders bring a unique perspective to the table, which can lead to more diverse and inclusive storytelling and content creation. They can also challenge traditional gender roles and stereotypes in the industry, paving the way for more opportunities for women and other underrepresented groups (Liddy and O'Brien, 2021). Additionally, women leaders can bring a fresh approach to business strategies and decision-making, which can improve the overall performance and success of audiovisual companies (Andersen and Jensen, 2014; Blass et al., 2022). Some examples of successful women-led audiovisual companies include Reese Witherspoon's Hello Sunshine, Ava DuVernay's ARRAY, and Shonda Rhimes' Shondaland. As the industry continues to evolve, women-led powers in audiovisual companies will undoubtedly play a significant role in shaping its future. The topics discussed, fall into the diversity management stream, which could be summarized as an active and conscious development of a forward-looking, value-oriented strategic and communicative managerial process of accepting differences and using some differences and similarities as a potential

of the organisation, a process that creates added value to the enterprise (Keil et al., 2007; Marr and Schiuma, 2001; Davenport and Prusak, 1998; Barney, 1991). Reaching active and conscious development accepting differences, hence, assumes to pursue development inspired by the principles of sustainability, not surprisingly, diversity management issues are among the topics of goal 5 of the sustainable development goals (SDGs) issued by the United-Nations (Paoloni et al., 2023a; Dello Strologo et al., 2022).

Diversity management and sustainability are two interconnected concepts that are essential for organizations to thrive in the long run (Paoloni et al. 2023b). Diversity management involves creating an inclusive workplace culture that values and respects individuals from diverse backgrounds, including different races, genders, ethnicities, religions, sexual orientations, and abilities. On the other hand, sustainability focuses on balancing economic, social, and environmental factors to meet the needs of the present without compromising the ability of future generations to meet their own needs (Elkington, 1998; Alhaaddi, 2015; Dal Mas and Paoloni, 2020). By embracing diversity and inclusion, organizations can tap into a wider pool of talent, ideas, and perspectives, which can lead to better decision-making, innovation, and creativity.

From what is written, sustainability is becoming an increasingly important consideration for audiovisual companies. As the world becomes more aware of the environmental impact of human activities, there is a growing expectation for businesses to operate in a sustainable manner. Audiovisual companies can contribute to sustainability in several ways. For instance, it can incorporate sustainability into their content by promoting environmentally responsible behaviors and raising awareness about sustainability issues (Lupu et al., 2023).

They can use energy-efficient equipment and lighting, minimize waste and recycle materials, and reduce carbon emissions from transportation and production processes. Also, by embracing sustainability, audiovisual companies can not only reduce their environmental footprint but also enhance their reputation, attract environmentally conscious customers, and create a positive impact on society. Therefore, for this kind of companies become crucial to prioritize sustainability in their operations and content creation to contribute to a sustainable future. By adopting sustainable practices, organizations can reduce their environmental footprint, improve their reputation, and contribute to the well-being of their stakeholders and society as a whole.

Hence, diversity management and sustainability are not only the right things to do, but they can also be a source of competitive advantage and long-term

success for organizations. In this direction, according to Global Soft Power Index, which highlights how the companies aiming to manage their international brands better, audiovisual companies must strategically invest in young people and women leaders, crucial during pandemic periods (Rumi, 2020). Although the gender gap is still very wide in the entire creative and cultural sector, something is changing throughout the Italian audiovisual world.

Fostering this recognition, as in the whole European context, are organizations and associations committed to enhancing the female presence in all-around entertainment, such as the Italian division of WIFTM (Women in Film, Television and Media).

However, a lack of literature emerges regarding the studies on “behind the line” themes, which represent the key factors for this industry. Specifically, one of these regards soft power, i.e., the use and persuasion to change minds and influence behaviour. Its main sources include culture, political values, and positive global engagement.

In this stream fits in the present work aiming to define the possible identikit of women managers in the audiovisual industries and the contribution they make to improving the positioning of Italian audiovisual production in national and international markets. Particularly, the present study investigates on *how women’s leadership can support audio-visual companies in reaching sustainable development (RQ1)?*

To reach the declared goal, a qualitative methodology using a face-to-face survey analysis based on 16 in-depth interviews supports the paper. The interviews were conducted mainly with companies’ key figures/role, such as TV producers, production managers, directors of public and private TV networks, heads of audiovisual archives.

The analysis reveals the importance of supporting talented women emerging around the world, also confirming the persistence of an education gap between men and women. It is extremely important to provide support with the training and job opportunities needed to give audiovisual women a voice. This needs for support come from a shortage of soft skills, capable of creating more inclusive opportunities for all in a strategic sector, and of powerfully influencing imaginations.

The originality of this study can be observed from a theoretical and a practical perspective. From the theoretical perspective, the present research contributes into gender studies literature, deeping to the topic of diversity management and sustainability. From the practical perspective, the originality of the paper can be

can be linked to the usefulness that the contribution provides in describing the needs of a specific sector such as audiovisual, highlighting the ongoing presence of gender gaps.

The main limitation of the study could be recognised to the number of observations. In fact, in the future, authors will be implementing the research with new interviews in order to try to be able to generalize the results obtained. In addition, future works will be directed toward expanding the survey to international audiovisual content as well.

This work is organized as follows. Section 2 proposes an insight into the main literature strands; section 3 describes the methodology, while section 4 presents the results from the interviews. Section 5 provides concluding remarks and summarizes the main implications of the work. The final section (6) details the research limitations and future direction.

## **2 Literature review - From gender gap to diversity management: inclusion as a new audio-visual paradigm**

The present section investigates the progressive affirmation of inclusion as a new paradigm in the audiovisual sector, starting with prestigious studies highlighting the increasingly close relationship between women and Soft Power (Brand Finance, 2021). In international relations since the 1980s, the term "soft power" describes the ability of a political power to influence through intangible resources such as culture, values, and politics. However, over time the concept has progressively taken on a strategic dimension to describe and understand a country's ability to exert influence and improve its international image. An image that no longer depends as much or only on the exercise of Hard Power and the consequent costly search for new protection systems, linked to a coercive capacity resulting from a nation's military and economic strength, but on the exercise of a new power, "the other side of power" (Nye, 2004, 2009).

Indeed, these studies indicate that governments intent on improving their international brand management and influence in terms of soft power must strategically focus on young people (especially millennials), considered the most receptive target to nation-branding. However, the focus should also be on female leadership, capable of generating governance practices oriented by a shared public agenda capable of ensuring resilient transformation.

The female leadership, supported with conviction by the UN 2030 Agenda, which already identified gender equality and women's self-determination as an unavoidable stage in the realisation of a new development model (Paoloni et al.,

2023a; Dello Strologo et al., 2022) aimed at integrating the social, cultural, political, economic, and environmental dimensions, is confirmed by the analysis of the political framework called upon to manage the emergency dictated by Covid-19. Adopting a gender-sensitive perspective, even in interpreting the dynamics that most characterised the pandemic period (Rumi, 2020), is a courageous but decisive choice to examine and fully understand the social transformations underway (Zemon Davis, 1976; Touraine, 2006).

It is no coincidence that the states that responded most efficiently to the pandemic had female heads of state (Wittenberg-Cox, 2020), showing an alternative way of exercising power and giving rise to examples of true female leadership in the management of an unprecedented crisis. Women leaders who distinguished themselves in managing the pandemic with humanity and the ability to generate a transversal consensus among the population were *"more respectful of limits, more attentive to rights, more cooperative, capable of reassuring, less aggressive, less prone to boasting, reluctant to go the extra mile, but capable of throwing their heart over the obstacle"* (Soave, 2020).

While it is well known that women leaders have managed the pandemic far more effectively and consistently than their male counterparts, it is not as well known that female leadership has performed better in all the metrics examined to draw up the Global Soft Power Index, and in particular in those that best enable the maintenance of long-term achievements (such as governance or international relations). These are key prerequisites for a nation to thrive in an uncertain and volatile environment, called upon to capitalise on the knowledge gained, especially in terms of soft power, for the design and implementation of effective recovery strategies.

Despite several studies<sup>1</sup> that have long shown that more women at the top of companies equals greater profitability and better management, "diversity" still struggles, regardless of sector, to become a strategic element in running companies. Moreover, this awareness struggles to permeate even in the cultural and creative industries, which, although often seen as "cool" and egalitarian (Gill, 2002), are still characterised by serious gender inequalities (Conor et al., 2015; Barca, 2018).

---

<sup>1</sup>Among them the Report of the International Labour Organization (ILO, 2019), which shows how the companies with a good level of gender equality in the workforce and in top positions achieve, in addition to better profitability and labor productivity, a general improvement in business of enterprise. In fact, the study highlights how female leadership leads to a greater ability to attract and retain talent, higher levels of innovation, an improvement in corporate reputation, a better ability to evaluate consumer interests.

An analysis of the most recent data from the Internet Movie Database (IMDBb)<sup>2</sup> shows that, in the audiovisual industry, women account for no more than 34% of the total workforce. This gender gap testifies to the persistent presence of an “inequality regime” (Acker, 2006), embedded in organisational structures, which is strongly influenced by the role expectations imposed by the creative and cultural sector and, more generally, by society. The interaction of such expectations with the sector’s working practices thus produces and reinforces specific gender roles and professions, which inevitably affect access to resources and the relevant market (EENCA, 2020) (Figure 1).

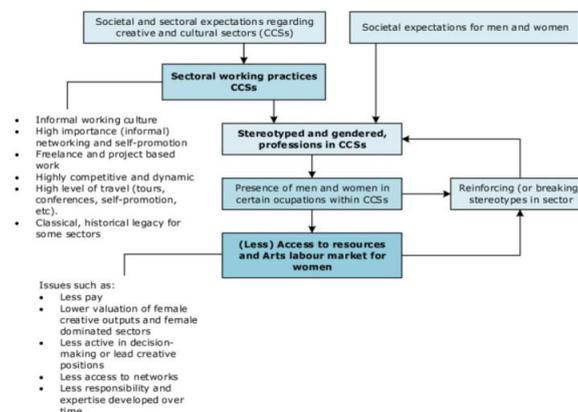

Figure 1: Gender gaps in the Cultural and Creative Sectors: The Audiovisual Sector  
Source: EENCA (European Expert Network on Culture and Audiovisual), 2020.

This is a dense network of gender stereotypes and prejudices that contributes to creating segregation of a horizontal nature, confining women within specific fields in which they are believed to best express the skills attributed to them (Hesmondhalgh and Baker, 2015), and of a vertical nature, leading women to occupy top positions less often than men, as shown by the latest research published by the European Audiovisual Observatory (2022) (Figure 2).

<sup>2</sup> This is the largest and most internationally accredited archive for collecting information in relation to films, actors, directors, production personnel and television programs (as well as video games, video clips and TV commercials), which, starting from 2017, has equipped with a new classification (F rating) aimed at grouping films that are written or directed by women, or in which women are protagonists or really relevant in the plot.

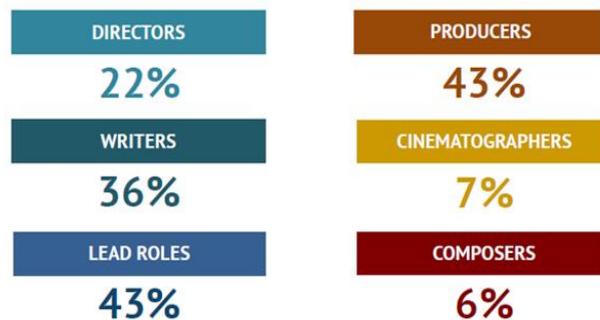

Figure 2: Women represented among active professionals of European TV works 2021  
 Source: European Audiovisual Observatory/LUMIERE, Plurimedia, 2022.

The same trends emerge from the analysis of the Eurimages document on gender equality (Gender Equality Strategy 2021-2023), which underlines how, despite the efforts made by Member States, including Italy, the gender gap in audiovisual production is still significant. This has required the introduction of more drastic and incisive interventions, unbalanced in favour of *female-driven* projects, encouraging greater female participation in both creative and technical roles and supporting initiatives that upgrade the entire audiovisual sector.

These and other incentives have undoubtedly contributed in recent years to a general improvement of the situation in the sector: from managerial appointments to new recognition paradigms, inclusion is progressively making its way onto the agenda of the audiovisual world, together with a more consistent enhancement of women as managerial figures (Giancipoli, 2022). The number of female-led or predominantly female-led initiatives in our country grew in 2021 (by 19%), as did the number of female directors under 35 (an increase of 6 percentage points compared to 2020). Alongside these positive trends, there is also the share of women involved in screenwriting and editing, which stands at 30% and 28%, respectively, with an overall growth of 4% compared to the previous year (MIC, 2021). As Marta Donzelli, president of the Centro Sperimentale di Cinematografia, emphasises –*“the critical core of the issue is that of decision-making processes: where gender parity is achieved in top positions, the climate changes and the balance shifts, not because women choose women but because the diversity that opens up difference is brought into play, producing different decisions”* (MIC, 2022).

This new awareness is making its way through the entire supply chain of the audiovisual world, also thanks to organisations and associations committed to enhancing the female presence in the audiovisual sector, including the Italian

division of WIFTM (Women in Film, Television and Media). As Domizia De Rosa, President of WIFTM, pointed out, it is indeed necessary to extend the count of creative roles also to a statistic of managerial roles to allow a broader understanding of the participation of female professionals: producers, managers, presidents or CEO's who are an integral part of the design and entrepreneurial development of productions.

### **3 Methodology**

The present paper is supported by a face-to-face survey qualitative methodology. The qualitative survey research method fits in the main five qualitative research described by Creswell, 1998 as: biography, phenomenology, grounded theory (Glaser and Strauss, 1967), ethnography and case study (Yin, 2009). Particularly, qualitative survey analyses are inductive indeed, and it is, first of all, a simple research design, not for the study of social structures and processes but for the study of diversity in a population (Jensen, 2010), like the context that authors intend to investigate. In fact, the research aimed to investigate the relationship between women and soft power in the main Italian audiovisual companies through 16 in-depth interviews (Kvale, 1996) with representatives of Italian media companies<sup>3</sup>. The purpose of these interviews was to identify the point of view of female professionals in the audiovisual sector. To obtain an external point of view, male testimonies were also considered. The approach was aimed at capturing their opinions, shaped by the professional role they hold and their personal and professional experiences to understand the extent to which women's social, psychological, cultural, and economic conditions influence organisational and production processes and the quality of the media narratives produced.

It was decided not to dwell on women facing significant job insecurity in the media production system but to focus on overcoming gender inequalities by enhancing soft skills. Furthermore, the choice of interviewees, both women and men who hold significant positions in the media companies analysed, was also geared towards favouring a project approach and emphasising the added value of women's presence in television productions regarding soft power.

---

<sup>3</sup> In-depth interviews took place between December 2020 and December 2021. The interviewees belong to the following media companies: RAI, Mediaset, Fascino PGT Srl, Aurora Film&Tv, Stand by Me.

#### **4 Results - Enhancing the soft skills of female leadership for a new positioning of the audiovisual sector**

This section is devoted to answering the main research question (RQ1) of the work: how women's leadership can support audiovisual companies in reaching sustainable development?

In light of the interviews, the analysis suggests enhancing the soft skills of female leadership for a new sustainable positioning of the audiovisual sector. Particularly, the research shows how gender still significantly influences the working environment and how being a woman is often perceived as disadvantageous. This can be identified by certain tendencies highlighted by many of the women interviewed, such as the astonishment when a woman is elected to a professional role of great prominence and responsibility or when she is the only woman in work meetings. Furthermore, motherhood continues to be seen as a disadvantage, showing how women's work and relationship needs still represent a site of competitive tension between professional achievements and family roles (Liddy and O'Brien, 2021).

The perspectives of many of the professionals interviewed, therefore, converge in the view that motherhood creates obstacles for working women, that the environment of the Italian audiovisual industries is predominantly male, and that women have had to work much harder than men to establish themselves, earning less on equal terms (World Economic Forum, 2021). However, Italian public service broadcasting has undergone many changes over the last ten years, especially when female managers have stepped in. Annamaria Tarantola's presidency represented a real turning point in this respect, making RAI the first European public service company to have a gender policy.

Along the same lines are other testimonies – also inherent to the commercial networks – which highlight how it is precisely the ability to reconcile domestic life and professional responsibility that characterise Gina Nieri, director of the Board of Directors of Mediaset, defined as a complete person, with an outstanding balance, very authoritative for personal competence, history and professionalism, which she accumulated over the years. In other words, in the opinion of the interviewees, it is the more numerous presences of women in managerial roles and responsibilities that leads to a better understanding of the female condition, improving the quality of life of women involved in the audiovisual production processes and, more generally, favouring a positive change in the organisational climate to the benefit of all.

The need to find a balance between personal and professional spheres is supported across the board by respondents who recognise that, without family support, reconciling professional and personal life, especially in relation to motherhood, would be almost impossible: *"The family network was really very present, and has helped me manage it. Without help, it would not have been possible"*.

A concrete example of the importance attached to the value of empathy, understanding and mutual support can be seen in the case of the managing director of Stand By Me, who is able to convey her own value framework to all the employees of the company and who are called upon to act as bearers of these values. As Stand by Me's chief entertainer reports: *"She entices you, she does not implement any psychological subterfuge to ensure that then your desire to become a mother is curbed by wanting to make a career, and this also becomes a male issue because consequently it also sensitises men"*. Considering motherhood as a human and professional value, focusing on reciprocal support, is useful in companies to create stronger bonds - men also understand, respect, and appreciate the work of mothers, empathising with situations that facilitate differentiated, creative, and inclusive work environments.

A similar situation concerns Fascino PGT Srl. According to the interviewees, its pink imprint derives from the fact that the company was born with Maria De Filippi, who has always been surrounded by female collaborators who have absorbed her approach. Hence the presence of female figures in crucial roles in many of Fascino's programmes, with whom the men are called upon to make the main decisions. This presence fits in well with the characteristics assumed by the current, strongly expanding television offer that has seen the birth of some thematic channels explicitly focused on a female audience. With respect to this offer, the presence of female authors is fundamental to establishing a relationship with the audience marked by empathy, and loyalty, and to guarantee greater involvement. Having women at the top of the company is therefore a huge advantage, as women are distinguished by strong attention to detail and nuance, and a high degree of sensitivity.

The Mediaset interviewees also deal with the theme that women are more sensitive than men due to a greater propensity to listen and to manage several jobs at the same time, even with different criticalities and problems: *"The difference in this exists, without being a feminist. The value of diversity lies in this"*.

The great challenge for many women in the audiovisual sector is to enhance soft skills related to sensitivity, training, collaboration, and responsibility within

predominantly male areas, not only to bridge the gender gap discussed above but to implement a different management approach oriented towards innovation and sustainability. In this perspective, one cannot but agree with the director of RAI Fiction when she states that it is essential for women to deal with the organisation, budget and management of audiovisual industries in order to assert themselves: *"If you do not know the management of an industry, you cannot carry it out, you can also be a very good intellectual, a fine writer, but who makes you enter the real focal points of movements, of organisations, is management"*.

Supporting women audiovisual workers and their empowerment – according to RAI's entertainment day-time director and coordinator of the European "No Women No Panel" campaign<sup>4</sup> – presupposes first and foremost a joint effort, by individuals and institutions, to promote a true gender balance in public contexts and professions. This is because women not only have a high level of education, experience, and competence equal to that of men, but also soft skills capable of creating more inclusive opportunities for all in a strategic sector, capable of powerfully influencing imaginations and, consequently, the positioning of our country on the world stage. Hence the importance of supporting talented women emerging around the world, providing them with the training and job opportunities needed to give them a voice.

## 5 Conclusions

The proposed study starts from the awareness of a lack of literature regarding studies on the "behind-the-line" issues (Couldry, 2003), which represent the key factors for this type of industry (Buonanno, 2008, 2020; Gavrilă, 2014; 2023). Amongst these factors, it is undoubtedly possible to identify Soft Power since the audiovisual sector represents an area in which the industrial and cultural aspects are closely interconnected and the decisions taken at the educational, organisational, and legislative levels have the capacity to decisively influence individual and collective imaginaries.

To understand how these soft skills are managed and what kind of impact they have at the level of diversity management, it is crucial, on the one hand, to consider the relationship between the use of this "soft" power's ability to use persuasion to change minds and influence behavior and which finds its primary

---

<sup>4</sup> The memorandum "No Women No Panel - Without women we don't talk about it" commits the public television company to include female and male presences in the debates as equally as possible. RAI participates in the change of a system of representation of reality and information completely deranged by joining the initiative, started by the European Commission and initially endorsed by Radio RAI Uno, for an equal and balanced gender representation in communication activities.

sources in culture, political values and positive global commitment, and women managers in the audio-visual sector on the other. This is also with a view to promoting a better positioning of Italian audio-visual production in the national and international markets.

Indeed, many studies (Milestone and Meyer, 2012; Hesmondalgh, 2017) have shown that the lack of gender, ethnic, and religious diversity in audiovisual professions leads to offensive and inappropriate narratives and/or a decrease in the amount of representation of these socio-cultural categories. Often the result of stereotypes and inappropriate representations is precisely discrimination against certain social groups, including women, beginning with staff selection practices (Jones et al., 2017). This unbalanced presence of diversity in production environments also has a negative impact on the interpretation of this plurality of identities in media texts (O'Brien et al., 2016; Gavrila and Parziale, 2018).

Starting from the general Italian situation regarding gender inequality, this study points out the extent to which gender influences the career trajectory of audiovisual professionals and the capacity for soft power. Moreover, it offers an insight on how female competence is perceived within media organisations in the Italian context, with particular attention to roles, creativity, and decision-making process. Underlying the need of creating more inclusive opportunities for all in a strategic sector, and powerfully influencing imaginations and the soft-skills.

This study has several theoretical and practical implications. Theoretically, it enriches the literature on gender studies and deals with various aspects of sustainable development and diversity management in the company. From a practical point of view, it highlights the main characteristics of transversal competencies that female leadership must fulfil to achieve sustainable development for the company. In this perspective, the audiovisual sector is a driving factor for narrating positive role models. This starts with specialised training to introduce new professional figures in this field, given how access passes through an imaginary of skills and possibilities. It is, therefore, a matter of adopting a different approach, capable of looking at the different professions operating in the audiovisual sector, including creative and managerial roles.

Finally, using an intersectional lens should be a general key, capable of considering, in addition to gender, the different social identities that systematically contribute to discrimination, hindering the formation of true leadership positions (EENCA, 2020). Hence the need for a set of initiatives (such as the support to *female-driven* projects) that can have a long-term impact, also in terms of diversity and sustainability, through the enhancement of a female Soft

Power, for a new positioning of the Italian audiovisual system, and of our country, on the international scene.

## **6 Limitation and Future research perspective**

The main limitation of the research could be recognised to the number of interviews conducted. In fact, the future lines of research aim to expand the survey, also considering international entities. This perspective will help the authors identify the main characteristics of women managers allowing the audiovisual companies to reach the best outcome format for the market. Moreover, extending the analysis could promote the generalisation of the main findings of the research.

## Abstract

The topics of sustainability and digitalization are increasingly present in contemporary academic, economic and social debates. Both topics are drastically changing the behaviour of companies. This article aims to examine the disclosure of information on digitalization and sustainability in the context of the Integrated Report of European companies. It seeks to understand the extent to which these companies are moving towards a sustainable business model (SBM) that includes new digital technologies. In particular, the analysis started from the systematic literature review proposed by Broccardo et al. (2023) who, in order to investigate the contribution of new technologies to the transformation of companies' SBM, provides a new table of categories started by the Business Model Canvas. Based on this framework, the authors constructed the useful items to develop and test the research objective. For this purpose, the qualitative research method was chosen. In detail, an automatic content analysis was conducted. This work analysed the Integrated Reports

using a sample of 125 European companies in the period 2020-2021. The results showed that companies are increasingly including digitalization and sustainability issues in financial and non-financial reports. However, the financial sector seems to include digitization issues more closely, while the non-financial sector includes sustainability issues. Although studies in this field are increasing considerably, it seems that the academic debate is still in its infancy and that there are not enough empirical studies. To fill this gap, this article can contribute to the existing literature and provide an element of support for academics, companies and standard setters.

**Keywords** – Sustainable Business Model, digitalization, integrated report, disclosure

**Paper type** – Academic Research Paper

## 1 Introduction

The paper aims to investigate the disclosure of information on digitalization and sustainability in relation to the financial and non-financial reports (NFRs) of European companies. The study proposes an analysis to understand whether key issues related to digitalization and sustainability, are disclosed in the Integrated Report of European companies, and if so which ones. The scope is to try to understand the level of migration of these companies towards a Sustainable Business Model (SBM) (Stubbs and Cocklin, 2008; Garetti and Taisch, 2012; Boons and Lüdeke-Freund 2013; Evans et al., 2017) that includes new digital technologies.

New digital technologies, such as the Internet of Things, big data and its analysis, virtual and augmented reality, are revolutionising society today (Acciarini et al., 2021) and radically changing the way companies produce or provide services, facilitating their transition towards sustainability (Bressanelli et al., 2018; Broccardo et al. 2023). In recent years, the issues of sustainability and digitalization have been the biggest and most significant challenges that companies, in particular, are facing. The connection between these two areas shows extraordinary, as yet untapped, opportunities to promote a transformation towards sustainable development (Del Río Castro et al., 2021). Sustainable development (SD) is generally defined as meeting the needs of the present without compromising future generations from an economic, social and ecological perspective (WCED, 1987). The requirement to also implement the social and environmental dimension in the overall 'modus operandi' of companies has resulted in them increasingly moving towards the development of Sustainable Business Models (SBMs). Companies are becoming more aware that the sustainability of their business model (BM) is a key success factor (Acciarini et al.,

2021). Indeed, according to Broccardo et al. (2023:2) SBMs provide a promising theoretical framework for identifying how firms design and implement innovations that lead to further improvements in sustainability performance. In this process, many authors agree on the supporting role that digitalization offers in achieving sustainability goals. For instance, Fernandez-Portillo et al. (2019) emphasised the enabling role of digital paradigms; for Atos (2019:8), digital technology is fundamental to the concept of the circular economy for both mapping, organising, controlling and ensuring consistency throughout the chain, while Andreopoulou (2012) argued the benefits of technology for environmental protection. What is certain is that *'a future without digital technologies is not imaginable, nor is a future in which sustainability discourses disappear'* (Lenz, 2021:190). Although studies concerning the relationship between digitalization and sustainability have increased exponentially, they are still in an embryonic state (Pagoropoulos et al., 2017; Dubey et al., 2019; Lenz, 2021). Specifically, to the best of our knowledge, there are still few research studies that include digitalization and the use of digital tools in the theoretical framework of the sustainable business model (Bressanelli et al., 2018; Tiscini et al., 2020; Acciarini et al., 2021; Broccardo et al., 2023).

The present study applies a qualitative research methodology based on automatic content analysis. The Integrated Reports (IR) published on the websites of European companies inserted in the International Integrated Reporting Council (IIRC) database were analysed, and a qualitative disclosure index about digitalization and sustainability has been developed. Then, this information was compared between different years and sectors to understand the analogies and differences by time and by sector. Moreover, this analysis allows an understanding of the effectiveness of IIRC guidelines in conveying potentially crucial information that can be used to evaluate a business model increasingly oriented towards sustainability concepts and digital transformation. To this end, the authors chose to analyse IR because *"it represents a tool capable of aligning governance aspects with corporate decision-making processes through socio-environmental impact assessments"* (Di Vaio et al., 2021:692). IIRC defines the Integrated Reporting as a document which *"brings together material information on the strategy, governance, performance and perspectives of an organization in a way that reflects the commercial, social and environmental context within which it operates. It provides a clear and concise representation of as an organization creates value, now and in the future"* (IIRC, 2011:2). In addition, according to Di

Vaio et al. (2021:706) the integrated model reaches its maximum expression in the creation of SBM for the creation of long-term value.

The results showed that companies are increasingly including digitalization and sustainability issues in financial and non-financial reports. However, the two themes do not yet appear to overlap and appear to be separate, although with some interconnections. In the sector analysis, the financial sector seems to embrace digitalization topics more, while the non-financial sector embraces sustainability topics.

This research contributes to the growing debate on the relationship between digitalization and sustainability by analysing the role of technologies in the sustainable business model framework. Furthermore, it contributes to filling gaps in the existing literature and aims to increase theoretical knowledge on the link between digitisation and SBM, in order to provide companies with valuable support in their decision-making process through the dissemination of practices and activities in this area in European financial and non-financial companies.

The paper is structured as follows: Section 2 presents the literature review on the relationship between the concept of SBM and digitalization. Section 3 illustrates the methodology and the sample investigated. Section 4 presents the results and conclusions.

## **2 Digitalization in the Sustainable Business Models framework**

Sustainability and digitalization have been the megatrends at the forefront of political, economic, social and academic debate (Lichtenthaler 2021; Broccardo et al., 2023; Holzmann & Gregori 2023). Both trends have strongly influenced companies' behaviour to change progressively their business practices, strategies and processes.

Sustainability is a relatively broad concept and traditionally refers to the triple bottom line of financial, environmental and social outcomes (Elkington, 2018). In light of the Covid-19 emergency, the recent war in Ukraine and the growth of the global economy, all organisations are under increased pressure to take sustainability into account in their business models (BMs). The concept of BM emerged mainly with the advent of the internet in the 1990s (Yip, 2014; Teece, 2010) and academic literature deals extensively with this concept providing numerous definitions (Magretta 2002; Zott and Amit, 2010; Teece 2010; Osterwalder and Pigneur 2005, 2010; Beattie and Smith 2013). Some authors define BM as the logic of "*how an enterprise does business*" (Magretta 2002; Teece 2010). Others, broadly associate the concept of BM with the concept of value

creation (Richardson 2008; Osterwalder and Pigneur 2010; Lüdeke-Freund, F., 2013; Bocken et al., 2013). Richardson (2008) proposed a framework for BM consisting of three elements: value proposition, value creation and delivery and value capture. These elements are also included in the definition proposed by Bocken et al. (2013). Lüdeke-Freund (2013) suggested a framework composed of four elements: value proposition; supply chain; customer interface; and financial model. Osterwalder and Pigneur (2010) developed the most famous framework, the so-called Business Model Canvas, which contains nine blocks: value proposition, customer segments, customer relationships, channels, key partners, key activities, key resources, cost structure and revenue streams.

The need to integrate sustainability into BMs becomes the biggest challenge for companies and requires a more holistic understanding of the concept of value, which must include the creation of social and environmental value (Schaltegger et al., 2012). To this end, the concept of a sustainable business model (SBM) has emerged (Stubbs and Cocklin, 2008). In recent years, academic interest in SBM has grown rapidly and many authors tried to provide a general definition (Boons and Lüdeke-Freund 2013; Bocken et al. 2014; Schaltegger et al. 2016; Evans et al. 2017). For instance, to Schaltegger et al. (2012:112) SBM *“creates customer and social value by integrating social, environmental, and business activities”*. Geissdoerfer et al. (2018:404) conducted a literature review on this topic and defined SBM as *“business models that incorporate pro-active multi-stakeholder management, the creation of monetary and non-monetary value for a broad range of stakeholders and hold a long-term perspective”*. According to Geissdoerfer et al. (2018:403), the common element of the definitions in the literature is that they see SBMs as a modification of the conventional BM concept. This modification can be translated by adding concepts, principles or objectives that aim at sustainability or integrating sustainability into the value proposition, value creation and delivery activities and/or value capture mechanisms.

In this context, a number of scholars (Joyce et al., 2016; Jones and Upward, 2014; Fichter and Tiermann; 2015) have attempted to adapt the traditional BM Canvas, which is mainly oriented towards economic aspects, to the necessary integration of social and environmental aspects. Joyce et al. (2016) extended the traditional BM Canvas by adding two levels, the environmental and the social layer. In addition to the economic structure of the traditional BM Canvas, the authors proposed two other models of BMs by constructing them from a social and environmental perspective. This innovative approach is called the Triple Layer Business Model Canvas. Cardeal et al. (2020), in the same vein, proposed a new

business model canvas for sustainability (BMCS) and an evaluation method to assess it. The difference between the other models is the tripartition of each of the nine blocks that includes all dimensions of sustainability. Indeed, each element of BM Canvas is translated in an ecological and social point of view. They also validated this model with an industrial case study, which showed significant results although it requires further investigation (Cardeal et al., 2020).

Currently, also the phenomenon of digitalization offers the potential to create new SBMs impacting the overall strategy, choices and actions of firms (Capurro et al., 2023). The author Vial (2020:118) defines digitalization as *"a process that aims to improve an entity by triggering significant changes to its properties through combinations of information, computing, communication and connectivity technologies"*. Verhoef et al. (2021) through their study of the existing literature, divide the digital process into three phases: digitization, digitalization and digital transformation. Digitization expresses the changing of information from analogue to digital format; digitalization refers to the role that digital technologies play or can play within the processes and activities of companies; digital transformation is the most pervasive phase and describes how the whole company, thanks to technology, can move towards new business models. Researchers have focused on studying digital actions in specific disciplines, e.g., banking (Bernini et al., 2021), marketing (Lamberton et al., 2016) or healthcare services (Agarwal et al., 2010).

Nowadays, businesses are realising that sustainability and new digital technologies offer a wide range of possibilities (Capurro et al. 2023). Understanding the increasingly influential role of digitalization in the framework of sustainability is vital (Broccardo et al., 2023:2). However, the role and influence of digitalization in the implementation of SBMs have not yet been studied in detail, despite its growing importance (Dubey et al., 2019; Bressanelli et al., 2018; Nobre and Tavares, 2017; Pagoropoulos et al., 2017).

Indeed, few authors have conducted analyses on SBM in order to analyse the link between sustainability and digitalization. Some studies are industry-specific (Watanabe et al., 2018; Fiorentino et al., 2020), while others have focused on specific digital technologies (Del Mas et al., 2020a; Tiscini et al., 2020; Pizzi et al., 2021). For instance, Di Vaio et al. (2020) analysed the role of artificial intelligence in the implementation of SBM; Del Mas et al. (2020) focused on blockchain technology as a tool to support SBM; Annosi et al. (2020) studied the same relationship in the agricultural sector. Acciarini et al. (2022) through the analysis

of the automotive sector, explains the role of digitalization and sustainability in the innovative business model of companies.

Broccardo et al. (2023) through a literature review analysed the link between digitalization and SBM, illustrating the potential impact of digital tools for each element of the model proposed by Osterwalder and Pigneur (2010). Starting from the BM Canvas, the authors identify the elements through which digitalization can influence each SBM block. The blocks most involved in the digital process, leading to the integration of sustainability in the BMs, turn out to be key partner, activities, resources, channels, and customer relationships. The results of this research show that the unanimity of the analysed studies recognises the supporting role that digital technologies play in the implementation of a sustainable business model. In particular, most of them emphasise its enabling role, others the beneficial effect alone. However, although the positive impact that digitization has on sustainability is always emphasised, its negative aspects must also be considered. Some authors mention among negative effects, the degradation of the natural ecosystem, the increase of information asymmetries and digital divides. For instance, Saunila et al. (2019:184) analysed the relationship between smart technologies and corporate sustainability shown that the environmental and social returns from smart technologies are not self-evident, and smart technologies alone are not sufficient to generate environmental and social sustainability.

### **3 Methodology and research design**

To analyse the content of the European companies' IR this study adopts a content analysis method, which is defined as "a research technique for making replicable and valid inferences from texts (or other meaningful matter) to the contexts of their use" (Krippendorff, 2004:16). This tool enables a large amount of information to be collected in a systematic, objective and reliable manner (Guthrie & Parker, 1990; Guthrie et al., 2004). It is required to codify the information to be investigated using predefined categories (Guthrie et al., 2004; Guthrie & Abeysekera, 2006; Cinquini et al., 2012). According to Cho and Hambrick (2006:459), the methods assume that words or phrases "frequently used are cognitively central and reflect what is most on the user's mind". In a similar context, many authors use this method in prior disclosure studies (Hossnofsky & Junge 2019; Bernini et al., 2021). In order to assess the presence of digitisation-related terms within the theoretical framework of the SBM, the analysis was constructed in several steps.

First, to build the dictionary, the framework proposed by Broccardo et al. (2023) has identified the list of the information items about digitalization inserted in SBM's context. Broccardo et al. (2023), through a literature review, identified the new opportunities that digitisation can bring to each SBM block, starting with the nine blocks of the Business Model Canvas proposed by Osterwalder and Pigneur (2010). The elements identified by this work represented for analysis the key elements for the construction of our dictionary, i.e. a list of words associated with a given category. Using this SBM, we grouped such drivers into different nine categories, and nine dictionaries were constructed, one for each block: key partners, key activities, key resources, cost structure, value proposition, customer segments, customer relationships, channels and revenue stream. In total, the final dictionary (see Table 1) contains 722 words, when including all word variations of these keywords.

Table 1 - Information Items about Broccardo et al. (2023)'s framework

Second, has been used companies' IR to apply the dictionary. The authors chose to analyse the Integrated Reports of the selected companies as they provide additional information about corporate strategy, governance and performance, and combine financial and non-financial information in one document (Nicolò et al., 2019; Ciubotariu et al., 2021). The content elements of the IR are fundamentally interconnected and are presented in a way that makes the interconnections between them evident, rather than as isolated, stand-alone sections (Fundation, V. R., 2021). Moreover, one of the elements in the IR Framework is specifically related to the business model's information.

Third, the coding process was performed through automatic content analysis, thanks to a special tool, called Lexos v4.0 2019 Wheaton Lexomics. This automatic method is considered superior because is faster and more consistent than manual techniques in the coding process (Kondracki et al. 2002:226). The Lexos software is a web-based tool which is capable of different types of text analysis and representation and allows us to digitize massive numbers of texts so that they can be understood visually (Peterson 2015:63). The software provided us with the absolute number of words in the dictionaries, which, when compared to the total number of words in the documents, represents an index by which to assess the degree of migration of the business model towards issues such as sustainability and digitalization.

As previously seen in other studies (Tavana et al., 2022; Yang & Deng, 2023), the disclosure index adopted to analyse the frequency of words in the dictionary in the companies' IR, we used the ratio between the frequency of words in the SBM framework provided by Broccardo et al. (2023) in the integrated report and the number of total words.

$$SBM \text{ towards digitalization index} = \frac{\text{Total number of dictionaries' keyword frequencies}}{\text{Total number of word in the IR}}$$

In addition, to further validate our dictionary, we collected the most frequently used words and phrases in the financial and non-financial sectors by year.

### **3.1 Sample**

The empirical analysis of the level of digitalisation disclosure in SBM in Integrated Reporting was conducted on a sample of 161 European companies. These companies were selected from the "Integrated Reporting Examples Database", which aims to provide an online resource for organisations that are developing, or planning to develop, Integrated Reporting. When selecting the companies to be analysed, the focus was on the IR based on the framework which has been designed based on the IIRC or the one within which there are references to it. Only European companies were selected from the database. Therefore, the websites of all 161 companies were analysed. Accordingly, to the aim of this study, we selected just the documents denominated IR and Annual Report published in English and downloaded in pdf extension. Among these, for applying the content analysis, we considered the last IR and Annual Report published by the companies in the two years 2020–2021. Of the 161 European companies selected, only 125 (78%) met the requirements for the analysis: some companies were discarded because they did not submit the report for the selected years, or because the report was in a different language. A total of 250 documents were analysed, of which 125 were for the year 2020 and 125 for the year 2021.

## **4 Results and conclusions**

A first assessment of the results can be conducted with the average values of the word frequencies in each block of the digitalization oriented SBM framework (see Table 2). The average was calculated by considering the word frequency for each block divided by the number of companies in the sample. These values were

reported for both the year 2020 and the year 2021 to capture the possible increase in the use of this terminology over time.

Table 2 – Average value of word’s frequencies

<b>Categories</b>	<b>Averages_2020</b>	<b>Averages_2021</b>
<b>Key partners</b>	30.4	30.5
<b>Key activities</b>	32.5	33.1
<b>Key resource</b>	83.9	87.3
<b>Cost structure</b>	100.0	100.6
<b>Value proposition</b>	37.4	37.5
<b>Customers segments</b>	33.0	32.7
<b>Customer relationship</b>	66.1	65.0
<b>Channels</b>	144.8	144.9
<b>Revenues flow</b>	122.8	124.0
<b>Word Count</b>	721700.1	729943.8

As the above table shows, the categories or blocks with the highest average value are Channels (144.8) and Revenue flow (122.8). How the product or service is delivered to customers is the focus of the channel’s element of the Business Model Canvas (Osterwalder and Pigneur, 2010). Such a result is expected because, from a digital point of view, the use of digital channels and platforms have become indispensable for several types of companies (Broccardo et al., 2023), especially to build safe customer relationships. Moreover, digital platforms bring in new revenue corresponding to additional services, effectively increasing the revenue stream (Broccardo et al., 2023). More specifically, digital technologies could open up new possibilities in logistics and distribution, or be seen as an increasingly important sales channel, but also as a means of supporting the adjustment of cost structures (Capurro et al., 2023). While, contrary to expectations, the category with the lowest average value is that of Key Partners. Key partners are stakeholders who are directly involved in the early stages of the company’s core activity (Cardeal et al., 2020). Digital transformation changed the business processes and the interactions between firms and their external partners (Ashok, 2018) and allow for reaching new investors (Broccardo et al., 2023). In general, these initial results also show a slight increase in the averages from one year to the next. This is probably due to the increasing use of these terminologies in the business environment. However, a lower average is evident in the categories 'Customer segment' and 'Customer relationship'. For instance, in some

companies, it is interesting to note that within the category 'customer relationship', there is a marked decrease in the presence of the words "community\*" or "consumer\*".

Table 3 shows the value of the SBM towards digitalization disclosure index calculated from the frequency of keywords in the Integrated Reporting of the selected companies.

Table 3 - The categories of SBM towards the digitalization disclosure index

X_63	0,63‰	0,651‰			

The disclosure index shows moderate value: in the documents for 2021 only 48 companies show an index higher than 1‰, in 2020 only 44 companies. It is interesting to note that almost 50% of the companies in the sample show an increase in the index from one year to the next.

The frequency of the phrases in the dictionaries used at least once are shown in Figure 1.

The term 'circular economy' is very frequent in the documents analysed. Many authors see this concept as supporting companies in the operation of sustainable developments, also promoted through 'digital' (Bican 2020; Centobelli et al., 2020; Kirchherr et al., 2017). Indeed, other authors highlight the role of digital tools to enable or favour the circular economy by facilitating exchanges among different stakeholders.

The value proposition should define why a customer chooses a company over another and it is characterized by a combination of products and services that create value for a certain type of customer (Osterwalder and Pigneur, 2010:22). Indeed, the term is often found in the IR of companies. As Ashok, (2018:2) unveil digital transformation allows companies to create new value propositions and has changed the way that business is conducted, despite the potential risk. Moreover, digital technology can support firms in their collaboration with stakeholders to increase value co-creation. As a result, new business models can be created which allows for the formation of new business ecosystems with partners and customers. This concept is also supported by Volberda et al. (2021).

Some important considerations emerge from this graph. Firstly, the increase in the use of certain keywords from one year to the next is reconfirmed. Secondly, the dominance of sustainability-related terms such as 'circular economy' and 'sustainable products' is evident. According to Acciarini et al. (2021) the sustainability aspect predominantly emphasizes the opportunity to build a valuable network of stakeholders within the community.

On the other hand, the role of terms related to the concept of digitalization is also of significance. However, the concept of digitalization probably does not refer to the use of specific tools: in fact, we note that the terms 'digital tool', 'smart product' and 'virtual product' are not prevailing in the analysis. The use of digital platforms also seems not to be a popular element in companies' reporting. The link between digitalization and sustainability must be adequately recognized, for companies to fully understand how their BMs can be innovated to increase their value offering to all parties concerned, including society (Acciarini et al., 2021).

Finally, the analysis was also conducted by dividing the companies by sector (see Figure 2 and Figure 3). Out of 125 companies, 22 companies belong to the financial sector and 103 to the non-financial sector. To provide homogeneity in the analysis, the frequency of the number of keywords was divided by the number of companies, resulting in an average score.

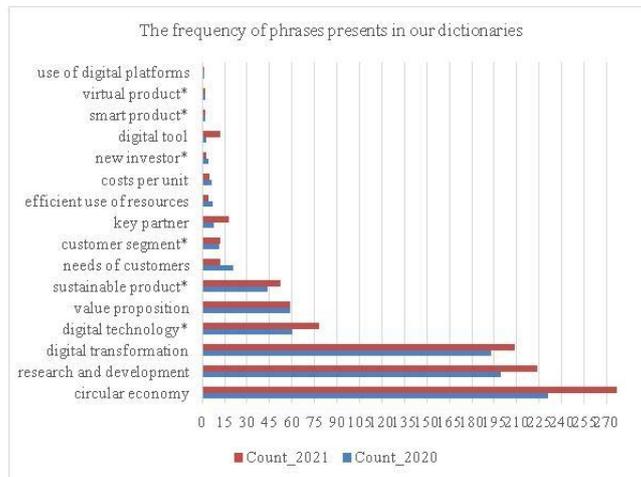

Figure 1 – The frequency of phrases presents in our dictionaries.

It is interesting to note that the words most found in documents differ according to sector. In the financial sector, the first keyword is 'digital transformation', while for the non-financial sector it is 'circular economy'.

This indicates that the financial sector and banks in general, are leaning more towards strengthening their digital transformation, in accordance with Bernini et al., (2021). Starting from this point, Bernini et al. (2021:1230) confirmed the efforts of banks to improve their digital initiatives. Despite this, the authors shed light on the need for greater disclosure to better balance the several types of information provided.

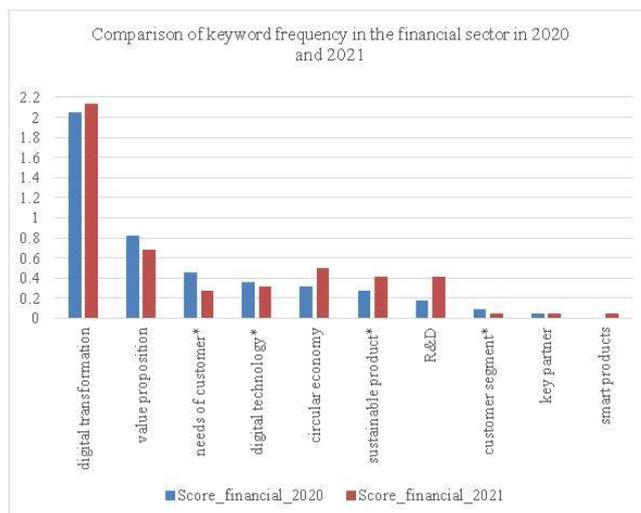

Figure 2 – Comparison of keyword frequency in the financial sector in 2020 and 2021

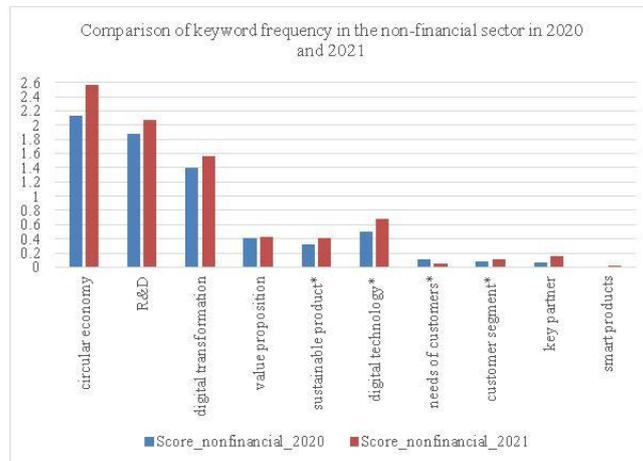

Figure 3 – Comparison of keyword frequency in the non-financial sector in 2020 and 2021

As far as the non-financial sector is concerned, the most frequently used terms are those referring to sustainability, in particular the 'circular economy'. Less attention, on the other hand, is paid to consumer needs and relationships. For instance, according to Bressanelli et al. (2018), companies may improve the design of their products, including through technology, in order to respond more effectively to consumer needs. Zorich (2020:14) states that the lack of digitalization and standardization of companies and business processes are the most critical challenges for Food Supply Chain sustainability, especially in the wholesale and retail segment. However, Capurro et al. (2023), through an analysis of corporate documents and press releases contained in the websites of companies belonging to the food and fashion sector, highlight the importance but above all the pervasiveness of digitalization and sustainability issues. Overall, the analysis shows how companies are increasingly moving to include digitalization and sustainability issues in their financial and non-financial reporting, which is also evidenced by the increase over the years in the frequency of terminology associated with these issues.

This exploratory research contributes to the growing debate on the relationship between digitalization and sustainability and is helpful in filling the gap in the existing literature. By analysing the role of technologies in the framework of the sustainable business model, it aims to increase theoretical knowledge in order to provide companies with a first valuable support in their decision-making process and to understand what their level of digitalization and sustainability is at the current stage.

Furthermore, we would like to acknowledge that the research we conducted was purely exploratory approach and may have some limitations. The first is represented by the sample, which could be extended to the international panorama, including more companies. The second limitation can be recognised in the choice of keywords included in the dictionary, which could be expanded in order to capture as much information as possible.

### **Abstract**

The purpose of the study is to analyze the credibility of non-financial reports of companies belonging to the fashion and luxury sector and to understand the role played by gender equity in the pursuit of sustainability goals.

The pursuit of sustainability by nations and companies is an increasingly discussed topic in the literature and is closely related to the ways in which the activities put in place are not only implemented, but also reported and disclosed.

In this context, sustainability issues are particularly relevant for companies operating in the fashion and luxury sector, where companies belonging to the "Made in Italy" can exploit a competitive advantage. In fact, a number of principles and regulations have emerged aimed at outlining proper reporting and disclosure of non-financial activities, among which those aimed at sustainability have assumed a prevalent role. Some companies, however, take a "check the box" approach with regard to sustainability-related reporting, and this has compromised their reputation, as positive results are extolled and negative ones omitted

Therefore, to achieve this goal, a qualitative content analysis of reports prepared in 2021 by No. 23 companies within the top 100 global luxury brands was conducted.

The qualitative analysis was carried out through a self-constructed credibility index based on Habermas' idealism. Credibility was considered as a construct consisting of: truthfulness, sincerity, and adequacy and comprehensibility. The results show that non-financial reports of companies operating in the fashion and luxury industries tend to have

low credibility. This result contributes to the expansion of empirical research directed at verifying the credibility of communications regarding the pursuit of sustainability goals carried out by companies.

The study also contributes to providing a better understanding on sustainability reporting carried out by companies in the luxury fashion industry by highlighting best practices that other companies can also follow.

**Paper type** – Academic Research Paper

## 1 Introduction

The past decade has seen a significant increase in initiatives to promote responsible behavior, at the level of nations, businesses, and citizens. This process has also involved companies belonging to the luxury sector where customers are increasingly interested in how companies carry out production (Marshall et al., 2016).

In this context, many companies have activated sustainable programs throughout the value chain and, consequently, there has been an intense activity aimed at making timely disclosure regarding sustainable performance within the broader sphere of non-financial reporting (Jestratijevic et al., 2020).

The fashion and luxury industry has also been involved in such reporting practices and in the process aimed at pursuing sustainability (D'Anolfo et al., 2017; Kapferer and Michaut-Denizeau, 2014) as shown in a recent survey (McKinsey, 2022).

This has resulted in companies dedicating specific reports to related sustainability goals (Jestratijevic et al., 2022) and, as a result, several international reporting frameworks have developed over the years, of which the most relevant are the Global Reporting Initiative (GRI) and the International Integrated Reporting Council (IIRC) (Izzo et al., 2020). These frameworks are intended to guide companies in the selection of information to be included in reports.

Corporate reporting can also be influenced by the choices made by companies (Landrum & Ohsowski, 2018), and in this context, environmental and social governance (ESG) factors become a crucial element for stakeholders in assessing corporate performance (Savio et al., 2023).

Therefore, it seems crucial to understand what reporting policies are used by companies and, in particular, those belonging to the fashion industry by placing

special emphasis on the credibility of the information rendered to corporate stakeholders (Li et al., 2014).

In fact, the increase in the number of reports prepared by companies and the amount of information provided has raised questions about the credibility of such disclosure (Chen et al., 2014).

The study, therefore, aims to analyze the disclosure made by companies belonging to the luxury sector in order to understand the level of information conveyed to the market.

Specifically, the study intends to analyze: i) the credibility of the reports prepared by companies belonging to the fashion and luxury sector; ii) the role played by gender partisanship and in particular SDG 5 in the pursuit of sustainability; and iii) the role played by made in Italy in external corporate communication.

Credibility was conceptualized on the basis of Habermas' theory of communicative action (1984, 1987, 1990), which operationalizes it on the basis of three subdimensions: truthfulness, sincerity, appropriateness and comprehensibility.

To achieve the objective of the study, the 2021 sustainability reports of 23 companies belonging to the fashion and luxury industry were analyzed. The results obtained show low credibility of these reports.

The study, which is among the first to investigate the credibility of disclosures made by companies belonging to the fashion and luxury sector, makes contributions to both the literature and practice.

It contributes to the existing literature by providing empirical results on the issue of the credibility of reports made by companies. Second, the results of the study provide suggestions to companies on ways they can use to increase the credibility of their disclosures to stakeholders and, as a result, increase trust between companies and stakeholders.

## **2 Literature review**

Reporting activities carried out by companies are gaining both academic and practical interest in all sectors, including the fashion and luxury industry, for which it has been argued that it possesses characteristics that make companies operating in it inherently sustainable (Garvare & Johansson, 2010).

In what follows, the theoretical background of the research will be outlined with reference to both corporate reporting and critical factors related to the sustainability of enterprises belonging to the fashion and luxury sector.

## **2.1 The implementation of sustainability corporate reporting**

In light of the fact that society is increasing expectations of companies on disclosure beyond financial performance, voluntary disclosure continues to be a growing area of interest for companies (Stuart et al., 2022). In tandem, the accounting literature has also increased the number of studies dealing with corporate CSR disclosure. However, however, the growth of studies have been modest in the area of the quality of disclosure made (Huang & Watson, 2015) and even more so in the area related to the credibility of communications made by companies (Lock & Seele, 2016) for which a high potential for research has been indicated, as it has been recognized that non-financial reports by companies lack credibility (MacLean & Rebernak, 2007).

Since disclosures made by companies on sustainability issues are predominantly voluntary, the research initially analyzed what factors lead to the decision to disclose. The researchers then used different theories to carry out this analysis and found that companies may use disclosure on sustainability issues for self-interested purposes and to satisfy a variety of stakeholders (Stuart et al., 2022). This circumstance raises questions about the credibility of such disclosure (Chen et al., 2014).

The literature in an attempt to increase knowledge on the topic has therefore sought to fill this gap.

Indeed, academics and practitioners have developed some proxies for assessing the quality of CSR carried out by companies. The first measures developed focused on quantitative measures (Shane & Spicer, 1983; Bowman & Haire, 1976). Over time, researchers began to qualitatively analyze the content disclosed by companies (Wiseman, 1982; Luo & Wu, 2019) by first indicating which elements are inconsistent with high-quality non-financial disclosure. Indeed, some authors (Cho et al., 2012; Boiral, 2013) have found that CSR disclosure is often used to obfuscate companies' true performance on sustainability issues.

It therefore becomes crucial to focus not only on what elements can determine quality disclosure, but more importantly what elements can improve the credibility of companies' reports.

## **2.2 Sustainability in the luxury market**

Recent years have seen a radical shift with reference to the sustainable approach of luxury brands (Joy et al., 2012), as companies in this sector realized that it could become a driver of success.

Indeed, companies belonging to the sector have incorporated sustainable actions into their business strategies (Kang & Sung, 2022) and have made specific disclosures to communicate to stakeholders their efforts to integrate sustainable practices (Arrigo, 2018).

Indeed, consumers with high purchasing power have begun to pay more attention to environmental and sustainability issues (Garcia-Torres et al., 2017). As a result, the concept of "sustainable luxury" has emerged and is gaining increasing relevance (Karaosman et al., 2020) and is developing in the literature in three distinct research strands: i) harms, supply chain and communication; ii) CSR issues; and iii) issues related to sustainable activities of luxury producers.

The literature, however, has also noted a possible contradiction between the typical values of luxury businesses that focus on exclusivity and hedonism and those, on the other hand, typical of sustainability aimed at equality and universalism (Torelli et al., 2012; Wong & Dhanesh, 2017).

It is from such possible contradictions that the analysis of how companies belonging to this sector communicate the pursuit of sustainability goals to strengthen their corporate identities becomes relevant (Balmer et al., 2011).

The literature that has focused on analyzing corporate social communication in the luxury and fashion industry has found that excessive communication in this regard can devalue the prestige of brands (Athwal et al., 2019; Janssen et al., 2017). This study-responding to requests for further investigation made by previous literature (Wells et al., 2021; Athwal et al., 2019)-therefore aims to fill an important gap in the literature, namely the empirical analysis of the credibility of sustainability communications of companies belonging to the luxury sector.

## **3 The research framework**

In order to explore the credibility of reports from companies belonging to the luxury sector, consistent with the prevailing literature, a qualitative analysis of secondary data was conducted (Morhardt et al., 2002).

To this end, first, the scope of the research was determined and second, the framework of analysis.

### 3.1 Sample

In order to analyze the credibility of the sustainability reports of companies belonging to the luxury industry, it was first necessary to select the companies to be included in the sample. Consistent with the previous literature, the 2022 ranking of the Global Powers of Luxury Goods conducted by Deloitte (Deloitte, 2022) was analyzed. This document identifies the top 100 companies belonging to the luxury sector globally based on sales in the previous year.

The following criteria were used to define the sample under analysis starting with the companies belonging to the Deloitte ranking: i) companies operating mainly in the fashion field (thus, companies producing jewelry, watches or luggage were excluded); ii) availability of the 2021 sustainability report within the company websites.

The application of the described criteria led to the definition of a sample of No. 23 companies (Table 1). A preliminary observation of the sample shows that two continents, Europe and North America, are exclusively represented. Specifically, 19 European companies are included in the sample, with a predominance of Italian companies constituting 42 percent of the sample (No. 10 companies).

Table 1: The sample analyzed

Name of company	Country of origin	Zone	Selection of luxury brands	FY2021 Total revenue (US\$M)
Acne Studios Holding AB	Sweden	Europe	Acne Studios	278
Aeffe SpA	Italy	Europe	Moschino, Pollini, Alberta Ferretti,	394
Aritzia Inc.	Canada	(North) America	Wilfred, Babaton, TNA	643

Salvatore Ferragamo SpA	Italy	Europe	Salvatore Ferragamo	1342
Tapestry, Inc.	United States	(North) America	Coach, Kate Spade, Stuart Weitzman	5746
TFG Brands (London) Limited	United Kingdom	Europe	Hobbs, Whistles, Phase Eight	256
TOD'S SpA	Italy	Europe	Tod's, Roger Vivier, Hogan, Fay	1064

### **3.2 The Research Framework**

To analyze the credibility of sustainability reports of companies belonging to the luxury sector, the authors referred to the framework used by Mazzotta et al. (2020), who based on the theory of material legitimacy as defined by Dumay et al. (2015) and Habermas' (1984) theory of communicative action, identified what requirements make rational communication possible. These requirements are truthfulness, sincerity, intelligibility, and appropriateness and were declined based on the findings of previous literature as represented in Table 2.

Table 2: The framework

DIMENSION	SUB-DIMENSION	ITEM	MEASURE	RATING	REFERENCES
Truth	Assurance	Type of assurance	Accountant, non-accountant	0/1	Lock & Seele, 2016; Simnett et al., 2009; Reynolds & Youthas, 2008;
		Extent of assurance	Entire report, specific section/not specified	0/1	
		Level of Assurance	Limited, reasonable	0/1	
	Report's features	Standard application level	GRI referenced: in accordance (core), in accordance (comprehensive)	0/2	Lock & Seele, 2016
		Length of the report	Normalized length	0/1	Beretta & Bozzolan, 2008; Gray et al., 1995;
		Location of the report	Annual report/integrated report, autonomous document	0/1	Mazzotta, 2020
	Accuracy	Methodology	Section on methodology (yes/no)	0/1	Reynolds & Youthas, 2008
		Data measurement	Info on data measurement (yes/no)	0/1	
Sincerity	Materiality	Materiality matrix	Existence of a materiality matrix, updating of the materiality matrix, ratifying of the materiality matrix by the Board of Directors	0/1	Amelio et al., 2018; Michelon et al., 2015; Hahn & Kühnen, 2013;
	Stakeholders' relationship	Stakeholder mapping	Stakeholder description (yes/no)	0/1	Searcy & Buslovich, 2014
		Stakeholder dialogue	Section on stakeholder dialogue (yes/no)	0/1	
		Stakeholder engagement	Section on stakeholder engagement (yes/no)	0/1	

	Sustainability governance	Sustainability committee	yes/not (if yes, autonomous or inside an existing committee)	0/2	Amelio et al., 2018
	Sustainable Development Goals	Reference to SDGs	yes/not (if yes, autonomous or inside an existing committee)	0/1	Izzo et al., 2020; Amelio et al., 2018
Appropriateness and understandability	Readability		Normalized Gulp index	0/1	Reynolds & Youthas, 2008
	Communication		The use of visual tools	0/1	Helfaya et al., 2019

Therefore, having defined the sample the data were extracted from the company documents available on the websites of the sample constituent companies (Hahn and Leulfs, 2014; Dilling, 2010). Once the company reports were downloaded, the authors performed a content analysis (Krippendorff, 2004) that was conducted manually by the authors.

To improve the reliability and replicability of the analyses performed, the authors firstly defined the research framework punctually (Duriau et al., 2007). All documents from the sample firms were examined on the basis of a framework in which a value of 1 was assigned in case the element under investigation was detected and 0 otherwise (Hahn and Leulfs, 2014).

In addition, the authors used inter-coder reliability, which ensures the reliability of the classification procedure (Savio et al., 2023). This model considers the classification valid only if the result arrived at is the same for different coders (Weber, 1990).

The first of the variables analyzed is the truth dimension for which the literature has indicated that it has a positive impact on the credibility of communications made by companies (Simnett et al, 2009). The truth dimension has been divided into type, extent, and level of assurance (Lock & Seele, 2016; Reynolds & Youthas, 2008).

The second dimension of credibility, truthfulness, has been divided into four sub-dimensions: materiality, stakeholder relations, sustainability governance committee, and Sustainable Development Goals (SDGs).

The last dimension of credibility, composed of adequacy and understandability, was broken down into readability and communication.

The sum of the dimensions of the credibility construct return the credibility index, a semi-objective index that can take a value between 0 and 20.

#### **4 Results, discussions, and conclusions**

The study analyzes sustainability communications made by companies belonging to the fashion and luxury industry in reports published on their respective websites. The analysis was aimed at checking the credibility of such communications.

To achieve the research objective, the authors conducted a content analysis of the reports prepared by the companies in the sample. In particular, a research framework derived from Habermas' theory of communicative action was used, consistent with previous studies. The determined framework of analysis allowed the determination of a semi-objective credibility index that considers the dimensions of truthfulness, sincerity and comprehensibility. These dimensions were in turn subdivided into sub-dimensions and, subsequently, into items. The subdivision made was based on literature that identified communication items that have a positive association with credibility.

The study, to the best of the authors' knowledge, was the first to analyze the credibility of companies belonging to the fashion and luxury industry for which sustainability issues play a strategic role.

The results, shown in Image 1, highlight that the disclosures made by companies belonging to the luxury sector tend to be truthful, but not very credible, with most of the companies being in the medium to low sincerity range of the credibility matrix. This result is believed to be inconsistent with the maturity of the companies in the sample in disclosing social issues and with the results of studies investigating the quality of non-financial information (Lock & Seele, 2016). The results show that companies belonging to luxury and fashion did not pay much attention to strengthening confidence in the credibility of their NFIs. Moreover, the use in some cases of standards such as GRI, recalled by 60 percent of the companies in the sample, can only be done to check a compliance box and not to change the activities performed and/or the impact on the environment (La Torre et al., 2018).

In addition, the analysis of the SDGs showed that less than half of the companies in the sample reported gender equality as one of the goals pursued, for which the literature has shown that it represents the goal that should be prioritized in the expected pursuit that allows for improved performance even in the high SDGs (Dello Strologo et al., 2022; 2023).

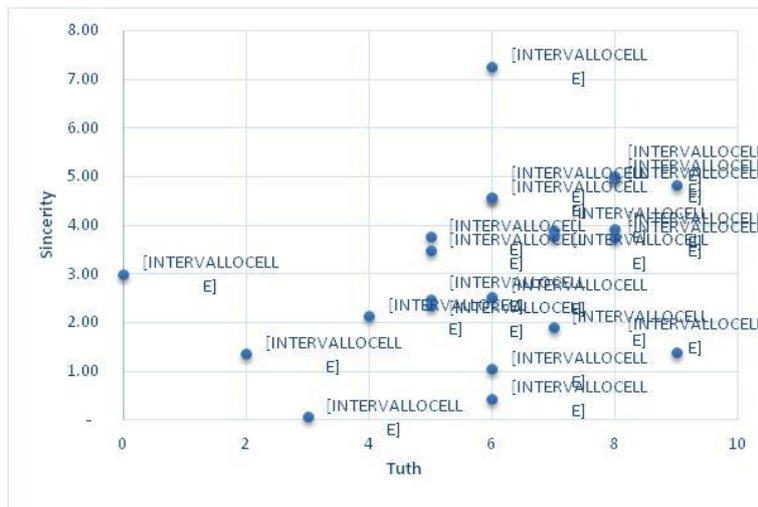

Image 1: The results

Despite the relevance of the results obtained through the present study, it is believed that this study is not without its limitations. First, the study analyzes reports from only No. 23 enterprises belonging to the fashion and luxury sector, and therefore, the results achieved may not be generalized to other enterprises. Future research could therefore expand the sample both to include more enterprises belonging to the same sector and to analyze different sectors. A second limitation of the study is that it focused on only one year, 2021, but that takes into account problems arising from Covid-19.

A possible future line of research could therefore carry out the analysis over a longer period of time in order to also compare the performance of the credibility index over time.

Despite the limitations, it is believed that the study may have both implications for the literature and for managers. The results highlight that companies operating in the fashion and luxury industries should seek to make their sustainability communications credible by increasing their levels of truth and sincerity.

At the managerial level, the results make it possible to highlight the parameters for improving the sincerity of communications related to sustainability actions carried out by companies and to draw the line to follow in writing and reading/understanding non-financial communications issued by companies.

### Abstract

This paper aims to analyse how an innovative financial tool for female-led Small and Medium-sized Enterprises (SMEs) can contribute to the development and sustainability of these businesses. Women's enterprises can only reach high levels of indebtedness if there are equally high personal guarantees. Women's enterprises have always been distinguished from men's enterprises by simpler financial management, mainly related to the control of internal sources of finance, such as treasury and equity of the female entrepreneur, and only residually of external sources by way of debt capital. The development of sustainable finance in recent years has opened up the use of capital to the explicit aim of reducing the gender gap. In this context, Gender Bonds (GB) seem to be the most viable solution to solve this issue and, at the same time, meet today's sustainable development challenge. In this way, the present paper aims to answer the following RQ.

*RQ1: what is a Gender Bond and what are its characteristics in term of sustainability?*

*RQ2: what economic and financial benefits can a GB bring to women's enterprises?*

The present work is supported by an exploratory descriptive qualitative (EDQ) research. As above, EDQ conducted by document analysis represents the first step in developing grounded theory (GT).

This paper aims to expand the literature on the topic of sustainable financial tools for woman enterprises, with a special focus on the gender bond. This study therefore highlights how all those new financial tools, such as gender bond, succeed in improving the economic results of woman companies. It also highlights how the use of gender bond can allow to woman enterprises to improve their financial structure.

**Keywords** – gender bond, sustainability, innovative finance, gender, SME

**Nature of proposed paper** - Academic Research Paper

## 1 Introduction

Recent studies have shown a positive correlation between global economic development and the presence of women entrepreneurs (Mustapha, 2016; Ramadani et al., 2015; Sowmya et al., 2010). Despite progress in integrating women into the workforce, they still face significant challenges in maintaining a work-life balance. Previous studies have shown that women experience social, cultural, and economic discrimination, which has resulted in an entrepreneurial gender gap (Dal Mas and Paoloni, 2019). This gap is characterised by a low number of female-led enterprises and structural limitations that affect their competitiveness. The root cause of this gap is often attributed to an educational gap that impacts women's entrepreneurial intentions and performance (Modaffari and Manzo, 2022; Paoloni, 2021). Although gender inequality is gradually decreasing, in many countries, even among the seemingly more developed ones, there are still many difficulties for women and, in general, there is a pervasive and stubborn mentality that pays little attention to the issue (United Nations, 2021) that does not allow SDG 5 to progress appreciably and, logically, to meet the deadlines dictated by the Plan in the scarce decade that remains (Thil et al., 2021). In finance, these issues are also beginning to be the subject of interest by investors, as it pays to finance actions to eliminate the gender gap or, at least, to manage it.

The development of sustainable finance in recent years has opened up the use of capital to the explicit aim of reducing the gender gap. In this context, Gender Bonds (GB) seem to be the most viable solution to solve this issue and, at the same time, meet today's sustainable development challenge. In this way, the present paper aims to answer the following RQ.

*RQ1: what is a Gender Bond and what are its characteristics in term of sustainability?*

*RQ2: what economic and financial benefits can a GB bring to women's enterprises?*

The present work is supported by an exploratory descriptive qualitative (EDQ) research. Exploratory research can be defined in several ways, but from a

comprehensive perspective it consists of an attempt to explore something new and interesting, by working your way through a research topic. To reach the declared goal, in the present paper EDQ methodology has been conducted by the document analysis (Bowen, 2009). This method concerns to a systematic procedure for reviewing or evaluating documents, allowing researchers to develop empirical knowledge on the topic analysed (Corbin and Strauss, 2008; Rapley, 2007).

From the document analysed emerges that the Gender Bond is a type of bond whose objective is to support entrepreneurial companies managed by women in order to reduce the Gender Pay Gap and to search for new financial sources to support women's business. Aiming at achieving gender equality and women's empowerment through financing projects and economic activities, gender bonds encourage behaviour and corporate policies in line with Goal 5 of the SDGs. They can be used to improve gender equality in many areas of the enterprises like in terms of representation of women in leader roles or among the employees and the benefits can be measured through some performance KPI exposed in the Appendix of the present paper (table 1).

This paper aims to expand the literature on the topic of sustainable financial tools for woman enterprises, with a special focus on the gender bond.

## **2 Literature review**

Over time, women's participation increasing in the workforce has led to a growing interest in studying the subject and developing models for these businesses (Paoloni et al., 2021). Since the late 1990s, in Europe and Italy, women-led businesses have been recognised as a key factor in improving the economy, employment, and society.

Recent studies have shown a positive correlation between global economic development and the presence of women entrepreneurs (Mustapha, 2016; Ramadani et al., 2015; Sowmya et al., 2010).

Specifically, the participation of women in economic activities, especially in developing countries, would help to produce employment, welfare and health, reduce poverty, create human resource development and increase the level of education (Neumeyer et al., 2019; Brush and Cooper, 2012). Recent OECD studies, nevertheless, show that if by 2040 female labour participation, especially in the entrepreneurial capacity, were to reach male levels, the Italian labour force would

grow by 7%, and GDP per capita would increase by 1 percentage point per year. In this sense, sustainable finance may represent an interesting challenge.

Despite progress in integrating women into the workforce, they still face significant challenges in maintaining a work-life balance. Previous studies have shown that women experience social, cultural, and economic discrimination, which has resulted in an entrepreneurial gender gap (Dal Mas and Paoloni, 2019). This gap is characterised by a low number of female-led enterprises and structural limitations that affect their competitiveness. The root cause of this gap is often attributed to an educational gap that impacts women's entrepreneurial intentions and performance (Modaffari and Manzo, 2022; Paoloni, 2021).

These have been attributed to differences in human and social capital (Greene, 2000); differences in the degree of risk tolerated and endured (Jianakoplos and Bernasek, 1998); differences in managerial style (Brush, 1992); and the greater sensitivity of women than men in considering all the factors involved, financial and otherwise. Among the typical characteristics of the female personality, we note, first and foremost, risk aversion, which leads women to invest in projects with low-risk profiles and to manage businesses with low rates of debt (Langowitz and Minniti, 2007). This is attributed to their fear of bankruptcy (Carter and Cannon, 1992) and the relative fear arising from the social embarrassment that would eventually result from the failure of their business (Shabbir and Di Gregorio, 1996).

Another factor to consider is the lower negotiating propensity (Amanatullah and Morris, 2010). It has been noted that, in the negotiation stages, women are less inclined to bargain than men, especially to defend their causes and substantiate their arguments. Lastly, women need more self-confidence in the economic-financial sphere and are disinclined to seek start-up capital from credit institutions if they are more likely to use credit granted to them by family and friends (Modaffari and Manzo, 2022). Furthermore, the fact that women generally seek greater flexibility to prioritise home production leads them to move towards industries where entry and capital costs are low and where work-life balance is easily achievable. For this reason, they are mainly concentrated in the service sector, particularly those dedicated to personal care, health and social care, education, retail, catering and clothing.

These elements reinforce investors' propensity to finance business activities that are more profitable and for which the economic returns are higher and less risky, thus more frequently those of men (Brooks et al., 2014).

For all these reasons, female entrepreneurs often struggle to access credit, which threatens their competitiveness (Aernoudt and De San José, 2020; Cotei and Farhat, 2017; Derera et al., 2014). To address these challenges, entrepreneurs can adopt different strategic choices, such as seeking alternative financial sources and microfinance institutions or relying more on family loans (Yazdanfar and Abbasian, 2013).

According to several studies, when women, in the early stage of their business, request venture capital, they receive significantly less funding than their male counterparts, which, in line with international research findings (Roper and Scott, 2009; Fielden et al., 2003), indicate a strong behavioural bias of banks against the former. Suffice it to note that the credit openness towards women, in the case of microcredit, is reversed compared to the traditional trend: according to the Microfinance Barometer report (2019), women, globally, are the predominant beneficiaries of microfinance institutions, accounting for about 80% of microloans.

According to data from the Policy Brief on Women's Entrepreneurship, prepared for the Organisation for Economic Co-operation and Development (OECD), at the European level, on average, men are able to access the financial resources they need to start their own businesses 1.5 times more than women; while, at the national level, this figure is still rising, at 2.3 (Halabisky, 2018)

In Italy, only 29% of female entrepreneurs state that they have no problems in dealing with credit institutions; on the contrary, the remaining part openly states that they encounter the greatest problems with (i.) the conditions of the economic and social context; (ii.) the high guarantees required, regardless of the goodness of the project being assessed and (iii.) discouragement for fear of being rejected. Thus, it follows that the gender variable intersects with others linked to the peculiarities of female feelings and the characteristics of the enterprise and its size (Alesina et al., 2013; Saporito et al., 2013).

However, the problems inherent to women's enterprises and credit institutions must be read according to the broader and more critical meaning of a change in the traditional and pre-existing relationship of esteem between the customer and the bank. With the process of economic globalisation and the opening of financial markets to international competitors, however, the balance of the banking system has been altered.

To support the real economy, banks no longer limit themselves to granting credit and managing customers' assets but structure efficient strategies to foster

the economic growth of the countries where they are located, working alongside companies - the founding fabric of the production system - to support them in the modern markets of the leading sectors and in the most innovative businesses.

This new function reflects the needs of an economic system willing to interact with the surrounding environment that, through open and increasingly digitised platforms, allows constant innovation to satisfy even the most demanding customers.

The functioning of the economic system depends as much on the natural ecosystem as it does on aspects of social equity, such as the distribution of wealth, respect for human rights and freedoms, gender inclusion in economic activities and corporate responsibility (Kobayashi and Fukushima, 2012), which manifest themselves in different forms and degrees according to the territory they belong to and the actors who promote them.

Although gender inequality is gradually decreasing, in many countries, even among the seemingly more developed ones, there are still many difficulties for women and, in general, there is a pervasive and stubborn mentality that pays little attention to the issue (United Nations, 2021) that does not allow SDG 5 to progress appreciably and, logically, to meet the deadlines dictated by the Plan in the scarce decade that remains (Thil et al., 2021).

In relation to the national context, it was observed that, at the end of 2019, the female employment rate had only reached 50 per cent, well below the European average rate (around 63 per cent).

The development of sustainable finance in recent years has opened up the use of capital to the explicit aim of reducing the gender gap. Sustainable finance is about a joined-up approach to the development of financial services that integrate the ESG dimensions across market practices, products and policy frameworks' (Alessi et al., 2022). It represents the set of business strategies and investment choices that, in identifying assets to be promoted, considers ESG aspects according to a holistic approach (Recalcati and Carulli, 2021).

In particular, the advent of sustainable finance in recent years has opened up new avenues for the use of capital, which, among other social issues, include the explicit narrowing of the gender gap.

Given the growing demand for financial instruments that incorporate gender-based factors, such as women's influence and employment, a variety of financial products are now emerging, including bonds, exchange-traded notes (ETNs) and exchange-traded funds (ETFs), certificates of deposit and private equity funds, all

focused on achieving gender equality. In this context Gender Bonds seem to be the most viable solution to solve this issue and, at the same time, meet today's sustainable development. However, to explain in what terms this is true, it is necessary to look at the institutional efforts made in the past to strengthen decision-making independence and stimulate the employment autonomy of women and girls. Gender bonds, on the other hand, could more effectively counteract the unequal treatment experienced by women in the world of work while still offering, to those who intentionally invest in them, a definite commercial advantage commensurate with the natural economic return.

### **3 Design/methodology approach:**

Exploratory Descriptive Qualitative (EDQ) research (Carvalho et al., 2005; Cleff, 2014; Modaffari and della Corte, 2022) supports the paper. EDQ is a qualitative methodology suitable for addressing research objectives that aim to provide a direct description of phenomena (Sandelowski, 2004). Particularly, Caelli et al., 2003 points out that this methodology allows scholars to learn about the involved subjects, their characteristics and the locations of the phenomenon of interest.

Exploratory research can be defined in several ways, but from a comprehensive perspective it consists of an attempt to explore something new and interesting, by working your way through a research topic (Swedberg, 2020). Explorative research can be defined as a method aimed at underlining how a phenomenon is manifested. Explorative research allows researchers to explore an issue with limited coverage, contributing to the development of new knowledge in that area (Glaser and Strauss, 1967; Glaser, 1978). According to Hunter et al. (2019), EDQ methodology was born as a hybrid methodology between the exploratory research proposed by Stebbins (2001) and the descriptive qualitative research promoted by Sandelowski (2004; 2010). Specifically, Stebbins (2001), defines explorative research as the conception of an exploratory project to be developed through research design, data collection, and final report writing.

Sandelowski (2010) emphasizes that qualitative descriptive studies are not intended to rescue poorly or partially conducted research. Rather, they are appropriate when a different, more interpretive qualitative methodology would not have been better suited to the research goals.

To reach the declared goal, in the present paper EDQ methodology has been conducted by the document analysis (Bowen, 2009). This method concerns to a

systematic procedure for reviewing or evaluating documents, allowing researchers to develop empirical knowledge on the topic analysed (Corbin and Strauss, 2008; Rapley, 2007). As above, EDQ conducted by document analysis represents the first step in developing grounded theory (GT) (Glaser and Strauss, 1967; Corbin and Strauss, 1998). According to Glaser and Strauss, 1967 recalling the attention to the usefulness of documents for theory building, *pari passu* document analysis represents the first explanatory step to build a theory on the phenomenon of gender bond and its usefulness in supporting small medium enterprises (SMEs) led by women.

Assuming document analysis as a technique to conduct intensive studies of a single phenomenon, event, organisation, or program (Stake, 1995; Yin, 1994), one of its main goals can be recognized in verifying findings and corroborate evidences from other sources. Therefore, to reach this goal become fundamental the triangulate process between the information. The triangulation allows the researchers to validate the data sources obtained during the study (Angers and Machtmes, 2005; Bowen, 2003).

Regarding the gender bond issue, no relevant literature has been produced by scholars, in fact, advancing a query by keywords on Scopus database at 2023, Apr 04, a solo contribution emerged.

In this way, the authors enrich their data sources by the following authoritative sources, points out by international practitioners and public entities (de la Roza and Romero, 2023; CDP, 2021; IFC, 2021; IISD, 2021; FSD Africa, 2020).

#### **4 Findings and Discussion**

The documents analysed in this paper are institutional documents aimed at defining the gender bond framework in different parts of the world. The information elicited allowed us to answer our two research questions.

From the combined analysis, gender bonds can be traced back to thematic bonds, i.e. bonds whose issuance is aimed at achieving a sustainable purpose and to which Green Bonds, Social Bonds and Sustainability Bonds also belong (IFC, 2021).

There are two approaches to issuing Gender Bonds: i) the use-of-proceeds approach, which requires issuers to use all proceeds of the bond issue to implement the types of projects identified prior to the bond issue; ii) and the performance-based approach, which incorporates quantifiable key performance

indicators to assess and compare impacts, as well as to evaluate improvements in its sustainability performance targets, by a given date (de la Roza and Romero, 2023). Proceeds from the issuance of these different types of bonds must be used to finance or refinance, in whole or in part, new and/or existing Eligible Loans/Projects that fall within the Eligible Categories and meet the Eligibility Criteria (CDP, 2021). Eligible Categories include infrastructure and city development; SMEs and corporate finance; social housing; green energy and environmental sustainability. As to the way the funds are raised, as explained in the document IFC (2021) in Gender Bonds, the cash flows needed by the underwriter to repay the debt granted to it may come (i.) directly from the gender-oriented activities or projects identified for the bond issue or (ii.) from its other business activities, not necessarily linked to the support of women's empowerment. These two different mechanisms correspond to the type of approach adopted for issuing the instrument itself, i.e. the use-of-proceeds approach or the performance-based approach. In the first case, the proceeds of the bond are used to finance activities that have a direct impact on the livelihood and welfare of the female gender, one example being the provision of credit to small and medium-sized enterprises run by women; in the second case, instead, the proceeds obtained constitute a reward for the issuer for the adoption of internal policies rather than for the achievement of performance that benefits women, such as the inclusion of more women on its board.

IFC (2021) defines a framework of corporate areas where gender equality can be pursued through funds raised through gender bonds. For instance, in the area of corporate leadership, gender bonds can be used for the activation of mentoring programmes to strengthen the pipeline of female talent for board and management positions; in the area of workforce representation, they can be used to build awareness and reduce bias, or to implement respectful workplace programs to assess, prevent, and address gender-based violence above and beyond required risk mitigation programs. They can further be used to develop and offer products and services that will disproportionately benefit women, like digital products, childcare facilities, and mobility services, or to build facilities that provide services primarily for women. Concerning the customer experience, they can help upgrade facilities or improve services to increase safety or access for women, including women with disabilities, or to train staff to address unconscious bias and better serve women customers/users' distinct use patterns, needs, and preferences. Gender bond che help offer skill-building, digital literacy, business

development training, and other support that targets or is tailored to the needs of women in the community. Hence, to reply RQ1(*what is a gender bond and what are its characteristics in term of sustainability?*), the Gender Bond is a type of bond whose objective is to support entrepreneurial companies managed by women in order to reduce the Gender Pay Gap and to search for new financial sources to support women's business. Aiming at achieving gender equality and women's empowerment through financing projects and economic activities, gender bonds encourage behaviour and corporate policies in line with Goal 5 of the SDGs. The results have started to point out that the greatest obstacle encountered by women in starting their own businesses and growing them over time has always resided in the difficulty of accessing credit (Brush et al., 2014), mainly due to (i.) a strong tendency to attend marginal and less profitable sectors; (ii.) lower experiential levels and (iii.) less reliable credit scores in the lending process (Alesina et al., 2013; Saporito et al., 2013).

For these reasons, the approach adopted at the institutional level in recent decades has led government bodies to provide more resources to women, in particular by creating the preconditions for easier access to finance and wider knowledge networks as well as by providing training, coaching and mentoring to enrich their entrepreneurial spirit.

*RQ2: what economic and financial benefits can a gender bond bring to women's enterprises?*

IFC (2021) defines a framework of corporate areas in which gender equality can be pursued through funds raised through gender bonds. For instance, in the area of corporate leadership, gender bonds can be used to activate mentoring programs to strengthen the pipeline of female talent for board and management positions; in the context of representation in the workforce, they can be used to build awareness and reduce bias, or to implement respectful workplace programs to assess, prevent, and address gender-based violence above and beyond required risk mitigation programs. They can further be used to develop and offer products and services that will disproportionately benefit women, like digital products, childcare facilities, and mobility services, or to build facilities that provide services primarily for women. Concerning the customer experience, they can help upgrade facilities or improve services to increase safety or access for women, including women with disabilities, or train staff to address unconscious bias and better serve women customers/users' distinct use patterns, needs, and preferences. Gender bonds can help offer skill-building, digital literacy, business

development training, and other support that targets or is tailored to the needs of women in the community. Most important, the framework also define some KPI allowing to identify and measure the economic and financial benefits that women's enterprise can obtain. They are shown in the table 1 in the Appendix.

## **5 Conclusion**

As already outlined, the biggest obstacle encountered by these to start their own business and grow it over time has always been the difficulty in accessing credit (Brush et al., 2014), mainly due to (i.) a solid tendency to attend marginal and less profitable sectors; (ii.) lower experiential levels and (iii.) less reliable credit scores in the lending process (Alesina et al., 2013; Saparito et al., 2013). It turns out that companies with greater gender parity, particularly at higher hierarchical levels, are better managed, more innovative and less inclined to take high risks than companies whose shareholders are predominantly male.

Gender equality is a much-debated topic these days thanks, above all, to the growing activism that has brought much attention to the issues of the Gender Gap and Gender Equality. In finance, these issues are also beginning to be the subject of interest by investors, as it pays to finance actions to eliminate the gender gap or, at least, to manage it.

For years, attempts have been made to solve the problem of access to credit for women's businesses, which are victims of discrimination and limitations by the banks themselves. However, precisely because, as analysed for women's enterprises, bank credit is a difficult instrument to exploit due to the historical vicissitudes that have involved the banking system and due to the lack of trust in these types of enterprises, alternative finance seems to be the optimal solution to the problem and, in particular, Gender Bonds can represent a valid support to the financial function of women's enterprises.

Gender Bonds aim to achieve gender equality and women's empowerment through financing projects and economic activities, encouraging behaviour and corporate policies in line with Goal 5 of the SDGs. Therefore, capital will be allocated based on predictions of the impacts that particular entities will have on women and the internal policies of various institutions regarding gender equality. According to IFC (2021) the gender-related projects that best lend themselves to using bond proceeds are specific training initiatives or funds for customised products and services and improving infrastructure to accommodate women

better. Opportunities to address gender inequalities vary depending on the type of issuer (public or private) and the sector and country of the issuer. Unfortunately, in Italy, issues of Gender Bonds have not yet taken place, and in the rest of the world, issues are scarce compared to the issuance of other types of thematic bonds. This shows how the topic of gender equality, despite being highly topical, has not yet wholly entered investors' minds, as most banks do not consider women-led SMEs as a segment requiring specific programmes and differentiated approaches.

The challenge is to make people understand how these bonds can be of great help for the growth and development of women's businesses and that, beyond government funds and aid provided by the state, a specific instrument to support female entrepreneurship can make a difference in terms of access to credit for women. The benefits deriving from this instrument can be countless, from eliminating the discrimination and limitations that women have faced up to now to enabling them to make investments without sacrificing financial returns, thus facilitating the mobilisation of private investment for sustainable development projects.

This paper aims to expand the literature on sustainable financial tools for women enterprises, focusing on the gender bond. This study, therefore, highlights how all those new financial tools, such as gender bonds, succeed in improving the economic results of woman companies. Furthermore, the analysis of the documents allowed us to study the gender bond phenomenon more closely and to answer our research questions, which constitute a starting point for a more in-depth future analysis aimed at studying more precisely the instrument's characteristics and its effects concerning a specific case study.

### **Abstract**

The cultural landscape of Phlegrean Fields is famous for the variety and value of territory - volcanic and geo-morphological nature, archaeological and historical heritage, naturalistic and high biodiversity, rural areas- that forms the articulation of mutual relations as unique landscape of exceptional value and identity. This landscape has been in continuous evolution over the millennia for different reasons: 1) changes produced by volcanic activity and anthropic impact that it generates; 2) historical processes of settlement, from the Greek and Roman until the periods of depopulation after the fall of the Roman Empire, the reclamation of ninetieth and the industrial settlements of the twentieth century and finally the post II World War urban expansions and deindustrialization; 3) the socio-economic changes interacting with settlement. In this context, the identity of the city of Bacoli territory has acquired a progressive complexity and continuity, despite the current presence of critical elements, its matrix based on the permanence and interweaving of environmental and cultural values remains very strong. Starting from these strengths, the local government works on the KM by minimal sustainable projects that represent important actions to increase the community wellness. Also for the abandoned area of an ex-military site is proposed a green regeneration and reuse.

**Keywords** – Cultural Landscape, Sustainability, Knowledge management, Best practice

## 1 Introduction

The Phlegrean Fields represent one of the regional territories with the highest environmental and historical-archaeological value. The extraordinary volcanic nature of the places has caused the formation of important values: the particular scenic and natural beauty; thermal waters of excellent quality; brackish lakes and lagoons; protected inlets, real natural harbours; the copious presence of tuff and pozzolana, excellent building materials; a fishy sea; a fertile countryside whose most valuable production is represented by the heritage of original vines, unique in the world. These values determined, in the 1950s, the decision to bind for landscape protection purposes the entire territory of the municipalities of Bacoli, Monte di Procida and Pozzuoli. At the institutional level, it is no coincidence that a process of defining protective measures has been underway for some time: from the ministerial decrees that have declared several areas of the Phlegrean territory to be of considerable public interest under Law 1497/39, to the decrees issued under Law 1089/39 for historical and archaeological assets, to the approval of the current territorial landscape plan. Nowhere more than in the Phlegraean Fields is it essential to read the territory in terms of an ecological network, understood as a model of land planning and management based on the enhancement of endogenous resources. In fact, in this territory the mixture of natural resources, their use over the centuries, historical-cultural heritage and myth is inseparable. It is in this perspective that the municipal interventions for the enhancement of the territory and the case study are placed, which is intended to be a punctual recovery project to extensively enhance the Phlegrean cultural landscape with the definition of eco-museum routes for the defence and knowledge of the territory's identity.

Figure 14- The volcanic character of Phlegrean Fields

## 2 From the past to the sustainable development of the city of Bacoli

The territory of the city of Bacoli, the second largest in the Phlegrean peninsula, is located, together with that of the municipality of Monte di Procida, in the extreme southwest of the province of Naples. It has a polycentric territorial structure, consisting of five hamlets: Bacoli centre, Baia, Fusaro-Cuma, Cappella, Torregaveta and Miseno and Miliscola. The town stands on ancient *Bauli*, which was a renowned resort in Roman times almost as much as nearby *Baiae*, compared to which it offered greater quiet. Remains of considerable value can still be admired from that period, perfectly preserved in a unique setting: the Cento Camerelle, the Piscina Mirabile, the so-called Sepulchre of Agrippina. Its history is identified with that of *Baiae*, and consequently with the decline of the former there was also that of *Bauli*. Around 1600, a colony of Neapolitan Jews settled in Bacoli giving it new vitality, through an economy based on fishing, viticulture, and the working of stones in the tuff and pozzolana quarries. The city revived and attracted new travellers in the 17th-18th-19th centuries: it was the season of the *Grand Tour*. However, the imprint of modern Bacoli was mostly given by the urban development that took place in the second half of the 20th century. To date, the town has about 25,000 inhabitants. The town, in line with other neighbouring municipalities, has suffered from inadequate management and decision-making, which has led to a critical scenario. Contemporary buildings of inadequate architectural and urban quality have taken over the archaeological remains, resulting in a distorted landscape. The solution for Bacoli is not to enhance it as it is, but to address the serious issues that require a significant increase in the quality of the area. It involves restoring public spaces, promoting cultural and artistic initiatives, managing public transportation, and introducing pedestrian areas and bike sharing services. These interventions could transform the landscape of the Phlegraean Fields peninsula, improve the quality of life for residents, and attract visitors.

*Figure 2 – View of the city of Bacoli*

### **2.1 Public Policy for a City on the Water**

It is not a simple task to formulate a governance agenda for a city facing a situation of financial chaos and limited staffing, especially given the current context of post-pandemic difficulties and the threat of war at the country's doorstep.

Nonetheless, the city of Bacoli, a municipality on the northern end of the province of Naples, can boast a three-year program in which almost forty million euros have been put to use in the execution of over 30 public works, financed by regional, metropolitan, national and European sources, and (has realized over this same time period the definitive closure of over twenty shipyards). These local interventions are the result of the implementation of a political agenda that is characterized by utmost attention to environmental concerns and cultural heritage, the urgent need to recover the salient assets of the region's cultural treasure trove that had been effectively abandoned, and most importantly the desire to protect and recover the coastal landscape that had been laid to waste by fifty years of poor governance. The result of this political agenda is a coordinated and integrated strategy to regenerate urban and environmental spheres in such a way that no single intervention or action is executed in an isolated manner, but rather all such interventions are joined by a single, governing thread.

*Figure 3 - Bicycle and walking path around the Lake Miseno*

*Figure 4 - The first Phlegrean university campus in Villa Ferretti in Bacoli*

This integrated policy can be clearly seen, for example, in the interventions targeted at the Fusaro lake - to clean the various water outlets, to recover the perimetral path and the historical and archaeological elements that look onto the lake- which are combined with the cultural initiatives aiming to recover ancient uses and increase the value of its spaces.

The results can also be seen in the current state of the Vanvitellian compendium, the new safety conditions of the water grottos, the vast improvement of the parking areas, the construction of new bridges along the perimetral path and between the bank of the lake and the Royal Lodge. The efforts to rationalize the use of the city's existing public spaces are brought together with the construction of new spaces and the rehabilitation of abandoned buildings: a former school building which had been abandoned for a decade will now house homeless families, another formerly abandoned building will now house the local administration, and yet another will be home to religious communities.

A simple effort to clean and restore previously overlooked areas thus represents an opportunity to create new spaces where young families can come together: from the playgrounds of the Frutteto Borbonico and the Cuma residential area, to the long-abandoned Bellavista pitch. Similarly, a building confiscated from the local mafia in Baia has now become the first university campus on the Phlegrean coast, as well as becoming -thanks to the targeted financing- the most extensive archaeological land and sea research area in our region. Similarly, the interventions in Miseno finally resulted in the completion of the secured perimetral which had been left incomplete for twenty years, and the reopening of the Cinque Lenze area which had formerly been an abandoned military space. The disinfection of weeds from the waters of this area have allowed for the reopening of this aquatic space as a recreational location, hosting

various local and national aquatic sport tournaments. Today there is efficient and coordinated rationalization of Bacoli's coastal areas on an urban scale, with the possibility of connecting these coastal areas to each other by optimizing the public areas that separate them (some given over to military use, some abandoned, some improperly used). The result is a new urban design plan that allows the weaving together of Bacoli's internal and external aquatic spheres, and the re-learning and re-writing of our territory's dormant assets in such a way that they can see a new dawn.

The urban projects fielded are the result of a programmed technical translation of a political program that stands out for the attention paid to environmental issues, the priority given to cultural heritage, the need given to the recovery of disused and abandoned heritage, but above all for the attention given to the protection of the coastal landscape besieged in the last 50 years by short-sighted speculative policies. The strategy derived from the networking of these priorities has fine-tuned an integrated program of urban and environmental regeneration actions such that no intervention, action or strategy, realized, in place or planned is isolated, but all are linked by a single thread.

So that the interventions along Lake Fusaro to clean up the mouths, restore the circumlacustrine strip, and recover the historical and archaeological assets overlooking it are wedded to the cultural initiatives and recovery of ancient uses and enhancement of its spaces (from the Vanvitellian compendium to the securing of the Water Caves, from the improvement of the rest areas to the continuity given by the paths on new bridges between mouths and between shore and royal casino). Indeed, the last five years have seen remarkable efforts to bring to light archaeological discoveries of rare value, such as the new discovery on the seabed of the Submerged Archaeological Park of Baia, a new colorful mosaic covered by the sea, visible from boats that travel the gulf of Baiae and through organized dives, and the new discoveries of thermal environments in the Archaeological Park of the Baths of Baia.

So that interventions to rationalize the uses of municipal real estate are coupled with the creation of new housing and new services from the reuse of disused buildings (a school that has been disused for ten years will house new housing for indigent families and another will house the municipal headquarters, others partly house religious communities and other social destinations).

*Figure 5 – Ancient roman mosaic in the Submerged Archaeological Park of Baia*

So that a simple cleaning, routine maintenance of forgotten areas becomes an opportunity for the creation of new gathering spaces for young families (from the play areas of the Bourbon orchard to the play area of the abandoned for years small field of the Bellavista Locality to the playground of the residential area of Cuma).

So that the Miseno area where only after twenty years since the realization of the curcumlacual promenade could be completed the circuit with a protected route and the area of the Cinque Lenze, a former military area abandoned for so many years and today the stretch of water is the playing field and scene of national and international water sports championships, could be opened by clearing away weeds.

Today there is reasoning for Bacoli, planning better consolidated and permanent uses of coastal areas especially at an urban scale, on the possibility of connecting together the many interlocking public areas (because military, because disused, because improperly used) in a new urban design that allows to stitch up, to reconnect internal and external water banks, to re-cognize and re-write the territory in its latent values, but waiting to be brought to light.

Fortunately, there are many cultural rewiring interventions in place in the municipality of Bacoli, small interventions that make a huge contribution to the perception and sustainable enjoyment of the Phlegrean landscape, public places long since taken from the community and private places redeemed from the underworld and made public. All in a vision of cultural restoration and respect for the identity of the place, for a sustainable tourist-cultural development of the place.

Regarding the issue of transportation, the municipality of Bacoli has shown considerable interest in the bicycle-pedestrian network, also known as the greenway network, particularly of the two circumfluos of Miseno and Fusaro.

More than 100 electric scooters have also landed on the Phlegrean town, with charging stations and stations distributed throughout the municipality. The municipal administration of Bacoli has proposed an expansion of the sea transportation service, as a sort of cumana of the sea, active from the summer of 2022 and stopping at the marinas of Torregaveta, Monte di Procida, Miseno and Baia, arriving at the port of Pozzuoli. In this sense, sea routes can help decongest and fluidify the flows affecting this highly urbanized area. An appropriate use of port infrastructures can allow an articulated fruition of the "sea resource" in the context of regional mobility and a fluidization of coastal flows through the enhancement of an "axis of the sea" that, by fitting into the Tyrrhenian connective system and the broader Mediterranean geocultural sphere, gives new centrality both to Campania's centres arranged along the coastal strip and to those pertaining to micro-insular realities. In this perspective, it is possible to enhance coastal centres, ancient maritime villages, or fortify the so-called cultural tourism, considered of fundamental importance to understand the Mediterranean nature of Campania's cultural and environmental heritage.

There are many interventions aimed at the redemption of public places that have been sadly abandoned and/or taken away from the community due to abuse by private concessionaires. It is the case of the beaches, for decades closed by grates and gates, now completely freed to protect the interests of the community itself. It is the case of Cerillo Park and Quarantine Park, green lungs long abandoned and now reborn and returned to the community through cooperative management between the public and private sectors, virtuous examples of the enhancement of urban spaces. The case study below, the rehabilitation of the "Cinque Lenze" site, is also in this perspective.

### **3 A punctual design for a territorial vision - the case study**

#### ***3.1 Recovery project of Cinque Lenze site: Ecomuseum and sensory park for Bacoli***

The choice of the proposed case study stems from the desire to respond to concrete needs that emerged from the analysis of urban voids in the Bacoli area, also identified by the PUC approved in 2021, whose need to be recovered and reintegrated into the territory is a priority. The intervention lot identified is the so-called "Complesso Cinque Lenze" an area of about 2.5 ha in size, a short walk

from the historic centre: this is a green area overlooking the southern shore of Lake Miseno, within which there are Navy buildings dating back to World War II, abandoned and in a state of advanced environmental and built degradation for over fifty years.

*Figure 6 - Location of the "Cinque Lenze" site*

The choice of the theme led to a process of field investigation, with the analysis of urban planning prescriptions, historical cartographies and with direct interviews, concluded with the application of the S.W.O.T. method, in order to identify the three basic principles that underlie the guidelines of the project.

*Figure 7 – Ex-military site called Cinque Lenze*

They are " naturality," because of the presence of protected green areas and floro-faunal qualities recognized at the regional and European level; "identity," because of the strong traditional connotation perceived in the scenario of the urban fabric and in the numerous points of historical and cultural interest; and

finally "sustainability," because the need of this territory is to be managed in a respectful, non-invasive way, so as not to disfigure the qualities that distinguish it, but, on the contrary, to enhance them and bring them back to an active state.

Therefore, it was decided to intervene with a design of "stitching up" the area through the design of an Ecomuseum: it is built on the network of existing water routes, which to date have not been connected to each other in an organic way, through an itinerary, made recognizable by a specific system of signs and custom-made elements of street furniture; the fulcrum of the intervention is represented by the Sensory Park and Nature Center, which is identified precisely in the area of the Cinque Lenze Complex. The Park has been designed to comply with sustainability requirements as best as possible: the goal is to reuse existing structures and re-functionalize them so that they can once again be used by the community. Indoor and outdoor functions have been incorporated within the Park. Indoors there are exhibition areas connected to the water paths of the ecomuseum, laboratory areas for the study and reuse of aquatic plants, a multifunctional area, an info point, a spa and wellness center, a bar/bistro where the sale of typical products made on site takes place, and a multifunctional exhibition space that also extends outside the building. Outside, the sensory park is developed, created with a series of common areas, docks serving sports and being, social gardens, and evocative nature trails that activate the visitor's senses, such as sight, touch, smell and hearing.

A representative element of the whole intervention is the use of marsh grasses as a multifaceted resource: marsh cane will be used as a technological material for thermal insulation of military pavilions, as an architectural material for the creation of furnishings and artistic installations, as a material for human activities in local craft workshops and creative and educational workshops, and as a material intended for natural phyto-purification of water and lake shores.

### *3.1.1 Goals and ecomuseum proposal*

The on-site analysis revealed a high potential of the Phlegraean Fields territory and specifically of the area covered by this paper. The characters of the landscape denote the presence of a dense fabric of potential and interest, unfortunately not adequately exploited and little known.

What emerges, with regard to the area under investigation, is its difficult harmonization with the surrounding context, resulting as a place-non-place, alienated by barbed wire and unrecognized by the community, despite its

location so close to the neighboring attractive centers and the historical center, and the naturalistic and historical value it holds.

It was, therefore, possible to delineate the objectives of the project in an inevitable manner consistent with the analyses carried out:

- Reconnect the intervention site to the context;
- Refunctionalize and give new identity to the intervention site;
- Reuse local resources in the design phase;
- Reclaim the built environment as a visible example of green building;
- Recover the naturalness of the site.

Before starting the project to recover the site, it was considered appropriate to make a wider assessment of the territory and identify possible widespread ecomuseum paths, to enhance the cultural and environmental resources of the territory and connect these resources to the intervention site. In this way, it will be possible to reconfigure the functions of the site to make it a useful service to the Ecomuseum. The Ecomuseum is by definition an open-air museum, an open window on the history, culture and beauty of the territory, which is crossed and lived in a sustainable way with a quality cultural tourism.

So a proposal has been made for thematic ecomuseum tours based on the most representative element of the territory, water. The itineraries will be divided into six thematic paths linked to water, such as

- water walks to discover the water that accompanies the territory,
- the underwater path to explore the water that holds hidden treasures,
- the aqueduct path to know the water guarded and managed,
- the thermal path to discover the healing water,
- the waterways to live the water carrying
- the ways of taste to taste the fruits of water.

This will create a 360-degree experience for the enhancement of the cultural and environmental heritage linked to the water of the territory. The paths will cross the site of intervention and will be outlined indoor functions inspired by water paths.

Figure 8 – Project proposal for six different water ways on the Eco-museum theme

### 3.1.2 Minimum sustainable actions

The Cinque Lenze area needs to be redeveloped from a landscape, naturalistic, structural and functional point of view with interventions aimed at mitigating environmental incidence and impact.

Figure 15 - Rendering for the reuse design of the beautiful area Cinque Lenze between lake and sea

A physical reconnection with the surrounding context will have to be arranged, opening the boundaries and harmonizing the relationship between the lake and the sea. As far as water is concerned, there will have to be limited artificialization

and soil sealing, allocating as much area as possible to permeable arrangements. In addition, the buildings to be repurposed should not undergo volumetric and height transformations, so as not to increase light pollution and not to alter the direction of the winds, which could have repercussions on the microclimate and habitat, such as to modify in an area already anthropized and sparsely populated by wild species, the natural balance of the habitat to the detriment of plant species, with consequences for those animals that live there. In order not to alter the current established balances and to improve building quality, consideration will be given to using eco-friendly building materials in compliance with recent regulations for the reduction of energy consumption and the color plan. The entire SIC area must be considered as the main junction of a system of ecological networks on a larger territorial scale and as such must be safeguarded in its naturalistic aspects and ecological connections with other junctions of the network must be protected.

#### *Reconnecting the site to the context*

In order to rediscover and recover the site's connection with the surrounding context and with the lake and the sea, a number of specific actions will be taken. First, the lot will be cleared of boundaries, remove architectural barriers such as barriers and barbed wire. Accessibility will be defined to see how the complex can fit harmoniously into the pre-existing context. The bike path will be extended into the lot by increasing its travel length, while the area of squatter parking lots bordering the south side of the lot will be eliminated to make way for a filtering forest connected with the maritime shoreline. The connection between the two bodies of water will be achieved through the construction of water portals, which are paths drawn transversely to the lot whose directions are oriented toward the islands of the gulf. The transverse walkways will be used as connecting elements of the two shorelines by becoming docks serving sports and being on the lake, viewing terraces and beach access paths.

Figure 10-11: Project paths

Pre-existing paths are preserved to minimize the impact on the area. The design will also take into account the paths marked by the footsteps of patrons who used a shorter route to travel between points on the site. Finally, the existing bike path will be connected with the lot and the coastal road in anticipation of the ZTL planned in the updated PUC. Possible paths, made of stabilized earth and marsh cane, will then be outlined as below. Driveway access will be allowed only on the lot adjacent to the Cinque Lenze Complex as parking for electric shuttles serving the community and for authorized vehicles. Thus, efforts will be made to minimize the presence of cars on the shoreline with the provision of parking areas served by an efficient and sustainable public transportation system.

#### *Giving functions and new identity to the site*

It is necessary to functionalize the outdoor and indoor spaces in order to give new identity and lifeblood to the intervention site. It was planned to create a sensory park through which one can experience the natural peculiarities of the context as well as include new covered functions inspired by and serving the ecomuseum trails, also suitable for knowledge and learning of crafts with local resources. This will give new identity to the site compatible with its vocation, stimulate knowledge of the area and intangible heritage of knowledge and encourage the maintenance of the site. Indoor and outdoor functions have been included within the park. Indoors there are exhibition areas connected to the water paths of the ecomuseum, workshop areas for the study and reuse of aquatic plants, a multifunctional area, an info point, a spa and wellness center, a bar/bistro where the sale of typical products made on site takes place, and a multifunctional exhibition space that also extends outside the building.

Figure 12 – Proposal for the refurbishment of the buildings functional to the ecomuseum

Outside, the sensory park is developed, along the lines of the KurPark in Villabassa (BZ) and the Parco della Masone in Fontanellato (PR) created with a series of common areas, docks serving sports and being, social gardens, and evocative nature trails that activate the visitor's senses, such as sight, touch, smell and hearing.

Figure 13 - The Sensory Park: design proposal about outdoor activities

Functionalization is also to be considered in relation to the paths that interpenetrate open and covered spaces, generating an osmotic relationship

between indoor and outdoor functions and consequently between nature and the built environment.

Figure 14 - Sensory park in "Kurpark" in Villabassa (BZ) as example to imitate

#### *Using local resources*

Central role plays local marsh grasses as design resources. Marsh reeds, particularly the native *Phragmites Australis* type, will be used/reused in the present project as:

- Architectural material: furniture elements and art installations, evocative and sensory pathways;
- Technological material: thermal and acoustic insulation panel made of swamp reed;
- Material for environmental restoration: natural Phyto depuration of the banks and waters of the coastal lagoon;
- Material for human activities: local crafts and environmental education activities.

Figure 15 – Different uses of marsh cane

#### *Recovering the built as a visible example of green building*

The buildings built by the Navy present in the "Cinque Lenze Complex" will be recovered entirely at the structural level, preserving the technological aspects typical of the industrial architecture of the 1940s, while, with regard to the infills, action will be taken to minimize the production of waste.

*Figure 16 – Analysis of Cinque Lenze military architectures*

The pavilions recovered with minimum sustainable interventions will be visible examples of green building thanks to the interventions with low environmental impact and the use of eco-friendly materials for energy upgrading. The buildings, therefore, in order to be salvageable need structural interventions to make the interior spaces habitable and energy upgrading to give them thermo-hygrometric comfort and sustainability in terms of energy savings.

*Figure 17 - Design rendering*

From the project, therefore, only local volumetric concrete recovery and reconstruction interventions and a shear and flexural reinforcement of the columns by affixing unidirectional natural fiber bandaging are planned.

Energy interventions are necessary since the quality of the sheds from this point of view is very poor being the building elements lacking thermal insulation for the dispersing surfaces. Starting from the analysis of the state of the building and identified the areas of intervention, it was assumed to implement a thermal

insulation system consisting of reed panels, a material that has good thermal insulating capabilities, is breathable, promotes the diffusion of vapor and is present in abundance in the vicinity of the site. The panels, with a thermal conductivity of  $\lambda = 0.050 \text{ W/mK}$ , will be applied to the interior surface of the walls and roof in order to ensure energy savings without changing the exterior appearance of the structure. The intervention allows an improvement of four energy classes despite being minimally invasive and costly. The absence of wall insulation results in a high thermal bridge value ( $\psi_e = 0.463 \text{ W/mK}$ ) and possible presence of mold due to a very low internal surface temperature ( $13.93^\circ\text{C}$ ). By proceeding to insulate the entire dispersing surface, the thermal bridge value is greatly reduced ( $\psi_e = 0.015 \text{ W/mK}$ ) and there is no presence of mold. In fact, a more even distribution of temperatures within the wall is evident, as well as a higher surface temperature ( $18.86^\circ\text{C}$ ).

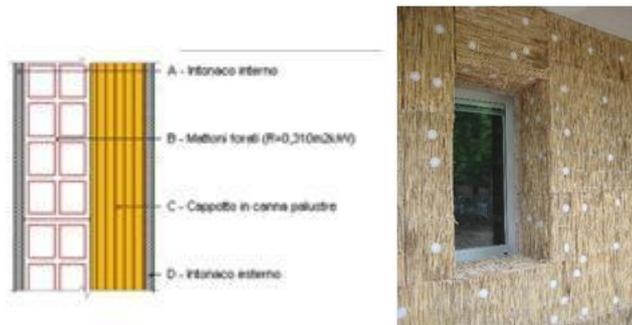

Figure 18 – Type of new insulation with marsh cane

In conclusion, the solution is effective in abating all problems related to thermal bridges in the structure. The intervention will not change the appearance of the building, configuring itself as a low-invasive and high-impact solution for the purposes of thermohygrometric comfort and energy savings.

#### *Recovering the naturality of the site*

It means reconstituting a nature park by replanting native vegetation, particularly *Phragmites nativa australis*.

Such an operation, which is necessary and unavoidable, will promote biodiversity and reconstitute habitat for the local fauna that is highly endangered. It will also naturally reclaim soils depleted by the presence of heavy waste poured over the past decades on the lake shores and in the waters.

Figure 19 - Design rendering of the Park

Native shrubs and plants, such as *Phragmites australis*, and native marsh grasses, aromatic bumps of biodiversity typical of the coastal lagoon Mediterranean scrub, forests of holm oaks and poplars, and white willows will be arranged within the Cinque Lenze Park, as shown in the following abacus of greenery:

Figure 20 – Design with green abacus

### 3.1.3 Economic sustainability and future prospects

The implementation of the present project will lead to strengthening the strengths elaborated in the meta-project phase. It will, in fact, go to protect and recover the flora and fauna of common interest, reconnect the site with the context by generating a harmonious relationship between the parts of the area, and encourage the influx of cultural tourism in line with the area.

In addition, the foreseen ante operam weaknesses will be resolved, with the elaboration of possible new weaknesses, such as the presence of the pest tree species in the area and the lack of a waste management plan.

*Figure 21 - Design rendering*

Regarding the sustainability of the project, on the other hand, it is necessary to assess its environmental and economic sustainability over time. It is taken into account that this aspect turns out to be crucially important and will need to be further investigated in the future by competent technicians in the field. However, a study on economic sustainability related to the implementation of this project has been prepared in general.

The funding required to carry out the work can be drawn from both public and private funds.

The public funds identified are the PNRR (National Recovery and Resilience Plan) and REACT-EU, the site being among the areas of the ROP2021-2025.

Private funds could come from Associations or entrepreneurs who would contribute through a PPP (Public Private Partnership) to implement and manage the planned commercial activities within the thesis area.

It was estimated, through a summary statistical analysis, about 2,000,000.00 euros in annual revenues from activities such as: Bar-bistro, SPA and wellness center, sale of km0 culinary and artisanal products, outdoor cinema, seminar room, sports activities (rental and lessons in sailing, kitesurfing, canoe windsurfing), bicycle rental, creative workshops/craft activities for children and adults, social gardens, against approximately 100,000.00 euros in expenses, in addition, the revenue to the public administration from the sale of these activities to private individuals would cover the cost of maintaining the green areas and equipment, estimated at around 200,000.00 euros annually.

## 4 Conclusions

Considering the strong responsiveness of the new municipal administration to the issues of sustainability, the green city and the knowledge management, in synergy with the higher authorities and with the arrival of new forms of public funding, it is clear there is an opportunity to implement sustainable planning to serve the cultural landscape for community benefit. This will result in greater awareness of the environment and consequential development of sustainable, low-impact tourism with continuous durability. In particular, the case study "Cinque Lenze site" restoration project can be an initial opportunity not only to regenerate the specific area identified, but also to improve the quality of life of the community and to preserve and enhance natural ecosystems on a larger territorial scale. The project would, with an analysis to be further investigated, be sustainable from both an environmental and naturalistic as well as an energy and economic point of view, respecting existing protection plans and promoting the preservation of naturalistic aspects and ecological connections with other sites in the system.

### Abstract

Used clothing carries a story to tell. While the circular economy emphasizes reusing, recycling, and recovering materials to minimize environmental impact, research is focused on technical aspects of circular products, such as materials composition and quality. However, little is known about the impact of a product's provenance on its value perceived. We argue that a product's previous owner can imbue it with a sense of value beyond its physical characteristics. Accordingly, we conducted a between-subject experiment to test this hypothesis. We compared two different background information settings, which we call *status provenance* (socialite vs no-frills previous owner), and the type of circular product (remanufactured vs second-hand). We found that remanufactured products, which are crafted by previous owners, had a higher perceived meaningfulness and purchase intention than second-hand products. Furthermore, the status provenance of the previous owner had a negative effect on perceived meaningfulness, suggesting that the focus should be on the crafting process rather than the identity of the previous owner. The

study's findings highlight the importance of recognizing the intangible, value-based aspect of remanufactured products, which can be an important aspect to promote to consumers and ultimately accomplish the transition towards a circular economy.

**Paper type** – Academic Research Paper

## 1 Introduction

The circular economy emphasizes reducing environmental impact by reducing, reusing, recycling, and recovering materials in production and consumption (Kirchherr, Reike, & Hekkert, 2017). Circular products, particularly those that are repurposed or recycled, may present distinct value propositions to consumers due to their regenerative logic (Testa et al., 2022). Research has examined the technical aspects of these products, such as materials composition and perceived quality (Machado et al., 2019), but has largely overlooked the impact of the prior owner of the item. However, provenance has been shown to be a prominent feature for buyers in other markets, such as antiques and art (Feigenbaum et al., 2012), and early evidence suggests that even common goods like second-hand sneakers can increase in value with a compelling provenance story (Slaton & Pookulangara, 2022).

In fact, we argue that a garment that comes from someone else entails a story. Such a story then, can imbue the garment with a superior meaning for the person who buys it. To explore the value-based worth of remanufactured products, we conducted a 2 x 2 between-subject experiment to compare two different background information settings, which we call *status provenance*. The experiment employed a two-factor design: provenance information (socialite vs no-frills) about the previous owner, and the type of circular product (remanufactured vs second-hand). Each scenario depicted the same scarf, but with different combinations of information attached. Participants rated their level of agreement on items regarding uniqueness, meaningfulness, and purchase intention. Data were collected from the five largest countries in Europe: France, Germany, Italy, Poland, and Spain (n = 5,123).

The study's findings suggest that remanufactured products have a higher value of meaningfulness to respondents, which comes from the work of crafting the

product by the previous owner. This value increases the propensity to purchase such a product. On a theoretical level, the study acknowledges an intangible, value-based aspect linked to remanufactured products beyond the physical characteristics of the product. On a managerial level, promoting the knowledge that remanufactured products contain superior value may encourage consumers to prefer them over new products, thus promoting the transition towards a circular economy.

## **2 Literature review**

### ***2.1 Beyond technical aspects of circular products***

The circular economy advocates for reducing, reusing, recycling and recovering materials in production and consumption in order to reduce environmental impact (Kirchherr, Reike, & Hekkert, 2017). More specifically, the regenerative logic underlying the circular economy suggests that repurposed and recycled items may present distinct value propositions to consumers. Some research has examined the factors that make such products appealing to consumers (Confente, Scarpi, & Russo, 2020; Magnier, Mugge, & Schoormans, 2019; Testa, Gusmerotti, Corsini, & Bartoletti, 2022), yet much of that research has concentrated on the perceived technical aspects of circular products, such as materials composition, quality perceived, and appeal (Machado, Almeida, Bollick, & Bragagnolo, 2019; Testa, Di Iorio, Cerri, & Pretner, 2021). For instance, recent research on second-hand products demonstrates consumers highly rate and are likely to purchase items made out of recycled plastic; however, the perceived value of the product is lessened by plastic worry (Testa et al., 2022).

Research is focusing on second-hand products, yet still lingering on branded ones (De Angelis et al., 2017; Testa et al., 2022), since brand embodies consumers' beliefs and perceptions, which are influential in consumption (Kim & Jang, 2016). Specifically, a positive image of a company brand can encourage customers to choose its products or services over competing alternatives, even when products are made out of recycled material (Testa et al., 2022).

## ***2.2 Uniqueness, meaningfulness, and purchase intention of circular products: uncharted waters***

Consumers' purchasing decisions are influenced by further, deeper, intangible factors, namely uniqueness and meaningfulness. Understanding their importance in purchase intention can help businesses tailor their marketing strategies and product offerings. Uniqueness refers to the distinctiveness of a product or service; more specifically, "the 'perceived uniqueness' of a product is the extent to which the customer regards the product as different from other products in the same category" (Tian et al. 2001, p.95). Research on about perceived uniqueness in customized products argue that, in addition to aesthetic and functional fit, the perceived uniqueness contributes independently to the utility a customer experience, especially when one is in need of uniqueness (Franke & Schreier, 2008). Another study by Hagtvedt and Patrick (2008) found that unique products can enhance the perceived value of a product and increase purchase intention. The study found that when consumers were presented with two products, one that was unique and one that was not, they were more likely to choose the unique product, even if it was more expensive. This suggests that uniqueness can be a powerful tool for businesses to differentiate their products and increase purchase intention.

Meaningfulness refers to the personal significance or relevance of a product to the consumer in terms of appropriateness and usefulness (Im et al., 2013). Studies on meaningfulness have argue that differentiation through meaningfulness has been linked to a superior customer satisfaction, since more meaningful products better fulfill consumers' needs and expectations (Im and Workman, 2004; Kim et al., 2013). Further research consumption-supportive package functionality shows that one underlying mechanism that aids in our understanding of the beneficial impact of such a package functionality on purchase intention is perceived product meaningfulness (Im et al., 2013). Henceforth, consumers are more likely to purchase products that are both unique and meaningful to them, as they perceive such products as more valuable and satisfying. However, scholars have not investigated the role of these products domains referring to circular products, neither second-hand not remanufactured products.

### ***2.3 Uncovering the hidden value of used products***

Perhaps surprisingly, the literature has not yet investigated the distinguishing feature of a handmade product – neither repurposed nor recycled – namely, the prior owner of the item. Beyond the technical aspects, there is reason to believe that the provenance of a product may affect its value. Provenance has already been documented as a prominent feature for buyers of antiques and art (Feigenbaum et al., 2012). Usually, these products gain meaning over time and through the history of the owners they have gone through. But it is not clear how provenance may affect more typical consumer items. Indeed, common wisdom suggests that resold items may lose value. Early evidence though has shown that even common goods can increase their value; for instance this is what researchers have found by looking into secondary sneakers markets (Slaton & Pookulangara, 2022). This discrepancy in the literature has yet to be explained.

We argue that there is an overlooked value that makes remanufactured products meaningful – the provenance story they entails. As humans, we are all moved by stories. Hence, we explore this value-based worth that circular products can entail. By doing so, we delved into products bearing a provenance, namely second-hand and remanufactured products. They both come from previous owners – someone who has worn it in the past and collected memories with it; someone, in short, who has attached an intimate bond to it. Therefore, our study aims at uncovering the embedded value of used clothing by testing:

1. Which type of circular product (second-hand vs remanufactured garment) is perceived as more unique and more meaningful and to what extent
2. Which type of status provenance (socialite/no-frills background information setting) is perceived as more unique and more meaningful and to what extent
3. Which of the two (uniqueness and meaningfulness) leads to higher purchase intention and to what extent

## 3 Method

### 3.1 Experiment design

According to those premises, we conducted a 2 x 2 between-subject experiment to compare two different background information settings, which we call *status provenance*. We employed a two-factor design: the provenance information (socialite/no-frills previous owner—factor 1), and the type of circular product (remanufactured/second-hand – factor 2). To manipulate each factor, two similar short vignettes were shown. Each scenario depicts the picture of the same scarf, yet with different combination of information attached. We picked the picture of a scarf since it represents one of the easiest garments we can either recraft from old garments or pass it down, being extremely simple. Each respondent is randomly assigned to one out of four scenarios and asked to rate on a 1-to-5 scale his/her level of agreement on items regarding *uniqueness* (Franke & Schreier, 2008), *meaningfulness* (Vogt, Jenny, & Bauer, 2013), and *purchase intention* (Chen & Chang, 2013). Items were adapted to best fit the purpose of the study.

#### 3.1.1 Sample

In order to test our experimental design, we selected a representative sample of the five largest countries in Europe: France, Germany, Italy, Poland, and Spain (n = 5,123), whose ages ranged from 18 to 70 years old, and whose age cohorts' proportions reflect those in the actual population. The survey was administered in January 2022 through an independent company that carries out online surveys, in order to reduce sampling error and reach a broader number of respondents.

Sampling takes place through pre-registered users on the provider's platform, who are invited to fill out a questionnaire if they meet the requirements - initial filters - and follow the established socio-demographic quotas. Invitations are sent by email. Each participant receives a link that sends it directly to the online platform where the actual compilation begins. The compilation is subject to various automatic checks to avoid: missing answers, inconsistent answers, low-quality answers, and answers that are unreasonably fast, or suspected to be given by a BOT. Respondents receive incentives. The incentive system allows participants to accumulate points, which can then be converted into digital rewards.

### 3.2 Results

Manipulation check was run to guarantee accountable responses. Specifically, we conducted a chi-square test to analyze contingency tables in order to determine whether there is a relationship between two categorical variables. Being the sample sizes large, we checked for Pearson's chi-squared test, since it is a specific type of chi-squared test. We outline two contingency tables; in the first one, we cross-tabulated *socialite vs no-frills* as categorical variables and manipulation check answers *yes vs no/don't know* as a manipulation check answers; in the second one, we replicated the same approach yet entered *remanufactured vs second-hand* as categorical variables and cross-checked them with their *yes vs no/don't know* answers. Pearson's chi-squared test was significant, showing  $p=.000$ .

After, we run an exploratory factor analysis to check whether the items reflect the variables they were supposed to represent. Principal-component factor loading retained 3 factors as expected: *uniqueness, meaningfulness, and purchase intention*.

Ultimately, regressions have been run to get the following results. Remanufacture provides meaningfulness ( $b=.1885609$ ;  $SE=.05312$ ;  $p<.000$ ), which leads to purchase intention ( $b=.4825551$ ;  $SE=.0099494$ ;  $p<.000$ ). However, status provenance has a negative effect on meaningfulness ( $b=.0714482$ ;  $SE=.0533682$ ;  $p>.1$ ). The interaction between provenance status and remanufacture suggests that these processes are distinct ( $b=-.1097418$ ;  $SE=.0751739$ ;  $p>.1$ ). Additionally, uniqueness impacts remarkable on purchase intention ( $b=.5715558$ ;  $SE=.0127736$ ;  $p<.000$ ), yet is such a scenario remanufacture does not provide purchase intention anymore ( $b=.0430698$ ;  $SE=.0322284$ ;  $p>.1$ ) and, eventually, status provenance hinders purchase intention ( $b=-.1818294$ ;  $SE=.0322758$ ;  $p<.000$ ). See table 1.

Table 1: Effects of control variables, main effects, and moderator effects

Independent Variables	Equation 1 (DV = Meaningfulness)	Equation 2 (DV = Meaningfulness)	Equation 3 (DV = Meaningfulness)	Equation 4 (DV = Purchase Intention)	Equation 5 (DV = Purchase Intention)

#### 4 Discussion and implications

The study's findings imply that remanufactured products entail higher value – meaningfulness – for the respondents. This value comes from the work of crafting the product by the previous owner. In turn, meaningfulness increases the propensity to purchase such products, no matter the status provenance.

The findings of this study provide important insights for both scholars and practitioners. On the scholarly front, this study highlights the importance of considering the intangible value of remanufactured products beyond their physical characteristics. This insight can contribute to the ongoing discussion on circular economy and sustainable consumption (Kirchherr et al., 2017; Confente et al., 2020; Testa et al., 2022), as it uncovers the unexplored value which used

clothing entails, and provide further empirical evidence supporting the appeal of circular products.

For practitioners, the knowledge that remanufactured products contain superior value can be a valuable marketing tool. Besides private reselling markets, companies can appeal to consumers who are looking for more sustainable and ethical purchasing options by promoting the fact that their products have been re-crafted. This can help companies differentiate themselves in the market and attract consumers by providing them with products with greater meaning and value. Furthermore, this study also suggests that companies may benefit from investing in the development of new business models that emphasize the value of remanufactured products. By adopting circular business models, companies can capture more value from their products and create new revenue streams, while also contributing to a more sustainable economy.

Overall, this study provides valuable insights into the potential benefits of remanufactured products and underscores the importance of considering both the tangible and intangible value of these products. Scholars and practitioners alike can use these insights to advance the discussion on sustainable consumption and circular economy, and to develop new strategies for promoting the adoption of more sustainable production and consumption practices.

#### ***4.1 Limitations and Avenues for further research***

Interestingly enough, status provenance becomes statistically significant (although negatively relevant) to purchase intention when uniqueness is included in the regression. That suggested that when facing background information about the previous owner, we suspect, the value that comes from the work of crafting the product by the previous owner might be diminished. That opens interesting scenarios that deserve further investigation, such as whether that depends on the type of background information.

## **5 Conclusions**

According to the study, it appears that remanufactured products hold a greater level of meaningfulness for respondents due to the craftsmanship of the previous owner. As a result, this increased level of meaning can lead to a higher likelihood of purchasing such products. On a theoretical level, this study acknowledges that there is an intangible, value-based aspect linked to remanufactured products

besides the physical characteristics of the product, such as the perception of quality, the aesthetics and so on, which are better known in the literature (Confente et al., 2020; Magnier et al., 2019; Testa et al., 2021, 2022). Furthermore, on a managerial level, knowing that a remanufactured product contains superior value can be an important aspect to promote to consumers. When consumers are aware that the product was re-crafted, they may prefer it over other products. This may tip the balance away from old fashion *buying-new* mantra, and promote the transition towards a circular economy.

### Abstract

Technological advancements are progressively changing tourism value chains. Tourism value chains are transforming into global value ecosystems and for tourism businesses is

becoming essential to evolve their business model to ensure a smart, sustainable and inclusive tourism development and the adoption of innovation strategies which place the user, the citizen, or the tourist at the centre of the destination processes and value co-creation. This means not only adopting digital technologies to improve products and services but also changing and enhancing organisational culture, competencies, structure, leadership, operating model to be more agile, adaptable and innovative. Looking at management literature on digital transformation (DT) and DT in tourism sector, it emerges that the role and skills of leaders in guiding and inspiring their organisations to adopt and leverage digital technologies for creating new business models and value propositions, remain under investigated. By drawing on extensive literature on DT, the study briefly examines some key management issues regarding DT in tourism and discusses leadership traits that help organizations successfully navigate their transformation towards the absorption and exploitation of digital technological knowledge. Then, the research suggests some directions for future research.

**Paper type** – Academic Research Paper

## 1 Introduction

Culture and tourism represent a key source for growth, employment and social cohesion in a country and especially, in its rural and isolated inner areas and historical small towns, characterized by a widespread and remarkable cultural and natural wealth (e.g. Brandano and Crociata, 2022; Richards, 2021). Unfortunately, the recent pandemic has put a strain on culture and tourism industries, although in different ways across sub-sectors. Additionally, the undergoing energy crisis and the geopolitical instability are slowing down the recovery and growth of the sectors. In such scenario public and private actors operating in tourism ecosystems have to face several challenges and find new paradigms of development rooted in principles such as sustainability, smartness, resilience, and safety (e.g. Demartini et al., 2021; Duran and Uygur, 2022; Gretzel et al., 2015; Najda-Janoszka and Kopera, 2014). Among the key challenges there are building of more resilient, circular, and sustainable models of tourism, based on the use of digital technologies, and the development and implementation of smart and sustainable tourism policies (e.g. Hjalager et al., 2018; Topal et al., 2020). Therefore, the actors of cultural and tourism ecosystems are called to improve the quality of life of communities and tourists and increase the levels of cultural, creative and touristic services, pursuing smart and sustainable practices and riding

the emerging wave of the digital and green transitions. Digital technologies represent a key means to deal with these challenges. Artificial intelligence, internet of things, virtual and augmented reality, big data, neuromarketing techniques, data analytics, smart travel facilitation tools such as online booking, boarding passes, automated clearance gates and electronic validation, can be exploited to create innovative and smart tourism solutions, enhance cultural tourism and create personalized offers, improve the quality of the tourism experience, and facilitate a more inclusive socio – economic growth for all the stakeholders of tourism ecosystems (Ammirato et al., 2021; Dredge et al., 2018; Fereidouni and Kawa, 2019; Goodwin, 2018; Hjalager, 2010; Santarsiero et al., 2021). However, using digital technologies to change the way the organization operates, delivers value, interacts with customers and stakeholders, and adapts to the changing environment, is not straightforward. Tourism businesses, especially micro-businesses, tend to be focused on business survival, and risk averse with limited inclination for innovation and digital transformation (DT) (Meyer and Mayer, 2015). Moreover, tourism sub-sectors are different among them in terms of resources, access to finance, skills, culture, etc. This potentially influences approaches and ways of implementing DT. However, technological developments are progressively changing tourism value chains. Tourism value chains are transforming into global value ecosystems and for tourism business is becoming essential to evolve its business model, by leveraging DT, to ensure an intelligent, sustainable and inclusive tourism development and the adoption of innovation strategies which place the user, the citizen, or the tourist at the centre of the destination processes and value co-creation (Tussyadiah and Zach 2013). This means for tourism business not only adopting digital technology to improve its products and services but also changing its culture, structure, leadership, operating model and talent to be more agile, adaptable and innovative. Looking at management literature on DT and DT in tourism sector, it emerges that the role and skills of leaders in guiding and inspiring their organisations to adopt and leverage digital technologies for creating new business models and value propositions, remain under investigated (e.g. OECD, 2020; Pesonen, 2020). Yet DT is challenging and requires leadership and direction to be successful. Without a clear vision and goals, any DT project can quickly stall or fail. By drawing on extensive literature on topics connected to DT in tourism, the study briefly examines some key management issues regarding DT in tourism and discusses leadership traits that help organizations successfully navigate their transformation

towards the absorption and exploitation of digital technological knowledge. Then, the research proposes an outlook for future research.

## **2 Digital transformation in tourism**

In the digital age, the capacity of a tourism organisation to produce a smart, sustainable, responsible and accessible offer requires the use of innovative digital solutions that connect organisations with the local environment and culture, and protect and promote its heritage and beauty, as well as an understanding and adapting to the changing consumers' needs. Nowadays, tourist is an experienced and well-prepared traveller who prefers and requires customised services tailored to his/her needs. Its habits and attitudes are even more digital, mobile and social based. Tourists use web and ICT tool as their primary source for searching or planning trips, customise travel experience, access information and review, benefit from lower prices and greater convenience. Additionally, nowadays tourists informed by digitally derived data, seek hyper-personalisation and customisation, experiences rather than just products, services or travel arrangements. They want to be involved in the production and/or design processes and co-create service with other customers, local communities, stakeholders, employees and entrepreneurs.

In such scenario, tourism businesses of all sizes have to be able to effectively answer such renewed requests and needs of their customers and stakeholders, rethinking services, products, processes, business models and embarking on digital transformation (DT) journey. Tourism businesses need to embrace DT as a strategic priority and a source of competitive advantage (Nonaka and Takeuchi, 2019). However, compared with other productive sectors, tourism presents a fragmented offer and its sub-sectors are inherently labour intensive, namely characterized by a value offer based on the direct contact with clients. Moreover, enterprises in the tourism sector, especially micro-businesses, have a reputation for being focused on business survival, and being risk averse with limited appetite for innovation, reluctant to innovation and digitalization (Meyer and Mayer, 2015). They are characterised by a lack of collaboration with stakeholders, and rapid turnover of employees and business failures (Weidenfeld et al., 2009). Moreover, tourism sub-sectors are different among them in terms of resources, access to finance, skills, culture, etc. The differences between the fundamental nature of tourism business subsectors such as the accommodation, travel and distribution

system, hospitality and related services, greatly influence their capacity and speed to implement DT. Additionally, the tourism sectors are characterized by a majority of businesses being single-person or family-owned small businesses with limited investment capabilities (Cooper, 2015; 2018). However, technological developments are progressively changing tourism value chains and the position of micro, SMEs or large within them requires an evolution of business model. Tourism value chains are transforming into global value ecosystems and it is essential to leverage DT to ensure an intelligent, sustainable and inclusive tourism development and the adoption of innovation strategies which place the user, the citizen, or the tourist at the centre of the destination processes and value co-creation (Tussyadiah and Zach 2013). Nowadays the innovation in tourism sector has to be technology enabled, human centred and user driven. Technology advancements enable human-centred and user-driven innovation. Digital innovation such as Artificial Intelligence, Internet of Things, Cloud, etc., Analytics, big data, cloud computing and other emerging and enabling technologies, along with new habits and customers' behaviours, have created new trends such as platformization, prosumerization and business virtualization (Gimpel and Westerman, 2012). Furthermore, technological advancements lead to a new way of thinking about destination configurations. The interconnection between physical and digital world allows for reimagining and customizing visitor experience, and enhancing new models of destinations such as rural areas, hamlets and other second-rate destinations. In this new context, DT in tourism organisation cannot be referred to the mere exploitation of digital technologies in daily tasks such as organizing travel, choosing a destination, planning an itinerary, booking flights and hotels, organising a virtual tour of a museum, offering the experience of discovering the digital twin of a monument, etc. It involves a more complex process opening up new and highly creative ways of delivering tourism services and enhancing the visitor experience, by taking advantage of digital advancements to handle transactions, capture and process information and data on tourism supply and demand, and improve and connect operations along tourism value chains and ecosystems. This requires refreshed ways of creating and delivering value, and the development or enhancement of new knowledge, skills, competencies, work practices and leadership.

### **3 Leadership for Digital transformation in tourism**

#### ***3.1 The human side of digital transformation***

Capturing value from implementing DT is not straightforward. To date, many organisations that have embarked on DT have not yet achieved their expected outcomes from digital investments (LaBerge et al., 2022). This is because frequently organizations conceive DT as incorporating digital technology into all business areas and not as an organisational transformation requiring the management of digital technological knowledge together with other complementary knowledge assets (Schiuma et al., 2021).

DT's success is a complex process not merely related to adopting new digital technology solutions. It involves an organisation's transformation driven by acquiring and generating new digital technological knowledge (Guinan, 2019) and the creation of a receptive culture (Tabrizi et al., 2019) that allows to rethinking the working mechanisms by adopting new practices and refreshing business models (Ashkenas, 2015). In fact, whilst digital tools and technology provide possibilities for gains in efficiency and productivity if most employees do not have the mindset or knowledge and skills to enable change, any DT project or programme is destined to fail. The wider engagement of employees in DT process is, indeed, essential to develop organisation's capabilities in managing digital technological knowledge and mature a receptive organisational culture (D'Este et al., 2012). DT is a complex and multi-dimensional process that requires significant changes to an organization's operations, interactions, and value creation (Barton et al., 2018). It is not only tech enabled but also a human led process. It requires a continuous process of learning and unlearning, experimentation, adopting new processes, ways of working and mindset to thrive under continual change. Therefore, only the right meeting point between people skills, mindsets and competencies and the opportunity provided by complex digital tools to increase value for stakeholders, can generate successful DT. Shaping an organisational culture and organisational context for fostering, developing and managing digital technological knowledge requires leadership. Leaders and top managers are critical in governing organizational learning and transformation (Sathe, 2007). They guide organisations through the DT journey by rethinking old structures and processes, encouraging a culture of change and leading people to adopt a new

mindset, knowledge, attitudes and ways of working to thrive under continuous change.

### ***3.2 Leading tourism organisations in Digital Transformation journey***

Leadership plays a key role in organisation's digital transformation, especially with reference to the creation of a receptive culture that enables a digital transformation strategy to become reality (Hensellek et al., 2020; Kane et al., 2015; Oberer and Erkollar, 2018). The analysis of literature on successful cases of digital and traditional companies that have led the transformation towards digital-based business models highlights that leadership as the core management attribute in determining successful organisational transformation (Hensellek et al., 2020; Klein, 2020; Mccarthy et al., 2021; Pabst von Ohain, 2019; Sainger, 2018). Management literature suggests various labels to describe leadership styles that are effective in navigating organizational transformations. These labels denote a leadership capacity of activating, supporting and managing the processes of an organization's transformation. In particular, the notions of transactional, transformational, entrepreneurial and wise leaders are considered critical ones (Ardi et al., 2020; Bass and Riggio, 2006; Fernald et al., 2005; Mccleskey, 2014; Odumeru and Ogbonna, 2013). Transactional leaders use management by exception to set clear goals and expectations for their followers and to monitor their progress closely to ensure they meet the predefined standards (Bass, 1985). They motivate their followers by using rewards and punishments, with the main focus being achieving specific outcomes and targets (Bass and Riggio, 2006). This leadership style works well in stable and predictable environments where leaders can create clear procedures and guidelines to facilitate goal attainment (Bass, 1998). Instead of criticizing or punishing employees for their mistakes, transformational leaders see them as opportunities to learn and grow (Bass and Avolio, 1990). They use mistakes as a way to enhance and refine future outcomes. Transformational leadership is a style that builds on and enhances transactional leadership. Bass and Avolio's (1990) emphasize the importance of the transformational leader's behaviour and how it affects their followers, consisting of four key elements known as the four "I"s. These elements are idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration. Idealized influence means that a leader can act as a role model and gain the trust and respect of their followers. Leaders must have the right traits

and communicate the organization's mission and values. Inspirational motivation means that a leader can set a captivating vision that inspires employees to join in achieving it. Leaders should also show optimism to increase their confidence and enthusiasm. Intellectual stimulation means that a leader can encourage employees to think creatively and innovatively and find novel solutions to problems. Leaders may also challenge employees to explore opportunities for improvement on their own (Shields, 2020). Lastly, individualized consideration means that a leader can provide customized support and guidance to suit each employee's unique needs and abilities. Leaders act as mentors to foster individual growth and development. Entrepreneurial leadership is a style that fosters innovation, risk-taking, proactiveness, autonomy, and competitive aggressiveness for individuals and companies to enhance their market adaptability, performance, and survivability. An entrepreneurial leader needs to align ambitious visions with the team's capabilities and create challenges that stretch the team's limits but do not overwhelm them. They are accountable for developing a persistent vision and building trust to achieve it while foreseeing and removing internal and external obstacles and engaging key stakeholders to facilitate its accomplishment. Moreover, an entrepreneurial leader must motivate and commit to realizing the vision through team-building skills and efficient use of scarce resources. Entrepreneurial leadership is regarded as suitable for dynamic and uncertain environments. This leadership style demands leaders to be creative, innovative, and adaptable, with a high tolerance for ambiguity and uncertainty. Wise leadership is a concept that considers the moral compass in today's digital world (Freeman et al., 2006) and empowers leaders to gain wisdom. A wise leader balances attention to detail and larger goals and creates social and economic value for the common good. Wise leaders act as informed decision-makers (Nonaka and Takeuchi, 2019) and cultivate practical wisdom. They consider factors such as changing realities, time sensitivity, and both small-scale and broad perspectives when making choices. They strive for what is best for society and the company and adopt a sustainable approach. They are also capable of making informed decisions in complex contexts and driving digital transformation and innovation throughout the organisation.

In sum, transactional leadership rewards employees that achieve pre-defined goals, while transformational leadership inspires, motivates, and grows them; entrepreneurial leadership fosters innovation and risk-taking in dynamic and uncertain environments; and wise leadership highlights the importance of leaders

gaining wisdom and aligning their decisions with the values and purpose of their organisations. The above four leadership styles highlight the importance of different leadership dimensions and suggest the distinguishing features of the leadership required to drive organization in DT, i.e. digital transformative leadership. Digital transformative leaders create a corporate culture that promotes digital technological knowledge and continuous organisational change. They use digital technologies to prioritise and improve value creation for the company, either by establishing new businesses or enhancing existing ones. Digital transformative leaders possess a dynamic combination of mindset, attitudes, skills, and behaviors that make the strategic use of technology both feasible and beneficial (Sheninger, 2019). They need to perform three types of tasks for digital transformation (Heavin and Power, 2018): 1) strategic tasks, such as reimagining and re-engineering business processes, and creating new e-business models; 2) tactical tasks, such as aligning business processes with IT processes and developing digital management capabilities; and 3) operational tasks, such as identifying key skills for employees and exploring new databases and data analytic. In doing this, they have to be interested in leading people to work most effectively by exploitation and employment digital technological knowledge, not only for the organization, but also for the benefits of the society as a whole (Ahlquist, 2014). A digital transformative leader has to find, assess and implement the DT opportunities and influence the culture and mindset of the organization in a horizontal and diffuse way, inspiring change. He/she has to effectively communicate with employees at all levels, from top managers to frontline staff, to foster a culture of teamwork and trust, and encourage constant learning and innovation. This way, he/she can help ensure that all activities and processes, even if under DT, are aligned and that everyone is on the same wavelength.

Digital transformative leaders must also practice inclusivity in their digital transformation projects/programs. This practice of inclusivity is important to reduce employees' reluctance to technology and change. By involving them in the change process, they feel more responsible for the digital transformation initiatives and adopt them more willingly and actively. This is particularly crucial in service organisations, such tourism organisations, characterised by a high customer-centricity. As outlined by several scholars (e.g. Liden et al., 2014; Zheng et al. 2020) in service organisations, leaders have to set clear performance standards for their followers and act as role models of service behavior. Service

leaders have to inspire and motivate their followers to engage in their work and deliver high-quality service outcomes. In the field of tourism, empirical studies that look at leadership skills and positions in digital transformation are a few. Recently, Pesonen (2020) examined the digital transformation in tourism and how it impacts on leadership and management in tourism organizations. He suggested that digital transformation is a creative process triggered by knowledge management and knowledge transfer, which aims at creating new business opportunities and models. Xiang (2018) analysed the challenges and opportunities of DT in tourism and argued that digital leadership in tourism needs to align with customer-centricity, which is a top priority for tourism businesses. The scholar suggested that digital leadership in tourism encompasses developing a digital mindset, culture, and capabilities. Gretzel et al. (2015) explored the impact of digitalization on destination management and marketing and emphasized the importance of destination leaders adopting digitalization as a strategic tool for improving destination competitiveness.

To date the relationship between DT and leadership both in start-up, micro, small and medium enterprise tourism as well as in larger tourism businesses, remain under-investigated. Yet the development of smart destination and intelligent tourism solutions, is generating new challenges and opportunities requiring new leadership competencies and high level skills. In this vein several questions require further research, especially from an empirical viewpoint. Among them: what are characteristics and competencies of effective digital transformative leaders in tourism and how to develop them? Do these competencies differ in startup, micro, small and medium enterprise tourism and in larger tourism businesses? What knowledge, skills, competencies entrepreneurs and managers of tourism organisations perceive as crucial to drive their organisations in DT journey? How do leaders foster a receptive culture of DT in tourism organizations? What are the leadership styles and practices that foster a culture of innovation, learning and collaboration in tourism organisations? What are the challenges and barriers that leaders face in implementing DT in tourism and how to overcome them? How do leaders cope with the challenges and risks of DT in tourism? How do leaders collaborate with their organisation's stakeholders, other sectors and society to leverage the benefits of DT in tourism? What is the impact of DT on leadership roles and responsibilities in tourism and how to cope with them? These are a few open research questions concerning the understanding of how leadership can effectively support DT in tourism

organisations. They call for further research achievements about the rich and complex issues of “human side” of DT in organisations.

#### **4 A research outlook**

Leadership is essential in successful DT projects and activities. Without it, there is a high likelihood of failure. This doesn't mean that the right leadership is the only factor responsible for the success of DT. Collaborative effort between leaders and all the employees who are working for and on the transformation is crucial. However, having proper digital transformative leadership skills at all levels of an organization is just one piece of the wider mosaic of organisational and management issues to deal with to successfully navigate in DT journey. The challenges that tourism businesses have to face in their DT journey can vary significantly depending on several factors such as: type, size and the subsector the tourism businesses belong (Calvino et al., 2018; OECD, 2019); access to technologies, information, expertise, advice, mentoring and other resources and support (OECD; 2020); management and strategy-making capabilities (Rachinger et al., 2018); location of the business, the social and economic context, and the access and availability of digital technologies (Dredge et al., 2018). Therefore, unlocking the potential of digital technologies and DT in tourism requires a nuanced approach. Besides this, what is sure is that tourism businesses have a lot of room for improvement in using and applying digital solutions, although they may gain from ICT investments in other sectors by outsourcing some of their business activities, e.g. sales and online advertising (OECD, 2019).

From a research perspective, studies on DT in tourism businesses and the impact of leadership and management on the digital technologies adoption and exploitation are still in their infancy (Pesonen, 2020). To date there are still several key knowledge gaps on which research should focus in the future, using both quantitative and qualitative research methods and numerous research questions should be deeply explored (Cabiddu et al., 2014; Gretzel et al., 2020; Pesonen, 2020). Among them: what is the impact of DT on tourism micro SMEs and their competitiveness, innovation and productivity? What are the challenges and opportunities of DT for different types of tourism businesses, such as hotels, travel agencies, attractions, etc.? What is the role of government and policy in creating the right framework conditions and support mechanisms for DT in tourism? What are the ethical, social and environmental implications of DT for

tourism stakeholders and destinations? What are the emerging trends and technologies that are shaping the future of tourism, such as the metaverse, industry 5.0, AI, etc.? What is the role of management and leadership in technology acceptance models and use of technology? How managing the whole process from the introduction of new technology in tourism to technology affordance?

These are a few open research questions in the management literature regarding the understanding of how tourism businesses can effectively set up, implement, and manage DT. They open the way for further research achievements about the rich and complex environment in which digital technologies advancements introduce new ways of thinking, working and building capabilities in tourism businesses.

## **Abstract**

Life Cycle Assessment (LCA) and related methods have been widely used for sustainability assessment. However, the integration of these methods with quantitative methods such as mathematical models, statistical methods, and artificial intelligence has received less attention. This literature review aims to examine how these methods have been integrated to pursue sustainability assessment objectives. A systematic literature review was conducted using Scopus database. The search was limited to articles published in peer-reviewed journals from 1960 to 2022. The search keywords included Life Cycle Assessment, Social Life Cycle Assessment, Environmental Life Cycle Costing, Emery Accounting, Sustainable Value Stream Mapping, mathematical methods, statistical methods, economic methods, simulation methods, building information modelling methods, and artificial intelligence methods. The literature review identified a total of 150 articles that addressed the integration of Life Cycle methods and quantitative methods for sustainability assessment. The majority of studies focused on the integration of LCA with mathematical models, statistical methods, and artificial intelligence methods. The studies demonstrated that the integration of these methods can improve the accuracy and reliability of

sustainability assessments. Additionally, several studies proposed novel methods, such as the integration of LCA with building information modelling and simulation methods. The integration of Life Cycle methods and quantitative methods has the potential to enhance sustainability assessments by providing more accurate and reliable results. However, the integration process requires careful consideration of the assumptions, data quality, and uncertainties associated with each method. Further research is needed to develop standardized guidelines for integrating these methods and to identify the most effective integration approaches for specific sustainability assessment objectives.

**Keywords:** Life Cycle Assessment (LCA), Quantitative assessment methods, sustainability assessment.

**Paper type** – Academic Research Paper

## 1 Introduction

Firms nowadays are adopting sustainability methods to assess the performance of purchasing, production and distribution systems. However, the rise of sustainability has questioned the explanatory power and usefulness of extant Life Cycle methods, including Life Cycle Assessment (LCA), social Life Cycle Assessment (s-LCA), Life Cycle Costing (LCC), EMergy Accounting (EMA), and Value Stream Mapping (VSM).

Life Cycle methods allow organizations to evaluate and improve the sustainability of their products and processes. However, these methods can benefit from the integration of quantitative methods used for decision-making, such as mathematical methods, statistical methods, economic methods, simulation methods, building information modeling methods, and artificial intelligence methods.

LCA is based on the fundamental tenet that all stages of a system or product's production, from resource extraction to final disposal, must be considered to effectively estimate the environmental impact of the system or product. LCA is the computation and assessment of the potential environmental impacts over the life cycle of a good, material, or service, as well as the ecologically relevant inputs and outputs.

S-LCA sheds light on the social repercussions connected to a product's life cycle, although it still lacks details and is still being developed. S-LCA was described by Andrews et al. (2009) as an assessment technique that aims to evaluate social and economic aspects of products and their potential positive and

negative impacts throughout their life cycle, which includes raw material extraction and processing, manufacturing, distribution, use, re-use, maintenance, recycling, and final disposal.

LCC identifies the total amount of money spent to support an object from its conception and manufacture until the end of its useful economic (White and Ostwald, 1976).

EMA is a thermodynamics-based and systems-oriented methodology providing an assessment of processes from the viewpoint of the environment (Odum, 1994; Raugei et al., 2014). All available energy (exergy) used both directly and indirectly to create a resource in the biosphere and to manufacture a good or a service for the economy is referred to as "eMergy" (spelled with a capital M). Therefore, all the thermodynamic effort necessary to produce a resource throughout time must be known to compute the resource's eMergy value.

VSM has its roots in lean management domain. VSM attempts to find waste in manufacturing processes and eliminate it in a way that is effective (Hines and Rich, 1997). The definition of waste originally came from an economic standpoint, emphasizing squandered time and inventory as signs of ineffective manufacturing systems. VSM has been modified to include more environmental (waste) indicators because of a growing awareness of the potent synergies between lean and green manufacturing.

Recently, there have been paradigm shifts in how companies assess sustainability. Firms are abandoning the idea that sustainability is mostly an internal process and they inflow external knowledge to renew firms' knowledge base and improve their sustainability performance.

Meanwhile, scholars found evidence that the integration of different methods is critical for assessing sustainability processes. Consequently, firms are nowadays devoting considerable effort to improving their sustainability assessment methods and especially through the integration of Life Cycle methods and quantitative methods, including mathematical methods, statistical methods, economic methods, simulation methods, building information modeling methods, artificial intelligence methods. Several studies have explored the integration of these methods in various contexts, including product design (Luo et al., 2021), supply chain management (Li et al., 2018), waste management (Yao et al., 2020), and sustainability assessment (Guan et al., 2021). These studies highlight the potential benefits of integrating these methods, including improved decision-making, increased transparency, and more holistic sustainability assessments.

With these premises, in the attempt to move the sustainability assessment literature streams forward, this study analyzes the integration of Life Cycle methods and quantitative methods to pursue sustainability assessment objectives. The aim is, thus, to systematize previous studies revealing the link between the adoption of sustainability assessment approaches and other more general managerial assessment methods, with reference to the decision-making methods. To achieve this aim, this literature review aims to analyze the current state of research on the integration of Life Cycle based methods and quantitative methods for decision-making. It will examine the existing literature on the integration of these methods, identify gaps and challenges, and provide recommendations for future research. In this paper, we focus on the following quantitative methods:

- *Mathematical methods*: are essential tools for solving problems and modeling complex systems in various scientific fields, including physics, engineering, economics, and computer science (Luenberger & Ye, 2008);
- *Statistical methods*: are a fundamental part of scientific research and data analysis, providing tools for summarizing and interpreting data, making predictions, and testing hypotheses (Gelman et al., 2014);
- *Economic methods*: are a set of quantitative tools and techniques used to analyze economic phenomena and make informed decisions;
- *Simulation methods*: are a powerful tool for modeling complex systems and predicting their behavior (Banks et al., 2005);
- *Building information modeling methods*: is a digital representation of a building or construction project, which includes information on its physical and functional characteristics;
- *Artificial intelligence methods*: is a branch of computer science that involves the development of algorithms and models that enable machines to perform tasks that would normally require human intelligence;

The remainder of the paper is structured as follows. In Section 2, we discuss the methodology adopted to collect and review relevant papers. Section 3 presents a summary of the findings, while Section 4 presents conclusions, implications and research limitations and future steps.

## 2 Methodology

To explore the sustainability assessment framework outlined in Figure 1, we followed the systematic review methodology presented by Tranfield et al. (2003), which identifies the use of transparent criteria in the selection of publications to review and outlines the phases to provide a replicable review. First, an initial list of keywords was set. The keywords emerged from an in-depth analysis of key documents defining life cycle methods (e.g., Guinee et al. 2011; Hellweg et al., 2014) and quantitative assessment methods (e.g., Ha and Krishnan, 2008), from the authors' experience in the field and from interviews with a panel of experts composed of sustainability consultants operating in different sustainable transition projects (Tasca, 2010). Two categories of keywords were defined, related to life cycle methods and quantitative assessment methods. An example of a string used to search articles in the Scopus database is: "*life cycle assessment*" OR "*LCA*" AND "*Analytic Hierarchy Process*" OR "*AHP*".

For an article to be eligible for consideration, it had to include one of the combinations of keywords from the first and the second categories in the title, abstract or keywords. The search ended on February 20th, 2023, and was conducted through the Scopus database. We limited our search to articles published between 1960-2022. The publishing journals, in addition to any other potential field, had to pertain to at least one of the following main fields, namely, business, management and accounting, economics and econometrics, decision sciences and finance. The review was limited to empirical peer-reviewed journal articles and neglected books, book chapters and conference proceedings. According to these selection criteria, an initial sample of 309 articles was retrieved. The titles and the abstracts of these articles were reviewed to exclude those articles that were considered to not be relevant for the research, thereby leaving 245 articles. We fully read the 245 papers, but only 150 were deemed suitable for consideration. The content analysis for the paper selection was guided by the following inclusion/exclusion criteria. First, the articles had to examine the interplay between life cycle methods and quantitative assessment methods. Second, the articles had to provide implications for the sustainability assessment field. Third, any articles presenting exclusively technical aspects without a managerial perspective were also excluded. Overall, the selection process was collaborative, with discussions on articles that were deemed to not fully meet all the criteria (Combs et al., 2010).

Figure 1 shows the sustainability assessment framework adopted. Particularly, it is worth underlining that it presents only macro-categories of quantitative assessment methods, but not the single approach and methods considered in each of these. Also with regard to the life cycle assessment approaches, Figure 1 does not show the combinations of methods considered in the search in the Scopus database.

Simulation methods					
Statistical methods					
Artificial Intelligence methods					
Mathematical methodology					

### 3 Findings

In the following subsections, we present the life cycle methods across the quantitative assessment methods, reflecting each cell of our sustainability assessment framework.

#### 3.1 Mathematical methods

##### 3.1.1 Multi-criteria decision making (MCDM)

The use of multi-criteria decision-making (MCDM) methods is a useful approach to evaluate the environmental impact of products, production processes, and other human activities. MCDM allows for a comprehensive product evaluation by considering environmental, economic, and technical criteria. The integration of MCDM with LCA has been applied in several studies, (Vukelic et al., 2017; Yoris-Nobile et al., 2022; Kamble et al. 2017). The combination of MCDM and LCA provides a systematic approach to estimate environmental risks/impacts, costs, and the technical feasibility of processes, allowing decision-makers to select optimal solutions.

### 3.1.2 Multiple-attribute utility theory (MAUT)

In decision theory, a multi-attribute utility function is used to represent an agent's preferences for bundles of goods under both certain and uncertain conditions. Rochat et al. (2013) combined three evaluation methods, MFA, LCA, and MAUT, to support the selection of the best end-of-life scenarios for PET waste in a developing country's municipality. MFA analyses the material and energy balance of a business, region, or nation, identifying the most relevant processes; LCA evaluates multiple environmental impacts of a product or service from cradle to grave; and MAUT allows for the inclusion of other aspects along with ecological ones in the evaluation.

### 3.1.3 Data envelopment analysis (DEA)

Data Envelopment Analysis (DEA) is a non-parametric method used to estimate the production frontier in operations research and economics (Cooper et al., 2007, Vázquez-Rowe et al., 2010, Vázquez-Rowe and Tyedmers, 2013). It provides a mathematical programming method to estimate the production frontier of best practices and evaluate the relative efficiency of different entities (Bogetoft and Otto, 2011). DEA is widely used in the fields of economic efficiency estimation research (Ferreira et al., 2021), regional economics (Ibrahim et al., 2021), optimal resource allocation (Ibrahim et al., 2019), sustainable development (Amin et al., 2022), performance evaluation (Amaral et al., 2022, Cetrulo et al., 2020), and risk assessment (Hu et al., 2018). The advantages of this method include: (1) it can process more input and output data and obtain a single efficiency value; (2) no specific assumptions are required; (3) there are no restrictions on the units of measure of inputs and outputs; (4) it allows the calculation of the relative efficiency of points with respect to a given data set (Cooper et al., 2007). In recent years, the scientific community has used the joint application of LCA and DEA to identify and quantify the potential environmental consequences of operational inefficiency (Mohseni et al., 2018, Venkatesh et al., 2018). This type of mash-up has a unique preponderance. That is, while LCA collects inventory data and evaluates the environmental impacts of DMUs, DEA uses this information to individually evaluate their eco-efficiency. In addition, DEA provides individual environmental and economic targets for improving inefficient DMUs based on best practices. Previous studies have demonstrated the feasibility and effectiveness of combining the two methods in research fields related to

industrial ecological eco-efficiency (Avadi et al., 2014, Vázquez-Rowe et al., 2010; Mohammadi et al., 2013, Mohseni et al., 2018, Masuda, 2016, Nabavi-Pelesaraei et al., 2017, Rybczewska-Błazejowska and Gierulski, 2018).

Moreover, in cases where the number of evaluated structures (rafts) is high, the interpretation of results becomes rather difficult if LCA is used alone. According to it, Lozano et al. (2009) demonstrate the adequacy of the joint application of LCA and DEA tools, contributing to facilitating and enriching the discussion and interpretation of results by combining strengths and minimizing weaknesses attributable to both methodologies.

From the scientific literature, articles have also been found that combine Energy Analysis (EA) and Data Envelopment Analysis (DEA) (Mwambo et al., 2020; Liu et al. 2019; Martín-Gamboa et al. 2016). Other studies combine Energy Analysis and Dynamic Data Envelopment Analysis (DDEA) for the eco-centric evaluation of multiple similar entities over a prolonged period. The combined use of Energy Analysis and DDEA is considered a valid methodological framework for calculating resource efficiency and evaluating ecosystem services.

#### *3.1.4 Analytic hierarchy process (AHP) and Analytic network process (ANP)*

Analytic Hierarchy Process (AHP) is a multicriteria decision-making support technique developed in the 1970s by mathematician Thomas L. Saaty. Professionals can benefit from LCA + AHP to obtain better results in their studies and provide more practical solutions. In addition to the LCA, the LCC has also been integrated with AHP (e.g. Goussous et al. 2014; Xu et al. 2019).

Analytic Network Process (ANP) is a more general form of the Analytic Hierarchy Process (AHP) used in multi-criteria decision analysis. The AHP structures a decision problem into a hierarchy with a goal, decision criteria, and alternatives, while the ANP structures it as a network. In the study of Kek and Vinodh (2016), LCA integrated with ANP is used for selecting sustainable production processes by comparing injection molding (IM) and selective laser sintering (SLS) processes, identifying IM as the most sustainable process for higher production volume. Specifically, LCA is used to calculate the impact score and ANP is used to calculate the sustainability score of the Single Point Production Sustainability Score (SPPSS) process.

### *3.1.5 Decision making trial and evaluation laboratory (DEMATEL)*

Decision making trial and evaluation laboratory (DEMATEL) is considered an effective method for identifying cause-effect components of a complex system. It involves evaluating the interdependent relationships between factors and identifying critical ones through a visual structural model. Life cycle thinking is becoming increasingly important in addressing sustainability challenges within supply chains. In this regard, LCA has been widely used for assessing the environmental impacts of product systems; however, traditional LCA methodologies have various limitations. Blockchain technology offers great potential to overcome these limitations, but its adoption is hindered by various factors. For instance, the study by Farooque et al. (2020) aims to identify and prioritize barriers to blockchain-based LCA. Additionally, fuzzy DEMATEL was used, an extension of fuzzy sets to the standard DEMATEL technique, which can handle intrinsic biases and vagueness in human judgments. The prioritization of the identified barriers through DEMATEL provides a systematic way of analysing how to overcome the barriers.

The VSM method is very effective for the environmental and economic performance of production processes. Aouag et al. (2020) integrate VSM and fuzzy DEMATEL, using the former for data collection and process evaluation and the latter for analysing the current state map. The implementation of the proposed approach provided ample room for improving the economic and environmental aspects of production processes. The development of the extended VSM method helps to assess and control the economic and environmental performance of production processes.

### *3.1.6 Linear programming (LP)*

Linear programming (LP) is a branch of operations research that deals with the study of algorithms for solving linear optimization problems. LCA is also useful in waste management and food waste reduction, as shown by Laso et al. (2019), who use LCA combined with linear programming LP. Since 1990, LP has been combined with Life Cycle Assessment-Ment (LCA) to aid decision-making in sustainability studies (Steubin et al., 2016) or even to tackle the problem in reverse, i.e., estimate the value intervals in which the weights associated with a set of environmental impacts must be present (Cortés-Borda et al., 2013).

Again, Budzinski et al. (2019) also aim to demonstrate, through an example of biorefineries, how LCA can be improved by using linear programming (LP) (i) to determine the optimal choice among new technologies, (ii) to identify the optimal region to provide the raw material, and (iii) to deal with multifunctional processes without specifying a particular main product. By combining the LCA and consequential LCC objectives within a linear programming approach, it is possible to address environmental and economic trade-offs in the resulting decision-making process.

### *3.1.7 Mixed integer linear programming (MILP)*

An integer programming problem is an optimization or feasibility mathematical program where some or all variables are constrained to be integers. In most literature, the goal of studies is to simplify LCA studies by reducing the number of impact categories to evaluate. The integration of LCA and MILP optimization methods could lead to significant time and resource savings associated with data collection. Additionally, this work opens new avenues for the development of more effective environmental regulations that focus on controlling a limited number of key impacts. Finally, the MILP formulation allows for finding a global optimum without significant computational difficulties.

### *3.1.8 Fuzzy set theory (FST)*

Fuzzy logic is a logic in which a degree of truth between 0 and 1 can be assigned to each proposition. It is a many-valued logic, an extension of Boolean logic, and is related to the theory of fuzzy sets. Besné et al. (2018) present an eco-efficiency analysis methodology that takes into account life cycle assessment (LCA) and fuzzy logic. The aim is to integrate economic and environmental impact categories using fuzzy treatment and obtain the fuzzy eco-efficiency index. Thanks to this study, the validity of the proposed methodology has been validated. Fuzzy set theory is a research approach that can address problems related to ambiguous, subjective, and imprecise judgments, and can quantify the linguistic aspect of available data and preferences for individual or group decision-making processes (Shan et al., 2015a).

reveal the usefulness of the fuzzy-based approach in quantifying long-term spare parts management costs.

The VSM-fuzzy integration model has been applied in various fields in the Rathore et al. (2022), Liu et al. (2020), Seyedhosseini et al. (2013) papers, as a tool

that integrates lean and ergonomics to improve worker health and safety, together with operational performance in small and medium-sized enterprises, to improve the VSM methodology. Moreover, Taskhiri et al. (2011) and Reza et al. (2013) papers explore the usefulness of fuzzy-based methods in emergy synthesis.

Generally speaking, results indicate that fuzzy-based modeling can provide a better understanding for both emergy and LCA professionals.

#### *3.1.9 Multi-objective optimization*

Multi-objective optimization is a branch of mathematical optimization that specifically deals with optimization problems with multiple objective functions. According to Lourenço (2020), LCA should also be included in a problem of optimizing costs and environmental impact of a CCPP. The novelty of this work is in the methodology itself, namely the simultaneous application of a fuel, equipment and emissions LCA and a cost estimation in the optimization problem formulation.

### **3.2 Statistical methods**

#### *3.2.1 Analysis of variance (ANOVA)*

Analysis of variance is a set of statistical techniques that are part of inferential statistics that allow for the comparison of two or more groups of data by calculating and comparing the variability within these groups with the variability between groups. The ANOVA methodology has been used in conjunction with LCA in two papers by Mousazadeh et al. (2020) and Verbitsky et al. (2018) with the aim of minimizing the initial and life cycle cost of the building while simultaneously improving the seismic performance of the base-isolated structure. According to the results, the proposed approach proves to be effective in reducing the initial cost and life cycle cost of the building with an acceptable amount of computational effort.

#### *3.2.2 Correlation*

In statistics, a correlation is a relationship between two variables such that each value of the first corresponds to a value of the second, following a certain regularity. In these papers, the correlation between input parameters and the outcome of an uncertainty analysis performed for an LCA (Bojacá et al. 2010,

Groen et al. 2017) is analysed. Correlation is also used with the s-LCA methodology in the work of D'Eusanio et al. (2022). This work shows that, although the distinction between the two methodologies is clear from a theoretical point of view, when the existing differences are implemented, they become blurred.

### *3.2.3 Regression*

Regression formalizes and solves the problem of a functional relationship between variables measured based on sample data extracted from a hypothetical infinite population. The studies by Balugani et al. (2021), Grant et al. (2016), and García et al. (2019) examine the use of inferential statistics, particularly multivariate correlation and regression, as a means of interpreting LCA data. The use of inferential statistics provides useful information regarding the strength and statistical significance of correlations between variables, as in multivariate correlation, and allows for impact predictive capabilities, as demonstrated through regression analysis. The result is that these equations allow for simple and rapid estimation of very different scenarios that reflect the reality of different farms at present, but also future scenarios based on the implementation of technologies that will reduce both feed and fuel consumption.

### *3.2.4 Factor analysis*

Factor analysis is a statistical method used to describe variability among observed, correlated variables in terms of a potentially lower number of unobserved variables called factors. Factor analysis (FA) and latent class analysis (LCA) methods were studied in the document by Cao et al. (2021). Factor analysis is useful for understanding which foods are consumed in combination and for studying associations with biomarkers, while LCA is useful for classifying individuals into mutually exclusive subgroups and comparing disease risk between groups. Factor analysis was also combined with the LCC methodology in the document by Shamsuddin et al. (2021), which highlights a study result simulating the causal effect relationship between IBS cost factors and LCC cost distribution.

### **3.3 Economic methods**

#### *3.3.1 Activity based costing (ABC)*

Activity Based Costing (ABC) is a method of studying an industry or business that provides data on the actual costs associated with each product and service sold by the company, regardless of its organizational structure. In the three documents Jourdain, et al. (2021), Tsai, et al. (2015), Tsai, et al. (2014), the integration of Life Cycle Assessment (LCA) into an Activity-Based Costing (ABC) cost determination model to develop a guidance system for the electrical and electronic industry or for CO<sub>2</sub> emission costs and low-carbon construction methods has led to very encouraging results to help construction company managers better understand how to allocate resources and funding for energy-saving activities to each green building through appropriate cost drivers.

#### *3.3.2 Return on Investment (ROI)*

ROI is a financial index that measures the profitability and economic efficiency of a business irrespective of the sources utilized. It determines how much capital invested in a company is generating revenue. The analysis of ROI has been combined with Energy methodology to consider the environmental impact of energy resource exploitation and assess the energy return on investment (EROI) more effectively. EmEROI has the potential to be used as an integrated aspect of energy resource exploitation project assessments. Chiriboga et al. (2020) combined LCA and Energy analysis to determine the EROI of bioethanol and biodiesel in Ecuador. They evaluated the entire production chain by statistically processing primary and secondary information. The results suggest that EROI can serve as a technical criterion to minimize the impact on other energy resources and economic sectors.

### **3.4 Simulation methods**

#### *3.4.1 Monte Carlo*

The Monte Carlo method is a broad class of computational methods based on random sampling to obtain numerical results. It can be useful in overcoming computational problems associated with exact tests. In the papers by Sun et al. (2020), Vinodh et al. (2014), Hongxiang et al. (2013), Peters, G.P. (2007), the use of a combination of life cycle assessment (LCA) and Monte Carlo simulation to

evaluate potential environmental benefits in various areas is described. It is noted that through the study and research of the integration of these two methodologies, similar results have been obtained for all documents. The results show that the model is able to evaluate the potential reusability of used products, while the use of simulation significantly increases the effectiveness of the model in dealing with uncertainties. System dynamics is an approach to understanding the behavior of complex systems over time.

#### *3.4.2 System dynamics*

System Dynamics analysis is also integrated with the VSM methodology in the article by Stadnicka et al. (2019), observing how integration can increase the possibilities of waste identification and elimination. The article demonstrates that the proposed extended VSM can be used as a single data source for building a computer model of a production line. The paper also argues that the integration of VSM and SD not only enables the identification and elimination of waste but also understanding the impact of identified issues on WIP and production volume.

#### *3.4.3 Discrete-event simulation*

A discrete event simulation models the operation of a system as a (discrete) sequence of events over time. The VSM methodology is also used in the papers by Abidee et al. (2021) and Aziz et al. (2017), studying integration with Discrete-Event Simulation to enable dynamic quantification and visualization of the future state of a value stream map of warehouse supply chain and to improve productivity of road paving operations by achieving high production rates and minimal road closure times. A hybrid DES-VSM approach ensures an integrated approach to process optimization.

### **3.5 Building information modeling methods**

#### *3.5.1 Building information modeling (BIM)*

Building information modeling (BIM) stands for a method for optimizing the planning, construction, and management of buildings using software. Through it, all relevant data of a construction can be digitally collected, combined, and linked. The Building Information Modeling methodology is integrated with LCA in six documents (Morsi et al. 2022, Cheng et al. 2022, Abdelaal et al. 2022, Bueno et al.

2018, Najjar et al. 2017, Hollberg et al. 2020) applying the methodological combination in different fields. The common results identify BIM-LCA integration as an optimal procedure to achieve sustainable development and environmental protection and enhance decision-making processes in the construction sector.

### **3.6 Artificial intelligence methods**

#### *3.6.1 Machine learning*

Machine learning is a branch of artificial intelligence that encompasses methods developed in various scientific communities over the last few decades of the 20th century. The interaction of LCA methods and machine learning (ML) in the studies of Akhshik et al. (2022), Karka et al. (2022), and Ghoroghi et al. (2022) has highlighted that ML-informed LCA based on dynamic data paves the way for more accurate LCA, supporting the decision-making process of the life cycle. Machine learning methods have been demonstrated to be efficiently applied in optimization scenarios in LCA and have been integrated as part of existing inventory databases to simplify LCA in many use cases.

#### *3.6.2 Neural networks*

In the field of machine learning, an artificial neural network is a computational model composed of artificial "neurons," loosely inspired by the simplification of a biological neural network. The integration between LCA and artificial neural network has been applied in several case studies with application in different sectors (e.g. tomato-based cultivation, lentil cultivation) (Elhami et al. 2017; Ozbilen et al., 2013; Pishgar-Komleh et al., 2020).

#### *3.6.3 Genetic algorithms*

A genetic algorithm is a heuristic algorithm used to try to solve optimization problems for which no other efficient algorithms of linear or polynomial complexity are known. In the documents by Mousavi-avval et al. (2021), Gheibi et al. (2018), and Khoshnevisan et al. (2015), the use of LCA methodology combined with the multi-objective genetic algorithm was analyzed. Often, these two methods are further combined with additional techniques, such as adaptive neuro-fuzzy inference system, a multi-objective genetic algorithm, and metaheuristic genetic algorithm approach.

#### 3.6.4 Adaptive neuro-fuzzy inference system (ANFIS)

Khoshnevisan et al. (2014), Nabavi-Pelesaraei et al. (2019), Mousavi-avval et al. (2021), and Moayedi et al. (2020) used the LCA methodology and the ANFIS to predict environmental impacts in different fields. The common results in these papers demonstrate the usefulness of the multi-level adaptive neuro-fuzzy inference system for long-term management planning in predicting various environmental, energy, and economic indices of large-scale food production systems.

## 4 Conclusions

This study reveals that the integration of life cycle methods and quantitative methods for sustainability assessment is a rapidly evolving field that has attracted significant research interest in recent years. The review highlights that there is a wide range of methods and approaches available for integrating life cycle methods and quantitative methods, and these methods are being applied across a variety of sectors and domains, including manufacturing, energy, transportation, and agriculture. The review also shows that the integration of these methods can improve the accuracy, robustness, and transparency of sustainability assessments, and can help stakeholders make more informed decisions that balance economic, environmental, and social considerations.

The review found that the integration of Life Cycle methods with quantitative assessment methods offers a comprehensive and holistic approach to sustainability assessment. These methods provide a framework for assessing the environmental, social, and economic impacts of products and systems over their entire life cycle, leading to more informed and sustainable decision-making.

The review also identified some challenges in the integration of these methods, such as the complexity and data requirements of Life Cycle methods, the need for expert knowledge and skills, and the need for harmonization and standardization of the assessment methods.

The review identifies several future research directions that can help advance the field of sustainability assessment. First, there is a need for more research on the application of these methods in specific domains, such as food systems, water management, and construction. Second, there is a need for research that compares different methods and approaches to identify the most effective and efficient ways to integrate life cycle methods and quantitative methods. Third,

there is a need for research on the use of emerging technologies, such as artificial intelligence and big data analytics, in the integration of life cycle methods and quantitative methods.

### Abstract

Tourism is a complex and multidimensional phenomenon that involves social, cultural, and economic dimensions. While the economic benefits of tourism are often studied, there is a lack of a solid methodological framework to measure the impacts of tourism on other components such as the environment and cultural heritage. The tourism ecosystem is a network of resources and operators that spans across different domains and industries. This ecosystem is especially important for inland areas, where tourism can drive socio-economic development and prevent land abandonment. However, the COVID-19 pandemic has severely impacted the European Union's economy, including the tourism industry. Small and medium-sized enterprises (SMEs) have been hit hard, with many planning significant cuts in investments after the pandemic. In response, the EU has proposed a renewed New Industrial Strategy to support investments and strengthen the resilience of the EU Single Market. As part of the TechForYou project aimed at promoting and strengthening collaboration in the Calabria and Basilicata Regions, a data-driven approach using Artificial Intelligence and GeoAI is proposed to monitor tourism trends in inland areas in near real-time. The approach focuses on analyzing the huge flow of data

and information regarding tourism in a territorial/spatial dimension, and characterizes tourism as a relational phenomenon in a territorial perspective. The European Digital Decade initiative aims to improve Europe's competitiveness and ensure that European citizens can fully benefit from the opportunities offered by digital technologies. A single data space with a standard-based structure among all European countries will be established as part of the European Data Strategy, which will include the tourism ecosystem. This will facilitate the sharing of European data in key economic sectors and create a vibrant data-driven economy. In conclusion, a solid methodological framework is needed to measure the impacts of tourism on all components, including the environment and cultural heritage. The tourism ecosystem is a network of resources and operators that spans across different domains and industries, and a data-driven approach using AI and GeoAI can be used to monitor tourism trends in inland areas. The European Digital Decade initiative will establish a single data space with a standard-based structure for the tourism ecosystem, facilitating the sharing of European data and creating a vibrant data-driven economy. The tools derive from the ML and AI and the perspective to exploit the informative potential of available open data sources seems to be an encouraging research direction.

## 1 Introduction

Tourism is a multifaceted phenomenon that encompasses social, cultural, and economic dimensions. It involves flows of people, often travelling for leisure or business purposes, and it is closely linked to territory by local attractors, transportation system and hospitality services. A key lens for tourism analysis is to investigate the economic dimension of tourism activities in order to identify the financial benefits of tourism services in a specific destination while less remarkable efforts were paid to identify other components of impact of tourism flows on environmental, cultural heritage or other social dimensions (Sharpley, 2002). Indeed, the tourism industry produces synergies with sectors such as cultural heritage, transportation, skills, media, smart communities, and others. The transversality of the tourism industry brings researchers to consider the wider concept of tourism ecosystem as a meaningful term identifying the complexity of the interconnected network of resources and operators that spans across different domains and industries (Andreoli & Silvestri, 2017).

Investigating tourism development, the complexity of this spatial/territorial network is well defined in the literature. However it is possible to affirm that there

is a lack of a solid methodological framework accountable both for researchers and decision makers to measure tourism as a complex phenomena and to improve tourism analytics for better decision making and policy design. Researchers and decision-makers need to be able to trust the framework's output and the data that is used to develop it (Scorza, 2018, 2020). Thus, it is essential to ensure that the framework is built upon sound principles and that the evaluation process is objective, transparent, and trustworthy.

So we analysed the heterogeneity of the tourism industry and its transversality consisting of different services and functions because we reckon that these peculiarities will have a great impact on the territory (R. Gatto et al., 2022a, 2022b).

The tourism sector is multidimensional and multi-stakeholders and has tangible and intangible effects on territorial resources, SMEs values and on people of the place. As a matter of fact, tourism is ascribed with a pivotal role, especially in inland area, for increasing social cohesion, sustaining primary services, maintaining historical and cultural heritage, avoiding depopulation and land abandonment and increasing income. Such general idea that tourism may represents the driver to start an effective process of socio-economic development in inland area is a generalized approach in planning tourism public policies (Scorza & Gatto, 2023) and, very often, it remain an ambition hardly to bring effective benefits or expected results (Las Casas et al., 2018; Las Casas & Scorza, 2016).

In common with other sectors of the economy, it has suffered the shock caused by the pandemic. The COVID-19 crisis has hit the EU economy severely. Its impact varies across territories and enterprise sizes. The crisis also highlighted the interdependence of global value chains and demonstrated the critical role of globally integrated and well-functioning European market. In fact, the pandemic has affected the entire business fabric of the European Union and more so SMEs. There are over 23 million SMEs in the European Union (EU), accounting for 99% of businesses and two out of every three private sector jobs. The data show that 60% of SMEs experienced a decline in turnover in 2020, but a more worrisome finding is that 45% of SMEs planned a significant cut in investments after the pandemic. From these lessons learned from the COVID-19 crisis, the EU has proposed a renewed "New Industrial Strategy" (*European Industrial Strategy*, n.d.) to support investments. This Strategy focuses in particular on Strengthening of the resilience of the EU Single Market improving the functioning of the internal

market. Moreover, the Strategy aims to strengthening the resilience of the EU single market to stimulate trade and competition and to fuel growth and create new opportunities for EU businesses.

The EU single market is organized into 14 industrial ecosystems considered as a drivers of EU economy competitiveness and growth and they encompass all players operating in a value chain: from the smallest start-ups to the largest companies, from academia to research, service providers to suppliers. The industrial ecosystems are organized as follows: construction, digital industries, health, agri-food, renewables, energy intensive industries, transport and automotive, electronics, textile, aerospace and defence, cultural and creative culture industries, tourism, proximity and social economy, and retail. Focusing on tourism ecosystem (R. V. Gatto et al., 2023), this is defined by the network of stakeholders who operate the services of: accommodation, tourism travel operators, hospitality services and transport (Curatella & Scorza, 2020).

This paper highlights in a preliminary discussion on the need to define an accountable platform for monitoring tourism trend in inland area. This research is included in a wider project TechForYou aimed at the implementation of the Innovation Ecosystem promoting and strengthening collaboration through interaction and synergies among the academia and research labs, the production system and territorial institutions in the Calabria and Basilicata Regions.

The proposed approach is oriented to data driven tools referring to Artificial Intelligence and especially GeoAI to analyze in a near real time the huge flow of data and information regarding tourism in a territorial/spatial dimension (W. Li, 2020). We also affirm that tourism as a relational phenomena has to be characterized in a territorial perspective in order to point out the role of the "place" intended as a destination of tourism flows, the system of tourism supply, the "chest" of territorial values to be considered in a sustainable exploitation dimension.

## **2 "European digital decade" and data driven approach**

The "European Digital Decade" is an initiative promoted by the European Union (EU) to promote continent-wide digitization. This initiative aims to improve Europe's competitiveness and ensure that European citizens can fully benefit from the opportunities offered by digital technologies. The initiative is a 10-year plan proposed by the European Commission in March 2021, which aims to improve

the digital transformation of businesses and make Europe a leading global player in the digital economy. The ambition is to establish a vibrant data-driven economy and create a single market for data by ensuring the sharing of European data in key economic sectors, with interoperable and common Data Spaces. Following the European Data Strategy (*Data Act: Measures for a Fair and Innovative Data Economy*, n.d.) the tourism ecosystem will have a single data space with a standard-based structure among all European Countries to enable data sharing among various stakeholders and freely guarantee information flow.

The Digital Decade policy programme sets out four digital ambitions targets. The main goals can be summarised in the following points:

- secure and sustainable data infrastructures;
- digital transformation of SMEs;
- digitalisation of public services;
- a digitally skilled population and highly skilled digital professionals.

Therefore, the plan aims to increase the number of digitally skilled citizens in the EU, improve digital infrastructure such as high-speed internet and international cooperation in digital industry, and encourage SMEs and public services to embrace the most advanced digital technologies such as Artificial Intelligence (AI) (Hastie et al., 2021), data and cloud computing, Internet of Things (IoT) and Blockchain.

Among these ambitious goals, for the purposes of this work, we are firstly interested in the definition of secure and sustainable data infrastructures, through the design of a Spatial Data Infrastructures (SDI) able to manage and harmonize the heterogeneity of data related to the tourism ecosystem. Indeed, we believe that tourism analytics using open data is promising in delivering sensible information and knowledge for improving decision making in tourism development. In particular direct benefits could be addressed to tourism services supply organization, increasing SMEs' earnings, sustainable use of resources and ensuring better living conditions for tourism workers, especially in inland areas, and help policy makers toward effective, context-based (Las Casas & Scorza, 2008; Scorza et al., 2022) and sustainable design (Corrado & Scorza, 2022).

The role of data and information in tourism development planning has been radically transformed by the advent of digital technologies, particularly through the explosion of online platforms and social media. In the rapidly evolving of European tourism industry, which generates massive amounts of data, this is crucial for stakeholders across various sectors: including tourism operators,

private organizations, government institutions and policy makers and also academia to stay in touch with ongoing developments and foresee spatial dynamics (Corrado & Scorza, 2022). Therefore, the challenges in using data for tourism depends on data itself and their heterogeneity (Galasso et al., n.d.). There are many data sources to consider in modelling tourism ecosystem. Based on the literature 4 different types of data sources have been identified (J. Li et al., 2018):

- User-generated data;
- Transaction data;
- Device data;
- Context-specific data.

This initial analysis highlights the volume of data to be managed and the complex relationships between the different sources and types of data and also underline a personal data security issue.

Indeed, recognizing the key role of proper data governance is crucial to ensuring data usability, security, and transparency (Chen et al., 2021). Furthermore, dynamic personal and non-personal data interchange must comply with the European Data Protection Regulation (GDPR) (*Data Protection in the EU*, n.d.) standards and ensure the 7 principles outlined in the regulation: 1) lawfulness, fairness and transparency; 2) purpose limitation; 3) data minimization; 4) accuracy; 5) storage limitation; 6) integrity and confidentiality, security; and 7) accountability. Therefore, accountability in the framework is critical as it ensures that the evaluation process is transparent and that the results obtained are reliable.

The Tourism Satellite Account (TSA) (OECD et al., 2001) is a valuable tool for analyzing the economic impact of tourism. The TSA through a standard statistical framework indicates economic measures of tourism impacts since 2008. This methodological framework, developed by the World Tourism Organization in collaboration with the Statistical Office of the European Communities and the Organization for Economic Cooperation and Development, has prepared the basis for regional-level assessment of the economic impact of tourism. As much as this framework takes into account economic, social and environmental indicators, which are essential components in the assessment of the tourism ecosystem, the concept of territory and spatial dynamics remains marginal.

In order to analyze complex spatial dynamics and their socio-economic impacts on different territories, the most advanced data analysis technologies, such as AI, are needed (Athey, 2017). In particular, Machine Learning (ML) techniques are the

enabling technologies that characterize the emergence of GeoAI as a new interdisciplinary field (Mai et al., 2022)(W. Li, 2020). GeoAI algorithms are well-suited to analyze complex spatial processes and patterns. This techniques are focused on the development and application of AI and ML techniques to geospatial data and could identify complex nonlinear relationships, handle large and complex datasets, and get insight based on complex patterns in the dataset. GeoAI can also be used for multidimensional data visualization, which could help to highlight patterns and statistical relationships that may not be immediately see through traditional statistical techniques.

Data driven approaches and innovative methodological approach for data analytics represents the state of the art of territorial analysis and interpretation. In the perspective of tourism ecosystem as a complex produce of territorial organization: physical functional, social etc.; the discussed technology will be adopted to fulfill the requirements of the research project TechForYou. The new analytics for tourism ecosystem represent a precondition to generate new and more robust knowledge of the running territorial trend. The expectations regard the capacity to detect relevant insights in low demand areas where the scale of macro tourist phenomena are not applicable and different metrics has to be set-up.

Those sensible informative system could be a driver for strategic decision making regarding public investment in tourism or infrastructure balancing the issue of territorial development with the demand for basic services in low density areas. The Case study area of the TechForYou project offers a number of relevant cases characterized by internal areas suffering depopulation and underdevelopment but showing a strong potential in tourism development due to the endowment of natural, Cultural and anthropological resources.

The exploitation of such capital is a complex design problem where the issue of values presentation against over-tourism has a critical role.

### **3 Conclusions**

The connection between the "European Digital Decade" and the tourism ecosystem is therefore important to ensure that tourism can fully benefit from digital technologies and that Europe remains globally competitive.

The focus on tourism ecosystem represents the commitment to manage the complexity of tourism phenomena in a Multidisciplinary and multiscale approach.

The tools derive from the ML and AI and the perspective to exploit the informative potential of available open data sources is an encouraging research direction.

Concerning TechForYou, the research will finalize data infrastructures, analytical techniques in a Spatial Data Infrastructure. AI techniques will be at the bases of the design of a Destination Management System useful to address tourism flows in a more sustainable way.

Tourism sector represents a laboratory field of application and the methodological approaches that will be tested and formalized and next will be transferable on other sector characterizing territorial development planning. Implications regards several territorial planning domains (Pilogallo & Scorza, 2022; Santopietro & Scorza, 2021; Scorza, Pilogallo, et al., 2020; Scorza, Saganeiti, et al., 2020; Scorza & Fortunato, 2021, 2022; Scorza & Santopietro, 2021) directly and indirectly connected with tourism sector.

The potential beneficiaries of the research application will be: Public decision makers, SMEs, local cultural operators and stakeholders and finally the people of place representing the main target of sustainable planning .

### **Abstract**

The Directive 2022/2464 on Corporate Sustainability Reporting (CSRD) amended the Directive 2014/95 on Non-Financial Information (NFID) by introducing changes in gender disclosure. Starting by comparing the texts of two Directives, this paper investigates the factors that influenced the new gender information required. The new Directive devotes specific attention to gender equality information, requiring disclosure on equal pay for equal work, training and skills development, and employment. This is the main innovation introduced by CSRD in accordance with the principle of equal gender treatment that has inspired European legislation (EU, 2020). In this respect, CSRD requirements are consistent with the Pay Transparency Directive, which aims to strengthen the application of the principle of equal pay between men and women and the prohibition of discrimination, though also pay transparency mechanisms. These Directives contribute to the achievement of gender equality and the empowerment of all women worldwide, as envisaged in Goal 5 of Agenda 2030 (UN, 2015).

There have been no major changes in the disclosure of diversity on boards and gender policies adopted and their implementations.

This paper contributes to filling a gap in the studies by highlighting an unexplored area of literature related to the changes in quantity, quality and modalities of regulatory gender disclosure requirements.

**Keywords** – Gender research, Gender disclosure, Sustainability reporting, Sustainability standardisation, ESRS

**Paper type** – Academic Research Paper

## 1 Introduction

Over the last decade, there has been a growing interest by international organisations, national authorities, companies, and researchers in the gender issue. Gender equality is one of the 17 goals (Goal 5) indicated in the 2030 UN Agenda for Sustainable Development (UN, 2015). The aim of Goal 5 is to achieve gender equality and empower all women worldwide. UN (2015) recommend to world nations adopt and strengthen sound policies and enforceable regulations for the promotion of gender equality and the empowerment of all women at every level (Paoloni *et al.*, 2023).

In this international context of particular attention to gender issues, various EU legislative initiatives are being raised. One of these is the issuance of the EU Directive 2014/95 on non-financial information (NFID) which requires that specific categories of large European companies provide, among others, information on types of policy used and the results achieved with regard to gender disclosure. The EU Directive implementation required the adoption of guidelines to refer to and how non-financial information is represented. The Guidelines most used by European companies are those published by the GRI (KPMG, 2022).

At the end of 2022, the EU issued Directive 2022/2464 on Corporate Sustainability Reporting that amended, *inter alia*, Directive 2014/95. The new Directive expands the number of entities required to prepare a sustainability report providing the mandatory adoption of sustainability standards issued by the EU, called the European Sustainability Reporting Standards (ESRS). Corporate Sustainability Reporting Directive (CSRD) aims to improve the flow of information about the sustainability of companies. This directive will make undertakings' sustainability reporting more consistent so that all stakeholders can use comparable and reliable sustainability information.

The replacement of the term "non-financial" with "sustainability information" is due to a dissimilar approach to corporate accountability on sustainability issues. Some authors argue this thesis according to whom the change is prompted by a correct interpretation of the materiality principle required by the Non-Financial Reporting Directive (Baumüller and Sopp, 2022; Atanasov, 2022).

This paper aims to analyse the changes in the Directive and the factors influencing this development. From this perspective, we formulate the following research question:

*What factors influence the different gender disclosure requirements between Directive 2014/95 on non-financial information and Directive 2022/2464 on Corporate Sustainability Reporting?*

To comply with the paper's aim, we examine the quality, quantity and modalities of information presentation related to women comparing, on one side, the NFID requirements and, on the other side, the CSRD. This is a way that permits investigation of the reasons for certain changes in progress. The relevant factors taken into account in the analysis are the following:

- Directive 2022/2381 on improving the gender balance among directors of listed companies and related measures;
- the approval by the EU Parliament of the directive on pay transparency measures directive of the European Parliament and the Council to strengthen the application of the principle of equal pay for equal work or work of equal value between men and women through pay transparency and enforcement mechanisms (EU, 2023). This directive can be called a gender directive;
- the speech of the President of the European Commission to the European Parliament, in which she communicated her intention to simplify the sustainability reporting obligations and reduce them by 25% (von der Leyen, 2023). Sustainability reporting also includes gender disclosure; therefore, it can be assumed that there is an intention at the European level to simplify the ESRS drafts also about gender reporting. This should slow down the publication of the final EFRS by the EU.

## 2 The process of accounting harmonisation of sustainability reports

Sustainability has become, over the years, a central theme influencing how undertakings operate and communicate with their stakeholders (Epstein *et al.*, 1976; Larrinaga and Bebbington, 2021; Dhaliwal *et al.*, 2014; Gao *et al.*, 2016). This tendency is powerful in Europe, driven on the one hand by the trend of larger companies to prepare sustainability reports (Camilleri, 2015; Adams and Larrinaga, 2019; Amel-Zadeh and Serafeim, 2017) on the other, induced by intense regulatory pressure (European Commission, 2001; 2011; Cosentino and Venuti, 2023).

Information is central to efficient capital allocations; therefore, investors' demand for sustainability reporting has grown tremendously.

Scholars draw a distinction between two main paths for developing sustainability accounting. Critical theorists argue that corporate accounting is not fit to record and disclose information about corporate social and environmental impacts (Gray and Bebbington, 2000; Gray, 2002; Gray, 2010). However, through awareness raising, this critical approach contributes to developing sustainability accounting and reporting. Another path, the managerial one, views sustainability accounting as "the provider of solutions to problems and directs attention to tools which can support decisions to be made in a set of diverse circumstances by diverse actors, different types of managers as well as different stakeholders" (Burritt and Schaltegger, 2010:842).

The logical conclusion is that both paths must be followed if sustainability is to become anything more than an exercise in awareness-raising and problem-solving. Thus, sustainability accounting and reporting development should be more geared, on the one hand, towards improving management decision-making, on the other hand, to the convergence process towards standardising the sustainability accountability report.

However, the convergence process towards standardising the sustainability accountability report is still far from being completed for various reasons.

Firstly, many overlapping and slightly different sustainability concepts exist, such as corporate social responsibility and ESG (environment, social and governance) (Stolowy and Paugam, 2023; Berg *et al.*, 2022; Gillan *et al.*, 2021). At the same time, there is disagreement about its measurement and coexist different sustainability reporting: integrated reporting, sustainability reporting and non-financial reporting (Kimbrough *et al.* 2022).

The different views of sustainability and the distinct forms of measurement and reporting also depend on the coexistence of various international organisations engaged in sustainability reporting or the promotion of sustainable activities, such as the Global Reporting Initiative (GRI) and the Sustainability Accounting Standard Board (SASB, recently absorbed by the ISSB) which are among the international organisations that enjoy a high level of legitimacy and claim sovereignty over corporate sustainability reporting.

Further aspects that hinder the homogenisation of sustainability standards lie in the different relevance states give to the issue.

Some jurisdictions, such as the EU, require undertakings to disclose information about several dimensions of sustainability, whereas other states follow a voluntary sustainability disclosure approach (Giner, 2022). Furthermore, in some countries, mandatory sustainability-related disclosures are required for specific sectors (e.g. extraction industries in the USA) (De Lange and Howieson, 2006) or particular sustainable activities (e.g. corporate philanthropy activities in the UK or India) but not in other fields (Darendeli *et al.*, 2022). Lastly, certain countries allow firms to choose among several frameworks (e.g. GRI, SASB), even for mandatory sustainability reports.

### **3 Research methodology**

To comply with the paper's aim, we compare the legal provisions of two Directives (NFID vs CSRD). The method of comparison, appropriately adapted, is usually applied in studies of international comparative accounting and the evolution of standards (Nobes and Parker, 2010; Gebhardt, 2000; Van der Tas, 1988).

The specific purpose of this line of study often leads to considerations concerning the convergence process of accounting standards and the factors determining it (Van der Tas, 1988). In other words, this approach permits focusing on the various elements of rupture with respect to the past discipline and highlights the various innovative elements (Baldini, 2023).

This paper adopts the comparative approach between regulatory sets to identify the change that has occurred in the accounting rules and then carry out considerations on the ongoing evolutionary process and the factors that determine it. To this purpose, the paper examines the quality, quantity and modalities of information presentation related to women comparing, on one side,

the NFID requirements and, on the other side, the CSRD requirements. This is a way that permits investigation of the reasons for certain changes in progress.

The standards adopted by companies to implement the provisions of these directives are not examined in this phase of the research. The standards are essentially GRI in the case of NFID and draft ESRS in the case of CRSD. To date, the ESRS are still being defined.

The analysis carried out is of a qualitative nature under a double aspect: i) considering the type of analysis performed (content analysis of Directives paragraphs) and ii) due to the fact that the CSRD will enter into force starting in 2024.

For the purposes of the research, the requests in terms of gender disclosure of the Directives are first compared, initially examining the recitals and then the articles of the two Directives.

The analysis is carried out by identifying homogeneous clusters on a conceptual level on which to highlight any existing differences and the reasons for these differences.

## **4 Results and Discussion**

### ***4.1. Comparison of Directives requirements***

Tables 1 and 2 contain the comparison between NFID and CSRD as regards gender requirements. Table 1 compares the text of two Directives' recitals while Table 2 compares the text of their articles. Bold fonts are not present in the original texts of the Directives analysed and were added by the paper's authors to emphasise gender requirements. Thus, identifying the parts specifically referring to gender issues can be considered a first result of the research. The numbers next to the texts shown in Tables 1 and 2 indicate, respectively, the paragraph number of the recital and the article number from which the texts were extracted.

Table 1- Comparison of gender disclosure in the Directives recitals

<b>Directive 2014/95 (NFDI)</b>	<b>Directive 2022/2426 (CSRD)</b>
<p>(7) As regards social and employee-related matters, the information provided in the statement may concern the <b>actions taken to ensure gender equality</b></p>	<p>(49) Sustainability reporting standards should specify the information that undertakings should disclose on social factors, including working conditions, social partner involvement, collective bargaining, <b>equality, non-discrimination, diversity and inclusion, and human rights.</b></p> <p>Sustainability reporting standards that address social factors should specify the information that undertakings should disclose with regard to the principles of the European Pillar of Social Rights that are relevant to businesses, including <b>equal opportunities for all and working conditions. ...</b></p> <p>Sustainability reporting standards that address <b>gender equality</b> and equal pay for work of equal value should specify, amongst other things, <b>information to be reported about the gender pay gap</b>, taking account of other relevant Union law</p>
<p>(18) <b>Diversity</b> of competences and views of the <b>members of administrative, management and supervisory bodies</b> of undertakings facilitates a good understanding of the business organisation and affairs of the undertaking concerned. It enables members of those bodies to constructively challenge the management decisions and to be more open to innovative ideas, addressing the similarity of views of members, also known as the 'group-think' phenomenon. It contributes thus to effective oversight of the management and to successful governance of the undertaking. It is therefore important to enhance transparency regarding the diversity policy applied. This would inform the market of corporate governance practices and thus put indirect pressure on undertakings to have more <b>diversified boards</b></p> <p>(19) <b>The obligation to disclose diversity policies in relation to the administrative, management and supervisory bodies with regard to aspects such as, for instance, age, gender</b> or educational and professional backgrounds should apply only to certain large undertakings. Disclosure of the diversity policy should be part of the corporate governance statement, as laid down by Article 20 of Directive 2013/34/EU. If no diversity policy is applied there should not be any obligation to</p>	<p>(3) ... <b>diversity on company boards</b> might have an influence on decision-making, corporate governance and resilience.</p> <p>(49) Sustainability reporting standards that <b>address diversity should specify, amongst other things, information to be reported on gender diversity at top management and the number of members of the under-represented sex on their boards</b></p>

put one in place, but the corporate governance statement should include a clear explanation as to why this is the case	
	(58) In order to progress towards a more gender-balanced participation in economic decision-making, it is necessary to ensure that undertakings whose securities are admitted to trading on a regulated market in the Union always <b>report on their gender diversity policies and the implementation thereof</b>

Source: Authors' elaboration on the basis of NFID and CSRD

By comparing the recitals of the two Directives, three conceptual clusters emerge which can be likened: i) gender equality; ii) diversity in the boards; iii) gender policies and implementation thereof.

The first cluster concerns the actions taken by companies to ensure gender equality. In the NFID the issue is only stated as a general principle, without providing application details. In the CSRD, on the other hand, the topic is dealt with in several aspects, recalling the main components. Reference is made to relevant elements such as non-discrimination, equal opportunities and the gender pay gap. The general concept is therefore declined in more specific application concepts and, as such, with less blurred contours. This is a clear step towards goal 5 and, therefore, towards achieving effective gender equality at the European level.

The demand for this disclosure is in line with the provisions of the pay transparency directive which aims to strengthen the application of the principle of equal pay for equal work or work of equal value between men and women ('principle of equal pay') and the prohibition of discrimination, though also pay transparency mechanisms. The new legislation will require EU companies to disclose information that makes it easier for employees to compare salaries and expose existing gender pay gaps. In addition, the Directive fixed dissuasive penalties, including fines, for employers that do not comply with the rules and established companies will have to act if their gender pay gap is over 5%.

The directive aims to make wages more transparent by obliging companies with more than 100 employees to report and correct their pay inequalities, in a bid to reduce the gender pay gap in the EU, which currently stands at 13%. Thus, CSRD and Equal Pay Directive are two mutually coordinated regulations both aimed at using disclosure requirements as a pressure tool for companies to strive to eliminate the gender gap.

The second cluster concerns the issue of diversity in company boards. There are no substantial differences between the recitals of the two directives regarding the information on the composition of the boards. From this point of view, the simultaneous publication of Directive 2022/2381 on the gender balance among directors of listed companies does not seem to have had any impact. This probably derives from the fact that the proposal of the directive on gender quotas on boards dates back to 2012 and therefore had already had the opportunity to influence the information requests contained in the NFID. In this respect, there is a continuity of disclosure requirements between the NFID and the CSRD.

The third cluster we have identified concerns the CSRD's statement only of a general principle according to which "it is necessary to ensure that undertakings whose securities are admitted to trading on a regulated market in the Union always report on their gender diversity policies and the implementation thereof." Nevertheless, the recital refers to a type of information present in the articles not only of the CSRD but also of the NFID. Thus, it is not a new concept compared to the previous directive, but rather the underlying importance of required information.

Table 2 - Comparison of gender disclosure in the Directives articles

Directive 2014/95	Directive 2022/2426
	Article 19b) ... (2) The sustainability reporting standards ... shall require that the information to be reported is understandable, relevant, representative, verifiable, comparable, and is represented in a faithful manner The sustainability reporting standards shall, taking into account the subject matter of a particular standard: ... (b) specify the information that undertakings are to disclose about social factors, including information about: (i) <b>equal opportunities for all, including gender equality and equal pay for equal work, training and skills</b> development, and employment and inclusion of people with disabilities;
Article 20 (1) (g) <b>a description of the diversity policy applied in relation to the undertaking's</b>	Article 20 (1) g) <b>a description of the diversity policy applied in relation to the undertaking's</b>

<p><b>administrative, management and supervisory bodies with regard to aspects such as, for instance, age, gender, or educational and professional backgrounds, the objectives of that diversity policy, how it has been implemented and the results</b> in the reporting period. If no such policy is applied, the statement shall contain an explanation as to why this is the case.;</p>	<p><b>administrative, management and supervisory bodies with regard to gender</b> and other aspects such as, age, or educational and professional backgrounds, <b>the objectives of that diversity policy, how it has been implemented and the results in the reporting period.</b> If no such policy is applied, the statement shall contain an explanation as to why this is the case.</p>
---	--

Source: Authors' elaboration on the basis of NFID and CSRD

The same three conceptual clusters examined concerning the recitals are present in the articles of the two Directives.

Regarding the first cluster, it should be noted that, in line with the recitals, the CSRD requires that the standards provide detailed information on equal treatment and gender equality in its various profiles: equal pay for equal work, training and skills development, and employment. This information is complementary to the provisions of the pay transparency directive that require member states to establish gender pay gap reporting in which workers and workers' representatives will have the right to receive clear and complete information on individual and average pay levels, broken down by gender. Both directives fall within the logic of Equal gender treatment legislation, thus in terms of reduction and, in perspective, elimination of the currently existing gender gap.

The World Economic Forum (WEF, 2021) specifies that worldwide no state has filled the existing gender gap. Regarding the second cluster, there are no differences between the predictions of the NFID and the CSRD. Both require a description of the diversity policy applied concerning the company's administrative, management and supervisory bodies.

Even in the case of the third cluster, no differences are found.

Although the provisions are the same in the case of the last two clusters, it does not mean there will be changes in the reporting between companies.

These differences may arise at the level of implementing standards of the two directives. Thus, the three clusters examined should be further investigated with regard to the provisions contained in the GRI (the standard commonly adopted by European companies in terms of non-financial reporting; KPMG 2022) and in the ESRS. By comparing the provisions of these standards, it will be possible to obtain more detailed evidence of the expected evolution in terms of information on gender and the factors behind this evolution. A subsequent study of this first analysis carried out in this paper will be dedicated to this.

## 5 Conclusion

This research analyses the evolution of gender disclosure requirements in sustainability reporting according to European Directives, investigating the determinants of those changes. European Directives compared are NFID, currently in force, and CSRD which will enter force in 2024.

The methodological research used in this work is descriptive. It was carried out by highlighting the differences that emerged by comparing the old legislation and the novelties of the new one.

We grouped the disclosure requirements into the following three clusters: i) gender equality; ii) diversity in the boards; iii) gender policies and implementation thereof.

With regard to gender equality information, we found a significant increase in disclosure requirements in CSRD, in accordance with the principle of equal gender treatment that inspired the European legislation (EC, 2020). In this respect, CSRD requirements are consistent with the pay transparency directive, which aims to strengthen the application of the principle of equal pay between men and women and the prohibition of discrimination, though also pay transparency mechanisms. Both Directives contribute to the achievement of gender equality and empowering all women worldwide, as provided by goal 5 of the UN Agenda 2030 (Paoloni *et al.*, 2023; UN, 2015).

No changes were introduced in disclosure on diversity in the boards, presumably considering that the information required in the NFID took into account the political orientation already present in the proposal of the Directive on improving the gender balance among Directors of listed companies issued in 2012 converted only recently in Directive 2022/2381.

Substantially identical is the disclosure required on gender policies and their implementation. The only difference between the two directives is that the CSRD emphasises the importance of that information in the Directive recital.

This paper makes several contributions to gender literature.

First, this paper fills a gap in the studies by highlighting an unexplored area of literature related to the changes in quantity, quality and modalities of regulatory gender disclosure requirements.

Second, to the best of our knowledge, this is the first research exploring the factors influencing different gender disclosure requirements between NFID and CSRD.

This research has some limitations. It is preliminary research and offers some insights into changes in European sustainability reporting requirements. To reach more analytical conclusions, it is necessary to extend the analysis by comparing standards adopted on the basis of the two European Directives. However, the draft ESRS published in 2022 immediately raised controversy over the excess of information and the associated onerous compliance costs (Venuti, 2023). Currently, draft ESRS are under review given the political intention to reduce sustainability reporting requirements by 25 per cent (von der Leyen, 2023) and any assessment on them may have an element of uncertainty.

### **Abstract**

If "diversity" can be defined as the distribution of attributes among interdependent members of a work unit (Jackson et al., 2003), "diversity management" (DM) can be recognised as the comprehensive process of building an environment where all the employees can interact effectively through practice and organisational structure aimed to manage the diversity (Yadav and Rajak, 2022; Roberson et al., 2017; Pitts, 2006).

This process consists of implementing measures that make an organisation's workforce more diverse and inclusive, promoting genuine communication and transmission of knowledge (Trittin and Schoeneborn, 2017; Fáltholm and Norberg, 2017).

Among the most evident aspects of social diversity is gender diversity, which always kept women in a background position compared to men, both in the public and private sector (Fusco et al., 2022; Dong, 2022).

The measures and actions aimed at achieving equal representation of men and women represent Gender DM (GDM) (Kamasak et al., 2020; Uddin and Manir Chowdhury, 2015).

The present research aims to i) analyse how economic literature is facing GDM; ii) classify the main foci of analysis in the extant literature; iii) identify thriving future research areas.

The analysis is conducted through a Structured Literature Review (SLR) methodology (Paoloni and Demartini, 2016), a literature classification widely used in business studies to classify them according to four lenses: Article Focus, Research Area, Geographic area;

Research method. The present work considers 153 studies among articles, conference papers, book chapters and books identified on the SCOPUS database by searching "diversity management" and "gender". The authors considered only the studies that have been published in the last ten years.

This paper implements gender studies about women's emancipation in employment and improves studies about diversity management by adopting a gender perspective. It categorises all the studies related to Gender and Diversity Management (GDM) to give researchers a better understanding of the challenges and opportunities women face in the workforce, and the measures organisations take to address these issues.

**Keywords** – sustainability, gender gap, women, gender equality, diversity management

**Paper type** – Academic Research Paper

## 1 Introduction

The journey to Diversity Management (DM) began in the 1960s and has transversally concerned the social, legal and economic spheres of the United States, first and Europe and other countries later (McCrea *et al.*, 2022; Roberson *et al.*, 2017; Buemi *et al.*, 2015).

When the American nation cast a new light on the concept of equality, as the intention to progressively erase all forms of diversity so that everyone could enjoy access to social rights and citizenship, institutions began to implement politics based on Affirmative Actions (AA)<sup>1</sup> (Roberson *et al.*, 2017; Reddy and Parumasur, 2014; Anderson, 2004). However, scholars interested in inequality in workplaces for various reasons soon began to question the effectiveness of AA, noting that it was often consumed in isolated and circumscribed interventions in human resources (Ince, 2023; Booysen *et al.*, 2016). Since the 1980s, anti-discrimination practices have been reworked based on a new concept: "Diversity Management" (Foley, 1994; Berne, 1994). Among the most evident aspects of social diversity, there is gender diversity, which always kept women in a background position compared to men, both in the public and private sector (Fusco *et al.*, 2022; Dong, 2022). The set of measures and actions aimed at achieving equal representation of men and women represents Gender DM (GDM) (Kamasak *et al.*, 2020; Atena and Tiron-Tudor, 2019; Uddin and Manir Chowdhury, 2015).

---

<sup>1</sup> AA are interventions that aim to eradicate discriminatory practices through the implementation of strategies to incorporate previously disadvantaged groups into all aspects of community life and to remove obstacles that hinder the realisation of equal opportunities in the employment and social sphere (Topić *et al.*, 2020; Benslimane and Moustaghfir, 2020).

The present work examines the evolution of research about DM, with a specific focus on policies aimed at managing and reducing gender inequalities. Recently, literature about this topic has increased in line with socio-cultural evolution. With the aim of comprehending how literature about this topic has developed and how it could be further deepened, the present paper proposes a Structure Literature Review (SLR). Thus, the present research aims at answering the following research questions (RQs):

*RQ1. How is literature developing the topic of GDM?*

*RQ2. What are the main foci of analysis in the extant literature?*

*RQ3. What are the possible future research areas?*

The analysis uses the SLR methodology (Paoloni and Demartini, 2016), classifying scientific papers on GDM according to Article focus; Research area; Geographic area; Research methodology.

The next paragraph describes the SLR methodology, providing a presentation of the taxonomy used. The results obtained and the general trends identified are illustrated in the third paragraph replying to RQ1. Finally, in the fourth paragraph, answers to RQ2 and RQ3 are exposed.

## **2 Methodology**

To overview the last decade's economic literature concerning GDM, the authors resorted to an SLR (Serenko, 2021; Paoloni and Demartini, 2016), a more and more popular methodology in business studies (Rocco et al., 2023; Dal Mas et al., 2023). SLR requires a rigid protocol based on its validity (Petticrew and Roberts, 2008) and reliability (Yin, 2009) and a strict description of how the process happened. The pathway that the authors carried out is deepened in the following paragraphs.

### **2.1 The sample selection**

To answer the RQs, the authors extracted the results from the SCOPUS database, considered the most comprehensive database (Del Vecchio et al., 2022; Paoloni and Manzo, 2022). Since using the words "gender diversity management" only twenty-four documents resulted, the authors used the keywords "diversity management" and "gender", limiting the research to "Title, Abstract, Keywords," to prevent documents unrelated to the object from being extracted (Paoloni et al., 2020b). Hence, the starting string was TITLE-ABS-KEY ("diversity management"

AND "gender"). The research was carried out on 14 February 2023, and 331 studies resulted, but the sample was further reduced by imposing additional filters. As for the type of documents, only articles, books, book chapters, and conference proceedings (Paoloni et al., 2020b) were considered (namely 296 of the original set). In addition, to overcome linguistic problems (Mauro et al., 2017), the authors selected only the papers in English and Italian (287). Furthermore, as the SLR wanted to maintain an economic perspective, the authors focused on two research areas: Business, Management and Accounting; and Economics, Econometrics and Finance (201 results). Finally, being a subject that in the most recent years has attracted the attention of institutions, policymakers, and scholars, to comprehend the most recent studies better, a period was imposed, considering only the studies published between 2013 and 2023 (153). Figure 1 shows the sample selection process (Paoloni and Manzo, 2022; Paoloni et al., 2020a).

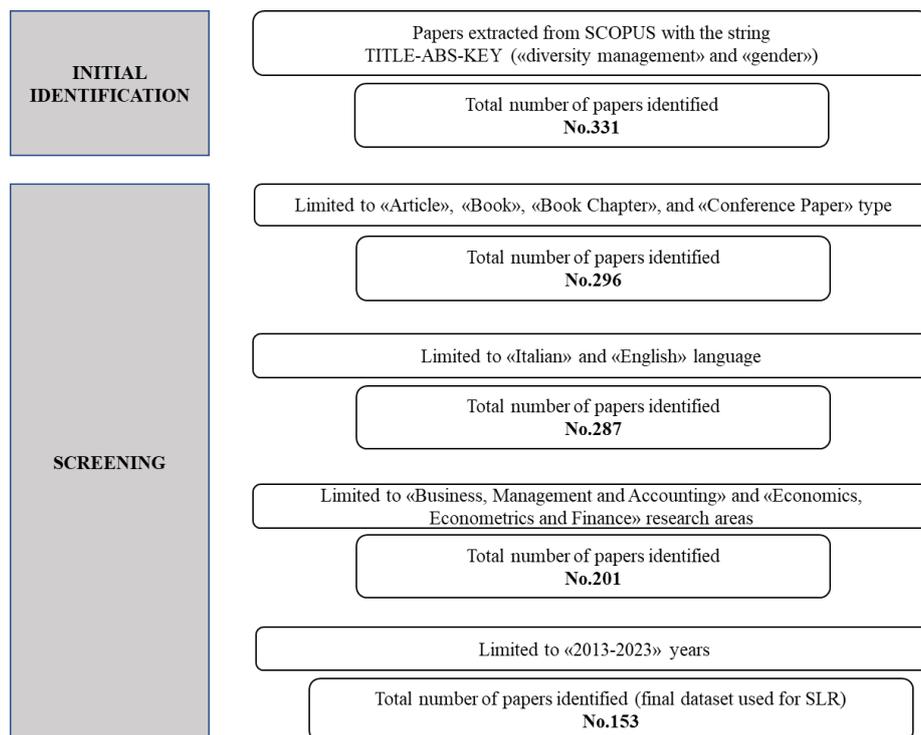

Figure 1 – The sample selection process

## 2.2 The analysis framework elaboration

As previously mentioned, SLR requires the application of a valid framework. The present study uses the one Paoloni and Demartini (2016) introduced and classifies the papers according to four lenses: Article Focus (A), Research Area (B), Geographical Location (C), and Research Method (D). Basing on the sample extracted, the authors elaborated a framework appropriately declined according to this research's needs. It is represented in the figure 2.

A. Topic	B. Research area	C. Geographical area	D. Research methods
1 - Public sector	1 - Business, Management and Accounting	1- Middle East	1- Literature review
2 - Corporate	2 - Economics, Econometrics and Finance	2- South and Central America	2- Qualitative
3 - Non-Profit		3- North America	3- Quantitative
4 - Generic organisation		4- North Europe	4- Mixed methods
5 - Other		5- South Europe	
		6- Asia	
		7- Africa	
		8- UK	
		9- Oceania	
		10- Comparative	

Figure 2 - Analytical framework  
Source: Authors

#### *A. Article focus*

The main topics faced in the extant economic literature concerning GDM are split into five categories, according to the application scope of the GDM policies analysed.

- A1. Public sector. This class involves studies focused on GDM policies applied in the public sector.
- A2. Corporate. The second cluster gathers all the studies facing gender inequalities in private corporations, operating in different fields (hospitality, banking, mining, manufacturing, and IT).
- A3. Non-Profit. This rank counts the studies analysing the GDM policies elaboration and application in Non-profit organisations.
- A4. Generic Organization. Literature involved in this class reports GDM policies analysed by adopting a generic perspective and without applying them in a specific context.
- A5. Other. This residual class includes studies that the author does not attribute to the categories mentioned above as dealing with topics that are not treated enough to constitute an independent category or not strictly relevant to the research topic, therefore difficult to contextualise.

#### *B. Research area*

The current SLR focus on the economical literature; hence only two research areas are involved. The papers are attributed to one or the other research area from the database SCOPUS.

#### *C. Geographical Area*

This variable indicates the geographical area that is investigated by the authors. To focus only on the essence of the research topic, we have not considered the researcher's country of origin but the area of interest in the research itself (Paoloni and Demartini, 2016).

#### *D. Research Methods*

This classification can show how specific research methods change based on different years, countries, and research topics. D4 involves research that applies both qualitative and quantitative methodologies.

### 3 Findings

#### 3.1 Article focus

The analysis only considers the works published in the last ten years, from 2013 to 2023. Figure 3 shows the relevance of article focus on the sample.

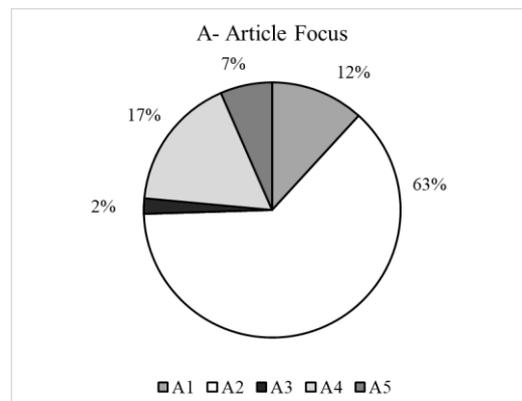

Figure3 – Article focus  
Source: Authors

The broadest category gathers papers about GDM policies adopted in Corporates (A2), representing 63% of the sample (96 papers). The second broadest category is A4, investigating GDM policies theoretically or adopting a generic perspective. This cluster represents 17% of the sample (26). Finally, the article focus A1, gathering the studies concerning the public sector, which represents 12% of the sample (18). As for the "other" cluster, A5, involves 7% of the documents (10). Finally, research facing GDM policies in Non-Profit Organizations (NPO) only constitutes 2% (3) of all the works.

#### 3.2 Research Area

Figure 4 shows in which research area the extracted studies are mainly placed.

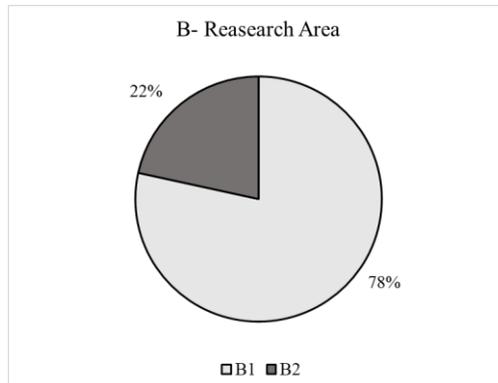

Figure 4 – Research Area  
Source: Authors

The largest category is Business, Management and Accounting (B1), representing 78% (120 papers) of the total sample. The cluster Economics, Econometrics and Finance (B2) counts the residual 22% (10).

### 3.3 Geographic Area

Figure 5 shows the distribution of studies focused on different geographical areas.

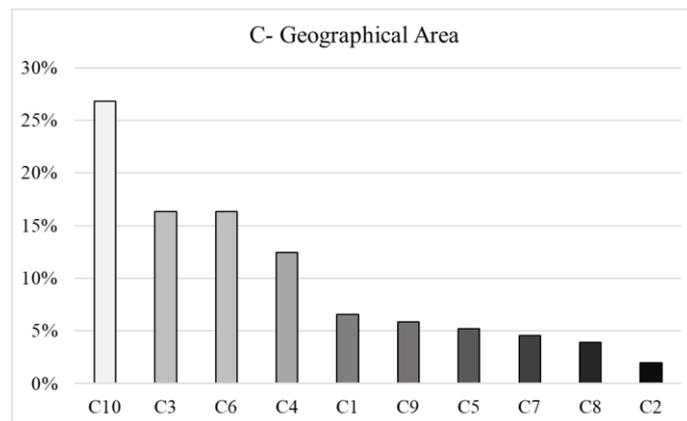

Figure 5 – Geographical Area  
Source: Authors

As shown in Figure 5, there is an apparent disparity between the geographical areas analysed by GDM scholars. The most significant number of studies

proposes a comparative study among two or more countries (C10), covering 27% (41) of the total. As for the research interested in one specific area, C3 and C6 contain the same number of documents involving the studies, respectively, focused on North America and Asia. Each of them occupies 16% (25) of the sample. After them, North Europa (C4) is the most analysed geographic area composing 12% (19) of the sample.

Except for C2, the gap among the other categories consists only of one document; indeed, C1 constitutes 7% (10) of the total, C9 represents 6% (9); C5 and C7 count both 5% with respectively 8 and 7 studies, and C8 represents 4% (6). Finally, C2 is the least analysed geographical area, South and Central America, counting only 3 studies and representing 2% of the sample.

### 3.4 Research Method

Figure 6 shows the distribution of the different research methods in the sample.

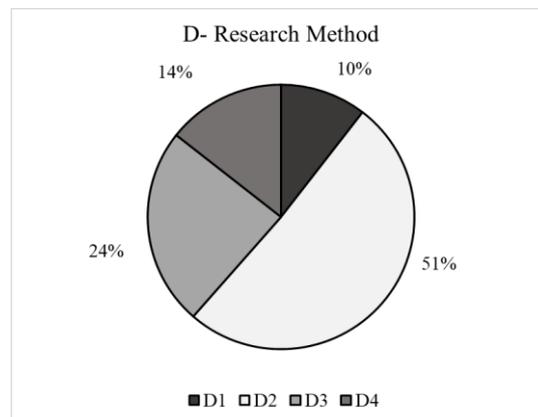

Figure 6 –Research Method  
Source: Authors

The primary methodology is qualitative research (D2), used in 51% of the contributions (78), followed by the quantitative method (D3), applied in 24% of the studies (37). Research using mixed methodologies (D4) represents 14% (22), and literature reviews (D1) constitute a residual 10% (16).

### 3.5 The most cited articles

The articles were also analysed based on how often they have been quoted in other research (Ardito *et al.*, 2015).

Years\Article focus	A1	A2	A3	A4	A5	Σ
2013	111	28			15	154
2014	1	208		27		236
2015		103		20		123
2016		186		40	9	235
2017	1	162		16		179
2018		21				21
2019	23	33		14	6	76
2020	19	149			8	176
2021	45	35		34		114
2022	5	12	3	4		24
2023						
Σ	205	937	3	155	38	1338
	15,3%	70,0%	0,2%	11,6%	2,8%	100

Figure 7 – The most cited articles

Source: Authors

The analysis reveals that studies investigating GDM policies implemented by corporates (A2) are the most quoted research (70%). It is interesting noticing that until 2013 research focused on the gender gap in workplaces was mainly focused on Public Sector (A1); since 2014 private companies have earned more and more relevance among the GDM scholars representing every year the most quoted field. A1 occupy 15,3% of all the studies cited in the literature, namely the second most-quoted cluster. Research quoting A4 are 11,6%, with a peak of maximum citation in 2016. The residual category involving "other" studies (A5) has been quoted for 2,8%, and A3 only records 0,2% of quotations, all in 2020.

## 4 Discussion

### 4.1 The main foci of analysis in the extant literature (RQ2)

The authors want to identify the themes explored in the present literature review.

A1. Promoting and protecting diversity and inclusion in public organisations is essential to pursue social equity (Hoang *et al.*, 2022). Gender equity requires a fair

separation of labour, rights, obligations and responsibilities between men and women, encouraging a fair organisational culture (Benslimane and Moustaghfir, 2020). The works involved in this cluster adopt a double perspective. Most of them consider gender diversity in boards, highlighting how inclusive leadership can create commitment, higher performance, and sustainability (Ince, 2023; Mitra et al., 2021; Nelson et al., 2021). Other studies consider gender diversity among employees, focusing on how gender may affect their perception of organisational inclusion (Mousa et al., 2021; Blouch et al., 2019).

The main sectors analysed in public organisations are academic (Mousa et al., 2021; Wieczorek-Szymańska, 2020; Asirvatham and Humphries, 2019; Nentwich and Sander, 2015) and healthcare (Blouch et al., 2019).

A2. Part of the literature about GDM in corporate organisations faces gender discrimination phenomena, such as the gender pay gap (Zhu et al., 2022) or the glass ceiling (Atena and Tiron-Tudor, 2019). Most of them focus on board gender diversity, which appears to be considered a relevant variable when replacing directors; indeed, female directors are more likely to replace females (Dodd et al., 2022). Some studies document a positive relationship between board gender diversity and firm performance (Raddant and Takahashi, 2022; Farag and Mallin, 2017), whereas other research focus on the positive link between board diversity and CSR performance, as it promotes information elaboration and improves the ability of the company to recognise stakeholders needs (Firoozi and Keddie, 2021; Harjoto et al., 2019). The sector mainly analysed are hospitality (García-Rodríguez et al., 2020; Madera, 2018), banking (Agbontaen, 2019), mining (Sasikala and Sankaranarayanan, 2022; Fältholm and Norberg, 2017), manufacturing, (Mansoor et al., 2021; Hennekam et al., 2019) and IT (Shanmugam, 2017; Kundu and Mor, 2017).

A3. Studies about GDM in NPO are only three, and all were published between 2022 and 2023; hence it seems reasonable to define it as an emerging topic. Shohaieb et al. (2022) focus on the relationship between board diversity and CSR disclosure, concluding that in NPO the DM disclosure level is very low and positively affected by the board size, women's presence, and board independence.

A4. Some studies that concern GDM without specific contextualisation focus on analysing the link between the implementation of GDM policies and firm performance (Mehng et al., 2019; Balanagalakshmi and Kumari, 2019). Other studies focus on gender discrimination, also considering sexual orientation

discrimination (Paniza and Moresco, 2022; Hildebrandt, 2018). The perception of employees is a sub-topic present also in this cluster. Balanagalakshmi and Kumari (2019) affirm that generally, employees consider women incapable of assuming leadership roles because they do not dispose of some characteristics that are essential to be a leader, like emotional stability, temperament, self-reliance, competitiveness, self-confidence, ambition and exhaustive information of the current affairs and happenings.

A5. This cluster involves some studies that are not perfectly inherent to GDM, but that emerged from the SCOPUS research because they concern related or similar themes. For instance, there is a paper focused on the dynamic effect of demographic dissimilarity on absenteeism behaviour (Reinwald and Kunze, 2020), or research on major outcomes from global employability surveys about gender diversity (Mutovkina et al., 2016).

#### **4.2 Future research areas (RQ3).**

To answer the RQ3, in light of the analysis carried out, we wondered what trends still needed to be deepened. Certainly, the analysis of GDM in NPO companies turns out to be a topic worthy of insights because only three studies have focused on the topic, highlighting different aspects, thus without exhausting a line of research that delved into a particular aspect.

Another issue worth exploring appears to be the GDM disclosure, namely the analysis of the methodologies, organisational processes and tools through which organisations choose to communicate the policies to reduce the gender gap. In the resulting sample, only one research focuses on CSR disclosure (Shohaieb et al., 2022). Currently, the most widely used tool for communicating policies and initiatives implemented by organisations to bridge the gender gap is gender budgeting, introduced in public organisations by the Directive of 23 May 2007 of the Department of Public Administration of the Presidency of the Council of Ministers. In addition, one of the first definitions of gender budgeting was provided by the European Parliament Resolution of 3 July 2003, developed by the European Commission 2002/2198, which refers to the theory of gender budget analysis and envisages the achievement of four objectives: equity, transparency, efficiency, and awareness.

On the other hand, private corporates have recently begun to dedicate a section of their sustainability report to diversity and inclusion, communicating the

policies applied to pursue gender equality. Nevertheless, they rarely decide to elaborate an independent report on gender equality. For this reason, it appears extremely interesting and relevant to analyse how gender budgeting or new tools can be adapted to a private organisation.

## **5 Conclusions**

This article contributes to the literature in several ways. Firstly, it enriches the literature about diversity management, offering an analysis of research that has interested this topic in the last ten years. Secondly, adopting a gender perspective, this paper implements gender studies about women's valorisation and emancipation in workplaces, considering both the public sector and corporate. Finally, it classifies all the studies focused on GDM, allowing the researchers to have a clearer view of women's difficulties and opportunities in employment and how organisations try to overcome them.

On the one hand, the study summarises the trends of previous research in terms of the topics covered, the methodologies considered most suitable, the countries and the research area that mainly analyse female entrepreneurship. Findings reveal that most of the studies analyse GDM in private corporations, that they mainly belong to Business, Management and Accounting, that they primarily compare the policies applied in different countries and that the most used research method is qualitative methodology.

On the other hand, the present work facilitates the identification of literary gaps that can be filled by future research. The authors consider it necessary to identify which article focus and sub-topic needed to be explored. Findings reveal that it is worthwhile for new research to delve deeper into how NPOs try to overcome the gender gap. An interesting topic that involves all the article focus would be the relationship between GDM and CSR disclosure.

The central limit of the research is identified in the sample phase; indeed, findings are limited to that resulting from the database used (SCOPUS); it is unlikely that significant variation in results would occur if a different database were used. Secondly, the coding process could be improved. Although it was carried out systematically with care to ensure consistency in each component, there may be errors of omission and coding. Finally, adding the variable: 'other' in classifying some categories may have hidden some exciting results.

### **Abstract**

The scientific debate about sustainability in agricultural sector is growing worldwide, thanks to the increasing awareness of customers towards the impact of their consumption behaviors. While a great deal of attention is given to the economic and environmental dimensions of sustainability, social sustainability is more easily left out of the analysis of agrifood supply chains. In particular, research on occupational health and safety (OHS) in agrifood is not vast, although the sector is among the most critical ones for what concerns accidents on the workplace. As an example, agriculture and food industry workers are considered high-risk groups during the handling of equipment, chemicals, and cleaning of contaminated instruments because they are exposed to health hazards that require an effective training program along with personal protective equipment. Similarly, the fishing industry has been identified as an exceptionally precarious occupation compared to other industries due to its high rate of accidents and deaths. This work is a first attempt to fill this gap: starting from the analysis of open data available through a national database

provided by the Italian National Institute for the Insurance of Work-Related Injuries (INAIL), a critical analysis of work-related injuries and near miss events in Italian agrifood companies is provided. A discussion on the results is presented proposing some evidence-driven guidelines and research gaps, with the aim of shedding light on OHS in the Italian agrifood sector, its main criticalities, and possible directions.

**Keywords** – social sustainability, safety data, injury analysis, prevention

**Paper type** – Academic Research Paper

## 1 Introduction

Evaluating Social Sustainability issues in the agricultural sector is a very complex issue as it equally emphasizes environmental, economic, and quality of life goals (Hayati et al., 2011). Over the years, most sustainable agriculture research has focused primarily on environmental stewardship and profitability, although agriculture ranks among the most hazardous industries. By analysing the social dimension of sustainability, one focus point is connected to health and safety of workers. Thus, data at national and international levels outlined that agricultural workers are at very high risk for fatal and nonfatal injuries (Hard, 2002; HSE, 2022; NIOSH, 2023). Agricultural injuries and illnesses are higher than many other industries, and information about these events can help in the development, implementation, and translation of prevention programs and policies. However, in some nations, there is a lack of structured information mainly due to the absence of a national surveillance system: it has to be noted that surveillance is a critical component of effective prevention and intervention, thus contributing to increase the overall resilience level of the agricultural sector. Similarly, current analyses about applying resilience in the agricultural sector mainly focus on environmental issues (e.g., climate change), almost neglecting influences due to social issues (Urruty et al., 2016).

The study proposes a quantitative analysis about the current state of safety levels of the agricultural sector in Italy based on occurred injury analysis collected from the national surveillance system. The paper is organized as follows: section 2 reports a state of the art analysis about injuries occurred in the agricultural sector, while section 3 proposes a quantitative analysis about Italian data aiming to point out most critical activities as well as risk factors affecting the agricultural sector at national level. Conclusions are summarized in section 4.

## **2 A literature review analysis**

Several recent and past studies have analysed safety data in the agricultural sector from different perspectives and methods. Some studies analysed current literature to highlight some critical issues. Jadhav et al. (2016) proposed a meta-analysis of current literature in order to point out emerging risk factors for agricultural injuries. Several factors were outlined ranging from organizational, technical to social ones. Kumar et al. (2000) analysed literature about injuries related to agricultural equipment, outlining most relevant suggestions essentially as preventive measures to be adopted during their use.

Different approaches are based on analysing structured data available at national/local level. Thus, the presence of a national surveillance system where structured data is collected could contribute to reduce the complexity of this task, and at the same time, guarantee more accuracy. This is confirmed by the study developed by Earle-Richardson et al. (2011), who proposed a quantitative analysis based on three different main data sources to evaluate feasible solutions for designing a national surveillance system in the US agricultural sector. Data originated primarily from ambulance reports, hospital discharge, and county safety officials. Even if the cross analysis had provided interesting feedbacks about most frequent causes of injuries: authors also outlined how a more integrated safety data system is essential to design an effective national surveillance system. With similar targets, Murphy et al. (2019) proposed and validated a specific classification methodology for data about injury, illness, and disease associated with agricultural hazards. Thanks to national data availability, Lovelock et al. (2007) proposed a detailed comparison about injury data in the agricultural sector collected in different areas in the world, from North America, Europe, and Australasia. Patel et al (2010) discussed injury data collected in a specific Indian region for farmer workers outlining safety of agricultural equipment as one of the most critical issues to be solved.

When national structured data are not available, one useful tool is a survey analysis developed on a specific sample. Westaby and Lee (2003) proposed a survey analysis for pointing out antecedents of injury among a specific cluster in the US agricultural sector: young people working in agricultural settings. Obtained results outlined strong relationships (e.g. between safety activities and safety consciousness) as well as more complex ones. Chae et al. (2014) discussed a survey analysis developed regarding the Korean farmers sector to estimate the

national agricultural injury rate and for identifying most relevant factors associated with these injuries. Mishra and Satapathy (2018) described results obtained from a survey analysis aiming to evaluate the impact of hand tool injuries in agricultural farmers in a specific area in India.

Differently from these studies, Pfortmüller et al. (2013) proposed a quantitative analysis for assessing injury severity in the Switzerland agricultural sector based on data derived by admissions to a specific emergency department.

Other studies analysed specific hazards and/or hazard sources. The impact of heat on occupational injuries in the agricultural sector is analysed in different ways. Spector et al. (2016) discussed, through a cross analysis between injury data and historical meteorological ones, the potential relationship between heat exposure and traumatic injuries in outdoor agricultural workers. Di Blasi et al. (2023) discussed effects and impacts of by using data extracted from national databases. Another study about a specific disease (Kidney damage) in a sample of California agricultural workers was proposed by Moyce et al. (2020): the analysis was carried out through wearable systems, and next, cross analysis was developed in order to point out more critical parameters of both working activities and workers health. Wibowo and Soni (2016) proposed a field analysis about potential hazards related to the use of specific agricultural equipment (i.e., hand tools) adopted by farmers in Indonesia: obtained feedbacks have been provided to redesign tools in a safer way.

### **3 An analysis of Italian safety data of agricultural supply chain**

In Italy, official data on injuries at work is collected by INAIL, the National Insurance Institute against Accidents at Work (Campo et al., 2020). Thus, a quantitative analysis has been carried out on this database (Inail, Statistical Database, 2023), available online, over a five-year period, i.e., between 2017 and 2021. The first target is to evaluate the accident trend of agricultural sector compared to others in order to evaluate its overall level of hazard. In Table 1 the comparison between the time trend of accidents occurred in the agricultural sector versus accidents recorded in all other industrial sectors is reported. Based on this data, the agricultural sector is contributing to the overall value with an average value about 7%.

Table 1. Accident trends analysed during the period 2017 to 2021

Sector	Year					Total
	2017	2018	2019	2020	2021	
Agricultural	27,465	26,699	25,936	20,649	20,607	<b>121,356</b>
Other industrial sectors	338,967	333,582	330,722	354,679	306,053	<b>1,664,003</b>
<b>Total</b>	<b>366,432</b>	<b>360,281</b>	<b>356,658</b>	<b>375,328</b>	<b>326,660</b>	<b>1,785,359</b>

Another interesting result is that 2017 and 2021 the accidents included in agriculture decreased by about 25%, which is a greater reduction than accidents in all other sectors, which is about 10%: this is also outlined by Figure 1.

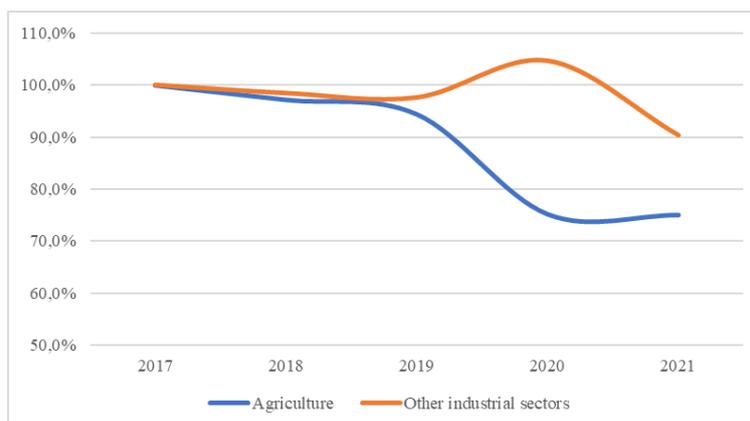

Figure 1 – Trends (expressed in %) in occurred accident at work in agricultural and other industrial sectors in the analysed period.

It should be emphasised that the peak observed in 2020 for all industrial sectors appears to be connected to Covid-19 diffusion, which had had less impact on agriculture due to its intrinsic dynamic of diffusion.

Next, an analysis on data about fatal accidents occurred in the analysed period has been developed. The total number of fatal accidents varies from 89 in 2017 to 91 in 2021, recording an increase of 2.2%: it has to be noted that also this value is lower than ones recorded for all industrial sectors, i.e., an increase of 5.5%.

Thanks to structured data in the INAIL database (Inail; Statistical Database 2023), a more detailed analysis about most frequent hazardous systems has been carried out. In detail, total number of accidents involving or not means of

transport in the agricultural are reported in Table 2. Data shows that at least 5.5% of accidents in agriculture involve a means of transport.

Table. 2 - Patterns of accident occurrence in agriculture for the period 2017 - 2021

Accident in agriculture	Year					Total
	2017	2018	2019	2020	2021	
With means of transport	1,341	1,418	1,480	1,163	1,324	<b>6,726</b>
Without any means of transport	26,124	25,281	24,456	19,486	19,283	<b>114,630</b>
<b>Total</b>	<b>27,465</b>	<b>26,699</b>	<b>25,936</b>	<b>20,649</b>	<b>20,607</b>	<b>121,356</b>

It has to be noted that although in the analysed period accidents involving means of transport essentially remains stable over time, they represent approximately 40% of fatal accidents recognized by INAIL. Thus, as vehicles - such as tractors, earth moving machines, tillers, etc. – are adopted in several working phases (tilling the land, mowing the grass, treatment with plant protection products, fertilizing, sowing) they usually represent one of the main accident hazard in the agricultural sector.

In order to analyse with more detail causes of fatal injuries in the Italian agriculture sector, a specific database has been used: Infor.Mo (from “Infortuni mortali”, work-related fatalities in Italian) the open access database of the Italian national surveillance system for occupational fatal injuries (Campo et al., 2020) which provides quantitative data about occurred fatal injuries together with their determinants. Infor.Mo system has been developed by INAIL in cooperation with Regions and Autonomous Provinces, and Local Health & Safety Departments (LHSDs), which are the centres of administrative operations related to public healthcare in Italy under the National Healthcare Service. The database is based on information derived from fatal injuries investigations conducted by LHSDs after each event.

In detail, the injury dynamic is analysed based on a backward path, usually applied in the judicial investigative process; next, a multi-factorial model is developed in order to point put root causes of occurred fatal injury (De Merich et al., 2022). Starting from the last event in chronological order (i.e. the biological damage), the multi-factorial model identifies the accident that occurred (e.g. a fall from a height of the worker or the overturning of a work vehicle) and the related causes (i.e. risk factors) of the injury, grouped by six major categories: (i) *activity of*

*injured person, (ii) activity of another person present in the injury dynamics, (iii) equipment, machines, plants, tools, (iv) materials, (v) working environment conditions, (vi) personal protective equipment (PPE).*

By analysing data in Infor.Mo from 2017 to 2021 (Inail Infor.Mo Database, 2023), 234 fatal injuries in the agricultural sector were selected; a total value of 465 risk factors were associated to these events. Summary data about the specific type of accident extracted from the database are reported in Table 3.

Table 3. Types of accident occurred for fatal injuries in the agriculture sector extracted from Infor.Mo in the analysed period (2017 to 2021).

Type of accident occurred	Total occurrence	Percentage
Vehicles exiting their route (overturning)	109	46,6
Fall of workers from height	24	10,3
Contact with moving vehicles or objects in their usual location	22	9,4
Unexpected starting of vehicle, machine, equipment	21	9,0
Fall of heavy bodies onto workers	14	6,0
Contact with moving parts of equipment	11	4,7
Other type of accidents not classified (N<10)	33	14,1
<b>Total</b>	<b>234</b>	<b>100,0</b>

The analysis of the specific accident dynamic outlines the clear prevalence of accidents due to loss of control while driving the work vehicle, which often led to the vehicle overturning. The data shows that the equipment most involved are tractors, with or without trailer. The second most frequent type of accident is falling from height, which occurs from equipment where work is taking place at height (e.g. portable ladders) or from working environments at height. These are the most hazardous activities based on historical data analysis.

Next, the analysis has focused on pointing out the risk factors that have caused these events: data are in Table 4. Information have been clustered aiming to outline the contributions of accidents that occurred from vehicles exiting their route (overturning) towards other accidents.

Table 4. Categories of risk factors for fatal injuries extracted from Infor.Mo in the analysed period (2017 to 2021).

Risk factor categories	Total fatal injuries	Accidents involving only overturning [%]	Other accidents [%]
	Occurrence *		
Activity of injured person	267 (57.4%)	61.3	53.3
Equipment, machines, plants, tools	99 (21.3%)	26.1	16,3
Working environment conditions	39 (8.4 %)	5.9	11,0
Activity of another person	31 (6.7%)	2.9	10.6
Personal protective equipment (PPE)	15 (3.2 %)	2.5	4,0
Materials	14 (3.0%)	1.3	4,8
<b>Total</b>	<b>465 (100.0%)</b>	<b>100.0</b>	<b>100,0</b>
*In parenthesis percentage values are reported			

Data outline the most critical risk factors in the occurred fatal injuries: the highest value is due to the specific activity developed by the worker, but a high contribution is also due to interaction with equipment. By overlapping data about vehicles loss of control, these two categories increase their criticality. Furthermore, for other types of accidents, two different categories - Working environment conditions and Activity of another person (e.g. other workers present in the accident scene) - have a greater weight compared to the total fatal injuries sample.

For *fatal accidents due to vehicles overturning*, in almost all cases the loss of control is connected to manoeuvring errors while driving the vehicles (88%). In about 75% of the data set, overturning occurs due to two concomitant factors: manoeuvring errors are often associated with structural deficiencies in the work equipment, mainly the absence of driver's seat protection systems and driver retention. This is a relevant information as the hazard could be reduced by substituting old equipment with safer ones.

In addition, driving errors are mostly due to underestimating the characteristics of the environment (e.g., the slope of the land, the presence of unevenness close to the work area, the stability of the land) where the workers operated; another issue to be considered is the procedure adopted for driving the vehicles on the road during the transfer phases from/to the workplace, which is usually a high source of hazard.

For *fatal injuries due to a fall of workers from height*, the analysis of the causal factors highlights a lack of or inadequate risk assessment activity. In maintenance activities, procedural errors of access/parking in the place at height are often accompanied by deficient structural characteristics of the same (roof capacity, absence of provisional works to protect against the risk of falling from a height such as walking surfaces and parapets, etc.) and failure to use the necessary PPE to work safety.

#### **4 Conclusions**

The study proposes a critical analysis about injuries occurred in the Italian agricultural sector in order to outline most hazardous activities and risk factors in this sector. The purpose is to analyse the social dimension of this sector aiming also to support the design of most effective prevention activities. The study aims to overcome a gap still present in the literature about the assessment of social sustainability in the agricultural sector, which is mainly focused on labour organization. Further developments could be oriented to evaluate how accident prevention could quantitatively contribute also to increase the resilience level of the agricultural sector towards interruptions due to accidents at workplace.

### **Abstract**

The agri-food context represents a very complex and dynamic sector, which influenced by the current competitive ecosystem, is experimenting with new way to enhance and implement knowledge. The characteristics of the agri-food organizations impose the need to rethink the "traditional" knowledge management practices (Bresciani, 2017; et al., 2018; Vesperi and Coppolino, 2023). Indeed, even in the agri-food sector, corporate museums are proliferating, with the aim to collect, archive and enhance knowledge, currently considered obsolete and not used within the agri-food organization. In this way, the corporate museum represents a "container" of knowledge (or organizational memory); that is, a space shared between various actors that through interaction, observation and experience between them, collaborate to start a process of co-creation of new knowledge (Durst and Zieba, 2019; Baima, et al, 2020, Vesperi and Ingrassia, 2021). The strategic role of the corporate museum emerges for the agri-food organization as Ba, in other words an ideal shared place for the creation of new individual or organizational knowledge (Nonaka 1994; and Konno, 1998; Del Giudice, et al., 2013). The aim of this study is to analyze the strategic role of the corporate museum, in the agri-food sector, in facilitating the creation

of new knowledge. In particular, the corporate museum is considered as a place shared by various actors to implement a process of co-creation of knowledge.

This study is based on a qualitative methodology of an exploratory nature. The complexity of the phenomenon has imposed the need to use a multi-step methodology (Bowen, 2009; Yin, 2009). The first step of the analysis, using the Museimpresa database (museimpresa.com), made it possible to develop descriptive indicators in order to understand the diffusion and characteristics of corporate museums in Italy and the connection with the agri-food sector.

A case study was analyzed in order to better understand the main aspects related to the creation of knowledge and the corporate museum. The results suggest the growing importance of the strategic role that the corporate museum plays in the agri-food sector; in fact, it allows to valorise "obsolete" knowledge and through a process of co-creation to generate new knowledge. In fact, the main innovative element of this study consists in the theoretical perspective used to analyze corporate museums in the agri-food sector.

The practical implications of this study can suggest entrepreneurs and the management of agri-food organizations to implement new solutions for the creation of knowledge, through the corporate museum.

## 1 Introduction

The agri-food sector represents a strategic sector for national (or local) economic systems. For this reason, it has always been at the centre of attention of policy makers and scholars. In fact, the evolutions and innovations of the agri-food sector have a direct consequence on the wealth and well-being of a community. In this competitive context, like the current one, agri-food companies must base their competitive advantage on the valorisation and transfer of knowledge. Some sectors have shown a greater propensity to value and implement knowledge in their internal processes. In fact, a current of studies shows this propensity of some sectors such as the automotive (Canonico, et al., 2021) or in public administrations (Wiig, 2002; Syed - Ikhsan and Rowland, 2004; Massaro, et al., 2015). Some entrepreneurial forms have also proved to be particularly inclined to valorise knowledge such as start-ups (Myers, 2009), spin-offs (Antonelli, 2004; Vesperi & Gagnidze, 2019). At the same time, the agri-food sector is considered as a sector with a low propensity for innovation and R&D. For these reasons, the agri-food sector and agri-food organizations represent a new challenge for KM scholars.

Indeed, the agri-food sector is represented by micro and small agri-food organizations (Ménard & Klein, 2004; James, et al., 2011) with a low propensity for innovation and low investments in R&D and characterized by low knowledge.

The characteristics of the agri-food sector have generated unique and specific knowledge management practices (KMPs). In fact, to enhance traditional knowledge (Ragavan, 2001) and the history of business, agri-food organizations have created corporate museums. Corporate museums are the subject of great attention from scholars, involving a plurality of disciplinary fields. There are still few studies dealing with corporate museums connected to agri-food organizations, making use of theoretical frameworks based on organizational theory, and in particular linking corporate museums to knowledge transfer and organizational memory. Studies on corporate museums have focused on the perspective of marketing (Piatkowska, 2014; Carù, et al., 2017) and corporate branding (Iannone, 2020) others in the more recent perspective of corporate culture (Nissley & Casey, 2002; Felipe, et al., 2017).

This study aims to offer some initial reflections to fill this gap in the literature. This study - in the context of organizational theory studies - analyzes the strategic role of the corporate museum as a form of organizational memory and heritage capable of transferring knowledge. To achieve this, a qualitative descriptive methodology based on the analysis of secondary sources is used. We present the rest of this work as follows: after this (i) introduction, (ii) the main theoretical elements on the Corporate Museum, Organizational Memory and agri-food organizations are discussed. In the following (iii) the methodological process is illustrated. Finally, (iv) the main conclusions and suggestions for future research.

## **2 Theoretical Framework**

### ***2.1 Corporate Museum and organizational memory***

The corporate museum is a phenomenon relatively recent in management and organization studies. In fact, the phenomenon appears in recent years. In general, the first corporate museums appear in the United States at the beginning of the 20th century (Danilov, 1992). Afterward, the first corporate museums arose in other countries, such as Great Britain (1906), Germany (1911) and Italy (last twenty years of the 20th century). The first corporate museums assume a historical character, i.e. corporate spaces dedicated to the collection and exhibition of

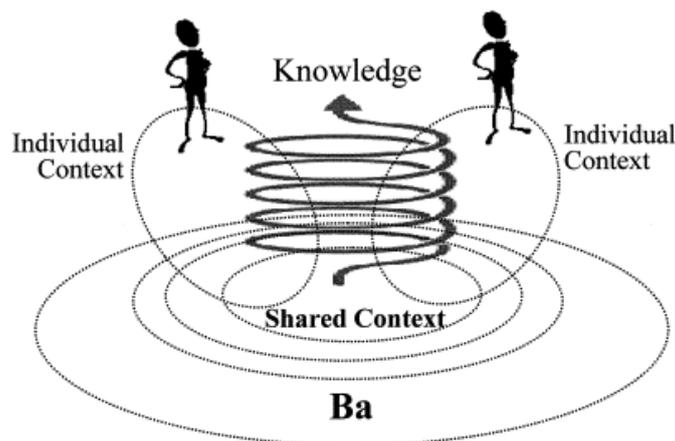

company documents, photographs and historic production machines, or they tried to reconstruct the history of the company or the contribution of the founder and other managers to the its growth. Alongside these dedicated corporate spaces, factory visits assume the same function (Axelrod & Brumberg, 1997; Mitchell & Orwig, 2002; Lin, 2020). The main purpose of the first corporate museums is to “collect” the artifacts of the company (Iannone and De Chiara, 2019; Martinez, 2020). Some authors do not identify this configuration as a corporate museum, but as a corporate collection (Nissley & Casey, 2002; Booth & Rowlinson, 2006). The corporate collection has no strategic value but represents a simple collection of organizational artifacts. In this way the corporate museum assumes a strategic value. Corporate museums are tools capable of sharing and transmitting the knowledge and values created within an organization, through the representation of organizational memory. The representation and narrative of organizational memory allows the organization to improve the dialogue with its external and internal stakeholders (Sandberg & Tsoukas, 2020). Several authors have proposed classifications of corporate museums. For example, Amari (2001) creates a classification based on museum ownership (public or private, single or multi-company ownership). Few studies have investigated the phenomenon of corporate museums using the theoretical frameworks of an organizational theory, based on the constructs of organizational memory and knowledge transfer. This study explores corporate museums as a form of organizational memory and, when used strategically, as a tool to transfer knowledge from the organization to the stakeholders. The concept of organizational memory assumes different conceptions in the academic literature. An interesting line of studies focuses on the definition of organizational memory as a repository (Huber, 1991; Grant, 1996; Alavi & Leidner; 2001; Antunes & Pinheiro, 2020; Zahra, et al., 2020). According to this line of studies, organizational memory represents a set of knowledge present within an organization in the form of documents, information material or any other form that can facilitate internal activities and be easily accessible. In this perspective, the artifact takes on a particular meaning. The corporate museum represents a form of organizational memory that must be used consciously and strategically. Corporate museums allow for the transfer of routine knowledge and practices through the narration of organizational culture and memory.

Organizational culture has distinctive and enduring characteristics and is part of organizational memory. The organizational culture is linked to the nature and success of the company and constitutes the starting point on which external

relations and decision-making processes are based. Some of the elements that characterize the organizational culture are codified and shared in the formal documents of the organization (such as official company deeds, strategic plans, internal communications, disciplinary procedures). These documents become organizational artefacts, often displayed and used in corporate museums. These artifacts make one organization instantly distinguishable from another organization. Organizational culture also affects the way individuals work within the organization.

## **2.2 The role of Ba in the knowledge co-creation process**

In the process of creating new knowledge, it is necessary to identify the context or environment (Nonaka & Takeuchi, 1995; Volpato, 1995; Nonaka & Kono, 1998; Zardini, 2012, page 28). According to this theoretical assumption, "space" (or place) influences KMPs. It is not possible to manage the knowledge creation process without a specific environment (Casey, 1999; Nonaka et al., 2000). Starting from the studies of the philosopher Kitaro Nishida, Nonaka & Konno (1998) define with the Japanese word "Ba" the ideal environment for the creation of knowledge.

*Figure 1 – "Ba" as a shared and dynamic environment  
Source: Nonaka et al., 2000; pag. 14*

The term "Ba" can be translated as a place or a shared space essential for the creation of knowledge. Nonaka and Konno (1998), analysing the concept of Ba, define it as a place, real or virtual, capable of creating new knowledge through human interactions.

The Ba assumes that knowledge possessed by an individual can be transferred and increased, within this space shared with other individuals, through the interaction, observation or experience of the other participants. The Ba can therefore be defined as a place where information is interpreted and integrated with the knowledge present in a limited place and time existing in the organization to become new usable knowledge (Wenger, 1998; Nonaka, et al., 2000).

Combining the SECI model it is possible to identify four different types of Ba: *originating*, *dialoguing*, *exercising* and *systemising*. Each type of Ba supports a particular knowledge conversion process.

*Originating Ba* is created through the sharing of a physical space (face-to-face) and an individual relational one. Through originating Ba an individual encounters another individual by sympathizing and empathizing, sharing emotions, experiences and mental models. This Ba represents the socialization phase of the SECI model. Tacit knowledge and individual organizational issues, through socialization, are transferred and shared to generate new knowledge and new organizational solutions. The second type of Ba is *dialoguing Ba*. The creation of this Ba, unlike the originating Ba, is more conscious. In fact, while originating Ba is generated almost spontaneously, the assumption underlying the construction of dialoguing Ba is the selection of specific knowledge and skills for a project team, a task force or a cross-functional team. In the SECI model, it represents the outsourcing process. Through dialogue, members of dialoguing Ba share their mental models and skills which are converted into common concepts and models. Dialogue is the key tool for such conversions, making extensive use of metaphors and elements of organizational culture for the creation of meaning and value for the whole organization.

The Ba that develops in the virtual space as a place of interaction are based on the use of online networks, group-ware, documentation and databases. The *virtual Ba*, therefore, represent a virtual platform for the exchange of data, information and knowledge. Like dialoguing and originating Ba, they can be determined by an individual or collective interaction. *Exercising Ba* is based on an individual interaction in a virtual space. In the SECI model it represents the internalization phase. This type of Ba places the emphasis on the continuous learning of the subject, who autonomously manages his own training program, through the consultation of databases and information systems of the organization. *Exercising Ba* facilitates the conversion of explicit knowledge into

tacit knowledge. Individual knowledge is continuously increased using formal (explicit) knowledge through simulated applications. Systeming Ba is based on a collective interaction using a virtual space. In the latter, the growing use of new technologies within organizations has allowed more effective support in the combination of explicit knowledge, creating virtual collaborative environments.

In conclusion, the Ba must be seen as an important element in the organizational planning of modern organizations as it allows individuals to interpret the information and data present in the organization, generating new knowledge and consequently expanding the knowledge base on which the organization can base its strategy and competitive advantage. Precisely for this reason, the organizational analysis effort of the Ba must be oriented towards defining an organic and dynamic place for the knowledge creation process.

### **3 Methodology**

The study aims to understand the phenomenon of corporate museums in Italy active in the agri-food sector. According to the protocols and indications suggested by Yin (2013), we adopted a qualitative and descriptive approach based on a case study (Eisenhardt, 1989; Yin, 1994, 2013; Ventura, et al., 2020). A qualitative nature seemed particularly coherent with the purpose of the research and for the complexity of the phenomenon since it allows us to take into account the specific characteristics of the public organizational context (Bamberger, 2000). This approach involved collecting data using a variety of sources, including semi-structured interviews and internal documents (Canonico, et al., 2020).

Privileged access to relevant information has allowed authors to collect data from different sources, increasing the quality of the information obtained" (Benbasat, 1984; Zardini et al., 2016, p.67).

A case study has been observed in this research because it is particularly favorable when taking an inductive approach and using theory to explain empirical observations. The complexity of the analysis required the need to divide the methodological process into two phases.

In the first phase of the methodological process, the main theories on the transfer of knowledge and organizational memory were compared to frame the phenomenon of corporate museums.

The second step - on the job - was the identification of corporate museums in Italy. This phase was carried out by analyzing those present in the public and free

dataset created by Museimpresa. Museimpresa is an Italian association, its aim is to promote the valorisation of company archives and corporate museums. Data has been observed up to 04/10/2022 (mm/dd/yy0yy). The dataset shows 101 corporate museums in Italy. The observed case study has allowed us to better understand the strategic role of the corporate museum.

#### 4 Main results and discussion

The data and information contained in the database were processed through descriptive statistics indicators. From the analysis of the database, it is possible to understand the diffusion of the phenomenon in Italy.

The first preliminary result is the geographic distribution of corporate museums in Italy.

The Figure 2 shows the geographical distribution is not homogeneous. In fact, Lombardy is the region with the highest concentration of corporate museums. Lombardy was among the first Italian regions to experience the industrial revolution. The regions with the highest concentration of corporate museums are the regions with a widespread and consolidated industrial and entrepreneurial fabric. The Valle d'Aosta, Sardinia and Molise regions do not have corporate museums. The other regions have at least one corporate museum.

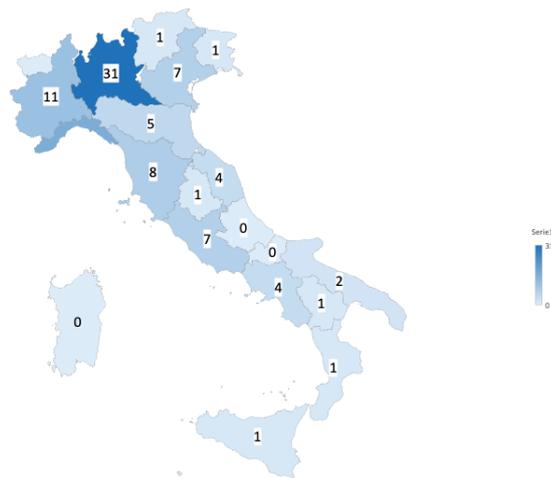

Figure 2. Geographical distribution of Corporate Museum in Italy  
Source: own elaboration

From the analysis of the Museimpresa dataset, it emerges that over a third of company museums in Italy are connected to the agri-food sector. The massive presence of corporate museums linked to the agri-food sector highlights the economic impact of the sector.

The next step is to understand the strategic value of corporate museums in the agri-food sector. To achieve this result, two variables have been related: size (micro/macro) and strategic value.

The Figure 3 allows corporate museums to be classified according to the strategic value they provide to the parent organisation. The second dimension is based on the breadth of organizational artifacts collected in the corporate museum.

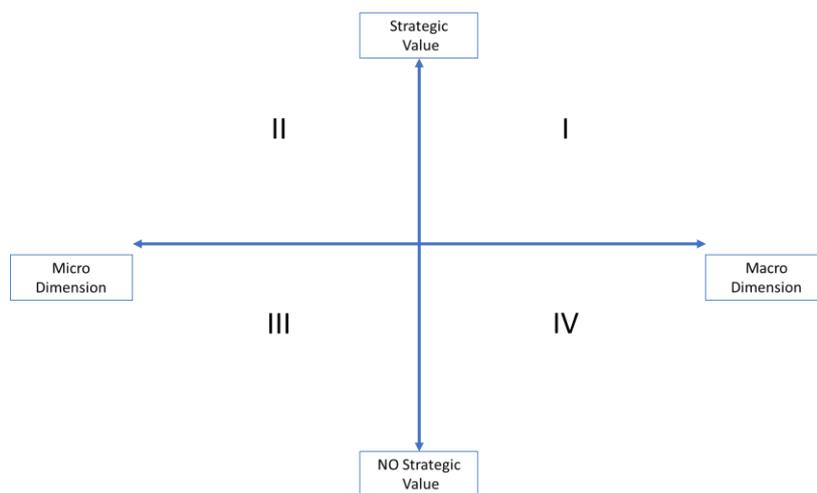

Figure 3. Framework on Corporate Museum  
Source: Own Elaboration

The growing strategic importance of the corporate museum emerges from the analysis of corporate documentation and the collection of information, to enhance knowledge and create value for the reference community. In fact, the central role of the corporate museum emerges in generating new knowledge. The corporate museum becomes a place in which to bring together different knowledge and above all to make different stakeholders interact. Thus, a dynamic process of co-creation of knowledge is generated, based on the knowledge present in the museum.

## 5 Conclusions

The growing attention of policy makers and scholars on the agrifood sector has generated a copious and vast literature. Corporate museums in the agri-food sector seem to have been overlooked in this debate. This study aims to offer initial reflections on corporate museums in the agri-food sector, from the point of view of organizational memory and the transfer of knowledge.

The identification of the corporate museum as a "Ba" assumes that the corporate museum assumes a strategic value in the transfer of knowledge and above all a fundamental role in the process of co-creation of knowledge. There are several actors who enter into this process of co-creation of knowledge (employees, suppliers, management, customers and above all the community).

The introduction of new innovations (or knowledge) in agri-food organizations has a direct and positive impact on the level of well-being. For this reason, the direct involvement of the reference community.

Furthermore, agribusiness organizations, through enterprise museums, have demonstrated their ability to design KMPS.

This study is not without limitations. In fact, the main limitation of this study is represented by the dataset. The dataset analysed does not include all corporate museums in Italy. Registration is voluntary, so some corporate museums may not be registered. Furthermore, since the aim of the study was to offer an overview of the phenomenon and for convenience, a clear distinction was not made between corporate museums, historical archives and hybrid forms. Despite these limitations, the results of this study offer interesting insights for the development of future studies on the topic. A gap emerges in the literature on corporate museums, from the point of view of knowledge transfer and organizational memory.

### **Abstract**

Digitalised work processes, fast information flows and flexible project structures also have an impact on the design of working environments and work organisation. Hybrid work and multi-structure offices are concepts that are often implemented in the private sector but rarely in the public sector. Due to the pandemic conditions of the last two years, however, many employees and employers in the public sector have gained experience with remote work in home offices.

The "paperless office" is increasingly becoming reality, filing cabinets are getting smaller and replaced by e-files. Digital screen work, video conferencing as well as extensive data and document exchange via cloud services increasingly determine everyday work. It can be questioned whether spatial-organizational formats such as the conventional two-person

office are still appropriate solutions for office work in the future public sector. Are there new (spatial) environments that create more suitable work conditions for the changing requirements? How can employees participate in the design of these new work environments? How can they be empowered to re-organise and re-use their work environment under the changing conditions?

This paper reflects on a feasibility study conducted by TU Dresden for a large Saxon administration. Addressing "Future Work" scenarios, it focused on new concepts for workplace design, work organisation and knowledge management. The feasibility study started with a survey of employees in order to derive spatial, organisational and technological requirements for new work organization and spatial concepts.

The paper introduces – besides the scientific and practice background – the overall procedure of the study as well as new concepts for work organisation and workplace design. On the one hand, it focuses on (online) surveys and co-design workshops as methodological approaches for the assessment of needs. On the other hand it discusses the specific results of the feasibility study. It concludes with the translation of the findings into schematic designs, and outlines how to incorporate the insights in the future planning of new work organization and spatial concepts in public administration.

## 1 Introduction

The "paperless office" is increasingly becoming reality, file cabinets are getting smaller and replaced by e-files. Digital screen work, video conferencing as well as extensive data and document exchange via cloud services increasingly determine everyday work. It can be questioned whether spatial-organizational formats such as the conventional two-person office are still appropriate solutions for office work in the future public sector. This paper reflects on an a feasibility study conducted by the TU Dresden at a large Saxon administration in terms of "Future Work" focusing on new concepts for workplace design, work organisation and knowledge management.

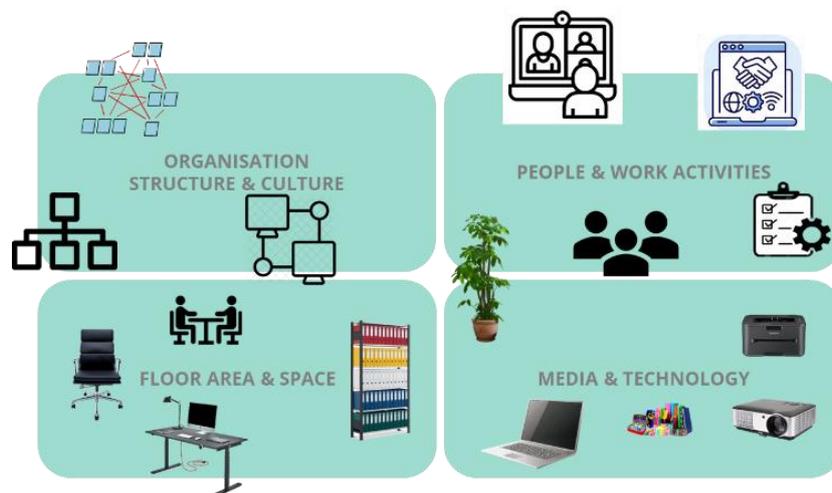

Figure 1: Design dimensions of work organisation and workplace design (Source: Wissensarchitektur TU Dresden)

Digitalisation and hybrid work are current developments becoming more and more widespread in connected work environments (so-called "Arbeitswelt 4.0"). Organisations and companies are required to rethink the structure of their work organisation and office space design. More flexibility is needed in the face of swift changes, such as the pandemic-induced adaptations during the past years. Four design dimensions – as introduced in the feasibility study – must be taken into consideration: **Organisation Structure & Culture**, **People and Work Activity**, **Floor area and Space**, as well as **Media and Technology** (Figure 1).

More flexibility in regards to working hours and to the place where work activities are carried out results in changed office workspaces, especially their design. Since the COVID-19 pandemic, office and knowledge workers have started to more frequently use their homes as places to work. This leads to temporary spatial overcapacities in office buildings that may be used otherwise in the future.

Employee work processes are heterogeneous and vary within a broad spectrum. There are activities that need to be carried out in quiet and in concentrated manner. On the other hand, there are multiple coordination activities, meetings, consultations and exchanges necessary. A suitable orientation is provided by the activity-based workplace concept (Marzban et.al. 2022, Appel-Meulenbroek et.al. 2011), which divides office space into different zones fitting best for the respective work and communication activity.

When introducing new concepts for work organisation and workplace design, above-mentioned four dimensions (Figure 1) and their interlinkage plays an important role. Aspects, such as strategic goals of the organisation, specific work processes as well as technical work equipment and the physical environment need to be addressed, assessed and described. Especially new and changing work processes (Figure 2) make it indispensable to analyse the current and future characteristics of the organisation in a very early design phase of planning to derive a well-fitting designs for work organisation and workplaces.

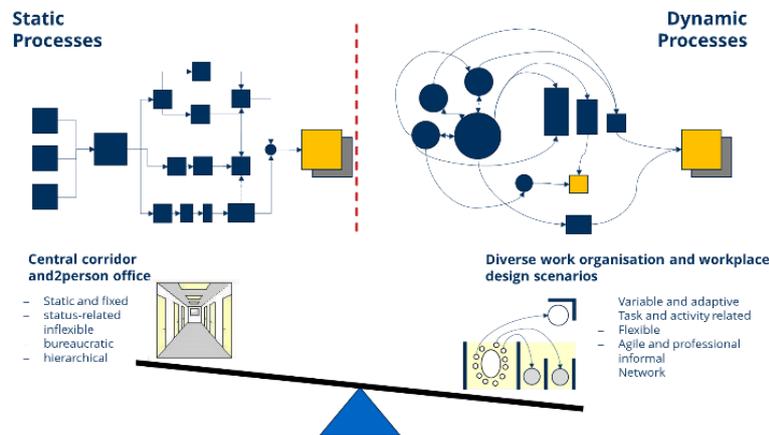

Figure 2: Balance between static and dynamic work organisation/processes in accordance with spatial workplace design. (Source: Wissensarchitektur TU Dresden)

## 2 Background from science and practice

Digitisation and hybrid working are current trends (Bamberg et.al. 2022) that have a massive influence on the cooperation of employees. They are related to higher flexibilisation, self-organisation, value orientation, transformation processes and hybrid work organisation. The flexibility of the place of work, working hours, work tasks and, beyond that, the division of functions between people and technology open up a different scope for design (Hofmann et al., 2019).

However, in the practical implementation in organisations and companies the high complexity of these design fields becomes notable, which goes far beyond the formulation and implementation of concepts of individual flexibility solutions. In addition to the reorganisation of work processes and workflows, their temporal and spatial flexibilisation and new competence requirements for employees –

digital systems in particular – influence and change the cooperation between people, and between people and machines. A wide variety of digital tools are already being used for collaboration, such as cloud-based platform and data exchange systems, collaboration software for project management, intranet solutions for organisational and work processes, remote systems for machine operation or messenger services for employee communication. More flexibility in working hours and the place where work activities are carried out is resulting in changes for office workspaces. There may be different reasons for using the home office, as has become a new standard during the COVID 19 pandemics, such as limiting commuting time, organising private appointments or deliberately withdrawing from the distracting office environment in order to perform more concentrated tasks. (Käfer et al., 2022).

Different office structures are possible, e.g. in the form of multi-structure offices, which spatially support new organisational concepts such as the activity-based workplace concept. However, since the work processes and contents of the employees are heterogeneous, it is important for the use of the shared space to be aligned according to suitable criteria. Activities that tend to be carried out in a quiet and concentrated manner, e.g. preparing test reports or planning and writing tasks, strongly contrast with coordination activities, meetings, advising people and informal exchanges that are carried out together in a communicative manner. The Activity-based Workplace concept provides a suitable orientation here. Here, the office space is divided into different zones (noisy/quiet, concentrated/communicative, communal/individual, etc.) and the users choose the (most) suitable place for completing the work themselves, depending on the task. Thus, workplaces are provided for quiet work as well as for joint (formal as well as in-formal) work-oriented exchange and are distributed over the area as needed.

Design science has identified the inherent planning dilemma that only towards the end of a design project a full understanding of the problem at stake is formed. So in the course of the design process, new findings on how to ensure resource-saving, needs-oriented and sustainable design planning emerge in hindsight, after decisions have been already taken.

The influence on design solution thus decrease in the course of the planning while the costs for design changes increase proportionally. For this reason, scientific research suggests a demand- and user-oriented procurement of information as a basis for design decision-making. Pena et.al. propagated user

involvement and the elicitation and translation of needs as early as possible already 1969 in the book: "Problem seeking: New directions in architectural programming in Architects, Planners, Engineers".

The establishment of planning cycles, evidence-based procedures and the application of scientific methods in monitoring, facilitation (supervision and support) and evaluation are playing an increasingly important role in the design sciences. Also from other disciplines, such as Industrial Design or Innovation Management, co-creative and evidence-based insights, cyclic principles and methods are increasingly being adapted. The principle of evidence-based design through user orientation and user insights on the one hand, and through comparative analysis of different design solutions on the other hand, is considered a resource-saving and efficient approach, as it enables higher-level learning from experience with comparable criteria (planners can carry out planning activities on a higher level of security when input variables, contexts and effects have been well described).

Christopher Alexander formulated a pattern principle for urban planning in the 1970s, by co-creating the specific patterns such as "entrance area", "private zone" or "public zone" through a participatory process with city residents (Alexander 1977). These principles form the scientific framework of the approach presented in this paper.

### **3 High potentials – the feasibility study**

The goal of the feasibility study was to integrate findings from (post) occupation studies and design research as well as experiences from the pandemic-related new ways of working in the administration, in order to outline new potential pathways for workplace design and work organisation as well as space management for public authorities in the federal state of Saxony. Based on the results, proposals and recommendations for new, optimised organisational and spatial concepts had to be derived and a concept for the implementation of a concrete pilot project in the form of a living lab was expected. These objectives had to be based on a systematic sequence of steps building on each other. A first step, the analysis phase, aimed at determining current and future needs, a typology of work and offices types, as well as carrying out an evaluation of the current state. The aim of the second phase was to look at the initial results in greater depth and to expand them qualitatively through the co-creative

involvement of project participants. In doing so, the connection between work tasks and activities as well as the suitable working environments should be established. The third phase aimed to develop exemplary implementation scenarios and conceptualise a possible living lab, as well as to derive recommendations for future action and the successful exploitation of the potentials identified.

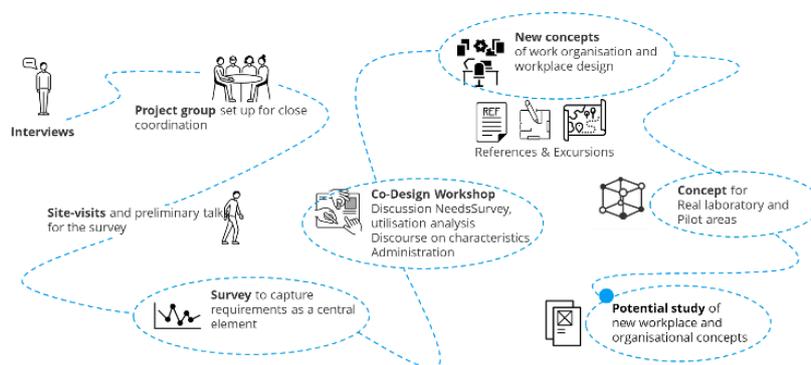

Figure 3: Methodological path of the potential study – procedural milestones. (Source: Wissensarchitektur TU Dresden)

The feasibility study of TU Dresden included seven work packages and was divided into several phases (Figure 3). The first phase comprised a detailed analysis with interviews and an extensive survey of the organisational units involved. In addition to the definition of needs and a status quo examination, a typology of work and office forms was established. In the second phase, results were deepened, supplemented and qualified together with the participating actors in a co-creative workshop. In the workshop, the participants also discussed spatial and work organisational scenarios for implementation. Within the feasibility study, the concept for a living lab was developed and a process for detailed and systematic needs assessment was outlined.

Various research questions had been formulated during the feasibility study. They concerned the future spatial design and work organisation in comparison to the current office environment and work activities, for instance:

- “What are the current work tasks and activities, utilisation needs and space requirements?”
- “How can administrative work in the organisational units to be surveyed be characterised?,

- “What potentials (space, organisation, etc.) result from the experiences for workplace and organisational concepts of the future?”
- “How can space be qualified at an early stage to meet needs?”

On such basis, the following sections of this paper reflect the overall methodological approach, the results of an online questionnaire and of the co-design workshops. It discusses the ways how needs assessments are to be conducted and how these insights are to be translated into spatial designs and organisational planning.

#### **4 New concepts for work organisation and workplace design – a methodical approach for user-driven and co-created needs assessment**

##### ***4.1 Overview of new forms of work organisation***

With regard to the organisation of work, different, new forms are possible which are primarily aimed at increasing flexibility in different areas. Local flexibilisation through various forms of mobile work (e.g. home office, co-working spaces) can lead to a multiple use of office space as well as time savings for employees, e.g. by eliminating the need to travel to work. An activity-based workplace concept in the organisation supports activity-related flexibility by setting up work zones for corresponding activities. Zones that were used for concentrated work, for joint work or for informal communication were common. This usually leads to a change in work tasks and processes.

Work tasks were carried out in designated zones. When employees work from home, communicative activities tend to take place in the office, e.g. exchanges with colleagues and planned meetings. Quiet activities were more likely to be done at home. The survey also provided indications of this. The employees name as reasons for coming to the office, above all, consultations with colleagues and that documents can only be processed in the office. Spatial as well as activity-related flexibility only works if mobile technical equipment is available. This applies not only to work equipment, but above all to digital access to and digital processing options for documents.

New forms of work organisation include:

- Local flexibility: Mobile work (e.g. home office, co-working spaces), teleworking, changed spatial (office) structures in certain work zones

(activity-based workplace), multiple use of space (e.g. multifunctional offices, desk sharing),

- Time-related flexibilisation: Optional working time, trust-based working time, service hours, working time accounts
- Task-related flexibilisation: Changes in work tasks, workflows and processes, achievement due to the inclusion of hybrid forms of cooperation, expanded range of tasks
- Hybrid leadership and leadership at a distance: Leadership of employees working together in physical (analogue) and virtual (digital) spaces
- Digital communication and collaboration: Promotion of digital competences (e.g. handling software, collaborative systems, compliance with data protection), virtual teams
- Technical systems: Increased use of digital assistance systems, changed human-technology division of labour (e.g. chatbot for customer contact in administration, algorithmisation of work)
- Cultivating a shared office and usage culture: e.g. the "clean desk concept".

An example is the "clean desk concept" which includes reliable and clear rules on how flexible workplaces and meeting zones should be used and tidied up. It also regulates how private items are handled in the office. Precisely, the clean desk principle implies that at the end of the working day, all employees should remove their personal work equipment (laptop, keyboard, computer mouse, headset, etc.) from the desk and store it in a lockable mobile container, wall cupboard, sideboard, locker or similar. For the purpose of mobile work, employees are free to take technical equipment home with them. A room or workplace booking system is required for this approach ("Who can be found where and when?"). The concept also implies a different attitude to data protection and security: all employees are required to remove documents from their desks, especially those with confidential or data protection-relevant content, so that unauthorised persons cannot view them. Other personal items should also be removed from the desk and stored away. It is not necessary to remove items (pens, punches, scissors, etc.) that are for common use. It is best to agree with the other employees in the respective home zone which items these are.

## 4.2 Overview of new solutions for workplace design

When designing and implementing new office concepts, structural and cultural specifics of the organisation – in addition to spatial concept – must be taken into account. Flexible work concepts, for example, must be suitable for the activities and work processes of the organisation. The organisational culture as well as participation formats for employees and their willingness to change are elementary factors for successfully introducing and adapting new work organisation and spatial concepts. Therefore, the design levels of space, organisational structure and culture, task and activity as well as the technical infrastructure should always be considered as a totality when setting up a new work organisation and space concept.

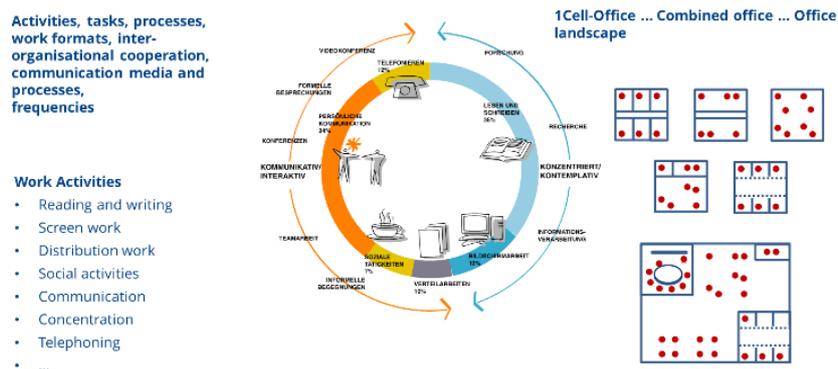

Figure 4: Interlink of work activity and user profiles with office patterns (Source: Henn architects, Wissensarchitektur TU Dresden )

There is no "one" solution for the design of new workplaces and working environments. Therefore, it is a matter of a holistic view and thus the definition of activities and work content with the survey of needs assessment (Figure 4) is crucial. This applies in particular to office construction, in order to make design, planning and construction more user- and use-oriented and multidimensional.

The first planning step of a comprehensive needs assessment is to analyse the status quo. For this purpose, the needs assessment process, the design planning but also the subsequent use should be oriented towards the following dimensions and consider them jointly. The dimensions and their input variables (see Figure 1) do not all have the same relevance to structural and floorplan design. However, due to their interactions, they are strongly linked, so that a

fundamental change does not necessarily start with a structural redesign, but also arises as a result of changing working and organisational conditions.

If possible, the needs assessment should be carried out with real users, i.e. with employees who also carry out the relevant work, activities and processes in their everyday lives. It should be ensured that not only the status quo is surveyed in the consideration of the different dimensions, but that these knowledge-holders are asked in particular for further concepts and ideas too. This applies, for example, to how work and organisational processes should be carried out in the future, or how structural relationships and functional connections can lead to better work and more efficient completion of tasks. The question in which direction the respective organisation wants to develop is also relevant for the design and solution, since the working environment should ultimately serve these goals and not counteract them.

## **5 Methodological Approach**

### **5.1 Online Survey**

The online survey carried out as part of the potential study serves as a general instrument to determine the specific requirements of an organisation. The survey should not only look at the current situation, but also ask about future developments and possible solutions.

The online survey was conducted in February 2022 among employees of the Saxon state administration and three other institutions. It centred around future forms of work and working environments in public administrations. More than half of the invited participants (approx. 54%) took part in the survey, which meant that a total of 724 data records could be included in the evaluation. The questionnaire developed for the study contained 34 questions with primarily closed but also open questions. They related to work activities, communication and cooperation, work processes, mobile work in the form of home office, work equipment, work environment as well as satisfaction with the current work situation and experiences with new, pandemic-related ways of working. The results formed a basis for the subsequent derivation of spatial, work organisation and technological aspects for future work environments and administration, as well as for the development of adequate spatial typologies.

## 5.2 Co-Design Workshop

A co-creative workshop was held with the members of the project group. This workshop served to further qualify the results of the survey. In this online workshop, new forms and scenarios of collaborative work were discussed. The participants actively contributed their input to the workshop questions via a digital whiteboard.

Figure 5: World Café - Thematic Tables "Workplace", "Meeting", "Common Area" and "Organisation" (Source: Wissensarchitektur TU Dresden)

During the workshop, the most relevant aspects – requirements for workplaces, meetings, common areas and organisation – were discussed. The aims of the workshop were 1) to discuss the implications of the aspects listed above and 2) to test and use under real-world conditions new forms of digital collaboration (digital whiteboard).

## 6 Results

The major results of the overall study were arranged in an analytic evaluation matrix (Figure 6) that summarises the strengths and potentials but also the potential weaknesses and risks for new work organisation and spatial concepts.

Figure 6: Analysis and evaluation matrix (Source: TU Dresden)

### 6.1 Findings and results of the (online) questionnaire

Based on the survey, detailed results could be determined for the four dimensions of the matrix. The following paragraphs excerpt some of the results which shed light on the activity, place of work, mobile work, degree of digitalisation and satisfaction of the employees surveyed.

The activities in the four studied administrative units are characterised on the one hand by daily work with the PC and on the other hand by a high proportion of telephone calls. Typical tasks are, for example, working with files, case discussions, concept work, preparation of statements and notes, research or evaluating measures. A large part of the tasks can be digitally supported. However, certain respondent groups work significantly more with paper files than other units. This is partly due to a different degree of digitalisation in the institutions. Figure 7 shows the results for the work tasks and activities.

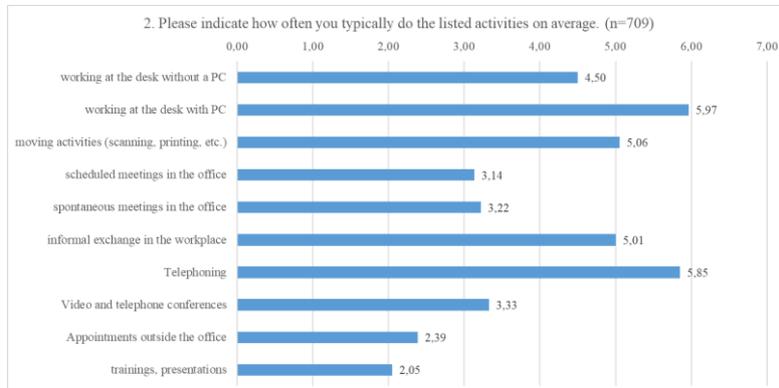

Figure 7: Work tasks and activities in the sample. (Source: CIMTT TU Dresden)

98% of the respondents in the total sample have a fixed office workstation. Only very few people have two fixed workplaces in different units or no fixed workplace (2%). 23% of the respondents work in a single office, 53% of the respondents sit in a room with another person. Of the participants, 18% work with two other people in the room. The fewest number of respondents sit in an office with three or more people (6 %). This means that there is a conventional two-person office structure in most of the areas surveyed. Before the COVID-19 pandemic, most employees in the sample worked in the office. Only a few people were able to work in a home office. As regards the future, 92 % of the respondents would generally like to have the opportunity to work in a home office to a certain extent. More precise results are shown in Figure 8. Furthermore, 85% of the respondents consider their job suitable for working in a home office.

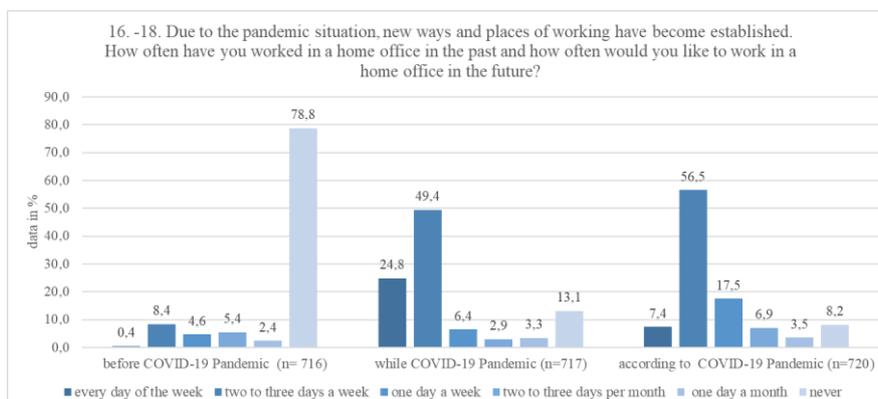

Figure 8: Home office before, during and after the COVID-19 Pandemic. (Source: CIMTT TU Dresden)

From the respondents' point of view, the main reasons for working in a home office are the better compatibility of work and family, the elimination of long commutes and flexible, and the chance for individual working. As reasons for coming to the office, the interviewees mainly mention the exchange with colleagues, the well-equipped workplace, the technical equipment as well as documents that can only be processed in the office. Exact results are shown in Figure 9.

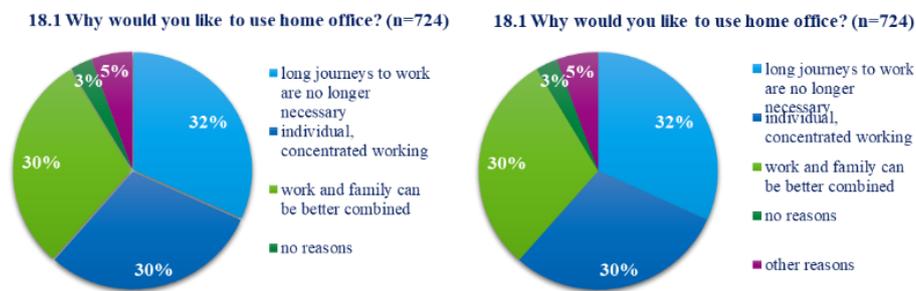

Figure 9: Left: Reasons to choose home office; Right: reasons to choose office. (Source: CIMTT TU Dresden)

## 6.2 Discussion and results of co-design workshop

Within the feasibility study, the four relevant aspects – requirements for workplaces, meetings, common areas and organisation – were reflected. The results of the survey and the functional relationships in terms of organisation and space were discussed, but also the fact that it is always a discursive process of weighing up on "how much of what" is sensible, financially viable and necessary in accordance with requirements. In a four-hour online workshop with the members of the project group, following questions and aspects were explored for the two scenarios (1) "Narrow old world" and (2) "Flexible new world":

- "What from this scenario fits well with us because ...?", and
- "What from this scenario irritates / does not fit to us, because ...?"

The aim was to identify functional relationships between activities and spatial requirements. Furthermore, in the two different scenarios, the aim was to adopt different perspectives and to rethink office and working conditions.

## SZENARIO#1 „Narrow old world“

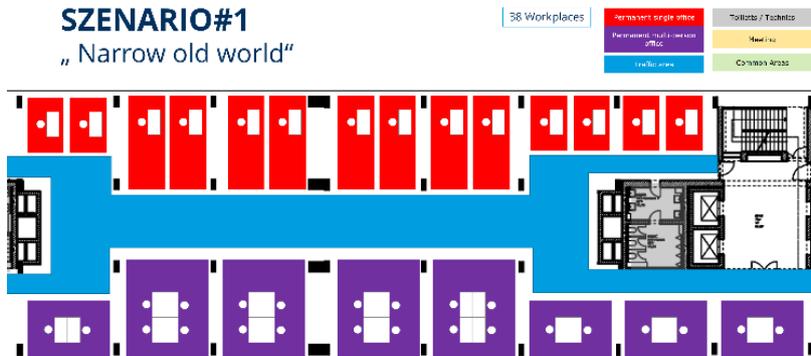

Figure 10: Floorplan visualisation of scenario 1 – „Narrow old world“ (Source: Wissensarchitektur TU Dresden)

<p>What from this scenario suits us well because ...?</p>	<ul style="list-style-type: none"> <li>• Single room/ file room available</li> <li>• clear work structure, little organisational effort</li> <li>• my computer at my workplace</li> <li>• Flexibility for everyday work without prior organisational effort</li> <li>• Everyone knows where everyone is placed and who is in reach</li> </ul> <p>But: "lone warriors" (controlling, lawyers) can also work well and concentrated at home.</p>
<p>What from this scenario is irritating / does not suit us because ...?</p>	<ul style="list-style-type: none"> <li>• lack of meeting rooms</li> <li>• different communication zones are missing</li> <li>• Semi-public communication zones are missing</li> <li>• There are no further education and training rooms</li> </ul> <p>Physical proximity of administrators and staff is advantageous, but communication sometimes interferes with concentrated work.</p>

Figure 11: Summary of Workshop Participants Feedback of Scenario 1 - „Narrow old world“

## SZENARIO#2 „Flexible New World“

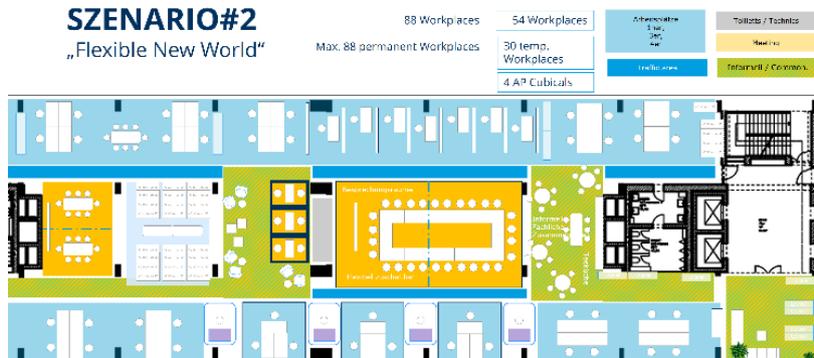

Figure 12: Floorplan visualisation of scenario 2 – „Narrow old world“ (Source: Wissensarchitektur TU Dresden)

<p>What from this scenario suits us well because ...?</p>	<p>Communication areas</p> <ul style="list-style-type: none"> <li>• Professional exchange and better communication, also informal</li> <li>• Topics are discussed more readily/openly and together through spontaneous encounters (idea generator)</li> </ul> <p>Flexibilisation</p> <ul style="list-style-type: none"> <li>• Increased effectiveness as added value</li> <li>• Space adaptable to team size</li> <li>• Flexibility in choice of workplace, no fixed workplace necessary</li> </ul> <p>Workplaces</p> <ul style="list-style-type: none"> <li>• Permanently allocated office space and archive rooms</li> </ul> <p>Meeting</p> <ul style="list-style-type: none"> <li>• Consultation rooms and informal consultation zones for short-term consultations</li> <li>• Meeting rooms of different sizes</li> </ul> <p>Community areas</p> <ul style="list-style-type: none"> <li>• Balancing zone between concentrated work/recreation times</li> <li>• Appreciation through common areas</li> </ul>
<p>What from this scenario is irritating / does not suit us because ...?</p>	<p>Organisational culture</p> <ul style="list-style-type: none"> <li>• We like what we know and what we have.</li> <li>• Opening up to new things is difficult</li> <li>• How are organisation units accommodated housed together</li> </ul> <p>Organisational effort</p> <ul style="list-style-type: none"> <li>• Fixed working structures need to be revised</li> <li>• Organisation of the different areas</li> <li>• How do I get my files?</li> </ul> <p>Data protection</p> <ul style="list-style-type: none"> <li>• Open work not possible, §30 AO tax secrecy</li> <li>• Data protection regulations!</li> <li>• no data about third parties on files (taxes) may be disclosed</li> </ul> <p>Acoustics</p> <ul style="list-style-type: none"> <li>• undisturbed work in case of noise or interruptions (depending on the person)</li> <li>• A lot of work with numbers, data and facts--&gt; Volume of telephone calls raises the noise level.</li> </ul>

Figure 13: Summary of Workshop Participants Feedback of Scenario 2 - „Flexible New World“

The World Café phase of the workshop dealt with four thematic tables on the topics of “workplaces”, “meeting”, “communal areas” and “organisation”. Through rotation, many suggestions were collected in a short time, and participants had the opportunity to express themselves on all four topics.

Figure 14: Visual summary of the participant feedback (Source: Wissensarchitektur TU Dresden)

## 7 First implications for practice

There is potential for new forms of work organisation as well as for new office space concepts in the surveyed administration and the subordinate areas. The respondents assess their work activities as suitable for mobile work in the form of home office and there is a high willingness to use home office as a new form of work. However, there are also workplaces in all the units surveyed that are fixed and have no equivalent in a home office due to certain work equipment (e.g. files, special hardware) and activities (e.g. consultation hours for customers). This must be taken into account in agreements in order to avoid dissonance in workforces. Furthermore, the use of a home office can lead to employees giving up personal space in the office. Organisational variants for workplaces can be desk sharing or room sharing, i.e. several employees share workplaces or work zones in these cases. Both concepts require good planning and self-organisation on the part of the employees as well as clear and transparent rules and structures on the part of the employer. The integration of a booking tool for the workplaces is recommended. Spatial potentials arise from spaces that become vacant due to home office. Office space can be qualitatively upgraded by making more work zones usable for collaboration and coordination. This also includes niches and extended workspaces that temporarily serve as flexible workplaces. Multi-

functionality and flexibility of rooms and spaces increase the possibilities for use. Meeting rooms can be used for exchanges with colleagues (e.g. teamwork, annual meetings, project coordination) as well as for telephone calls and concentrated work. Furthermore, space savings are possible to a certain extent by using or subletting space from other departments.

Hybrid working requires a suitable technical environment. First and foremost, this includes a secure IT infrastructure that allows employees remote access to documents and data. With continuous, digital processing of documents, access is possible regardless of location and work can thus be organised more flexibly. At the individual level, hybrid working can result in work being structured differently. Quiet work tasks with longer periods of concentration are more likely to be moved to the home office. Exchanges, meetings and group work phases with colleagues are more likely to take place during working hours in the office. Employees are given more leeway in deciding how to organise their work and schedule it more flexibly. This usually leads to a better reconciliation of work and family demands and promotes self-organisation among employees. For the implementation of measures regarding new work organisation and office space concepts, it is important to always consider the four dimensions "organisational structure and culture", "people and activity", "space and area" and "media and technology" in combination and not separately.

### ***7.1 Translation of needs assessment into spatial and organisational patterns***

As a translation and verification step of the collected requirements and needs, visualisation techniques are suitable to give the involved stakeholders quick access to complex content. Moreover, to open up content and consideration processes on key issues as: "What is needed, and how much of it?", "Priorisation of functions and needs", or "Sequence and temporal order of process steps" need to be graphically displayed. Visualisation techniques are useful to discuss jointly with the users and user representatives, to be able to discuss on eye-level and finally to speed up decision-making processes. Another helpful step in translating work requirements and identified needs into spatial patterns is shown in Figure 15. As an example, it visualises the basic functions of an office environment with a detailed characterisation of the workplaces. This translation service is flanked by modular patterns, icons or 3D visualisations of the facts (see also Figure 17).

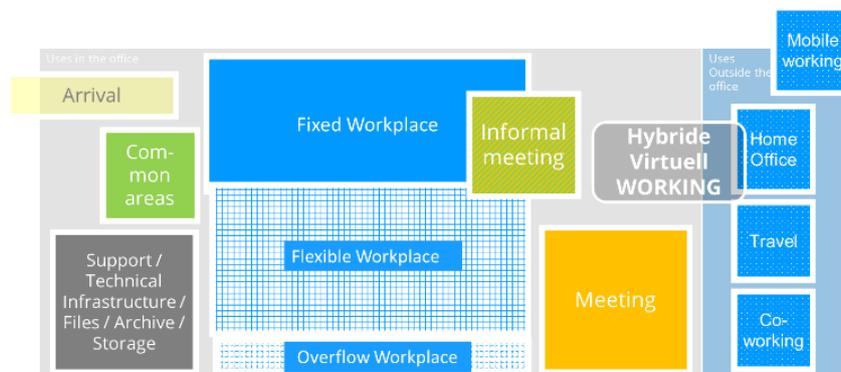

Figure 15: Subdivision of the functional area "workplace" into fixed, flexible and overflow workplaces (Source: Wissensarchitektur TU Dresden)

With regard to the organisation of the workplaces, the following scenario could arise in the division of the workplaces:

- There are *fixed workplaces with team assignment* for people who work in the office at least four days a week (and at least 6 hours a day). When planning and organising the fixed workplaces, special attention should be paid to inclusive workplaces. For persons with special requirements these workplaces are reserved. When the respective persons are working in a home office, it is possible for other employees to use the workplace as well.
- There are *flex workstations with team allocation* for people who work in the office two to three days a week (and at least 6 hours a day). These workplaces use a desk sharing solution, e.g. three people share two workplaces.
- There are *flex workplaces without team allocation* that function as so-called overflow workplaces. These workstations are used by employees who have a telecommuting workstation or who work in the office for a maximum of one day a week. Workplaces in meeting rooms can be used for this purpose or employees can be attached to teams with desk sharing.

Figure 16 shows an application example for the distribution of workstations when the principle of desk sharing is applied in a team of six people. In the example shown, two employees use fixed workplaces as they do their work in presence in the office. Three colleagues work hybrid and come to work in the office between two and three days. The sixth person in the team has a

telecommuting workstation and comes to work in the office no more than once a week.

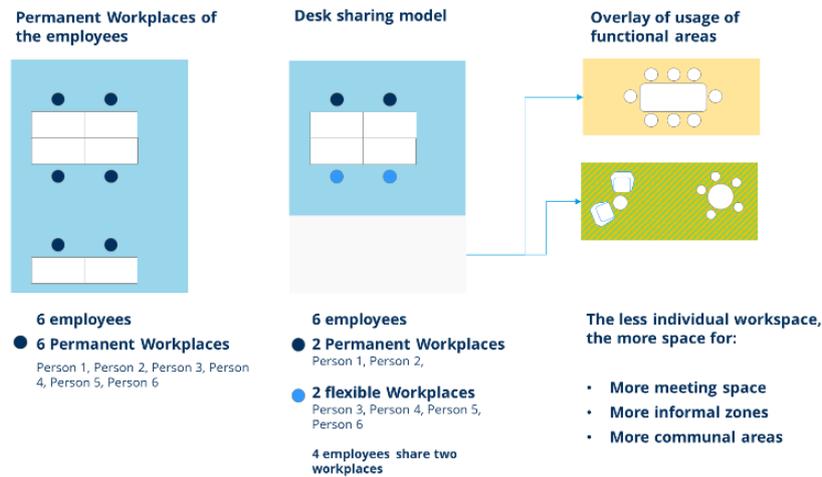

Figure 16: Desk Sharing - example for the distribution of workstations (Source: Wissensarchitektur TU Dresden)

## 8 Outlook

User-oriented needs assessment should be designed co-creatively – i.e. together with the users – as a process with the following steps (Fig. 17):

- Basic survey (online survey) of the factual situation, the actual state as well as the target state;
- Co-creative evaluation and accentuation of the requirements of the basic survey together with the users;
- Translation of technical, spatial, organisational requirements into workplace design and organisational concepts.

A test phase of potential spatial and organisational configurations still before the implementation in new floor plans and new working procedures and methods are very usefully, especially in public administrations.

Figure 17: Process steps of elicitation, co-creative qualification and translation of requirements into spatial patterns and organisational rules of use (Source: Wissensarchitektur TU Dresden)

During a qualitative and quantitative needs assessment, it is necessary to have goal-oriented controller discussions for all dimensions and aspects in order to enrich the design task with the right premises ("How-much-of-what?"). Figure 18 visualises some basic aspects that help clarifying the functional relationships between activities and spatial requirements.

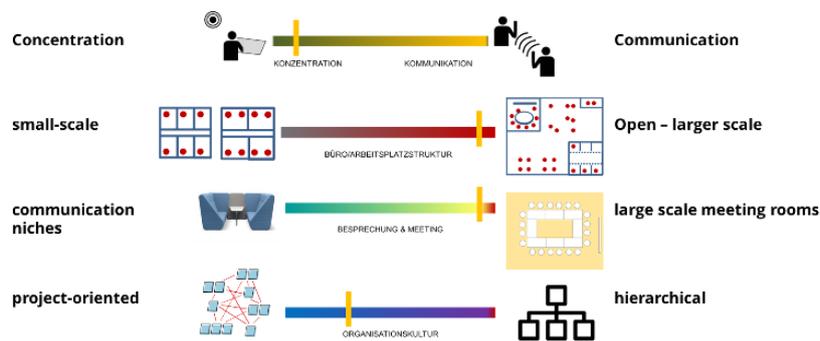

Figure 18: Patterns of the regulating principle for decision-making during the needs assessment (Source: Wissensarchitektur TU Dresden)

The aspects of the workplace, meeting rooms, communal areas and organisation, together with the activities that will take place in the rooms in the future, are decisive for the design of new solutions for a needs-oriented working environment. The quality of future work organisation and workplace concepts depends on the organisational, i.e. structural and cultural conditions, the spatial requirements and possibilities, the work activities to be carried out and the technical infrastructure. Only a common understanding of how the framework conditions on the individual dimensions should be designed beyond the mere use of space will lead to new concepts in work organisation and space design. For an activity-oriented form of office design, the respective requirements for the

workplace, the meeting areas and the common areas should be defined with the users at an early stage and the number of fixed, flexible and overflow workplaces should be ascertained, as well as a possible flexibilisation through temporary workplaces (niches, meeting rooms). Space allocations should be related to the smallest organisational unit, the "team" and its functional and work-organisational context. Rules of use, such as the acceptable noise level in rooms or zones, must be found together. However, these agreed rules of use may have to be adapted to new working conditions, and are subject to repeated change. Regular monitoring is recommended to be able to adjust the user- and usage-driven spatial and organisational measures.

### **Abstract**

Innovation played a relevant role in coping with the related economic-financial consequences of the 2008 crisis. In particular, several studies show the pivotal role of open innovation activities in responding to 2008 crisis-related downturn conditions. Remarkably, previous studies share several limitations. First, they leverage single-country data or single sectors to examine open innovation activities. Second, they examine open innovation activities and firm performance through binary comparisons between either pre-crisis and

crisis or crisis and post-crisis periods. An overall view of how the outburst of a crisis altered the 2008 pre-crisis collaboration strategies and how such strategies changed after the 2008 crisis is a relevant gap in knowledge. This article addresses this gap in knowledge by examining open innovation activities and firms' performance through a binary comparison between pre-crisis and post-crisis periods. In particular, this article analyses a repeated cross-sectional sample of firms from 13 European countries interviewed during 5 consecutive Community Innovation Survey waves. This article shows how after the crisis, European firms reduced – on average – the variety of their innovation partners. Such a loss was recovered only in 2012-2014. The outburst of a crisis seems negatively associated with the propensity towards open innovation and, specifically, with the number of different collaboration channels exploited by a firm to innovate. A crisis may urge firms to focus their energies on fewer collaboration channels to make the most out of them. The results also emphasise that the financial crisis temporarily reduced innovativeness. Interestingly, the results show that the positive relationship between collaboration breadth and innovation performance is more marked in the post-crisis wave for the firms more active in open innovation.

**Keywords** – Open innovation, Recession, Crisis, Interorganizational collaboration, Innovation performance

**Paper type** – Academic Research Paper

## 1 Introduction

A crisis can be defined as *'the process by which economic life adapts itself to new conditions'* (Schumpeter 1934, 218). In the case of the 2008 financial crisis, innovation – in all its multifaceted forms – played a relevant role in coping with the related economic consequences (Lee, Sameen, and Cowling 2015; Colombo et al. 2016). In particular, several studies show the pivotal role of open innovation (OI) activities in responding to the downturn conditions in the case of the 2008 financial crisis (Chesbrough and Garman 2009; Laperche, Lefebvre, and Langlet 2011; Skålholt and Thune 2014; Mandják, Wimmer, and Durrieu 2017; Filippetti and Archibugi 2011; Zouaghi and Sánchez 2016; Zouaghi, Sánchez, and Martínez 2018). Remarkably, previous studies share several limitations. First, they resort to single-country data or single sectors. Second, they examine OI activities and firms' performance through binary comparisons between either pre-crisis and crisis or crisis and post-crisis periods. An overall view of how the outburst of a crisis altered the 2008 pre-crisis collaboration strategies and how such strategies changed after the 2008 crisis is a relevant gap in knowledge. This article addresses this gap in knowledge (Sandberg and Alvesson 2011) by examining OI

activities and firms' performance through binary comparison between pre-crisis and post-crisis periods. In particular, this paper addresses the following research questions (RQs):

*RQ1: How can a crisis alter the collaboration strategies of European firms?*

*RQ2: How can a crisis alter the relationship between innovation performance and collaboration of European firms?*

The rest of the paper is structured as follows. Section 2 presents the theoretical background. Section 3 details the methodology adopted. Section 4 and Section 5 present and discuss the results, respectively. Section 6 concludes the paper.

## **2 Theoretical background**

Several studies examine the relationship between a crisis and OI initiatives, agreeing on the relevance of OI practices to contrast the effects of a crisis. One of the first studies on OI and crisis highlights how a purposive approach to OI projects determines an increase in the volume of external technology transfer, thereby producing huge inflows of financial resources (Di Minin, Frattini, and Piccaluga 2010). Additionally, by examining OI activities in large industrial firms, Laperche, Lefebvre, and Langlet (2011) point out that some firms resisted the crisis by rationalising R&D expenses, strengthening OI strategies, and developing skilful use of intellectual property rights. Papadopoulos et al. (2013) illustrate the case of Greece, examining OI practices and their applicability in a crisis. The findings suggest the importance of shifting from open-source software to OI practices to foster innovation and growth.

Furthermore, building on a quantitative analysis of 300 companies and examining clusters as forms of firm collaborations, Skalholt and Thune (2014) show that clusters are important for coping with the immediate impact of a financial crisis. In particular, the results show that clusters can stimulate innovation by capitalising on the opportunity of the crisis itself. Mandjàk et al. (2017) analyse the network behaviour, suggesting that an early understanding of the impending crisis strongly influences the network behaviour, pushing the company to intensify customer relationships. Ramella (2017) investigate the performance of firms owning European patents during the economic downturn, emphasising the importance of collaborative company culture to deal with the related economic-financial challenges.

Moreover, Zouaghi, Sánchez, and Martínez (2018) examine the role of internal and external knowledge in high-tech and low-tech firm innovation performance during the economic crisis. By analysing panel data from 13,000 Spanish firms, the authors point out that collaboration is crucial to both high and low-tech industries during a crisis, and comparatively more important for low-tech firms. Additionally, in an investigation about the persistence of adopting an open strategy during the economic downturn of 2008, Ahn, Mortara, and Minshall (2018) analyse the longitudinal impact of openness, its relationships with dynamic capabilities, and firms' innovation resilience. By leveraging manufacturing firms' data from three waves of the UK Community Innovation Survey, they find that an open approach can improve dynamic capabilities, which are necessary to adapt to a "slowing down" economy.

### **3 Methodology**

#### **3.1 Dataset**

The dataset draws from five consecutive waves of the Community Innovation Survey (CIS), from the 2006 wave (reference years 2004-2006 inclusive) to the 2014 wave (reference years 2012-2014 inclusive), covering both the pre-crisis and the post-crisis periods. CIS surveys are data frequently used in the OI literature (Garriga, von Krogh, and Spaeth 2013; Leiponen 2012; Laursen and Salter 2006). Since compiling CIS data is voluntary, different waves can see the participation of different countries. This study targets those countries that participated more frequently in the waves under investigation, including Bulgaria, Cyprus, Czech Republic, Germany, Estonia, Spain, Hungary, Italy, Lithuania, Norway, Portugal, Romania, and Slovakia. Based on the European innovation scoreboard<sup>1</sup>, the aforementioned countries include both innovative and less innovative ones. Notably, some country-wave combinations are missing: Germany (2006) and Italy (2006 and 2014). Overall, the resulting repeated cross-sectional dataset used in the main model includes 181,454 firms in 13 countries. CIS surveys draw from the statistical business register of each country. The random sampling and the likely presence of a stable subset of firms in multiple waves allow assuming that the samples in the waves are not systematically different from one another.

### 3.2 Variables and methods

In order to address the first RQ, i.e. “How did the 2008 crisis alter the collaboration strategies of European firms”, this study presents regression models on a dependent variable describing how innovation-oriented collaboration activities vary with time. Such a dependent variable, *collaboration breadth*, assesses the variety of the collaboration channels used by a European firm, as exemplified in Table 1.

Table 1: Description of the items composing the collaboration breadth variable

Please indicate the type of innovation co-operation partner by location				
Type of co-operation partner	[Your country]	Other Europe	United States	All other countries <sup>1</sup>
Suppliers of equipment, materials, components, or software				
Private or public clients or customers				
Competitors or other enterprises in your sector				
Consultants, commercial labs, or private R&D institutes				
Universities or other higher education institutions				
Government or public research institutes				

For each collaboration channel (e.g. suppliers, universities), the respondent can select up to four possible geographical locations. A higher number of channel/location combinations selected by the respondent denotes that his/her firm collaborates with more partners on its innovation activities. The propensity to engage in multiple innovation collaborations is quantified by summing all the combinations chosen, defining the *collaboration breadth* variable. For instance, a firm that collaborated with suppliers and universities from its country and a supplier from the United States would have *collaboration breadth*=3. Thus, *collaboration breadth* is included in the range 0–24. This approach to assessing *collaboration breadth* is similar to others previously adopted in the OI literature

<sup>1</sup> Some waves dedicated additional columns to specific countries (e.g., CIS 2008 specified a fifth column with “China or India”). In those circumstances, to maintain the longitudinal consistency of the variable, we assigned the tick to “All other countries” by construction.

(Poot, Faems, and Vanhaverbeke 2009; Drechsler and Natter 2012). The variable is skewed to the left (more than 75% of the sample declared no active collaboration). However, ordinary least squares models are potentially unsuitable to describe distributions with such a nature, whereas Tobit models represent a valid alternative (Amore and Murtinu 2021). Therefore, this article resorts to left-censored Tobit regression models to account for the previously mentioned left-skewness.

In order to address RQ2, i.e. "How did the 2008 crisis alter the relationship between innovation performance and collaboration of European firms?", this study uses collaboration breadth as an independent variable associated with an innovation performance dependent variable. Innovation performance is measured as *new-to-the-market*, a binary variable that takes the value 1 if the firm introduced a new or significantly improved good or service into the market before its competitors, 0 otherwise. The binary nature of the innovation performance variable induces the use of Logit regression models, specifically aimed at studying binary variables. Notably, the coefficients in Logit models refer to a standard deviation change in the logit of the dependent variable and not in the dependent variable per se.

CIS surveys provide additional innovation performance variables, but this article focuses on the *new-to-the-market* one due to the following shortcomings of the others:

- *new-to-the-world* innovations are more likely to happen in larger firms. Most firms in the sample and the population are small and medium-sized enterprises.
- *new-to-the-firm* innovations capture the novelty to a lesser extent than *new-to-the-market* innovations.

The main independent variable of the study, *wave*, describes the five CIS waves from which the dataset is drawn. Since the dataset used in this research does not allow a longitudinal analysis, *wave* is used as a factor variable. Therefore, the regression models report the coefficients of four waves (2006, 2010, 2012, and 2014), each compared with the base value (the CIS 2008 wave, with reference years 2006-2008), which allows grasping the pre-crisis and post-crisis differences. For instance, a statistically significant and negative wave coefficient would mean that the dependent variable was smaller during such a wave than in CIS 2008.

In order to verify the 2008 crisis altered the relationship between innovation performance and collaboration of European firms (RQ2), the regression models

present interaction terms between the *collaboration breadth* and the *virtual wave* dummies. A statistically significant interaction term would indicate that the effect of an increment of *collaboration breadth* on the dependent variable is different (stronger or weaker) at different *wave* values. Therefore, positive and statistically significant post-crisis interaction terms between *collaboration breadth* and *wave* would indicate a stronger effect of *collaboration breadth* on performance than in crisis time.

Other control variables include *R&D intensity*, *size*, *innovation abandonment*, country and NACE section dummies. *R&D intensity*, defined as the ratio of total R&D expenditures on sales (Berchicci, de Jong, and Freel 2016), is a proxy for the absorptive capacity of a firm (Cohen and Levinthal 1990), a known moderating factor of the relationship between OI and innovation performance (Huang and Rice 2009). In order to avoid the presence of outliers, the values of *R&D intensity* > 1 are set to missing. The variable *size* is estimated as the logarithmic transformation of the sales size of a firm. The variable is included since larger firms are likely to be involved in larger networks of collaborations and are more likely to obtain new-to-the-market innovations than smaller firms (Cheng and Huizingh 2014). During a crisis, many firms may want to reduce their investments in innovation (Archibugi, Filippetti, and Frenz 2013), negatively impacting their chances of introducing a new-to-the-market innovation. Therefore, the models control for the *innovation abandonment* dummy variable, which takes the value of 1 if at least an innovation project was abandoned or suspended before completion during the same time horizon of the innovation performance dependent variable. Country and NACE section dummies are included to consider how different sectors and countries were hit by and reacted to the crisis and control these factors while attempting to address the RQs. Based on the European Innovation Scoreboard 2008 (Pro Inno Europe 2009), the firms in the sample are also described by the variable *eis*. The variable takes three values according to the country innovativeness indicated in the scoreboard: 'innovation leader' (Germany); 'moderate innovator' (Cyprus, Czech Republic, Estonia, Spain, Hungary, Italy, Norway, Portugal); and 'catching up' (Bulgaria, Hungary, Lithuania, Romania, Slovakia).

Table 2 summarises the descriptive statistics of the variables and the cardinality of the sample in the five CIS waves, along with the 13 countries. The software package STATA was used to conduct the analyses.

Notes: descriptive statistics refer to the observations used in Models 1-2, except for new-to-the-market and abandonment, which refer to Models 3-5. NACE sectors: A, Agriculture, Forestry and Fishing; B, Mining and Quarrying; C, Manufacturing; D, Electricity, Gas, Steam and Air Conditioning Supply; E, Water Supply; Sewerage, Waste Management and Remediation Activities; F, Construction; G, Wholesale and Retail Trade; Repair of Motor Vehicles and Motorcycles; H, Transportation and Storage; I, Accommodation and Food Service Activities; J, Information and Communication; K, Financial and Insurance Activities; L, Real Estate Activities; M, Professional, Scientific and Technical Activities; N, Administrative and Support Service Activities; P, Education; R, Arts, Entertainment and Recreation; Q, Human Health and Social Work Activities; S, Other Service Activities.

#### 4 Results

The first RQ, i.e. “How did the 2008 crisis alter the collaboration strategies of European firms?”, is addressed through two left-censored Tobit regressions on the dependent variable collaboration breadth (reported in Table 3). Heteroscedasticity is controlled by using robust standard errors. Since the AIC value of Model 2 is statistically significantly better than the one in Model 1 (the baseline), introducing the variable wave – which allows studying how OI activities changed after the 2008 crisis - improves the quality of the model.

Table 3: Tobit regressions on collaboration breadth

	Model 1 (baseline)		Model 2	
	Coeff (S.E.)	P	Coeff (S.E.)	p
wave (w.r.t. CIS 2008)

Pseudo R2	0.0565		0.0577	
Observations	181'454		181'454	

Two main results can be observed in Table 3. First, the negative and statistically significant wave coefficient of CIS 2006 with respect to CIS 2008 suggests that the firms interviewed in the 2006 wave were less engaged in collaboration breadth than those in 2008. This emphasises that the economic system was experiencing a growth in OI-related activities before the 2008 crisis. Indeed, the value of collaboration breadth is 1.17 points lower for a firm in the 2006 wave than in 2008. Second, the negative and statistically significant wave coefficients of the post-crisis CIS waves compared with the 2008 wave indicate that the firms involved in the post-crisis period were significantly less engaged in collaboration breadth than those in the 2008 CIS wave. Hence, this shows a durable and significant withdrawal from OI activities, whose pre-crisis level was recovered only in the 2014 wave. The control variables show, as expected, that larger firms and firms investing more in R&D are more likely to collaborate with other organizations. More surprisingly, firms based in catching-up countries have – on average – smaller collaboration breadth values compared to firms based in moderate innovator countries and larger collaboration breadth values compared to firms based in an innovation leader country.

The second RQ, “How did the 2008 crisis alter the relationship between innovation performance and collaboration of European firms?”, is addressed through three Logit regressions on the dependent variable new-to-the-market (Table 4). The models use robust standard errors to control for heteroscedasticity. Model 3 is the baseline, while Model 4 includes the wave variable, and Model 5

includes the interaction term between wave and collaboration breadth. Several insights can be drawn.

First, the coefficients of collaboration breadth are positive and statistically significant in all models, emphasising a positive relationship between OI and innovation performance. The relationship between performance and collaboration breadth is expected to diminish returns or to take the form of an inverted U-shape (Radicic et al. 2019; Greco, Grimaldi, and Cricelli 2016). Therefore, the regression models also consider the squared term of collaboration breadth. As expected, its coefficients are statistically significantly negative.

Table 4: Logit regressions on innovation performance (new-to-the-market)

Observations	126,085		126,085		126,085	

Second, in Model 4, the negative and statistically significant wave coefficient of CIS 2006 (compared with CIS 2008) suggests that the firms interviewed in the CIS 2006 wave were less likely to innovate than those in the CIS 2008 wave. Similarly, the coefficient of the 2010 wave emphasises a reduction in the probability of innovating compared with the CIS 2008 wave. However, the 2008 wave level was reached again and exceeded since the 2012 wave.

Third, the positive and statistically significant interaction term between wave and collaboration breadth in the 2010 post-crisis wave emphasises that innovation performance increases more with collaboration breadth during such a wave than it did in the 2008 wave. However, the interpretation of logistic coefficients may not always be straightforward when interaction terms are present (Brambor, Clark, and Golder 2006). Therefore, Figure 1 presents the marginal effects of wave on the probability of introducing a new-to-the-market innovation (Pr(new-to-the-market)) at different levels of collaboration breadth. The bars indicate 95% confidence intervals. The probability of innovating at any level of collaboration breadth is lower in 2006 than in 2008 (reference wave, therefore not displayed) since the line describing the 2006 wave and its error bars are always below the horizontal 0 solid line, which is the boundary between a positive effect on the probability to innovate and the negative effect. Therefore, a firm in the

2004-2006 triennium had a lower probability of innovating than one with the same level of collaboration breadth in the 2006-2008 triennium.

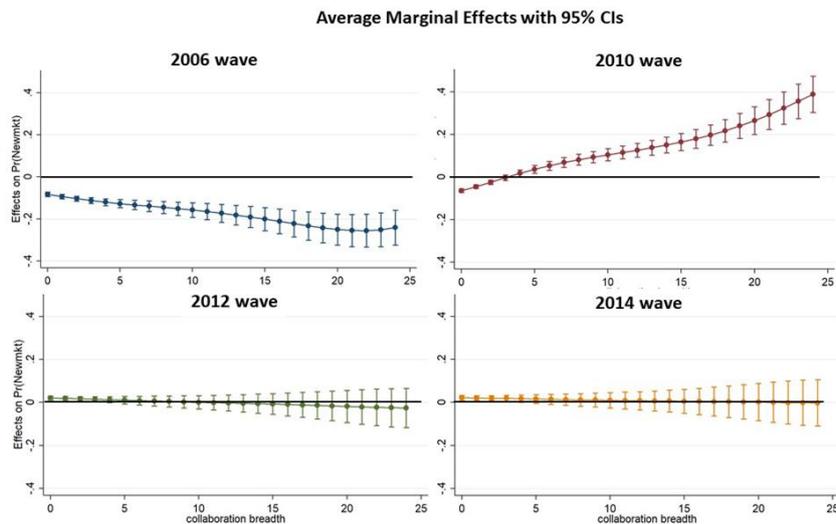

Figure 1: Average marginal effects of wave on newmkt at different levels of collaboration breadth

The curve describing the 2010 wave shows higher probabilities to introduce a new-to-the-market innovation than in the 2008 wave for values of collaboration breadth higher than 4. Instead, for levels of collaboration breadth lower than 3, the chances to achieve a new-to-the-market innovation were higher in the 2008 wave.

The subsequent waves (2012 and 2014) showed comparable marginal effects to the 2008 wave. Therefore, other factors being equal, the probability of developing a new-to-the-market innovation increases more with collaboration immediately after a crisis in highly open firms (with four or more active collaboration channels) but increases less with collaboration after a crisis in moderately open firms (with less than three active collaboration channels).

The control variables show, as expected, that larger firms, firms investing more in R&D, and firms having abandoned at least an innovation project are more likely to develop new-to-the-market innovations. Very surprisingly, the likelihood of developing new-to-the-market innovations decreases as the innovativeness of the country where the firm is based increases. The result most likely depends on newmkt being present in 24% of firms based in the innovation leader country, as

opposed to 36% in firms based in moderate innovator countries and 26% in catching-up countries.

#### **4.1 Robustness Checks**

A different specification of collaboration breadth that does not consider geographical variety (collaboration breadth redux), but only channel variety (i.e., defined in a 0-6 interval), was used to ascertain the robustness of the results. The replication of Models 1 and 2 using the collaboration breadth redux dependent variable returned the same results discussed in the original models, confirming that they do not depend on the specification of the variable. Models 1 and 2 were also replicated in two sub-samples, including service firms (i.e., NACE sections H-S) against industrial firms (i.e., NACE sections B-F). The overall results (not shown here for brevity) are substantially unchanged, with a few additional insights. Indeed, the subset of service firms did not recover the collaboration breadth reduction during the 2014 wave. Instead, in the industrial subset, collaboration breadth in the 2010 wave does not statistically significantly differ from the 2008 wave, which would suggest a stagnation rather than a reduction of collaborations. However, a reduction could be observed in the 2012 wave compared with the 2008 wave.

In order to better control for the marked differences that can exist between small and medium-sized (SMEs) and large-sized firms, Models 1 and 2 were also replicated in a subsample of large-sized firms (turnover  $\geq$  €50m)<sup>1</sup> and a subsample of SMEs (turnover  $<$  €50m). The findings show that larger firms' collaboration breadth stagnated in the 2010 wave rather than decreasing (the corresponding wave coefficient was not statistically significant) but decreased in the 2012 wave. Instead, SMEs' collaboration breadth decreased in 2010, as observed in the whole sample, but recovered already in 2012.

The replication of Models 3, 4, and 5 using collaboration breadth redux as one independent variable returns very similar results to the original models (see Figure 2).

---

<sup>1</sup> The threshold is based on EU recommendation 2003/361

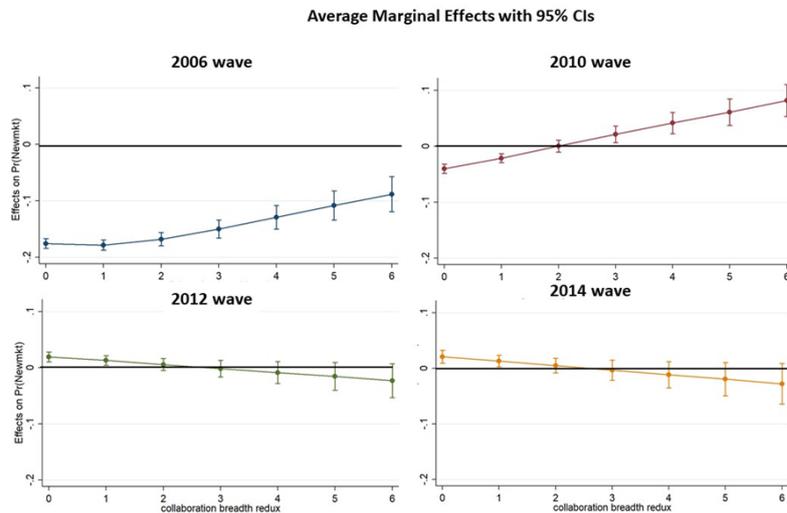

Figure 2: Average marginal effects of wave on newmkt at different levels of collaboration breadth redux

The figure suggests that, if the geographical variety is not considered, two collaboration channels are the threshold distinguishing “highly open firms”, that could increase their chances to develop innovations in the aftermath of a crisis, from “moderately open firms” that were less likely to develop innovations than the firms interviewed in the 2008 wave.

Models 3-5 were also replicated in two sub-samples, including services firms against industrial firms. The findings (not shown here for brevity) are substantially unvaried, with some neglectable changes. Among them, the loss of statistical significance of the interaction term between collaboration breadth and the 2006 wave for service firms, and the loss of statistical significance of the 2012 wave coefficient for industrial firms (which means that the 2008 wave's ‘innovativeness’ was recovered in 2012, but not exceeded by industrial firms). As done for Models 1-2, Models 3-5 were also replicated in two sub-samples comparing large enterprises with SMEs. The difference with respect to the original models lies in the innovation performance of larger firms, which improved in the 2012 wave (as in the whole sample) but in the 2014 wave was not statistically significantly different from 2008. Instead, SME regression models perfectly mimic those of the whole sample.

Since the variable R&D intensity was missing in more than 30'000 firms, which induced the exclusion of the entire 2014 German wave and of a great amount of

information from the models under investigation, a robustness check was conducted. It was conducted by substituting R&D intensity with the *rrdin* item, a dummy variable describing whether the firm engaged in intramural R&D, or not. The variable is widespread across waves and countries. The replicated models confirmed all the key findings presented before, with two additions:

In the replicated Model 5, a recovery in the likelihood to innovate was achieved only in the 2014 wave (one wave later than in the original model);

In the replicated Model 5, the probability of innovating at most levels of collaboration breadth in 2012 and 2014 is larger than in 2008 (the result was not statistically significant in the original model).

As a final robustness check, Models 3, 4, and 5 were replicated using a different dependent dummy variable, *new-to-the-firm*, which takes the value of 1 if an innovation new-to-the-firm but not to-the-market was introduced by the firm in the last three years. The results confirmed the inverted U-shaped relationship between collaboration breadth and performance; the lengthy recovery in the likelihood to innovate after the crisis (achieved later than in the case of new-to-the-market innovations, only in the 2014 wave); the increase in the probability of innovating than in the 2008 wave for highly open firms after the crisis as opposed to moderately open ones.

## **5 Conclusions, implications, and limitations**

This article explored the role played by the 2008 crisis on OI and innovation performance, through the analysis of a repeated cross-sectional sample of firms from 13 European countries interviewed during 5 consecutive CIS waves.

This article shows how after the crisis, European firms reduced – on average – the variety of their innovation partners. Such a loss was recovered only in the 2012-2014. Therefore, in response to the first RQ, the outburst of a crisis seems negatively associated with the propensity towards OI and, specifically, with the number of different collaboration channels exploited by a firm to innovate. Indeed, a crisis may urge firms to focus their energies on fewer collaboration channels to make the most out of them.

The findings also emphasise that the financial crisis temporarily reduced innovativeness. Interestingly, responding to the second RQ, the results show that the positive relationship between *collaboration breadth* and innovation performance is more marked in the post-crisis wave for the firms more active in

OI. This result suggests an underlying capability of recession periods to optimise OI in the firms that adapt to the new conditions, in line with Schumpeter's theory. Figure 3 summarises the findings, presents relevant implications, and suggests future research opportunities.

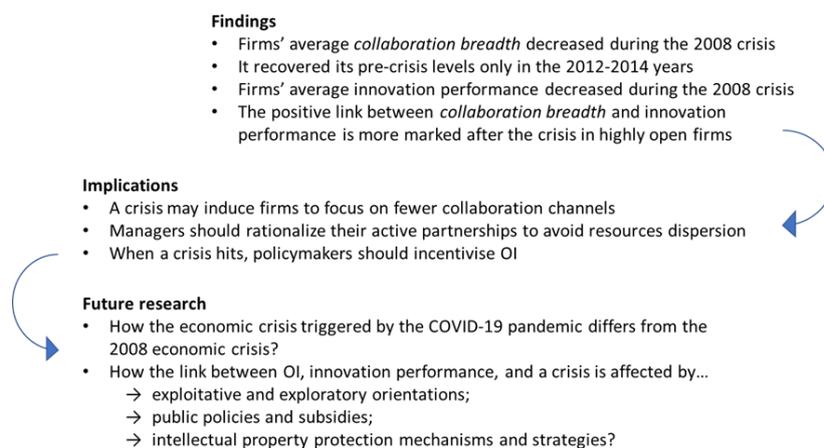

Figure 3: Findings, implications, and future research

This study is subject to some limitations. First, the need to analyse five CIS waves induced to use only those questionnaire items included in each wave and unchanged in a ten-year time horizon. This context required renouncing to other proxies for OI such as search breadth and search depth; to other measures for innovation performance such as the turnover share from innovative products; or other typical control variables (e.g., public funding, member of a group of companies, intellectual property protection mechanisms and strategies, etc.). Third, due to the same limitations of the secondary data source, the regression models could only consider one proxy for absorptive capacity, which cannot offer a complete perspective on firms' capability to absorb knowledge from their partners. Indeed, it misses – among the others – information on firms' human capital and relative absorptive capacity (Lane and Lubatkin 1998).

# Women Founders and Innovators: Technology and Intellectual Property as Success Factors on Eco-Innovative Companies

---

Valentina Battista

LUM Jean Monnet University  
Strada Statale 100 km 18, 73125 Casamassima

## Abstract

Today the role of women in entrepreneurship is assuming great value and has become one of the most relevant topics in literature. According to the latest World Bank report (2022) [1], promoting women's empowerment is essential to achieve inclusive growth, especially in sectors that pay particular attention to the environment such as eco-innovation. Women's participation in the economy can increase productivity and help build a more harmonious society. But what are the enabling cultural, social, and economic factors that make a company founded by an innovative woman a success story? This is the research question underlying this study. In particular, the analysis was conducted through the methodology of the case study, on a company operating in the eco-innovative industry and her founder. The analyzed innovative company is characterized by a business model oriented towards innovation. The importance of the topic is related to the need to identify the enabling factors that contributed to the business success of women entrepreneurs, to understand in-depth the main challenges that these women entrepreneurs faced and to highlight policy recommendations offered as key drivers for facilitating entrepreneurship. The qualitative approach allows for considering cultural, social and economic aspects in an integrated way.

**Keywords** – Women Entrepreneurship, Eco-innovation, Patents, Technology-Based Entrepreneurship, Success Factors

## 1 Introduction

Traditionally, the percentage of female entrepreneurs has been low worldwide. In recent years, the study of women entrepreneurship has experienced great growth, gaining a broad consensus among academics, and contributing above all to understanding the value of focusing on women in the economy especially in eco-innovative industries. In order to cause a tangible advance in women's representation, many jurisdictions have implemented legislative actions over the

past decades, also shifting from the presumption that gender-balanced companies result in better corporate governance and efficiency. Women entrepreneurs intensify competition through creativity and innovation and can lead to a wider range of solutions to a multiplicity of human challenges, and to more gender-inclusive product development. In this scenario intellectual property and innovation are a game changing driver not only as a measure of company's innovativeness, but also as success factors capable to attract investors in funding women led firms to move away from "gadget" technologies that fail to effectively mitigate the risk of failure. Higher ownership of patents and innovations among female business owners can improve their access to finance and help them achieve their growth aspirations and maximize revenues. From these perspectives related to the growth of women founders and innovators entrepreneurs, the research tries to investigate the factors which conduct the success of women starting from Bourdieu's non-material forms of capital theory: economic, cultural and social.

## **2 Methodology**

In this paper, the methodology of a single case study has been used. This method is suitable for the analysis of all those complex phenomena that are difficult to standardize and operationalize. According to the qualitative research approach described by Strauss and Corbin (1990), case study methodology is selected because the borders between phenomenon and context are unclear. In particular, aimed at understanding the phenomenon in all its articulation by observing the variables and their interacting relationships, the case study becomes very useful when it is not so easy to separate the object of observation from its context and its effectiveness has been proven when research requires observation of social phenomena and their interpretation by researchers (Ryan et al., 2009). In addition, as highlighted in recent literature, case study methodology has been shown to be useful in examining dynamics and environment. A qualitative research approach was adopted because women's collaboration is important because of their delicacy in disclosing information related directly to their business circumstances, their challenges and the personal context of their entrepreneurial success factors. As Silverman (2005) already noted, the effectiveness of qualitative research includes sensitivity in choosing research tools and a flexible approach to data collection, including the art to ask questions.

Qualitative research is appropriate where samples are small. The tradition of using small studies in qualitative research depends on the need to carefully examine the nature of enterprises, or phenomena under study and ask appropriate questions related to them.

Based on empirical evidence from a single case study of an Italian woman founded eco-innovative company the paper presents a comprehensive and triple contribution consisting to a) identify social cultural and economic factors that contributed to business success of the women entrepreneurs b) understanding innovation as a key successful factor to attract investors and drives both business competitiveness and the sustainable economic growth of the companies c) identification of potential public policies to advance the research agenda.

Table 1. Phases and decisions for conducting the single case study methodology.

<b>Phases of the case study</b>	<b>Key decisions</b>
Identification of the research goal	<i>How can cultural, social and economic factors enable the business success of women founded eco-innovative firms?</i>
Selection of the Case	Criteria for case selection: <ul style="list-style-type: none"> <li>- A female Entrepreneur and Innovator who runs an eco-innovative firm</li> <li>- The business should be successful or being recognized for its potential for growth.</li> <li>- Business model based on scientific research and innovation</li> <li>- Consolidated presence and participation at the local innovation ecosystem</li> <li>- The company has been in business for at least 4 years.</li> </ul>
Identification of case study's boundaries	Holistic view of the phenomenon in terms of innovation capability according to a cultural social and economic dimension.
Selection of Data Sources	<ul style="list-style-type: none"> <li>- Identification of the official website, and accounts on social networks (such as Facebook, LinkedIn, YouTube).</li> <li>- Interviews, press releases, videos, official documents made available by the company and semi-structured interviews with the entrepreneurs in person.</li> </ul>
Analysis of Data	Triangulation of data, by combining evidences resulting from the web-based desk analysis, official reports published external agencies and observatories
Writing	Developing of the case, in terms of context, main evidences, implications for theory and practice

Moreover, the semi-structured interview method has been used with a combination of some structured questions with some unstructured exploration. The interviews with the entrepreneur and the team of the company were in person from one to four times in convenient places, for example, in the offices of interviewees or in a cafe or on Zoom. The interviews lasted from one to three hours. The purpose of the interviews was to get an idea of the woman entrepreneur, her goals and aspirations for the future and of her entrepreneurial experience to date and develop a rich picture. The case study was intended to provide an in-depth study of the two companies providing a deep understanding of the entrepreneurial processes, recognizing the strategic role of innovation and how social truths are embedded in organizations. Participants were asked to identify milestones and critical issues, considering the value of this method in entrepreneurial learning and innovation. The research method based on case studies with in-depth interviews has a good basis in their progressive and repetitive nature with synergistic effects. Qualitative methods usually employ research methods aimed at exploring and discovering "new relationships". This means building an understanding of the meaning of experiences rather than pursuing a goal testing preconceived hypotheses. Case studies are based on specific findings that can be generalized to a larger theory to establish external validation. Unlike quantitative studies, which use surveys aimed at statistical generalization to obtain external validity. A list of interview questions that have been used include: (Table I1. Interview)

Table II. Interview

<b>FOUNDERS' PROFILE (CULTURAL FACTORS)</b>	
Your age	20 - 29 30 - 39 40 - 49 50 -59 => 60
Your highest educational achievement.	High School Diploma Bachelor's degree Master's degree Doctoral Degree
Do you think that a higher level of education is a factor of business success? Why? Tell me your opinion.	
Field of your studies.	STEM No STEM Both
Do you consider that having a STEM education is a factor of business success. Why? Tell me your opinion.	

Do you have any academic publications?	Yes Not
Do you think that publishing academic papers is a factor of business success. Why? Tell me your opinion	
Are you an Inventor (by that meaning if you have patented an idea)?	Yes Not
Do you think that being an inventor is a factor of business success? Why? Tell me your opinion	
Did you have any previous start up experience?	Yes Not
Do you think that having previous start up experience is a factor of business success? Why? Tell me your opinion	
<b>FOUNDERS' PROFILE (CULTURAL CAPITAL)</b>	
Did you receive any scientific or innovation awards, honors or recognition?	Yes Not
Do you think that receiving a scientific or innovation honors or recognition award is a factor of business success? Why? Tell me your opinion.	
Did you attend management course (MBA or similar)?	Yes Not
Role within your company	CEO Founder Both
<b>COMPANY CHARACTERISTICS</b>	
Company age	Before 2010 2010 – 2015 2016 - 2022
Company sector	Pharmaceutical & Biotechnology Advanced materials Health Care Medical Agtech Other eco innovative sector -----
Company location (Country Headquarter)	open
Number of employees	Only me 2 – 10 11 – 50 51 – 200 +200
% Of women in the management team	< 50% 50% > 50%

Do you think that an equal % of women in the management team is a factor of business success? Why? Tell me your opinion and experience.	
Does your Company have patents?	Yes Not
Do you think that having a Company patent portfolio is a factor of business success? Why? Tell me your opinion and experience.	
Does your Company have Technological Innovations?	Yes Not
Do you think that having Technological Innovations is a factor of business success? Why? Tell me your opinion and experience.	
<b>ECONOMIC CAPITAL</b>	
Company money raised	Up to 99,999 USD 100,000 – 299,999 USD 300,000 – 499,999 USD 500,000 – 999,999 USD 1,000,000 – 2,999,999 USD
Company sources of funding	Inner Circle (friends, family, own savings) Formal Capital (Angel, Accelerators and incubators, governments, seed, VC) Mixed of fund sources

<b>INNOVATION ECOSYSTEM - SOCIAL CAPITAL</b>	
Is your Company involved within a regional innovation ecosystem?	Yes Not
Do you consider the involvement in your regional innovation ecosystem a factor of business success? Why? Tell me your opinion and experience.	
Does your company collaborate with universities and research centers?	Yes Not
Do you consider the collaboration with universities and research centers a factor of business success? Why? Tell me your opinion and experience.	
Does your Region have effective science and technology local policies?	Yes Not
Do you consider science and technology local policies a factor of success? Why? Tell me your opinion.	
Has your company benefited from public calls for innovation promoted at regional or national level?	Yes Not
Do you consider the participation at regional or national call and tenders for research and innovation a factor of business success? Why? Tell me your opinion and experience.	
Have your Company attended accelerator and/or incubator programs?	Yes Not
Do you consider accelerator and/or incubator programs a factor of success? Why? Tell me your opinion and experience.	

<b>ABOUT YOUR BUSINESS</b>
Why did you start your business?
"A business model describes the rationale of how an organization creates, delivers, and captures value." What Is Your Business Model and how do you create value?
What are the most important challenges you have faced in your business?
In your opinion, what are the success factors that have led investors to fund your business?
If you are currently doing fundraising, what are the most important challenges you are facing?
Tell me the 3 main challenges have you faced as a woman entrepreneur?
What are the barriers challenges of female entrepreneurship practice? Tell me your opinion and your experience.

### **3 Research context**

The empirical context of the research has been identified into an Italian Smes company operating in the advanced materials sector: MATERIAS. The company operates into the eco-innovative industry.

Materias is an innovative company born in 2016 aiming to create new businesses, supporting the development of eco-innovative solutions in the advanced materials sector and accelerating their market entry. Materias invests in material based new ventures supporting the most promising technologies to overcome the "Death Valley", through the connection of the research world with industrial companies.

### **4 Data collection and analysis**

The data for this study was collected using various sources, especially official sources such as the company's website and accounts on the main social networks. In addition, company interviews and reports were also analysed. Interviews from the team and the co-founder of the company were also considered. The method used for the analysis is multidimensional one deriving from the in-depth analysis of the literature. This methodology has favored the collection of information in terms of cultural, economic and social enabling factors. Data analysis has been extended through an inductive process (Miles & Huberman, 1984; Strauss & Corbin, 1990). The data was compiled before the analysis. This has led to an activity of categorization and contextualization of the collected data. As suggested by Weber (1990), a coding process was adopted in order to analyze the content of the analysis and identify the most useful information for an effective understanding of the case. In this study the researcher has categorized

the interview data into four sectors - cultural factors, social factors, economic factors, and business characteristics of the firm. Moreover, has been labeled each theme and identified direct quotes from the interviews, which are relevant to each theme.

## **5 Findings**

The analysis of the case study relating to the cultural, social and economic factors that led to the success of the analyzed company. Specific parameters have been adopted that have been highlighted in the literature regarding the understanding of the observed cases. The main evidence that has been collected is in terms profile of the woman founder and innovator, the mission and main objectives of the company, cultural enablers in particular entrepreneurs and social enablers of the innovation ecosystem in which it fits and in particular the business model aimed at creating value was highlighted.

### ***5.1. Profile of a Woman Entrepreneur***

Caterina Meglio, Founder and Chief Operating Officer of Materias, an innovative materials-based SME that deals with the enhancement of research and innovation results through technology scouting, intellectual property management and the acceleration of innovation. Graduated in law with a Master in Business Administration (MBA). As an expert in innovation and cultural management, she has been President of the Conference of Presidents of the National Conservatories of Music and has directed the State Conservatory of music of Benevento. She is a member of the Board of Directors, as an expert of the Italian Ministry of Education, University and Research (MIUR) of the National Drama Academy "Silvio D'Amico". Since 2018 she has been a member of the strategic committee of the COTEC Foundation and has been the technological Manager for the Institute for Technologies Applied to Cultural Heritage (ITABC) of the National Research Council.

### ***5.2. Company mission and cultural social and economic factors***

About the mission and main objective of Materias, the official webpage synthesizes the vision as follows: "Ideas come to life for a sustainable word". Its approach is designed to follow the whole "value chain" of the development of

new ideas from its early stages to its transformation in market-ready solution. In particular, Materias supports inventors and investors in choosing which project has the potential to be successfully transferred to the market. Moreover, one of the best innovation strategies of Materias is the opportunity to introduce new technologies into products by cross-fertilizing researches and scientific results. This approach is also a direct consequence of the objective of Materias to create a bridge that connects research and industry. In order to achieve its mission, Materias has identified i three-fold activities: Scouting, InComing, Acceleration. - Scouting: Materias performs the identification, screening and evaluation of innovative ideas generated by the academic sector and the research world. The scope of this phase is to collect in a database, which represents a strategic asset for Materias, the most interesting and promising ideas available on the Italian and European scenarios in the Advanced Materials sector. In particular, Materias will focus its attention on deep-tech innovations, i.e. those technologies based on tangible engineering innovation or hard scientific advances and discoveries that can create disruptive solutions that redefine markets and industry processes. (<https://www.materias.it/it/mission.html>)

About the business innovation model Caterina Meglio said during the interview created for this study that "Innovations generally need highest investments to reach the market, in order to assess and validate the idea. - InCoMing: Incubation, Coworking and Merging: the second step of Materias value generation model foresees the development of the idea through technical-scientific assessments, technology validations, patent analysis, knowledge integration and cross-fertilization. In order to develop the technology on which the idea is based, Materias will involve experts from Universities and Research Centers which belong to its innovation ecosystem. - Acceleration: the third step of Materias value generation model foresees the creation of a market-ready solution through the development of a customized business model or the launch of a dedicated startup able to tackle the market needs. This step is carried out in collaboration with financial or corporate investors (interview 15 November 2022).

About social enablers factors, in this study, the innovation ecosystem of the Campania Region has been considered fundamental in terms of identifying the success factors. As Caterina Meglio has underlined during the interview: "thanks to the local efficient innovation ecosystem we collaborate with universities, research centers, companies, and institutions. For us playing an active role in this innovation context, represents a crucial crossroad relevant to establish strong

relations with industrial and institutional investors as well. Furthermore, with reference to the technology process, Materias work with professional players with expertise in the Intellectual Property management. Moreover, in order to develop our activities, we have created our innovation ecosystem that has allowed us to come into contact with excellent public and private research Centers of international relevance. The entire ecosystem has generated a valuable contribution in terms of technology transfer and first industrialization" (interview 15 November 2022).

Campania is the first region in the South by contribution to the value added of the manufacturing sector (33.8 percent of the total) and the estimated change in manufacturing value added between 2017 and 2021 is +10.9 percent, 1.7 p.p. more than the Italian average (+9.2 percent) (The European House - Ambrosetti on Istat data, 2022). According to the Regional Councilor of Research and Innovation, Valeria Fascione, the objectives of the Campania innovation ecosystem for the period 2021-2027 are: strengthening and enhancing the research and innovation system for green and digital transitions, stimulating the diffusion of innovation in Campania's business and promoting openness and exchange toward national and international partnerships and collaborations (open innovation) (article <http://ris3.regione.campania.it/index.php/news/notizie/660-innovazione-valeria-fascione-il-capitale-umano-al-centro-del-pnr-2021-27>). Moreover, there is a strong cooperation between all the major players in the innovation ecosystem in Napoli and Campania.

As Caterina Meglio has underlined: "Materias has participated to the initiatives adopted in the last 5 years by the Campania Regional Government to support R&D, Innovation and Startup creation. These activities have been designed through the active involvement of Industry and Business associations: Confindustria Campania, ConfAPI, Camere di Commercio and ConfArtigianato. This participatory process is a great opportunity and it is regularly implemented through public consultations, open forums, stakeholders' meetings that involve hundreds of representatives from Industry, Academia and Public Bodies." (Interview 15 November 2022)

The innovation ecosystem is composed by 7 universities, 40 advanced research centers active in technology transfer and innovation services and the largest researcher community in Italy of the CNR (National Research Council) with 16 main offices and 8 secondary ones. According to the Councilor Valeria Fascione "the innovation ecosystem has 7 High-Tech Districts and 30 structures to support

entrepreneurship”(incubators, science and technology parks, Fab lab, accelerators and service centers) (<http://www.campaniacompetitiva.it/>).

In terms of economic capital, Materias has raised more than 5.5 million in funds and among its shareholders are Intesa San Paolo, Ibsa Group and Dompé Holdings. (<https://www.volanogroup.com/venture-capital-al-sud-solo-il-4-degli-investimenti/>). As outlined by his President Luigi Nicolais “This is because Materias has invested and produced innovation which, according to the literature and as highlighted in this study, represents a factor of success. Our company operates on scientific knowledge-based technologies, which require more costs and risks than digital innovations. The work carried out in the first six years of activities has allowed the scouting of over 1100 ideas in the advanced materials sector, going from life science, civil engineering, food-tech to industrial engineering. Our force is represented by the patents of the company and its technologies in portfolio”. (article <https://www.politicameridionalista.com/2021/04/22/intervista-allo-scientziato-luigi-nicolais/>).

As pointed out by Caterina Meglio during the interview: “Companies led by women have to demonstrate more than those led by men. Having the ability to produce innovation through patents and technologies is a fundamental value and a critical success factor which has allowed us to be recognized as a point of reference in the field of advanced materials and to receive funds not only from institutional investors but also from large companies. Materias today has 80 proprietary patents with international extension belonging to 20 patent families and we have created technological platforms and financed research projects through its own funds. Materias in addition have funded three startups: Etesias, which aims to innovate the construction sector by reducing the environmental impact and increasing efficiency with the 3D printing of prefabricated reinforced concrete elements. Sanidrink based on a technology for the functionalization of tubular ducts using antimicrobial peptides for food and medical use. AMPure, a start-up that has developed a biomaterial against acne. Materias has offices and laboratories in Naples and Bari.” (Interview 15 November 2022).

Extremely rich of evidence is the aspect related to cultural factors. One of main cultural evidence is that the founder of Materias, Caterina Meglio has a strong academic and managerial background. And to the question whether a high level of education has helped her in the development and growth of the company she said that:” having an MBA and also a relevant professional career with has been for me an important starting point for the startup of my company. For these

reasons, my team is made up of more than 70% professional women, highly qualified and well-respected experts from the technical-scientific, legal, and managerial world with numerous experiences in the field of innovation, scientific research and intellectual property". (Interview 20 November 2022).

Likewise, regarding the cultural factors relevant are the awards and publications in the field of research and innovation. Materias has won several awards for its activity, showing itself as an excellence. Among the prizes won, the recent one received by the newspaper *Il Mattino*. (<https://www.ildenaro.it/caterina-meglio-materias-premiata-per-i-130-anni-del-mattino/>) and (<https://onlinelibrary.wiley.com/doi/full/10.1002/app.52052>).

## **6 Discussion**

The case study has revealed the social economic and cultural enablers which impact to women entrepreneurial success in eco-innovative companies. Women founders and innovators are bravely entered in a field dominated by male-led firms generally, demonstrating that they can tap into the shifting technological landscape and actively use its tools for economic and social advancement. According to the literature, women's entrepreneurship in tech field is still a relatively new phenomenon. The analysis of Materias provides the prospects for several contributions for the improvement of the academic debate related to women in technology-based entrepreneurship. Focusing on the evidence resulting from the study, it confirms the relevance of social factors like the innovation ecosystem and the social network based on universities and research centers. The importance of the innovation ecosystem of the Campania Region and its policy strategies highlighted in the study should not be underestimated. In fact, the environment in which Materias grows and develops is attractive and stimulating and allows the growth of entrepreneurship. In fact, women founded companies with patents and technologies have the opportunity to catch the attention of Venture Capitals and Public institutions in order to raise funds thanks also to an open innovation and sustainability strategy. Starting from its mission oriented towards innovation, the case of Materias highlights the importance reserved to patents and technologies, supporting the recent debate considering these intangible and "disruptive" assets for value co-creation. This is supported by the evidence about the academic and professional background of the woman founder and CEO, Caterina Meglio and its team, top women managers, and

directional staff into the eco-innovative sector. Such evidence contributes to the debate in the academic and managerial field on women entrepreneurship in innovation and to highlight the best practice in order to identify which enables factor should be taken in consideration.

## **7 Conclusions**

The analysis of the case allowed to identify the enabler factors characterizing the business success in women founded technology-based company and their strategy. A set of specific features have been identified through the analysis of Materias case. Organized around a multidimensional framework, the analysis of the case has allowed to identify the specific factors behind the woman founder and company organization according to Bourdieu theory of capital framework, into the eco-innovative industry. An emerging research trend in literature is whether the presence of women in leadership positions affects the competitiveness advantage through innovation. Several scholars studied women-controlled firms and deduced that social and cultural factors and entrepreneurial skills have a positive impact on enterprise innovation. Moreover, the innovativeness of the firms has significant impact on the competitive advantage of companies considered as success factor. Furthermore, Adam et al. according to study on woman entrepreneurs in Egypt reported that innovation positively influence competitive advantage. The literature concerning women entrepreneurship has its focus on identifying the characteristics and problems faced by women entrepreneurs. There is significant need to perform empirical investigations that connect the performance of women entrepreneurs with their characteristics and with other factors related to the entrepreneurial world. To answer to this question, the findings of this qualitative case study, have showed the positive association of different types of factors as classified by Bourdieu (1986) with the successful performance in terms of innovation of ventures that are owned by women entrepreneurs in the eco-innovative sector. Further research should focus on traditional sectors to understand whether women entrepreneurs in technology-based companies and traditional sectors both are affected by similar factors. According to this perspective, more effective and strategic public policies can be developed to improve women entrepreneurship.

### **7.1. Implications for theory and practice**

The importance of the study lies in the relevance of the topics for both theory and practice, as well as in the contextualizing contribution offered by the research. This study has analyzed a company that makes innovation the center of its business and its success factor capable of attracting investors. Specific elements of originality are identifiable into the business model of the company based on innovation and could represent a best practice to stimulate new policies and suggestions and promote women empowerment.

A further element of original value consists into the exploration of the social factors related to the regional innovation ecosystem with its networks, its strategic research and innovation policies and specific programs which are given a great contribution to the achievement of grand challenges in term of business development. Finally, the case study analysis of the Italian eco-innovative company operating in the advanced materials sector provides interesting evidence for this research goals offering elements for future speculation both in theory and practice. The company analyzed considers intellectual property a success factor for its growth. Indeed, as also confirmed in the literature, this case study demonstrates how the protection of intellectual property has helped the company headed by a woman to find partners, secure financing and commercialize the inventions. Finding investors and forming partnerships especially in women-led companies is not easy, but often the ownership of intellectual property rights on a technology or product, especially for technology-oriented companies or start-ups is relevant. Furthermore, patents are an intangible asset that confers greater market value among established firms. In general, according to statistics, women are engaged in the field of intellectual property less than men. Therefore, this case study could enhance policy makers to provide policies for a significant involvement of women-owned companies in intellectual property.

### Abstract

Information overload is putting pressure on organisations to provide a better-quality service and improve agility. The key challenges for knowledge intensive organisations are how to identify, map, assimilate, disseminate, and apply knowledge, particularly the knowledge mapping of different users with incompatible perspectives and purposes. As part of this study we started the development of ontology based knowledge map which reflects faculty knowledge and delivers knowledge to various users with different perspectives and purposes. The faculty knowledge map is based on the triad of faculty activities: teaching, research and consulting.

As there is no methodology for faculty knowledge map development the paper focuses on the methods of developing such digital knowledge maps, forming a multidimensional knowledge portrait module that can be later integrated into knowledge management systems. Methods of ontology engineering are used for developing the conceptual models of the knowledge domain and faculty activities.

## **1 Introduction**

Nowadays, dynamic technologies development and information overload effects the way people manage with complex information in educational organizations. It is a challenging experience to universities and other educational organizations to produce the knowledge intensive services desired by their customers. Knowledge mapping gives an opportunity to develop efficient and effective use of an organisation's knowledge base.

The paper presents the approach to the visual mapping of the university teacher knowledge for better communication and co-operation in research and teaching. The study is focused on the development of faculty knowledge map based on the triad of faculty activities: teaching, research and consulting.

The paper discusses the methods used for the development of digital maps, forming a multidimensional knowledge portrait module of faculty that can be integrated into the university knowledge management systems.

## **2 Faculty Knowledge Map**

Knowledge map is a powerful information visualization technique that allows connecting experts, accessing knowledge over time, identifying knowledge assets, existing knowledge resources and knowledge gaps (Faisal et al., 2019). The main tools that are most widely used in knowledge mapping, require the participation of both experts and analysts. Knowledge maps are closely related to competency maps and employee competency management, which are denoted as skills and competencies in corporate decisions.

The basis for the study of knowledge maps was laid by such authoritative researchers in the field of knowledge management as Wexler, Leibovitz, and also Davenport and Prusak. However, neither at the initial stage, nor now there is no consensus on the boundaries of the application of this tool and the key tasks to be solved. If the first author noted the strategic importance of a knowledge map for the firm's competitive advantage (Wexler, 2001), second focused on the analysis of gaps in knowledge and their filling (Liebowitz et al. 20000, the latter

considered knowledge map as a navigator while looking for the right specialist (Davenport, Prusak 1998). Over time, the amount of approaches and competing points of view only multiplied (Kudryavtsev, et al., 2022).

Technologies for working with employees' competencies are now actively developing, their review is given in the publications of the famous analyst Josh Bersin (Bersin, 2020) about the SkillTech market. According to the APQC study (APQC 2021), more than 70% of companies consider the knowledge map a priority tool for managing intellectual resources in an environment of instability and business transformation. APQC has great experience in consulting in the field of knowledge management and knowledge maps.

At the moment, research in knowledge maps typology development covers a wide range of knowledge-intensive areas: from construction (Wang, Cheng 2022) to artificial intelligence (Corea, 2019). Particular attention is paid to the knowledge maps of educational institutions and research teams (Hellström, Husted 2004; Saurabh, Sairam 2013; Sadeghi, Alireza, 2019), since in this area there is no business-specific desire to protect knowledge from transfer and reproduction. Recently there has been a trend towards convergence of research in the field of university knowledge maps and library sciences (Deng 2019) and the integration of maps into the digital learning process (Flanagan et al. 2019).

Several methodologies with knowledge maps structure and templates are proposed (Harper, Trees, 2018). However, at the moment there is no methodology to develop faculty knowledge maps integrating the triad of faculty activities: teaching, research and consulting. Therefore, the paper focuses on the methods of developing such digital maps, forming a multidimensional knowledge portrait module that can be later integrated into knowledge management systems.

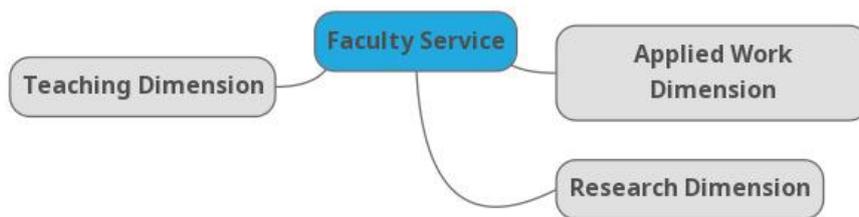

The methodology is based on the interdisciplinary framework including traditional polls and questionnaires for data collection and ontology engineering for developing the conceptual models of domains and activities. Existing templates and examples of knowledge maps structure and templates are analysed. Ontologies help to present and structure professional knowledge as systemic hierarchical graphs. Some domain ontologies use the refined and customized SCOPUS / ASJC classifications of subject areas. In-depth interviews with faculty members are carried for empirical validation of the developed ontologies.

Methods of ontology engineering have been widely developed for almost 30 years, starting with the pioneering work of Gruber and Uschold (Gruber, 1993; Uschold, 1998) to the present (Holsapple & Joshi, 2002; Human, 2017; Patel & Jain, 2018; Krieg-Brückner, Mossakowski & Codescu, 2021).

The number of steps of such methodologies used for building enterprise and/or conceptual knowledge maps varies from 3 to 11, depending on the degree of detail of each development phase. While the methodologies have different number of such steps, they use basic stages which include identification of the scope, domain of knowledge map and the develop team, of the knowledge resources or materials, of the knowledge in each knowledge item, building knowledge map, evaluation, use, and further knowledge map development.

Based on the analysis, summarizing it and our experience, we have proposed the novel methodology from 4 stages called it ONE-VID: Set of ontologies design (ON); Knowledge elicitation for ontology population (E); Visual knowledge mapping (VI); Knowledge map justification and dissemination (D).

The first stage of the methodology (ON) is focused on the development of a set of ontologies defining the conceptual structure of the future map. Our task was to create an ontology providing a big picture view of the teacher's activities at the university in the domain of management studies. Fig. 1 presents a simplified top-level ontology describing the work of a teacher. The duties of every faculty member include doing teaching, research and some applied work.

*Fig. 1. A simplified top-level ontology of the teacher's knowledge*

Each of the concepts of this ontology consists of a number of detailed pieces that are shown in figures 2, 3 and 4. These figures were developed in Protégé and present the ontologies of each of the three areas of the teacher's service at the university.

Fig. 2 shows the ontology for the domain of teaching.

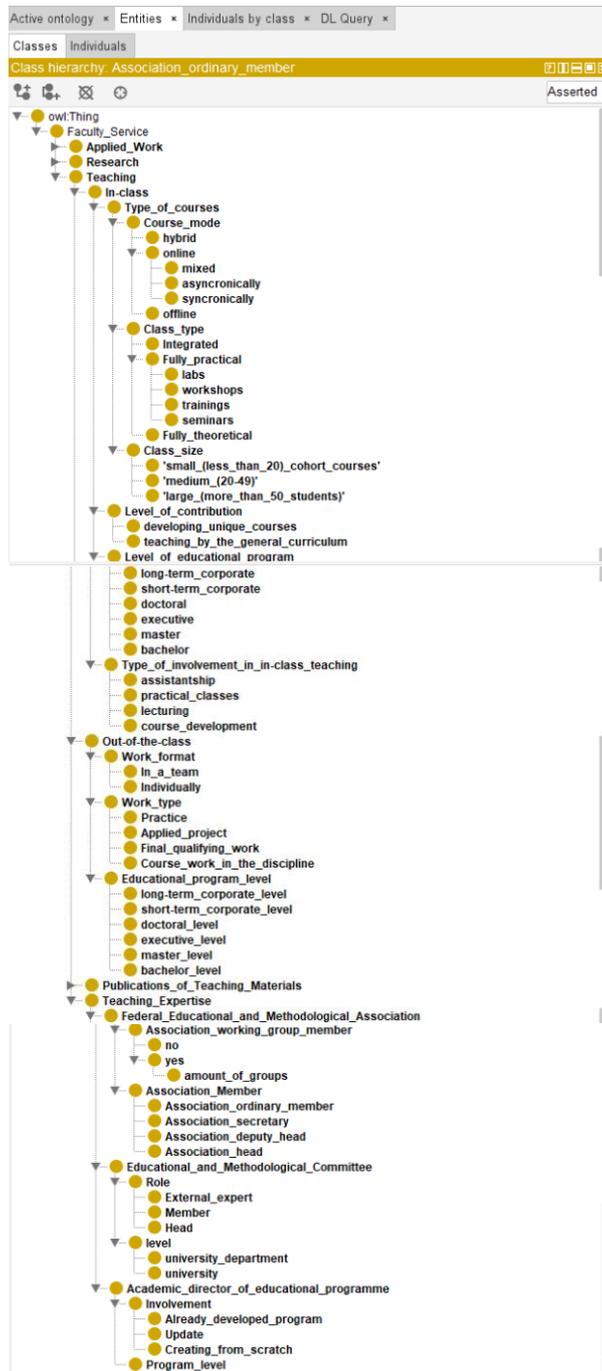

Fig. 2. Ontology of the teacher's knowledge: teaching

Ontology for teaching includes the following forms of activities: in-class (courses); out-of-the-class (supervision), publications of teaching materials and various types of teaching expertise dissemination; as well as levels of programs (bachelor/master, doctoral, executive and corporate), and types of involvement (course renewal, new course development, new training or business simulation development).

Fig. 3 shows ontology for the teacher's knowledge in applied work covering consulting services and different activities in the field of mass media.

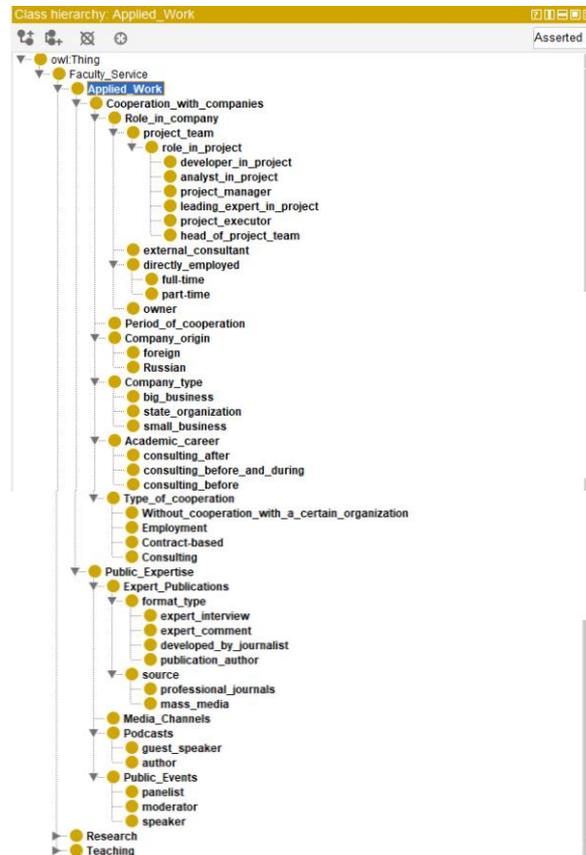

Fig. 3. Ontology of the teacher's knowledge: consulting and media

In terms of consulting this part of the ontology includes information about the duration of cooperation with companies and the link to the faculty's academic career, information about the company, type of cooperation and roles in consulting projects. Public expertise is presented by expert publications in

Fig. 4. Ontology of the teacher's knowledge: research

Research domain ontology includes detailed information on the types of projects (projects with external funding from research foundations, projects with external funding from industry, projects with internal funding from the universities), roles in applications for the projects and in the projects (head, executor, leading executor), types of project outcomes (e.g., theoretical models, analytical reports, research methodology, management methodology, etc.);

On the basis of the developed ontology, at the second stage (E) of our methodology the questionnaire was developed, and specific data collected.

Now we are at the stage of data analysis and the selection of metaphors and visualization (VI) which will be followed by knowledge map justification and dissemination (D). Fig. 4 illustrates some preliminary knowledge maps.

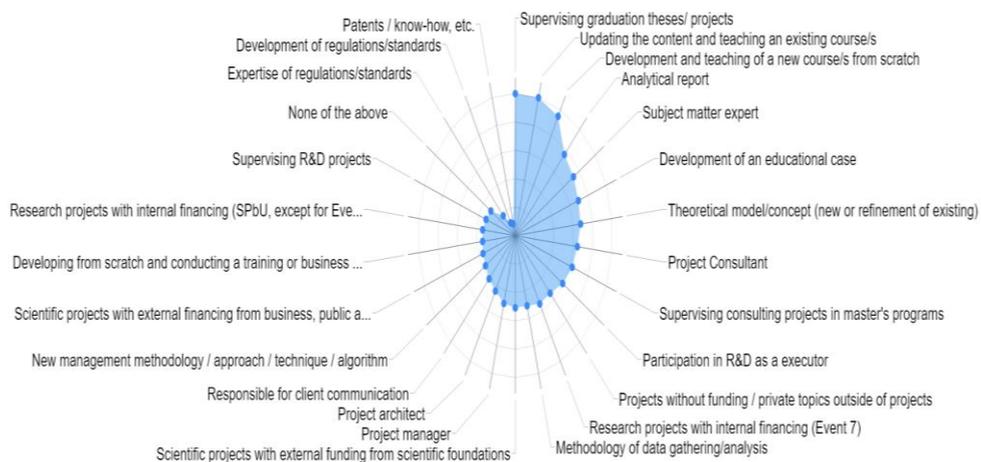

Fig.4. Radar Chart of Areas of Activities among Professors

Analysis of this figure shows that major of the faculty have bias to teaching and research activity. And less of them were involved in consulting and practical projects. By using a radar chart, it becomes easy to compare the level of experience of professors in different areas. For instance, it's clear that more professors have experience in supervising graduation theses/projects than in analytical reporting, as shown by the wider radius of the axis corresponding to the former.

The chart also highlights areas where there is a lack of experience among professors. For instance, the area with the least number of professors having experience is patents/know-how. This can help the department identify areas where they may need to attract more experienced faculty members to enhance their expertise in certain domains.

The radar chart provides a bird's-eye view of the overall distribution of professors' experience across different areas. This can be useful for departmental management to gain insights into the department's strengths and weaknesses and plan their recruitment, resource allocation, and development strategies accordingly.

### **3 Conclusions**

Academics are focused on the efficient use of collective intellectual assets. Our approach helps to create such asset in the form of simple and clear map which presents a multidimensional knowledge portrait of teachers and researchers. These individual portraits may be integrated into the collective portrait of the department or the school in general. We propose a four-stage methodology that is aimed at extracting, structuring and formalizing the knowledge of members of education and research academic teams to improve the quality of scientific communications and information exchange. At the moment the first two stages of the methodology are completed: ontology is developed, the data is collected. Further work will be focused on the third and fourth stages devoted to the selection of metaphors, dashboard development followed by knowledge map justification and dissemination (D).

Such a faculty knowledge map is valued as both organisational intellectual capital and a source of competitive advantage as it provides a visual orientation for managers or experts who wish to locate, evaluate or develop knowledge in an

organizational context. It could be used to establish the flow of the internal and external information in order to increase the efficiency of creativity and invention.

## Acknowledgements

The authors would like to express their gratitude to Dr. Dmitry Kudryavtsev, who was the initiator of this project and did a lot in terms of research design.

### **Abstract**

Disruptive innovation has become a hype in some industries, discourses and applied research fields and often has a positive connotation. This normative conception of disruptive innovation often arises from the context of sustainable development: outside existing systems and structures, new solutions for mitigating and adapting to climate change are to be sought. Ethical reflection is of particular importance. (IPCC, 2014).

The paper, therefore, argues that a critical examination and definition of the disruption concept are pending. This means that it should be examined how the term is used in such a way that it is linked to normative expectations of research and innovation processes. Based on this, it is argued that disruptiveness cannot easily be invoked in research projects as a legitimising approach to positive social consequences of development processes. The concept of disruption is therefore related to changing knowledge spaces in research and innovation processes. By changing social interactions in socio-technical systems, reference systems for research and development processes are altered and dynamics are disrupted. Starting from the discussion of various possible definitions, the legitimacy of the demand for disruption in research practice is critically questioned. Thus, it is less a matter of radical change happening through external force, but rather of disruptive research or innovation being actively pursued

Some problems with disruption are outlined in the introduction. The resulting questions are formulated in the first section. Some approaches and possible goals in modelling disruptive innovation are discussed in the second section. Finally, the state of the research and conclusions are discussed.

The overarching question for the contribution is: "What is the significance of the concepts of disruption and disruptivity for the practice of responsible research and innovation, taking into account the technical shaping of new knowledge spaces"?

**Keywords** – disruption, paradigm, path development, innovation, knowledge management

**Paper type** – Academic Research Paper

## 1 Introduction

Where does the enthusiasm for disruptions come from and how can the concept of disruption be normatively justified? This is our introductory question. After all, disruption is sometimes negotiated in research programmes as if it had a high intrinsic value without further ado. An important incentive for the enthusiasm for disruptive innovation arises on the one hand from the growing criticism of "business as usual" in the sustainability discourse. On the other hand, it is observed in the trend towards digitalisation that radical changes are occurring in established social interactions, that new expectations of social interactions are emerging in technological change, and that the fundamental transformation of discourse and knowledge spaces in just one generation has also created fundamentally new starting conditions for future developments. This creeping change can be understood as a "progress" whose dynamics, shape and consequences have developed largely independently of the research goals in academia. Thus, new digital devices such as wearables and everyday apps, new knowledge spaces and new dynamics of technology development as well as knowledge production have emerged. A linear concept of progress, which understands the current state of science as the last result of a long chain of consecutive developments, seems neither viable for capturing these dynamics nor for concretising the concept of disruption. Subsequently, it is argued that it must be critically questioned what role disruption and disruptiveness play in cutting-edge academic research on the one hand and in innovation networks on the other. In other words, is "disruptive research" really being done, are structures being changed and institutionalised practices as well as hierarchies being broken through, or is this happening in non-university development after all?

## 2 On the question of disruption

Observing the debate on disruption, the first question that arises is why disruption has become a trendy word in recent years and often has a positive connotation.

So the question is, firstly, where does the positive expectation of radical change come from, i.e. how is it justified, and secondly, how is such a change thought of as a plausible development, i.e. whether it can be evidently anticipated?

Since such a development is also linked to technical as well as scientific knowledge and developments, this raises the question of the meaning of disruption and the currently heterogeneous concepts of disruption in research practice. At first glance, different understandings of disruption seem to be at work. So how do these influence scientific practice?

Disruptive developments have an impact on science by shaping the space of scientific knowledge production and also by changing the demands on and dynamics of scientific developments. For example, online databases and events have changed the exchange between scholars, the possibilities of science management have changed in the course of digitisation, new forms of visualisation have emerged and the use of digital technology has become a prerequisite for setting content priorities in research as well as teaching in almost all fields. Using a clearly defined concept of disruption could lead to sustainable approaches to coupling research in the humanities and social sciences on the one hand and engineering and natural sciences on the other. The focus of the question of disruption in research practice thus touches on science-theoretical and ethical aspects concerning specific research practice.

Since the development of technical solutions is brought to the fore, especially in "innovative" projects, the discussion of disruptive developments should be assigned to technology assessment. A current focus in the context of technology assessment is on the question of what role the concept of disruption plays in responsible research and development, and what normative connotations come into play regarding societal impacts. (PROSO Consortium, 2018; A. (KIT/ITAS) Grunwald, 2019) The relevance of this stems from the role of disruption and disruptiveness in research practice. The focus is then not only on the outcome of development projects but also on their structure and dynamics, as examined in meta-studies on funding and research programmes, such as the German Excellence Initiative. (Hornbostel, Simon and Heise, 2008; Möller et al., 2012;

Hornborstel and Möller, 2015; Neumann, 2015) A rough value-based framework is outlined below.

It follows that addressing the notion and concept of disruptive research could be accommodated in recent approaches from innovation research, such as the concept of co-creation and open innovation. The overarching question for us in addressing disruptive research is: "What is the significance of the concepts of disruption and disruptiveness, taking into account technically shaped knowledge spaces, for the practice of responsible research and innovation?" In other words, the question is how routines, subject cultures and knowledge spaces are also changed in the context of disruptive research: "How do innovation networks outside academia fare? What dynamics shape these networks and how can the changing interaction of heterogeneous fields of development be classified into knowledge spaces? How are these heterogeneous knowledge spaces structured and where are potentials? What approaches arise from this for the development of new research projects?"

Answering these overarching questions on an abstract level requires addressing various sub-questions:

1. What does disruption mean, i.e. with which premises is the term connoted positively or negatively? On which approaches to describing and reflecting socio-technical change or scientific development can the term be concretised and how does the understanding of disruption or disruptiveness change through underlying concepts such as transformation, innovation, paradigm shift, scientific revolutions or in the development of new and emerging strategic technologies, breakthrough technologies and basic innovations? These concepts and their meaning, if adopted as frames of reference for the concept of disruption, are outlined below.
2. How is the term systematically classified and questioned by researchers? In the foreground is the question a) To which reference systems can the concept be specifically directed in academic research? For example, this could mean either structural changes in research institutions or the impact of research results when they lead to product innovations and business start-ups.

Furthermore, the question b) What role do knowledge spaces and the interaction of different professional cultures play in the development of disruptive innovations? For example, new media could change collaboration between

disciplines. New processes and responsibilities could also be institutionalised and change current practices.

This also raises the question c) What is the structure or what are the characteristics of the interaction of different disciplines concerning multi-, cross-, inter- and transdisciplinarity? For example, research projects can be characterised by a juxtaposition of different disciplines without the premises of their work being questioned. However, there can also be a deeper reflection on the methods and questions used, so that new subject areas emerge.

Finally, this raises the question of which normative ideas are used to legitimise disruptive research projects. That is, how are moral goals from engineering science projects negotiated in the humanities? What are the ethical problems in disruptive developments?

When these fundamental questions about disruption and disruptiveness in research practice are examined, further research questions arise: What limits arise for the elaboration of new inter- and transdisciplinary research approaches (methodological, spatial, temporal, organisational, structural, cultural and cognitive)? How does the concept of disruption relate to the historical development of the university into a research institution with third-party funding and an entrepreneurial orientation?

### **3 Perception and justification of disruptive developments**

#### ***3.1 On the perception of disruptive developments***

In the course of digitisation processes, the change in social routines and human-technology interaction makes the change in existing practices intuitively clear and comprehensible. A tangible example of this is the displacement of earlier data carriers such as CDs, floppy disks or punch cards, the displacement of readers for such data carriers, the spread and standardisation of new protocols for online communication as well as the emergence of new routines and frameworks, in combination with the expiry of support for "obsolete" software and devices, make it possible to experience a radical change. Particularly concerning digitalisation, there is very frequent talk of disruptive innovation. This process simultaneously refers to disruption as a social process and raises ethical questions about technical developments that cannot be answered with existing "customs". Ever faster innovation cycles that make existing infrastructures,

routines and institutions obsolete, new forms of work without social security models developed in the long term and ever more far-reaching possibilities of individual changes are developed as means for a leap into the unknown. (A. Grunwald, 2019)

Technical possibilities shape people as individuals, they shape forms of and expectations of social interactions, and they also shape the image of people, although this is usually not morally intended or ethically legitimised.

A normative conception of disruptive innovation, on the other hand, arises from the context of sustainable development: outside of existing systems and structures, new solutions are to be sought to mitigate and adapt to climate change and ensure human survival. There are many examples in this context. The following statement by the Intergovernmental Panel on Climate Change from its 2014 Synthesis Report is representative of this:

*"Restricting adaptation responses to incremental changes to existing systems and structures, without considering transformational change, may increase costs and losses and miss opportunities." (IPCC, 2014, p20)*

It is thus about a deliberative search, a normative claim for change. It relates, among other things, to infrastructures, new paradigms of development, technologies or practices, the formation of new financial structures or governance systems and the development of higher demands on the structures of political governance, to name just a few examples of ethical relevance. Change is implemented through iterative learning, deliberative processes and innovation. (IPCC, 2014) This scope of transformative change makes it necessary to give special importance to ethical reflection in the study of disruption. Without an ethical justification, such a far-reaching change as the one in question could not be legitimised. The normative demand is based on scientific findings, but in the weighing of possible measures and consequences, it represents an ethical object of investigation when, in addition to new governmental systems and financial structures, changes in development paradigms as well as practices are in the realm of possibilities.

These problems gain their contour through two opposing perspectives on the social embeddedness of research and development as well as on the social impacts of disruptive innovations: (1) on the one hand, the meaning of the term disruption in academic, third-party-funded cutting-edge research. Here, the prospect of fundamental change and disruptive research results is sometimes cited as a legitimising approach for basic research in engineering and the natural

sciences. Social and institutionalised systems of action have a dominant effect here on the dynamics of knowledge production. At first glance, however, less attention seems to be paid to bottom-up synergies. From a different perspective, these are in the foreground: (2) Grassroots innovations as well as innovation networks, which make a significant contribution to technical change partly within institutions, but above all also outside academic practice through social innovations, i.e. the technology-supported change of social interactions. Here, the focus is often on repurposing and recombining existing basic innovations, new forms of social interaction are tried out and networks are formed. This leads to a restructuring of the dynamics of knowledge production, new knowledge spaces emerge and, as a consequence, the disruption of established routines and practices can be observed.

Both of the observable dynamics are reflected in all technical and scientific developments. How they can be related to each other is therefore discussed below.

From the comparison of the poles mentioned, a picture emerges of the dynamics of knowledge production on a systemic as well as synergetic level based on changing knowledge spaces and thus changing reference systems for the production of knowledge. Since the basis for research and innovation is also being changed in techno-scientific development, the meaning of the concepts of disruption and disruptiveness in specific development and research practice must be sought in terms of which normative assumptions guide them. The change in socio-technically shaped knowledge spaces must be particularly taken into account here, while purely analytical investigations seem too abstract (Ropohl, 2009). Finally, only by referring back to practice can bring new approaches to coupling research in the humanities and social sciences on the one hand, and research in the natural sciences and engineering on the other. Hence, it emerges a concept of disruption that meets the demand for socially as well as ecologically responsible research and thus represents a disruption of "business as usual" in the academic context.

This is particularly important as the normative basis of the demand for disruption at the level of society as a whole is oriented towards ecologically as well as socially sustainable development paths. (Raworth, 2012; Leach, Raworth and Rockström, 2013; Steffen et al., 2015) Finally, the call for disruption in this context is linked to, and thus legitimised by, the demand to disrupt the business as usual. The implicit answer to the question of what is being "disrupted", forms

of path development at the economic and institutional level, is discussed further below.

### **3.2 Paradigm shift, path change, innovation and disruption**

A present-hermeneutic approach (A. Grunwald, 2019) and an evolutionary model of path development (Gebauer, 2003) can be used to concretise heterogeneous disruption concepts. However, critical aspects also arise in particular from the present-hermeneutic investigation. For example, innovation cycles cannot be accelerated indefinitely without undermining social security mechanisms. New forms of work, without union protection or the like, make it clear that disruption cannot be a model for the future in itself (Grunwald, 2019, p. 137).

Fundamental aspects of disruption and disruptiveness also do not result from a "natural logic", but are revealed in the relationship of scientific theoretical concepts that offer interfaces to the concept of disruption. Such interfaces exist in the structure of scientific revolutions as well as paradigm shifts (Kuhn, 2007), from path developments and mechanisms of path change (David, 1985; Mahoney, 2000; Werle, 2007; Osburg and Schmidpeter, 2013), the transformation of knowledge systems (Augenstein et al., 2020; Fazey et al., 2020), and innovation research (Michelsen, 2010; Schmeisser et al., 2013; Schmidpeter, 2013; European Union Committee of the Regions, 2016). Thus, depending on the methodological background, different meanings emerge, which may, for example, exclude natural disasters or violent conflicts as well as upheavals (Schumpeter, 1912), have a stronger focus on scientific developments (Michelsen, 2010) or concern processes of institutional change. (Beyer, 2005)

Current approaches in the fields of technology assessment (Hussinga, 1985; Gebauer, 2013; Lindner et al., 2016; A. (KIT/ITAS) Grunwald, 2019) and Responsible Research and Innovation (Boenink and Kudina, 2020) lend themselves to research ethics.

Since the aforementioned points of contact for interpreting disruption lead to conflicting perspectives, the basic pillars of responsible research and innovation practice must also come into play in the reflection and evaluation of research projects related to disruptive research (reflexivity, reactivity, deliberation and anticipation).

In this sense, inter- and transdisciplinarity can not only be a dedicated research object (Jantsch, 1970; Mittelstraß, 2003; Frodeman, Thompson Klein and Mitcham, 2010; Jungert et al., 2013) but must also be understood as a methodological component in the engagement with the disruption concept.

However, in order to develop new approaches to coupling humanities and social science research with natural science and engineering research from the demand for disruptive research, further content-related focal points must be developed and summarised in an iterative process. That is, the content-related framing of the idea of disruption in research projects at the European level, such as in the context of Horizon Europe, as well as at the national level, for example in the context of the German Excellence Initiative, in relation to digitalisation (A. Grunwald, 2019) or also in relation to the responsible development of artificial intelligence (EU, 2019; Smuha, 2019), serves to ensure a conceptual framing of disruption that is oriented towards specific research practice.

#### **4 Conclusions**

Overall, it is clear that the notion of disruptive research faces a number of open questions. When talking about disruption, it is usually not clear how exactly the notion of disruption can be incorporated, explicated, or concretised in research practice.

In addition to the aforementioned scientific theoretical approaches to analysis, the discussion about disruption must therefore be oriented towards concrete projects. For example, the critical examination of existing research projects and dynamics lends itself to this. In order to define the abstract term and instrumentalise it as a legitimisation for forward-looking research projects, these questions would have to be clarified. In order to speak of disruptive research in the context of engineering and the natural sciences, it is not enough to extrapolate existing trends and thus arrive at predictions for the future, but the dynamics in the production of knowledge as well as the design of knowledge spaces must be understood in their own right as the object of investigation.

If disruption is assumed as some sort of hype and blindly adopted as a solution scheme in all technical as well as social problem areas, this ultimately conflicts with the notion of responsible research and development that solves pressing problems at the level of society as a whole.

### **Abstract**

The outbreak of the COVID-19 pandemic has led to a sudden reorganization of surgical activities to deal with the global emergency. Non-urgent surgeries have been postponed providing resources for COVID-19 patients and non-deferrable cases. This collapse in activity has profoundly compromised the training programs of medical residents (whose activity is usually focused on inpatients, outpatient clinics, minor surgeries) (Hodges et al., 2020). An alternative to the traditional training method, where skills are acquired primarily in the classroom and operating theatre, is training with digital technologies that enable skills training remote. According to Vale et.al. (2021) in this transition process, teachers and students had to reflect, adapt, change, innovate and use digital tools. On these premises, the research focused on the implementation of Smart Glasses to support the training and learning of medical residents at the Hemodynamic Cardiology - Electrophysiology Unit of a University Hospital in Southern Italy. The methodological process was developed through a

qualitative approach based on a case study, according to the methods and indications suggested by Yin (2009), which involved the collection of data through semi-structured interviews and analysis of documents. The data reveal, the transition from face-to-face teaching to remote teaching, or online teaching and learning, became the possible alternative for Education institutions to ensure the continuity of courses and medical residents learning. In this case study, the technology used are the smart glasses web-connected glasses that can present data onto the lenses and record images or videos through a front-facing camera. The medical residents displayed positive attitudes towards using the new device. The study results show that technology tools can effectively improve learning efficiency and reduce learning cost and have shown that smart glasses training improved the technical abilities and reduced complication rates.

**Keywords** – Knowledge Sharing, Digital transformation, Smart Glasses, ICT tools, Case Study.

## 1 Introduction

The creation, acquisition, sharing and transfer of knowledge are essential elements of the learning cycle. Knowledge management and sharing processes are even more important for medical residents whose learning activities will help them to develop skills and services useful for others' health care and their own professional growth. On this premise, this paper seeks to explore the link between the process of knowledge sharing and medical residents with particular emphasis on the sharing of the different forms of available knowledge. Firstly, this paper will examine the literature related to knowledge sharing and its relevance for learning, including new technologies in healthcare. Therefore, a specific part of the work will focus on the case study under examination, analyzing knowledge sharing methods and tools used in interventional Medical Unit "Cardiology Hemodynamics – Electrophysiology" of the University Hospital in southern Italy. This article reports the use of "smart glasses" (by Rods&Cones Firm), for surgeon video streaming. The use of new technologies — including augmented reality — appears to be aimed at medical residents who share knowledge and acquire skills that are otherwise difficult to attain. Specifically, observation of surgical procedures performed by experts is extremely important for acquisition and improvement of surgical skills in the medical residents and allow trainees to experiment and face different challenges and other similar organizational processes useful for medical training.

## 2. Theoretical Framework

### 2.1. Knowledge Sharing and Learning in Healthcare

Knowledge is the most important strategic resource in organizations and its management is considered fundamental for organizational success (Nahapiet et al, 1998; Spender et al, 1996). Knowledge sharing is defined as the voluntary dissemination of acquired skills and experiences to the rest of the organization (Davenport, 1997; Ipe, 2003). The exchange of knowledge among individuals and among organizational units generates competitive skills that can lead to the success of organization (Ipe, 2003; Kogut & Zander, 1996; Nonaka & Takeuchi, 1995).

Nonaka and Takeuchi's well-known work on creating organizational knowledge emphasizes the explicit and tacit Knowledge interaction held by individuals, organizations and society. The model is shown in the Figure 1.

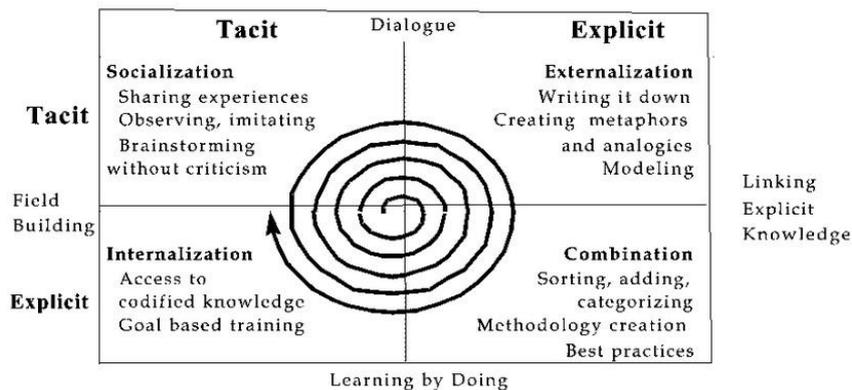

Figure 1. Knowledge creation Model  
 Source: Nonaka, I., & Takeuchi, H., 1995

According to Nonaka and Takeuchi (1995) the process of creating organizational knowledge is a circular dynamic process that never ends. The organization is stimulated by the environment.

Knowledge sharing has been linked to learning (Hurley & Hult, 1998; Weerawarden & O' Cass, 2004). Talking about organizational learning and organizational knowledge is therefore an implicit acceptance that knowledge is not just an individualized phenomenon, even if individuals are the basic "learning units". Hospitals and other health care facilities are knowledge-intensive

organizations where sharing both tacit (technical, expertise and experiential) and explicit (documented) is essential for the provision of quality health care (Saeed, 2009). The learning and sharing of knowledge among health professionals but especially among medical residents, are two essential aspects to ensure best practices in health care delivery. As a result, most healthcare organizations have implemented strategies that create opportunities for knowledge creation and sharing among their employees / medical residents to address the new challenges that organization faces in order to be successful for them (Steininger et al., 2010). For Ho et al. (2004) accident knowledge refers to learning from medical errors (Sim et al., 2001) and experience knowledge refers to experienced healthcare professionals who educate less experienced professionals on the best practice procedures (Stead & Lin, 2009).

Ruggles (1997) describes the different means of sharing knowledge identified in literature (Table 1).

Table 1: Knowledge sharing tools.

<b>Type</b>	<b>Tools</b>	<b>Authors</b>	<b>Definition</b>
<i>Techniques</i>	Communication Channels	Olsson et al 2008	Channels for communicating among staff members and between staff and patients including face-to-face, written communication,
	Social means	Zigan et al 2010	Every useful environment for sharing Knowledge
	Communities of practice	Wenger 2002	One group of individuals who share a concern about a topic and who deepen their knowledge in that area by interacting on an ongoing basis
	Training	Zigan et al 2010	Learning opportunities provided to share and receive required Knowledge
<i>ICT</i>	Social Technologies	Kahn et al 2010	Cover broad types of tools, all using technology to build collaboration and sharing Knowledge, they are mainly internet-based tools
	Clinical Decision Support Systems	Ozdemir et al 2011	An application that analyses data to help clinicians make clinical decision
	Electronic Health Record	Fichman et al 2011	Computerized health records to improve Knowledge sharing
	Mobile Phones	Gerber et al 2010	One useful tool for sharing medical Knowledge by using text messaging service or voice mail service
	Personal digital assistants	Kahn et al 2010	Shirt pocket sized tools that enable healthcare providers to gain access and share Knowledge
	Telemedicine	Singh et al 2010	Delivery of healthcare services using ICT for sharing of vital Knowledge for diagnosis, treatment and prevention of disease.

Source: adoption by Tabrizi and Morgan, 2014.

These different types of knowledge sharing means show the potential to greatly facilitate access to knowledge, improve communication, eliminate double documentation and, consequently, increase the quality of long-term health services (Ruikar et al., 2007; Gerber et al., 2010).

In the education context, the knowledge sharing among teachers is essential to encourage the proliferation of new knowledge thus adding value to the existing knowledge. Chang and Chuang (2011) believe that knowledge emerges from integrating information, experience, and theory. When people form groups and interact with each other, they tend to share knowledge and experiences, thus augmenting learning. Universities and students need to acquire sufficient flexibility in order to remain current and relevant in a rapidly changing educational environment (Milic et al. 2016; Allen & Seaman, 2010), in this way ICT resources have become available, both for support of on-site education and for on-line learning.

However, access to these modern learning opportunities is dependent upon student skill in using these high-tech assistive technologies (Dunlap & Lowenthal, 2013; Toro-Troconis & Murphy, 2014). Hodges et al. (2020) and Strangio et al. (2021) write that training programs of medical residents (whose activity is usually focused on inpatients, outpatient clinics, minor surgeries) been somewhat stopped or greatly jeopardized by the COVID-19 pandemic. An alternative to the traditional training method is training with ICT that enable skills training remote. This provided a broad reflection on new teaching methodologies, the creation of digital educational environments to develop the future of medicine (Guangul et al., 2020; Don et al. 2021). The reflection on how to teach and learn, in a process based on digital tools, has led to a change in the educational paradigm (Marshall et al. 2020), starting with educational technologies, and involving teachers and students in the same reflection and commitment (Flores & Swennen, 2020). According to Vale et al. (2021) in this transition process, teachers and students had to reflect, adapt, change, innovate and use digital tools. To achieve this, educational institutions had to become a space for change, in order to respond to disruptive changes in the way of teaching, interacting with students and sharing on knowledge. Globally, advances in the strategies used in remote teaching are recognized, as well as in the sharing of materials via digital tools (Huber & Helm 2020; Judd et al., 2022; Flores et al., 2021; Horn & Staker, 2017). Laufer et al. (2021) characterize the functioning features of distance education. Kem (2022) explore key platforms for distance and smart learning. Parsons et al. (2022)

investigate the features of distance learning implementation according to respondent's experiences in New Zealand. Ayoub et al. (2020) analyze Coursera-based instructional design. Alfadda and Mahdi (2021) characterized the functionality of the Zoom platform. In addition, Wedari et al. (2022) also analyze the Zoom application in the context of its security, learning, and other features.

### **3 Research Methodology**

This paper reports the results of a pilot study aimed at developing, implementing and evaluating the applicative use of "Smart Glasses" in Cardiology Emodinamica - Elettrofisiologia Unit of a University Hospital in southern Italy for medical residents. The methodological process was divided into two steps. It was developed a qualitative approach based on a case study, according to the methods and instructions suggested by Yin (2009), which involved collecting data through semi-structured interviews and document analysis. The documents considered were open access documents concerning the introduction of the Device "Smart Glasses" system to Cardiology Emodinamica - Elettrofisiologia Unit. Then a semi-structured interview was developed regarding the introduction and implementation of "Smart Glasses" system (Bamberger, 2000) and its role within the Medical Unit. Consistent with the purpose of our article, we conducted our interview with a privileged observer of this phenomenon: the member's staff. The interview, which lasted about 50 minutes and was reviewed and discussed to refine and improve the coding process. The interview focused, in primis on understanding the phenomenon, assessing whether the Covid-19 has changed educational contexts and subsequently, on the implementation process and the opportunities of Smart Glasses in the medical Unit.

#### **3.1. The Case Study Analysis**

Education is undergoing profound changes due to permanent technological innovations. This paper reports the results of a pilot study aimed at developing, implementing, and evaluating the medical Unit of a University Hospital in southern Italy for medical students.

### Cardiac Unit of a University Hospital

#### Emodinamica Operating Unit

<b>Member Staff</b>	<b>number</b>
Medical Head	6
Medical Residents	32
Nurses	7
Practical nurses	5
Radiographers	3

#### Electrophysiologist Operating room of a University Hospital

<b>Member staff</b>	<b>number</b>
Surgeon	0
Electrophysiologist	2
Medical Residents	1
Nurses	1
Practical nurses	1

The Unit analyzed is home to an Italian pilot project conducted in collaboration with the Taranto and other European offices. To date, the surgeries that have seen the use of "Smart Glasses" are No. 6. Specifically, these are pacemaker implants and defibrillators.

## 4 The Results

Consistent with the purpose of our paper, we conducted our first interview with a privileged observer of this phenomenon—the medical and technical staff. The interview focused on understanding the phenomenon, evaluating the applicative use of Smart Glasses in the Unit.

*HQ1: The Covid-19 has changed the education settings? And*

*HQ2: Are ICT tools a valuable support tool for the training of medical residents?*

### 4.1 Focus: Summary of the interview

Head mounted smart glasses can be implemented for very basic purposes such as education, simulation, live streaming of visualized image, to more interactive functions such as video recording and digital photo documentation, for telemedicine and many others. Observing surgeries is essential for young surgeons-in training, but sometimes it is difficult for them to be able to get the

volume of exposure to surgeries that they need. If a surgeon records a procedure, the medical students could watch the procedure from the surgeon's point of view, either in real-time or post-operatively, to allow more flexibility.

The data reveal, the transition from face-to-face teaching to remote teaching, or online teaching and learning, became the possible alternative for Education institutions to ensure the continuity of courses and medical residents learning. The existence of available resources, such as the communication and collaboration platforms (Zoom and Google Teams and the Moodle) the videoconferencing, computerized communicator for the knowledge sharing (smart glass), and file storage paved the way for rapid adoption of emergency remote teaching.

The Smart glasses enabled the best training for the medical residents, because the tool allowed him to convey exactly what the training surgeon sees "looking over the surgeon's shoulder" or "standing next to him", also, can zoom in on the smallest details and make annotations (*taken from an interview with the medical and technical staff*). This innovative tool allows medical to teach remotely through the presentation and discussion of cases.

In clinical training, reviewing recorded video from the trainees' point of view enhances their self-reflection and increases trainer feedback. The students (medical residents) displayed positive attitudes towards using the new device and acquired the proper skills needed to function effectively in an information-rich environment. (*Taken from an interview with the medical staff*). I am delighted that by using smart Glasses we are transporting our future surgeons directly into the operating theatre. Using this technology will support us to deliver high-quality training and safe care now and, in the future (*Taken from an interview with the medical staff*).

Finally, most of the actors involved claimed recognized that digital platforms made communication more flexible in time and space and, to that extent, facilitated interaction between all actors (*taken from an interview with the medical and technical staff*). The teachers considered that digital platforms were an asset to the teaching and that they should be integrated into the teaching environment, thus giving rise to a mixed learning environment (*taken from an interview with the medical staff*).

## 5 Conclusion

The Covid-19 pandemic it was a strong driver of the digitalization of teaching and learning and boosted the development of digital skills of teachers and medical residents. The study results show that technology tools can effectively improve learning efficiency and reduce learning cost and have shown that smart glasses training improved the technical abilities and reduced complication rates. In this case the teacher shared his knowledge with the medical residents enabling them to experience and deal with different challenges and other similar organizational processes useful for medical education. In the context of the Covid-19 pandemic crisis, training on remote took on a major role in most countries. However, due to its emergency nature, its implementation, in most cases, was not accompanied by all the necessary resources and support, which contributed to compromising essential. Despite the difficulties identified and having been experienced in a very different way by the different protagonists, we believe that this unprecedented experience not only achieved its main objective, but also configured an opportunity for the renewal of teaching and learning processes. In a short space of time, it induced a part of the teachers to change their methodological practices, pressured by the challenges posed by educational technologies and by the mediation of the teaching and learning processes by digital tools. In conclusion, during COVID-19 pandemic healthcare teams have been forced to work in an even safer and more efficient way, reducing footfall in the operating room to a minimum. In this scenario, the teacher is wearing Smart Glasses, this innovative tool allows doctors to teach at a distance through the presentation and discussion of cases. The medical residents have displayed positive attitudes towards using the new device and have gained adequate skills necessary to function effectively in an information rich environment.

Tampere University  
Korkeakoulunkatu 8, FI 33014 Tampere, Finland

## Abstract

Environmental impact assessment (EIA) is a procedure for producing knowledge for environmental planning and decision making. The aim of this study is to find out the information and knowledge management challenges of EIA and consider the connection between the identified challenges and paradoxical tensions in the knowledge production process. The aim is to answer the research question: What kind of information and knowledge management challenges and paradoxical tensions appear in the production of knowledge for environmental planning and decision making? The study was conducted as an interview study of EIA consultants and EIA authorities in Finland (n=24) with the aim of finding out how the practitioners of EIA understand the knowledge management practices of EIA. Results demonstrate the existence of different paradoxical tensions in the EIA procedure. Findings also reveal different identities of EIA authorities and EIA consultants and resulting differences between practitioners' way of thinking. For the EIA practice, this study concludes that even though EIA is a legal procedure, many paradoxical tensions affect how it is implemented in practice and what kind of impacts it has. An argument is presented that paradoxical tensions lie behind many of the challenges of information and knowledge management. Future research could delve deeper into the question of how EIA practitioners respond to the paradoxical tensions, and how these responses affect the effectiveness of EIA and sustainability outcomes.

**Keywords** – Knowledge Management, Information Management Cycle, Tension, Paradox Theory, Environmental Impact Assessment.

**Paper type** – Academic Research Paper

## 1 Introduction

The planning of large projects requires information about the sustainability and environmental impacts of the projects. The environmental impact assessment (EIA) is a procedure for producing this kind of information and knowledge for decision making (Cashmore et al. 2004; Morgan 2012). Many researchers have criticized EIA practice for not performing well enough (Cashmore et al. 2004; Pölönen et al. 2011). Solutions to this has been sought above all from legislation and regulations, even though EIA practitioners have a significant role to play in ensuring the quality of EIA. The focus has been on judicial and procedural development instead of EIA practitioners and their performance. Research is lacking about EIA from the perspective of management science and individual EIA practitioners (Chi et al. 2016). This is surprising, because along with the legislation, the discretion of EIA practitioners affects how the procedure is conducted (e.g., what information is produced and how it is used). In addition, EIA is recognized to be vulnerable to manipulation and corruption (Williams & Dupuy 2017; Enríquez-de-Salamanca 2018). Therefore, the discretion of EIA practitioners is crucial for the quality of EIA practice. In response, this study aims to extend the practitioner focus in the EIA research, which has been the motivation also in some previous studies (Kågström & Richardson 2015; Kågström 2016a; 2016b).

The aim of the study is to find out the information and knowledge management challenges of EIA and consider the connection between the identified challenges and paradoxical tensions in the knowledge production process. This study aims to answer the research question: *What kind of information and knowledge management challenges and paradoxical tensions appear in the production of knowledge for environmental planning and decision making?*

The research aims to contribute in two ways. First, by combining the theoretical perspectives of information and knowledge management and paradox theory, the analysis shows how the paradox theory may explain the reasons for the challenges of information and knowledge management. Second, the perspectives of knowledge management and paradoxical tensions provide a novel outlook on the EIA research, and the analysis of paradoxical tensions provides possible explanations for the differences in EIA practice. Only few studies have examined EIA from the perspective of knowledge management (Sánchez & Morrison-Saunders 2011; Sánchez & André 2013; Mitchell & Leach 2019). Furthermore, the

paradox perspective has not been previously applied to the context of environmental impact assessment, even though the management research on tensions and paradoxes is rapidly expanding (Putnam et al. 2016; Schad et al. 2016). The research field of organisational paradoxes (Putnam et al. 2016; Schad et al. 2016) offers insights into the management of tensions, where the concept of paradox or paradoxical tension has been used to describe and explain certain kinds of tensions. Research on paradoxes has developed towards a distinct perspective or a theory (Smith & Lewis 2011; Lewis & Smith 2014; Hahn et al. 2018). On this account, this study applies the knowledge management and paradox perspectives to the context of EIA, with the aim of increasing understanding about the EIA practice, especially from the perspective of the individual practitioners.

The paper proceeds as follows. Section 2 describes the theoretical background of the study. First, the context of the study, environmental impact assessment, and the previous research on the practices of environmental impact assessment is described. Then, the theoretical perspectives that are used in the analysis are presented: the information and knowledge management process model and the paradox theory. Section 3 describes how the research was conducted. Sections 4 and 5 present the results. Information and knowledge management challenges of EIA are discussed in Section 4. Section 5 delves into the paradoxical tensions that appear in the production of knowledge and identifies multiple identities of EIA practitioners. Finally, Section 6 presents discussion and conclusions. An argument is presented that paradoxical tensions lie behind many of the challenges of information and knowledge management.

## **2 Theoretical background**

### ***2.1 Environmental impact assessment (EIA)***

Environmental impact assessment, abbreviated as EIA, is a key tool in producing knowledge for environmental planning and decision making. It is a preventive and participatory procedure that aims to ensure that the environmental implications of projects that may cause significant adverse environmental effects are taken into account before their approval or authorisation. It is carried out in the planning phase of a development of e.g., an industrial plant, mining establishment or road infrastructure and it aims to

produce knowledge to be used in the decision making (i.e., in the consent decision and project design decisions). Since its introduction to the National Environmental Policy Act of 1969 (NEPA) in the USA, the institutionalisation of EIA has progressed steadily, and is now used in most countries in the world (Morgan 2012). Even though "EIA is now universally recognized as a key instrument for environmental management, firmly embedded in domestic and international environmental laws" (Morgan 2012, 6), many researchers have criticised EIA practise for not performing well enough (Cashmore et al. 2004; Pölonen et al. 2011).

In Finland, EIA is a two-stage procedure consisting of the making of assessment program and assessment report. The developer of the project (i.e., company or public actor) is responsible for the assessment process. Typically, the developer hires a consultant to conduct the necessary environmental investigations. The procedure is supervised and controlled by the ELY Centres, who act as EIA authorities. After both the program and the report, a hearing is arranged, statements and opinions are gathered and a statement by the coordinating authority (ELY Centre) is given.

The EIA procedure aims both for environmental effectiveness and participatory/democratic effectiveness. Environmental effectiveness can be interpreted as the extent to which environmental issues are fully considered in decision making and the extent to which environmental awareness is increased (Arts et al. 2012; Jha-Takur & Fischer 2016). Cashmore et al. (2004) distinguish the contribution of EIA to the consent decision (i.e., formal license to operate, environmental permit) and to decisions about the project design. Participatory/democratic effectiveness can be approached from different dimensions, such as empowering marginalised individuals, harnessing local knowledge, generating legitimacy, and resolving conflict (Glucker et al. 2013). Generally, the prevention of significant harmful environmental consequences is seen as the key goal of EIA and the cornerstone of effectiveness evaluations (Bartlett & Kurian 1999; Pölonen et al. 2011; Arts et al. 2012; Zhang et al. 2013; Jha-Takur & Fischer 2016).

The theory and practise of EIA have gained lot of attention in the literature (Morgan 2012; Pope et al. 2013). The quality of the EIA practice (e.g., Bond et al. 2018) and the effectiveness of EIA (e.g., Pölonen et al. 2011; Arts et al. 2012; Loomis & Dziedzic 2018) have been the focus of many studies. The research has typically identified strengths and weaknesses in different phases of the EIA

procedure and approached EIA from the perspective of judicial and procedural development (i.e., how to develop regulations and legislation in order to improve the quality and effectiveness of EIA). The approaches of administrative and management science have been scarce, even though the functionality and effectiveness of EIA is not solely determined by legal regulation (Chi et al. 2016). For instance, in Finland, the EIA legislation leaves a lot of room for interpretations of how assessment practices should be implemented (Jalava 2014).

The roots of the EIA lie in the rationalist approach to decision making (Jay et al. 2007) but the value-laden nature of EIA is currently widely acknowledged. The procedure of EIA can be characterised as a context with pluralism (Bond et al. 2018). It includes multiple stakeholders (e.g., the developer, consultant, authority, and citizens) with conflicting interests and expectations about the purpose, quality, legitimacy, and effectiveness of EIA (Cape et al. 2018). At the same time when the interpretative and value-laden nature of EIA practice has come to the fore, the significant role of EIA practitioners in guiding EIA practice has been recognized. However, only a few studies (Kågström & Richardson 2015; Kågström 2016a; 2016b) have studied EIA from the perspective of how the EIA practitioners make sense of the procedure.

EIA thus includes many practitioners and stakeholders, of which EIA consultants typically have an important role as producers of knowledge, i.e., as assessors, whereas competent authorities have their role as supervisors and reviewers of knowledge. In addition, EIA allows different stakeholders (e.g., citizens and their communities) with differing interests to participate in the evaluation process, so EIA is a knowledge co-production process and a field of dispute used to promote political purposes. For instance, EIA can be harnessed by the developer for legitimation purposes, and the opponents of the project can use EIA to prevent the project from materializing (Jalava 2014). Practitioners and stakeholders have different interests, so there exist different views about what kind of knowledge is needed and how this knowledge should be produced, shared, and presented.

## ***2.2 Information and knowledge management process model***

Since knowledge is created in EIA, and EIA aims to solve the problems of knowledge and respond to the information needs of various actors, the perspective of knowledge management is a relevant approach to examining the conduct and effectiveness of EIA.

Overall, information and knowledge management refers to a systematic process that aims to create value from data, information, and knowledge (Jääskeläinen et al. 2022). Choo's (2002) information management cycle is widely referred and applied model in the field of information and knowledge management (e.g., Jääskeläinen et al. 2022). It distinguishes six separate but related phases in the information management process: information needs, information acquisition, information organization and storage, information products and services, information distribution, and information use.

In this study, this process model is simplified to the context of environmental impact assessment by combining the phases of information acquisition, organization and storage into a phase called information acquisition and analysis, and the phases of information products and services and information distribution into a phase called information presentation and sharing. This model that is presented in Figure 1 is used in this study as an analytical framework to identify information and knowledge management challenges and paradoxical tensions in the EIA process.

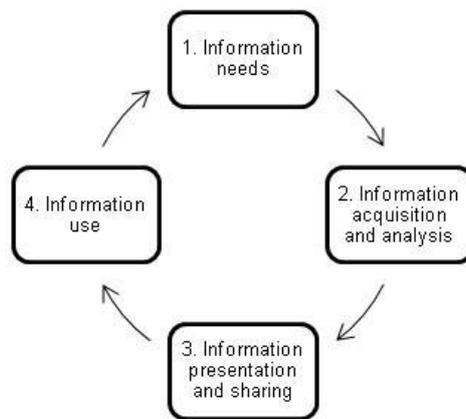

Figure 1. Information and knowledge management process model (based on Choo 2002).

At the core of the information and knowledge management process model is the idea of managing information and knowledge so that the knowledge is also used in practice and decision-making (Choo 2002). This requires exact definition of information needs. The model is based on the idea that information needs determine the desired (produced) information and knowledge. In practice, however, information is not necessarily produced from the perspective of

assumed need, but problems are caused by overproduction of irrelevant information or refraining from producing relevant information (Jalonen 2015).

### ***2.3 Paradox theory and paradoxical tensions***

Paradox theory is built on the concept of paradox. Paradox is typically illustrated by the symbol of yin and yang that describes two oppositional yet complementary elements. The concept of paradox refers to “contradictory yet interrelated elements that exist simultaneously and persist over time” (Smith & Lewis 2011, 386) or to a “persistent contradiction between interdependent elements” (Schad et al. 2016). Hence, three factors are central to the concept of paradox: contradiction, interrelatedness, and persistence (Smith & Lewis 2011). Overall, there exists a widespread consensus among researchers about what the concept of paradox generally means.

In the paradox literature, paradoxes are typically categorized into four types: paradoxes of learning, organising, belonging, and performing (Smith & Lewis 2011). Paradoxes of learning relate to the processes of sensemaking, innovation and change. Learning simultaneously requires the use of past understandings and the critique of them so to construct new understandings. At the core of the learning paradox is the tension between the old and the new, between the existing and novel practices, between radical and incremental innovations, whether to aim for exploitation or exploration, for stability or change. Paradoxes of organising appear as tensions in the processes, structures, and methods, which aim to simultaneously maintain and encourage control and flexibility, collaboration and competition, or direction and empowerment. Paradoxes of belonging describe the tensions between identities. Paradoxes of performing stem from the multitude of stakeholder demands that result in competing organizational objectives and goals. (Smith & Lewis 2011) Hence, paradoxes appear as tensions in knowledge, identity, processes, and goals, which create tensions in management and governance. In this paper, the terms paradox and paradoxical tension are used synonymously.

Responses to the paradoxical tensions can vary, which affects the consequences of these tensions in practice (Lewis 2000; Smith & Lewis 2011). Responses to such tensions may be different, and other responses may lead to long-term success whereas other may lead to vicious circles (Lewis 2000; Smith & Lewis 2011). Currently, researchers typically separate two opposing ways of

responding to paradoxes: defensive and active or strategic (Jarzabkowski & Van de Ven 2013; Iivonen 2018). Lewis and Smith (2014) describe the defensive responses as “cognitive, behavioral, or institutional resistances that seek to temporarily avoid or reduce the negative effects of tensions”, and strategic responses as “management strategies that seek to engage competing forces”. So, while defensive responses aim to eliminate the tension, active responses try to embrace it. Poole and Van de Ven (1989) distinguish four different modes of active responses: acceptance, spatial separation, temporal separation, and synthesis. While defensive responses provide temporary relief from tensions, vicious cycles are possible, whereas active responses provide opportunities for virtuous cycles (Lewis & Smith 2014).

In this study, the paradox theory is used as a methodological lens or a detective analytical tool to identify paradoxical tensions in the production of knowledge in EIA process (see different uses of paradox in Carmine & De Marchi 2022).

### **3 Research method**

The study was conducted as an interview study of EIA consultants and EIA authorities in Finland between the fall of 2016 and spring of 2017 (n=24). The purpose of the interviews was to find out how the practitioners of EIA understand the knowledge management practices of EIA. So, the focus was on the mindsets of EIA practitioners and not on the concrete practices of the EIA procedure as such.

Both EIA consultants and EIA authorities have a key role in producing knowledge in EIA. EIA consultants do the assessments and produce knowledge, and, unlike most developers, they often have experience in several and different types of EIA projects. The interviewees represented a total of ten different consulting companies. EIA authorities, in turn, supervise the production of knowledge. The interviewed EIA authorities were located in ten different ELY Centres: Lapland, North Ostrobothnia, Central Finland, Southwest Finland, Uusimaa, North Savo, Southeast Finland, Kainuu, North Karelia and South Savo. The regional coverage of ELY Centres was seen important because of the regional variations in projects: some project types are more common in some parts of country.

Apart from five interviews that were carried out as phone interviews due to practical logistical reasons, the interviews were conducted face-to-face. Two of the interviews with EIA consultants were joint pair interviews, others were individual interviews. The duration of the interviews ranged from 56 minutes to 200 minutes, with an average of 1 hour and 31 minutes. All interviews were transcribed, resulting in a total of 488 pages of material. Based on the transcription, a summary was written of each interview. The summary and transcription were also sent to each interviewee for possible corrections and additions to ensure reliability.

The analysis of the interview data was conducted as a theory-driven analysis. Information and knowledge management process model (section 2.2.) and the different types of paradoxes (section 2.3.) worked as theoretical frameworks, which helped to identify and categorise information and knowledge management challenges and paradoxical tensions from the interview data.

The analysis was done in two phases. First, the focus was on the question how the EIA procedure implemented information and knowledge management, and what kind of challenges related to the different phases of information and knowledge management. Second, the focus was on the paradoxical tensions and the question of what kind of paradoxical tensions appear in the different phases of information and knowledge management.

#### **4 Information and knowledge management challenges in the EIA**

The analysis suggests that the key knowledge management challenge of the environmental impact assessment procedure is that the multiple information needs are not systematically identified and evaluated. Information and knowledge are primarily produced for the sake of the procedure without evaluating the different contexts on which the knowledge is to be (or could be) used. Figure 2 summarizes the challenges of information and knowledge management in the different phases of the process.

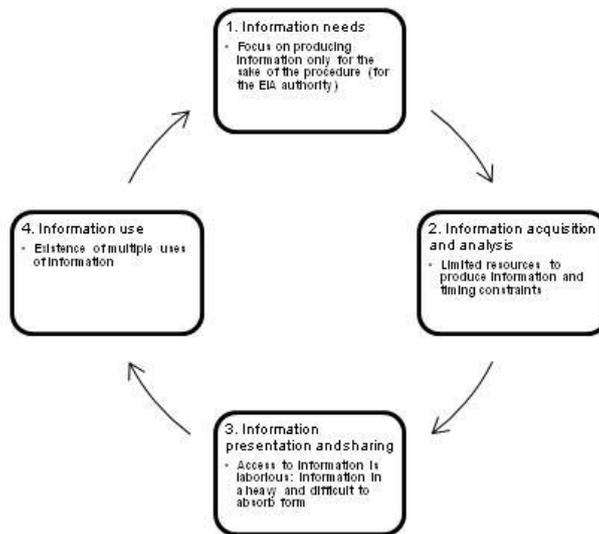

Figure 2. Information and knowledge management challenges in the EIA.

The developer decides on the timing of the EIA and determines how much resources will be used for the EIA, which sets limits for the knowledge production (phase 2). Information is presented in a heavy and not in an easy-to-adopt form, which furthermore hinders the use of information (phase 3). Finally, the existence of multiple uses of information makes the process challenging to manage (phase 4).

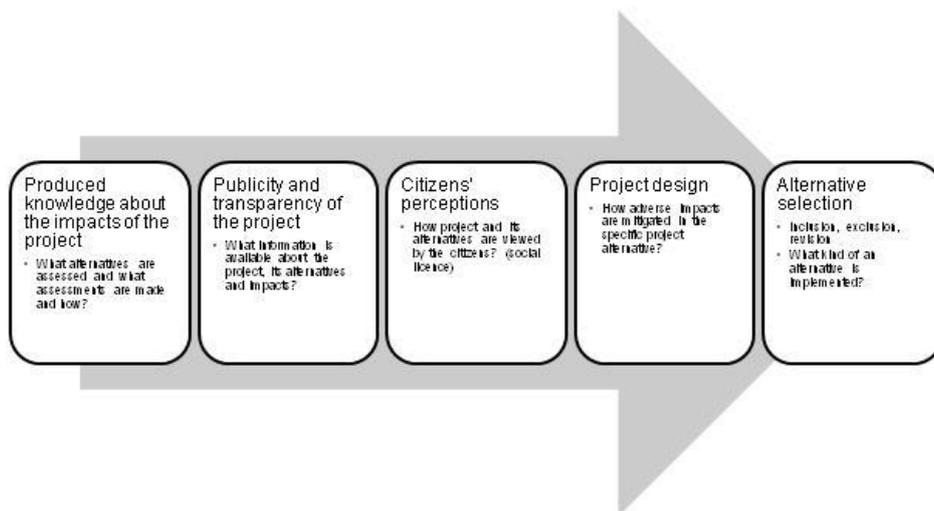

Figure 3. The use of EIA information.

Figure 3 illustrates these multiple uses of EIA, and how the produced information and knowledge affects or may have effect on the alternative selection, project design, citizens' perceptions, and on the publicity and transparency of the planned project.

## **5 Paradoxical tensions in the EIA**

The analysis brought up especially paradoxes of performing, which relate to the competing objectives or goals. In the first phase of defining the information needs, the performing paradoxical tension relates to the extent of consideration of different information needs. There is a tension between producing knowledge for the purpose of the procedure (when the focus is on the sufficient level of assessments and on cost-effectiveness) and producing knowledge for the purpose of fulfilling different information needs. This links directly to the challenge of producing information for the sake of the procedure and for the EIA authority only.

In the phase of acquiring and analyzing information, the performing paradoxical tension relates to the timing of knowledge production, whether the objective is to influence planning of the project as much as possible (i.e., to the comparison and choice of alternatives), which is easier at the early stages of the project planning, or to get as accurate and comprehensive assessments as possible, when the planning is already advanced. In addition, there is the performing paradox that relates to the extent of new knowledge production. There is a tension between the appropriateness of assessments to the context and the will to keep the level of assessments high and raise it. So, there can be simultaneously a will to treat developers equally and be reasonable in demands, and the perseverance to demand complete assessments of high quality. Both paradoxical tensions link to the challenge of limited resources to produce information and timing constraints.

In the phase of information presentation and sharing, the key paradoxical tension is a performing paradox that relates to the simplicity and comprehensiveness of information presentation. When the assessment is presented in a simple form some details are missed. There is a tension between the scope and richness of assessment reports and the readability of assessment reports. This links directly to the challenge that information is presented in a

heavy and not in an easy-to-adopt form, which hinders the sharing of information to the public.

In the last phase of information use, no paradoxical tensions emerged in this study. Table 1 summarizes the paradoxical tensions in the EIA. It also illustrates how paradoxical tensions are linked to certain information and knowledge management challenges. The paradoxes of belonging that relate to the competing identities of EIA consults and authorities do not focus on a certain phase of the information and knowledge management process but are present throughout the whole process.

Table 1. Paradoxical tensions in the knowledge production of EIA.

<b><i>The phases of information and knowledge management process and the related challenges</i></b>	<b><i>Paradoxical tensions</i></b>
<i>I Information needs</i>  <i>Challenge:</i> Focus on producing information only for the sake of the procedure (for the EIA authority)	<b>(1) Extent of consideration/inconsideration of different information needs:</b> Producing knowledge for the purpose of the procedure (cost-effectiveness, sufficiency) vs. Producing knowledge for the purpose of fulfilling different information needs <i>EIA consult:</i> Goals of the customer/developer vs. Goals of the EIA authority
<i>II Information acquisition and analysis</i>  <i>Challenge:</i> Limited resources to produce information and timing constraints	<b>(2) Timing of knowledge production:</b> Possibility to influence planning vs. Accurate assessments <i>EIA authority:</i> Ensuring the choice and comparison of alternatives (early timing) vs. Ensuring comprehensive assessments (late timing) <b>(3) Extent of new knowledge production and exploration:</b> Appropriateness of assessments to the context and ability to limit assessments vs. Keeping the level of assessments high and raising it <i>EIA authority:</i> Aim for better quality assessments (aiming for higher standards than in the past) vs. Equal treatment of developers. <i>EIA authority:</i> Perseverance to demand complete/proper assessments vs. Reasonableness in demands
<i>III Information presentation and sharing</i>  <i>Challenge:</i> Access to information is laborious: information in a heavy and difficult to absorb form.	<b>(4) Simplicity and comprehensiveness of information presentation:</b> The scope and richness of assessment reports vs. Readability of assessment reports
<i>IV Information use</i>  <i>Challenge:</i> Existence of multiple uses of information (and the	N/A

need to consider different users' needs)	
<i>Process as a whole</i>	<p><b>(5) Competing, concurrent identities of EIA practitioners</b></p> <p><i>EIA consult:</i> Identity as an objective researcher/scientist vs. Identity as a customer server agent vs. Identity as a broker/interpreter</p> <p><i>EIA authority:</i> Identity as a partner in joint deliberation and cooperation and guidance through collaboration and teamwork (subjectivity, participation) vs. Identity as a supervisor and guidance through statements (objectivity, independency</p>

Paradoxes of belonging describe the tension between identities. From the data it was possible to identify competing identities of EIA consultants and authorities. These identities are described in Table 2. Interviewees represented the identities simultaneously with different emphases. For instance, an interviewee may emphasize the identity of an objective researcher but also represent the identities of customer server agent and broker in a certain degree – or alternatively with different emphases.

Furthermore, paradoxes of performing and organizing can be recognized from the background of the paradoxes of belonging. The different identities of EIA consultants reflect the paradox of performing, i.e., tension between goals. The objective researcher aims for comprehensive and accurate assessments and knowledge of good quality. Customer server agent aims for taking care of the developer's advantage putting emphasis on producing appropriate knowledge cost-effectively. Broker/interpreter aims for building consensus between different actors and their demands.

The different identities of EIA authorities reflect the paradox of organizing. The supervisor aims to ensure the assessments are made in compliance with the law, whereas the partner aims to participate in joint deliberation and collaboration to ensure that the planning of the project proceeds in a best possible way considering the environmental and social impacts. The supervisor relies on guidance through statements, whereas the partner relies on guidance through teamwork. It is a tension between control and flexibility as well as between supervision and collaboration.

Table 2. Multiple identities of EIA practitioners.

<i><b>Identities of EIA practitioners</b></i>		<i><b>Characteristics Purpose</b></i>	<i><b>Guiding principle</b></i>	<i><b>Ideal role</b></i>
<i><b>EIA consultants</b></i>	<b>Objective researcher</b>	To assess impacts objectively and find solutions to problems	Objectivity, Transparency, Independency	Scientist
	<b>Customer server agent</b>	To serve the developer	The care of the customer's advantage, Reasonableness	Servant
	<b>Broker /Interpreter</b>	To support planning of the project and disseminate knowledge between participants to support knowledge co-creation.	Equal treatment, Openness, Innovativeness	Pragmatic developer and diplomat
<i><b>EIA authorities</b></i>	<b>Supervisor</b>	To ensure that assessments are made in compliance with the law – Power in form of official statements.	Compliance with the law, Objectivity, Independency	Legal authority
	<b>Partner</b>	To support planning of the project in compliance with the law – Informal power through discussions	Expertise, Innovativeness	Collaborator

In summary, paradoxical tensions in the knowledge production relate to five different aspects. The first is about the recognition or inconsideration of information needs, i.e., whether information is produced for the sake of the procedure or whether the information needs are considered more extensively. This also reflects the tension between the costs and the quality of knowledge. The second aspect is about timing, i.e., when information and knowledge should be produced. Timing should at the same time be early regarding the project planning to ensure the choice and comparison of alternatives, and late to ensure comprehensive and accurate assessments cost-effectively and with minimal uncertainties. The third aspect is about the quality of the produced knowledge, i.e., should the depth and scope of knowledge depend on the context or be of high quality in every regard. The fourth aspect relates to the way information is presented and shared: how to nurture both simplicity (e.g., readable reports) and accuracy (e.g., comprehensive reports). The fifth aspect is about the different approaches to the knowledge production process demonstrated by the competing, simultaneous identities of the actors.

## 6 Conclusions

This research identified four information and knowledge management challenges in the EIA process, where knowledge is produced for environmental planning and decision making: 1) focus on producing information only for the sake of the procedure, i.e., for the EIA authority, 2) limited resources to produce information and timing constraints, 3) access to information is laborious, and 4) the existence of multiple uses of information. Furthermore, the results demonstrate the existence of five paradoxical tensions in the EIA procedure, where knowledge is produced for environmental planning and decision making: 1) consideration/inconsideration of information needs, 2) timing of knowledge production: the choice and comparison of alternatives (early timing) vs. comprehensive assessments (late timing), 3) extent of new knowledge production, 4) simplicity vs. comprehensiveness of information presentation, and 5) competing, concurrent identities of EIA practitioners.

This study concludes that paradoxical tensions lie behind many of the challenges of information and knowledge management, i.e., paradoxical tensions and information and knowledge management challenges are interlinked. This implies that paradox theory may explain the reasons for the challenges of information and knowledge management.

Findings reveal different identities of EIA authorities and EIA consultants and resulting differences between practitioners' way of thinking. This can be seen as a possible explanation for the recognized differences in EIA practice. For the EIA practice, this study concludes that even though EIA is a legal procedure, many paradoxical tensions affect how it is implemented in practice and what kind of impacts it has.

This study did not investigate whether differences exist in the concrete practices of writing EIA reports and statements, but it shows the existence of differences in the mindsets of EIA practitioners. The different responses to paradoxical tensions in knowledge production may offer one explanation for the differences in EIA practice. Future research could delve deeper into the question of how EIA practitioners respond to the paradoxical tensions, and how these responses affect the effectiveness of EIA and sustainability outcomes.

Future research could also find out what kind of paradoxical tensions can be identified from the structures and processes of knowledge production in EIA. This study sees paradoxical tensions as cognitively and socially constructed. In

contrast, the ontological nature of paradoxes could be seen differently – not as mental representations that are constructed in the cognition and rhetoric but as material construction that are system contradictions inherent in intra- and inter-organizational practices and structures (Lewis 2000). It is possible that not all paradoxical tensions and responses to these tensions will come out in the speech of EIA practitioners that was the focus in this study.

### Abstract

Public investment programs consider tourism as a key driver to support the process of territorial development in in-land rural areas. Tourism activities increase production, safeguard tangible and intangible cultural heritage and foster social cohesion due to the high level of collaboration among operators and multifunctionality in a tourism supply chain. A generalised feature of tourism development strategies and projects is to be proposed as an alternative means of solving problems facing rural economies. The goal of enhancing local cultural resources is to stimulate demand for goods and services from external sources, ultimately aimed at mitigating the negative effects of marginalization and demographic decline.

Studies on systems for evaluating the effectiveness of current tourism-related policies adopt a fragmented and sectorial approach that may be useful for identifying variations in structural socio-economic trend but, mainly, fail to produce a comprehensive picture of the impact of tourism development investments over time.

However, given that tourism is a complex, multifaceted phenomenon that involves the contributions of multiple disciplines in both research and policy-making, the absence of an integrated framework for monitoring is a structural weakness. Such a framework would enable a more comprehensive understanding of the impact of tourism in a specific location. The study sets forward a framework hypothesis which, through the systematic

reading of selected practices, introduces evaluation criteria for successful strategies proposing an operative definition of "tourism ecosystems" to be adopted in multidisciplinary research project promoting tourism sustainable development (TechForYou).

The paper, after highlighting the lack of a common metric and the problems relating to tourism strategies, proposes an operational definition of the tourism ecosystem considering the cross-sectoral nature of tourism sector.

**Keywords** – Tourism ecosystem, Sustainable Development, Rural Areas.

## 1 Introduction

A number of public investment programs supporting the local sustainable development of rural areas consider tourism as a catalyst for the territorial capital's regeneration process (Croes et al., 2021). The development of Italy's tourism sector was significantly aided by EU funding from 2007 to 2013. Italy was required to contribute to the projects since the resources from the European Regional Development Fund (ERDF) and the European Social Fund (ESF) were combined with co-financing from the Italian government. Further funding for tourism development was also provided by the National Fund for Development and Cohesion (FSC) and the Action Plan for Cohesion (PAC).

Tourism has the potential to provide a valuable alternative to the crisis affecting rural economies through new sources of income as a response to a demand for goods and services related to tourism flow (Sharpley, 2002). According to the goals, resources, and governance outlined in the National Strategy for Internal Areas (SNAI), tourism is given a crucial role in the occurrence of the following conditions: "increase in income, increase in social cohesion, reduction of social costs, restoration of ecosystem balances, maintenance of historical and artistic capital" (Agenzia per la Coesione Territoriale, 2014).

If we focus on small Italian towns and settlements in in-land rural area characterized by inadequate accessibility to the main development poles and deteriorating infrastructure for personal services, classified by SNAI, many development experiments with recurring tourism models can be identified. The general purpose of enhancing (even boosting) the region's prominent tangible and immaterial tourism assets (natural, cultural, social) represent a replicable approach in design tourism development strategy (Andreoli & Silvestri, 2017).

In such instances, it becomes apparent that a restructuring of tourist offerings, with a focus on providing experiential and naturalistic activities, based on the identification of identity values (Carneiro et al., 2015) as well as a highly diversified range of tourism facilities, is necessary in the midst of a transition in tourism marked by the decline of mass tourism and the emergence of new leisure activities (Salvatore et al., 2018). The principles of "integration," "multifunctionality," and "place-based approach," supported by monitoring capacity to identify socio-economic trends and territorial effects, have emerged as criteria for the development of more effective tourism strategies.

This study aims to discuss a preliminary analysis of the current situation regarding the intervention strategies based on tourism development by providing an overview on the problems related to a weak programming capacity. Next, we look at the current approach used to monitor the success of intervention lines. Considering tourism as a cross-disciplinary integrated subject and the fragmentary nature of the current approach in the planning cycle a definition of the "tourist ecosystem" is proposed as a basic concept informing the wider research structure of the TechForYou<sup>1</sup> project. In the conclusions future related research scenarios are proposed defining conceptual and technological implications.

## **2 Tourism in planning**

Today, three different approaches can be identified to explain how tourism affects local development (Porter, 1998) (Andreoli & Silvestri, 2017) The following are domains of local context resource exploitation: a) temporary devices that generate tourism supply and demand (i.e., main attractor structures); b) improvements in accommodation infrastructure and the provision of tourism services; c) innovation and increased creativity in the network system between local and non-local actors.

While it is demonstrated that tourism flows open up growth opportunities in the destination areas/sites, the impact over the long run in some circumstances is debatable (Balaguer & Cantavella-Jordá, 2002). A specific argument of impact analysis is the durability of the positive socio-economic effects over time and the risk of over-tourism pressure on the cultural/natural/social values in the medium long term.

---

<sup>1</sup> <https://www.tech4youscarl.it/>

The results of the current tourism policy, which is based on the development and application of generalized approaches (also referred to as "main attractor"), demonstrate a significant contribution to increase the tourist presences, but the data analysis highlights the ineffectiveness on the trend of socio-demographic trends (Scorza & Gatto, 2023). It is difficult to quantitatively assess and model the relation between territorial regeneration combined with tourism infrastructure investments in marginal areas and economic growth (Gatto et al., 2022a, 2022b).

The distinctive characteristics of the context, according to recent study, have a significant impact on the likelihood of an investment's success (Brau et al., 2011), stressing the importance of human capital in the process of generating goods and services for the tourism industry (Pigliaru & Lanza, 2005).

Analysing objectives and monitoring systems of internal areas, however, a critical perspective emerges for territorial development planning in all phases of the planning cycle (Las Casas & Scorza, 2016): from the ex-ante evaluation which includes the classification of the in-land rural areas benefiting from public resources, passing from the evaluation and definition of the problems, from the construction of the logical link between directly correlated actions and expected results and the convenience of the investment up to the final phases of verification and post-realization verification. In fact, there are realities and traits founded in social practices and traditions that continuously modify the landscape inside the homogeneous areas identified by SNAI, making the identity values of the places obvious (Scorza & Gatto, 2023). The informal mechanisms that contribute to sustaining subsistence economies entrenched in the cultural system of the permanent population are represented by the niches of value. They are primarily experiential tourism-related activities that take place as a result of watching actors' interactions with service-oriented environments change.

Furthermore, the tourism industry's emphasis on providing a variety of services, rather than exchanging physical products, has led to the development of several theories that reinterpret organizational models based on the co-creation of value within systems (Polese et al., 2018). To facilitate the tourism transition in rural areas and achieve a fair balance between social, environmental, and economic factors, it is crucial to comprehend the complex network of connections and interdependencies between the various components of a "tourist ecosystem".

### **3 Tourism ecosystem frameworks**

#### ***3.1 Evaluation of successful tourism funding***

Tourism development objectives in Europe include fostering the creation of high-quality jobs, fostering the sector's diversity and competitiveness, and promoting sustainable growth. Diverse sub-sectors of tourism exist, including those centred on nature, culture, health, and adventure. To encourage sustainable tourism development, a comprehensive plan that incorporates market research, product development, marketing, and stakeholder engagement is required.

The monitoring mechanism used to evaluate the efficacy of sustainable tourism strategies and practices is still insufficient to learn from data evidences in order to define more effective tourism models to be considered as a DSS in planning sustainable development in inland and weakest areas. Despite the efforts of numerous organizations and governments to promote sustainable tourism, today a shared framework guide for sustainable tourism strategies design is still missing with negative consequences in information sharing, comparability of approaches, lessons learned.

The United Nations World Tourism Organization (UNWTO) plays a significant role in promoting sustainable tourism worldwide. Through its programs and initiatives, UNWTO seeks to foster tourism that maximizes economic, social, and environmental benefits while minimizing negative impacts. Some key principles of sustainable tourism promoted by UNWTO include responsible consumption of resources, preservation of cultural and natural heritage, and respect for local communities and their interests.

The current system heavily relies on quantitative metrics that fail to fully capture the intricate and diverse components of sustainable tourism, including visitor numbers and economic impacts (Corrado & Scorza, 2022). Furthermore, the system often neglects qualitative factors, such as destination competitiveness, stakeholder involvement, and environmental and social implications. As a consequence, it is imperative to develop more comprehensive monitoring frameworks that consider local contexts, encompass the multifaceted aspects of sustainable tourism, and facilitate effective decision-making and policy implementation.

It is a challenging task to evaluate the effectiveness of tourist public funding, and many approaches have been put out to measure its influence. Utilizing

economic metrics like job growth, income generation, and tax receipts is one strategy (Plzakova, 2022). Another strategy is to consider social and environmental indicators including participation in the community, preserving the environment and cultural preservation (Andereck & Nyaupane, 2011; Jepson & Sharpley, 2015) A third strategy is to gauge how satisfied visitors and locals are with the tourism offering and how they feel it has affected their quality of life (Buhalis, 2000).

Planning and development for the tourism industry frequently exclusively refers to economic impact assessments. Input-output analysis is a widely used technique that estimates the economic advantages of tourism in terms of jobs, income, and taxes. Cost-benefit analysis is a different strategy that assesses the financial costs and gains of tourism development initiatives (Plzakova, 2022).

Assessments of the social and environmental impacts of tourism, particularly ecotourism and sustainable tourism, have grown in importance. These evaluations examine the social and environmental effects of tourism initiatives and look for ways to lessen negative effects while enhancing favourable ones (Sharpley, 2002).

Surveys of customer satisfaction and perception are yet another crucial tool for assessing the effectiveness of tourism investment. These polls can provide information about how locals and visitors perceive tourism, as well as point up areas (physical areas in the destination sites and functional areas in the local tourism supply chain) that need to be improved (Buhalis, 2000).

In general, the methods employed to assess the efficacy of tourism financing are diverse and extensive, reflecting the intricacy of the industry and the multitude of stakeholders involved in its growth (Scorza et al., 2022; Soligno et al., 2015).

### ***3.1 Theoretical framework***

According to the concept of "tourism ecosystem" intended as a model to adopt in designing, monitoring and implementing tourism development in weakest areas, a comprehensive survey technique that demonstrates the effect that tourism services have on the area must be defined. Research efforts to define creative habitats for territorial tourist ecosystems are actively contaminated by the definition of an integrated approach focused on the involvement of local communities. Tourism, as an area transversal to different disciplines, is tackled by

fragments and steps in the logic of measurement (Merinero-Rodríguez & Pulido-Fernández, 2016).

In order to define a functional framework for the evaluation and interrogation of the territorial system of the role of tourism in the global vision, the study attempts to conceptually frame the concept of "tourism ecosystem" starting from the literature. When considering tourism as a relational phenomenon, a systematic approach is necessary, which asks for tools that can be used to analyse the phenomenon's various components and the connections among them (Picaud-bello et al., 2022). However, the structure of the relationships between the various sectors and the definition of the same serve as a significant starting point for identifying successful strategies and for identifying the locations that are best suited for particular types of tourism in the following stage.

An area's production and consumption of tourism-related goods and services are governed by a network of interrelated and interdependent players, resources, and processes (Hillebrand, 2022). The architectural and natural environments, cultural assets, human resources, transportation networks, and organizations involved in the development and management of tourism are all included in this. The idea underlines the necessity for a comprehensive strategy for tourism development that considers the interactions between various ecosystem components and the sustainability of the system as a whole.

Researchers in the field of tourism studies, have proposed the concept of a tourism ecosystem, arguing that tourist destinations can be viewed as complex adaptive systems that change over time in response to environmental changes as well as the actions of tourists and other stakeholders (Picaud-bello et al., 2022).

The ecosystem method has been used to study the effects of tourism on regional communities and the environment as well as to inform policy and planning choices meant to encourage the development of a sustainable tourism industry (Gretzel et al., 2015). Overall, the idea of a tourism ecosystem underlines the complexity and interconnection of the sector and the demand for a thorough and sustainable approach to tourism planning and management. It offers a framework for comprehending the dynamic connections between various tourism system components and for formulating plans to encourage the long-term viability of tourist destinations.

According with those considerations the proposed definition of "tourism ecosystem" is: *A tourist ecosystem is defined as a network of interrelated and*

*interdependent nodes that characterize a tourist destination area providing benefits in a territorial development scenario.*

The analysis of social networks aims to define local structures by identifying the relationships between the groups that represent the nodes. Protagonists of the cluster at the basis of the cooperation and coordination of territorial areas include tour operators, SMEs, institutional stakeholders of the local population and in general of the actors involved in sectors of the tourism dimension. The models to be defined require the cross-experimentation of different approaches oriented towards the evaluation of the system and services, incorporating different thematic areas. The models that are intended to be defined first in each individual thematic area will then be structured through a specific relationship between them. The result, tested, aims to reconstruct the situation before and after the tourist intervention in selected areas. The models thus intend to pursue the following guidelines: (i) the enhancement of local resources in the productive, environmental and cultural sectors; (ii) the materialization of opportunities for social and economic promotion rooted in the dimension of places; (iii) the protection of the environment and socio-ecological characteristics. The ecosystem is distinguished by the characteristics of adaptability and transdisciplinary based on the project of the relationship typical of tourism.

#### **4 Conclusions**

The research contributes to the definition of "tourist ecosystem" based on the targeted organization of the territorial tourist offer.

The emerging approach in tourism development based on the concept of tourism ecosystems represents a promising prospect for enhancing local approaches and applications within the paradigms of the NUA 2030 agenda. Compatibly with the objectives of the PNRR - tourism transition 4.0 - the outcome of the evaluation structures the network relationship between the actors of the tourism chain involved. The goal is to outline a methodology capable of anticipating and monitoring the results of governance choices made by measuring the impact on the social, environmental and economic components.

The proposed definition of "tourism ecosystem" is:

*A tourist ecosystem is defined as a network of interrelated and interdependent nodes that characterize a tourist destination area providing benefits in a territorial development scenario.*

The definition of "tourist ecosystem" represents a first step in a complex research project oriented to define effective and ready to market models for planning and design sustainable tourism development scenario for in-land areas. The research perspective adopts an operative approach based on data driven model for territorial tourism stock assessment defining minimum requirement for a "tourism ecosystem" according to a comparative analysis benchmarking minor and major tourist destinations. Implications regards several territorial planning domains (Pilogallo & Scorza, 2022; Santopietro & Scorza, 2021; Scorza, Pilogallo, et al., 2020; Scorza, Saganeiti, et al., 2020; Scorza & Fortunato, 2021, 2022; Scorza & Santopietro, 2021) directly and indirectly connected with tourism sector.

Future implications include:

- the development of territorial models in order to provide decision support systems (DSS) useful for implementing investment plans, programs and projects in the medium-long term in line with the objectives of sustainable local development. The design of data-driven models is based on different levels capable of identifying the alternative that best suits the specific territorial needs for both the public sector and private operators (Corrado et al., 2023);
- analysis and implementation of spatial data infrastructures essential for the evaluation of tourist services and the monitoring of territorial processes;
- the collection of information to reconstruct an exhaustive dataset represents a first phase to guide future developments effectively. In accordance with the envisaged models, it is necessary to characterize an integrated survey methodology aimed at illustrating the impact that tourist services have on the territory.

This framework is a component of a larger research project called "Tech4You" that implements national strategies for rebalancing the growth of Southern areas.

### **Abstract**

Nowadays, innovation has become the staple of every company. The nature of global economic growth has also been modified by the high speed of innovation, due to a very distinctive rapid and everlasting evolving technology, shorter product lifecycles, programmed obsolescence and a higher rate of new product development. Companies, institutions and organizations have to make sure or even guarantee that their business strategies are unique and innovative in order to build and sustain competitive advantage, otherwise they would simply die.

It is important to stand out that strategic knowledge management processes are quite significant for innovation, since they conceive knowledge creation, knowledge transfer and knowledge application. It all aims to create a unique knowledge resource that can eventually be added into products, processes and services (Nonaka & Takeuchi, 2009). The main purpose of it is contributing towards improving social well-being, enhancing economic growth as well as improving technological readiness (Kanter, 2015). In this sense, the current study aims to identify and analyse the key drivers for social innovation deployment. Chiva et al. (2014) state that knowledge is widely regarded as a new novel solution for a wide range of issues which have been wracking havoc all around the world.

On the one hand, there is a widespread agreement among authors, researchers, consultants and thinkers in the field of management. When it comes down to innovation, they all posit that it is the central capability for all organizations and they are all interested in it. It is all about doing different things with the same elements. On the other hand, social innovation turns out to be a vital outcome since it is related to providing a better understanding and results to global issues.

These two concepts must be considered to fully understand the abovementioned intrinsic relationship. The latter does not only solve specific problems, but also encourages collective action and inclusion.

To sum up, the current study aims to delve into these concepts and their contribution to science, technology and society. Once key drivers have been identified and analyzed, a theoretical methodology will be applied and interpreted through a thorough examination. By doing this it will also be important to determine the degree of importance so that data can be properly easily understood.

Finally, it is worth to mention that the output is expected to be disseminated in order to enhance practical scenarios facing up current circumstances regarding social innovation.

**Keywords** – Strategy, knowledge management, social innovation

## **1 Theoretical framework**

Knowledge management and social innovation are two important concepts that have emerged in recent years. While they may seem unrelated at first glance, they are actually closely linked and can have a significant impact on organizations, communities, and society as a whole.

Knowledge management is typically thought as the process of identifying, capturing, sharing, and effectively using knowledge and information within an organization. It involves creating and maintaining an environment in which knowledge can be easily accessed, shared, and utilized to improve business processes, products, and services. The goal of knowledge management is to enhance the efficiency and effectiveness of an organization by leveraging the collective knowledge and expertise of its employees. Still, it is not only restricted to organizations.

In order to understand this concept it is necessary to take a deep dive into several conceptions. López- & Meroño (2011) argued that despite considerable advances in certain aspects, heterogeneous and confounding results had been presented related to the variables affecting knowledge management programs. Duhon (1998) defined knowledge management as an integrated approach that aims to identify, capture, evaluate, retrieve, and share all information, and this information can take the form of databases, documents, policies, procedures, or formerly uncaptured expertise and experience among individual workers. Knowledge management was also observed as a process of creating, acquiring and transferring knowledge reflected in the behavior of the firm, which turns out

to be valuable (Bueno et. al., 2010). Basically, it is all about gathering and systematizing companies' assets.

### **1.1 Strategic knowledge management**

According to Hill (2023), strategic knowledge management is a plan of action that outlines how your organization will manage and centralize company information, data, and knowledge to improve the productivity and efficiency of an organization. The most successful of these strategies are closely aligned with company-wide goals and objectives. A knowledge management framework should actually incorporate a basic understanding of knowledge operations and infrastructures in order to support operations. According to Lee and Choi, knowledge management enablers are mechanisms that are employed by firms to foster consistent knowledge usage. By doing so, firms, organizations or companies make sure they keep the whole valuable data that could eventually be disseminated (Lee & Choi, 2003). Knowledge management refers to identifying and leveraging the collective knowledge in a firm (Krogh, 1998), but there is still a problem regarding the integration of such knowledge into a firm's strategic levels. The main difficulties for firms regarding sustainable development include the potential failure of knowledge management due to the difficulty of integrating the knowledge at the strategic level (García et al., 2010); hence, the ability of firms to identify, codify and leverage/use their knowledge sources as a firm strategy to increase overall performance and competitive advantages is limited. Hence, strategic knowledge management needs to be formulated as a set of measures at a firm's strategic level. This is the main idea of the current study, since they must be aware about the enormous challenge they have to cope with if it can be well handled.

### **1.2 Social innovation definition**

According to OECD (2023): "Social innovation refers to the design and implementation of new solutions that imply conceptual, process, product, or organisational change, which ultimately aim to improve the welfare and wellbeing of individuals and communities."

Several initiatives undertaken by civil society and the social economy have proven innovative in dealing with environmental and socio-economic issues while

contributing to economic development. To support public, non-profit, and private actors to co-construct and implement socially innovative solutions and thereby contribute to addressing socio-economic issues, build stronger territorial resilience, and better respond to future shocks, it is necessary to fully tap the potential of social innovation, an enabling policy framework is needed.

Social innovation, refers to the development and implementation of new ideas, products, services, and practices that aim to address social and environmental challenges. It involves identifying and addressing social needs and creating new solutions that can bring about positive social change. Social innovation can occur at the individual, organizational, or community level, and it often involves collaboration and partnerships between different stakeholders.

Once social innovation has been understood, it is important to get deeper into the innovation strategy, which also gets involved into these dynamics. The outcome of innovation strategy is regarded as the vital ingredient to produce superior products, processes and services which in turn stimulates economic and social growth.

### ***1.3 Why is important the relationship between strategic knowledge management and social innovation?***

Strategic knowledge management can help organizations collaborate and share knowledge. Collaboration is key to social innovation, and knowledge management can facilitate this collaboration. By creating knowledge-sharing platforms, organizations can connect with other stakeholders, including communities, NGOs, and government agencies. These platforms can be used to share knowledge, best practices, and resources, leading to the development of new solutions and innovations. For example, a group of NGOs may use a knowledge-sharing platform to collaborate on a project that aims to address the issue of climate change.

By developing a culture of learning and innovation, organizations can create an environment that supports social innovation. This culture can be supported by knowledge management practices, such as training and development programs, which can help employees develop the skills and knowledge needed to develop innovative solutions. For example, a social enterprise may offer training and development programs to employees, helping them to develop the skills needed to develop new products and services.

Additionally, strategic knowledge management can help organizations measure the impact of social innovation. By collecting data on the outcomes and impact of social innovation, organizations can understand what works, what doesn't, and what needs to be improved. This knowledge can be used to refine and improve social innovation initiatives, leading to better outcomes for communities and the environment. For example, an NGO may use data analytics to measure the impact of a social innovation initiative aimed at addressing poverty in a specific region

In conclusion, strategic knowledge management can serve as a key driver for social innovation.

By identifying needs, facilitating collaboration, building capacity, and measuring impact, organizations can use knowledge management to develop innovative solutions to social and environmental challenges. In a world where social and environmental challenges are becoming increasingly complex, strategic knowledge management can help organizations create positive social change and build a more sustainable future.

Having said that, knowledge management and social innovation are intertwined because effective knowledge management can help drive social innovation. When organizations have access to valuable knowledge and information, they are better equipped to identify social needs and develop innovative solutions to address them. Similarly, social innovation can lead to new knowledge and insights that can be captured and shared through knowledge management processes. One example of how knowledge management can support social innovation is through the use of data analytics.

By collecting and analyzing data, organizations can gain valuable insights into social needs and trends, which can help them identify areas where social innovation is needed. These insights can be used to develop new products, services, and practices that can help address social challenges.

To make it clear, knowledge management and social innovation are two important concepts that can have a significant impact on organizations and society as a whole. By leveraging knowledge and expertise, organizations can drive social innovation and create new solutions to address social challenges.

## **2 Methodology**

In order to keep on going with the proposed analysis, the methodological parameters are presented. These parameters guided the development of the

current research, with a focus on achieving and responding to the set objective. According to Gil (2008), a research can be classified as to the nature, the objectives and the means of searching the data. The current study is qualitative as to the nature, since it attempts to provide with a better understanding of the facts sought from the contents found in the literature review (Oliveira, 1999). The objective is exploratory, since it aims to gather information and to describe how the phenomenon occurs. As far as data collection and analysis are concerned, it is an integrative literature review, with the purpose of synthesizing results gotten in researches on a theme or question, in a systematic, orderly and comprehensive way (Ercole et al., 2014). For the preparation of the integrative review, six steps were followed: 1) elaboration of the guiding question starting from the question; 2) inclusion and exclusion criteria; 3) identification of pre-selected and selected studies; 4) categorization of the selected studies; 5) analysis and interpretation of the results, and finally 6) presentation of the knowledge review (Botelho et al., 2011). Table 1 presents the steps and their description.

Table 1 - Stages of the Systematic Review

<b>Steps</b>	<b>Description</b>
1) Elaboration of the guiding question	The guiding question of the research is: "How does strategic knowledge management impact on social innovation deployment?"
2) Inclusion and exclusion criteria	To search the literature, a survey was carried out on the following databases: Web of Science, Ebsco, Scopus, Emerald and Scielo. In the procedure, the survey fields "Titles, Abstracts and Key words", with the following descriptors and their combinations were used: "Strategic Knowledge Management" and "Social Innovation". The total of articles downloaded from the databases was 32. As for the content exclusion criteria, were selected only empirical articles that presented results obtained through the application of field research, thus discarding articles only theoretical. After this exclusion, only 8 articles were left for in-depth content analysis.
3) Identification of the pre-selected and selected studies	Based on the research question, it was sought to identify in the articles the similarities between the objectives and the main results.
4) Categorization of Selected Studies	Based on the identification of the pre-selected studies, it was sought to categorize them as to the coherence of knowledge management in social innovation
5) Analysis and interpretation of results	With the categories grouped together, it began the identification of which knowledge management initiatives were focused on each one of them.
6) Presentation of the knowledge review	The presentation of the review shows the interpretations and the results of the research based on the integrative analysis of the data of the articles.

Source: Adapted from Botelho et al., 2011.

### **3 Interpretation**

In accordance to Nonaka & Takeuchi, (1995) in an economy where the only certainty is uncertainty, the one sure resource of lasting new innovation and competitive advantage is basically knowledge resource. Based on the previous statement, the current study attempts to explore the association of strategic knowledge management processes with social innovation. As far as it goes to the literature review, strategic knowledge management can be conceived as the ability to identify, create, harness, transfer, integrate and apply superior knowledge resource resident in the individuals, teams or organizations that involves wide range of activities and interactions to improve and creates new innovation. If so, it is would be worth it to mention that a good example would be quality products, processes and services which is the key aspect of competitive advantage and to fulfil social needs (Meier, 2011).

At this point, it is also important to stand out the fact that strategic knowledge management creates three prominent processes namely:

- Knowledge creation
- Knowledge transfer
- Knowledge application

To be more specific, knowledge creation is associated with the development of new knowledge (Gourlay, 2006). Knowledge transfer refers to the whole transmission process whereby knowledge is transferred within or across organization boundaries (Argote & Ingram, 2000). At last but not least, knowledge application is described as how such knowledge is embedded and applied to create value, new innovation and competitive advantage (Grant, 1996). These three processes of strategic knowledge management provide superior knowledge resource that can be embedded into products, processes and services according to Nonaka & Von Krogh (2009).

As it has already been stated, the new paradigm of social innovation is defined as a new and novel solution that can be embedded into any given products, processes and services in order to fulfil social, economic and technological needs and to improved quality and quantity of people's life (Altuna et al. 2015). This conception does not go farther from providing quality of life. From the above statement, in ensuring the success of social innovation as an outcome innovation strategy there must be a presence of a new and novel solution. Battisti (2012) and Makimattila et al. (2015) describe the innovative kind of solution which is the

main element of social innovation that refers to the superior knowledge resource. This superior knowledge resource is embedded into products, processes and services which make them highly innovative and in turn lead to the outcome of improving the quality and quantity of people's life, stimulate economic growth and enhance technological advances (Unceta et al., 2016).

Furthermore, the creation of superior knowledge resource is within the processes of strategic knowledge management namely; knowledge creation, knowledge transfer and knowledge application (Audretsch & Cajazza, 2015). In addition, according to Van Wijk et al. (2008), university-industry partnership is the strategic platform to implement strategic knowledge management processes in producing superior knowledge resource. To show evidence, Kanter (2015) states that, social innovation helps to improve societal, economic and commercial related problems by creating new knowledge resource which acts as a novel solution into products, processes and services that work to meet pressing social, economic and technological needs and to improve quantity and quality of people's life.

As a matter of fact, an empirical finding by Surikova et al. (2015) established that in the aspect of poor public education system, social innovation offers new solutions i.e. superior knowledge resource; that contributes to a better future knowledge worker. Scheuerle et al. (2015) also revealed that the result of deployment of superior knowledge resource within social innovation outcome on the issues of massive unemployment, contributes towards increase in employment among people and also increase in consumption of economic benefits. Moreover, Cajiaba-Santana, G. (2014) and Spiess et al. (2015) highlighted that social innovation with the presence of superior knowledge resource leads to the introduction of superior products, processes and services that have a multiplier effects on the economic value in terms of profit maximization, market share monopoly and increase in private performance. El Arifeen et al. (2013) also stressed all of the positive effects of social innovation and knowledge resource on the issues of social health.

In contrast, Cajiaba-Santana (2014) provides another approach of social innovation since he conceives it a bit differently. This is the next academic article to review the growing interest in social innovation, suggesting there exist two main approaches to social innovation: agentic-centred (closely related to the literature on social entrepreneurship and the role of the individual 'hero' change agent), and structuralist (referring to the social structures in which these agents

operate). While the review is less systematic and uses a mix of sociological and institutional theories, it does importantly suggest the connection between social innovation and institutional change, and the necessary interactions between structure and agency to make this happen. Two years later, Van der Have & Rubalcaba (2016) conduct a more systematic network and bibliometric analysis of the expanding scholarly literature on social innovation, focusing on the relationship to innovation studies more generally. They suggest social innovation is more of an innovation paradigm than a separate category of innovation, referring to 'a large revitalization of the social aspects involved in any kind of innovation, technological innovation included' (Van der Have & Rubalcaba, 2016).

As a popular and expanding concept, some early reviews of social innovation highlighted the diversity of disciplines interested in the topic and a consequent and growing fragmentation around the scope and meaning of social innovation (Cajaiba-Santana, 2014; Edwards-Schachter & Wallace, 2017; Phillips et al., 2015); Silveira & Zilber, 2017); Van der Have & Rubalcaba, 2016; see Chapter 1?). Many early definitions tried to encompass a variety of views, often sociological in nature and incorporating aspects of both structure and agency (Van der Have & Rubalcaba, 2016). Reviews include Silveira & Zilber's (2017) bibliometric analysis of social innovation, Van der Have & Rubalcaba's (2016) network and bibliometric analysis, Cajaiba-Santana's (2013) structural and institutional summary of social innovation, and content analysis of key terms and understandings associated with social innovation.

In Pol & Ville's (2009) early review and discussion of the term, they describe its mixed emergence in varied academic but especially practitioner literature (as noted in definitions above). This review highlights the concept of social innovation as being related to institutional change, social purposes, the public good, and not necessarily delivered by market mechanisms (as social innovation is often perceived as addressing needs that have been ignored by the market). Pol & Ville (2009) describe social innovation in comparison to business innovation, offering a more economic conceptualization: where the former pursues social impact, the latter pursues increased profitability.

Once these approaches have been considered, it is important to stand out the role of strategic knowledge management, since it can be such a powerful tool for driving social innovation. It is well known that by effectively capturing, sharing, and leveraging knowledge, organizations can develop innovative solutions to social and environmental challenges. This is the reason why the theoretical study

explores how strategic knowledge management can serve as a key driver for social innovation.

Firstly, strategic knowledge management can help organizations identify social and environmental needs. By collecting and analyzing data, organizations gain valuable insights into social trends, needs, and challenges that have already occurred in our daily lives. This information can be used to identify areas where social innovation is needed, as well as to develop new solutions to address these challenges. For example, a social enterprise working on renewable energy may use knowledge management to identify trends in the market and develop “new products” that meet the needs of customers and future generations (Flores-López et al., 2023).

Secondly, strategic knowledge management can help organizations collaborate and share knowledge. Collaboration is key to social innovation, and knowledge management can facilitate this collaboration. By creating knowledge-sharing platforms, organizations can connect with other stakeholders, including communities, NGOs, and government agencies.

Thirdly, strategic knowledge management can help organizations build capacity for social innovation. By developing a culture of learning and innovation, organizations can create an environment that supports social innovation. This culture can be supported by knowledge management practices, such as training and development programs, which can help employees develop the skills and knowledge needed to develop innovative solutions. For example, a social enterprise may offer training and development programs to employees, helping them to develop the skills needed to develop new products and services.

Finally, strategic knowledge management can help organizations measure the impact of social innovation. By collecting data on the outcomes and impact of social innovation, organizations can understand what works, what does not, and what needs to be improved. This is something that already happens everyday. Also, this knowledge can be used to refine and improve social innovation initiatives, leading to better outcomes for communities and the environment.

In a world where social and environmental challenges are becoming increasingly complex, strategic knowledge management can help organizations create positive social change and build a more sustainable future. In order to support such a statement, the following data is presented:

- In 2021, the Global Innovation Index (GII, 2022) reported that social innovation is gaining importance as a driver of economic growth and

social well-being. According to the GII (2022), social innovation is particularly important for addressing social challenges such as poverty, inequality, and climate change.

- In 2021, the European Commission reported that social innovation is increasingly recognized as a key driver of social and economic progress. The Commission noted that social innovation has the potential to create new solutions to complex social problems, drive social entrepreneurship, and foster inclusive growth.
- According to Schwab Foundation for Social Entrepreneurship Report (2019), social innovation is growing rapidly around the world. The report found that social entrepreneurs are emerging in all regions, with a particular focus on areas such as healthcare, education, and sustainable development.
- The Ashoka Globalizer program, which supports social entrepreneurs in scaling their impact, reported that its alumni organizations have collectively impacted over 100 million people in more than 90 countries around the world.

#### **4 Conclusions**

At the end of this study, the goal was achieved, since it was possible to present, by means of reviews, dissertation and discussions, the set of strategic knowledge management traits that impact on social innovation actions. As to the goals and main results of the articles analyzed, it can be observed that, in general, knowledge management turns out to be a key driver for a suitable social innovation development. It is important to stand out the fact that there are many contexts where this interconnection takes place: social, economic, technological applications play a supporting role in knowledge management for these kinds of actions. In addition, it should be emphasized that social innovation actions bring a strong bias of cooperative work and attendance to social needs and in this way knowledge management should be attentive to how collective knowledge can be acquired, processed and how it can generate value and contribute to the abovementioned actions.

It was noticed that the knowledge management considerations are normally more focused on the improvements of processes and the use of technologies. As for innovation, it is worth to highlight the cooperative and collaborative work

among the players of social innovation, and the knowledge management tools. As far as it goes to the use of technologies, there is a special emphasis on open technologies with free access by societies. The motivational and flexibility factor to improve productivity and decrease the costs of public organizations is crucial. For future work, it is proposed a more in-depth study of strategic knowledge management concerning how people learn and what motivation can be related to social innovation in different communities, since people can be considered as a key point both in knowledge management and in social innovation actions. That study could actually be justified by the objective of improving social innovation and better understanding how the collaborative networks created in these dynamics from the point of view of knowledge generation.

### **Abstract**

The increasingly complex and uncertain socio-economic scenario and the new challenges and opportunities of the digital revolution are forcing organizations to anticipate changes and boost more and more their innovation processes in order to maintain their competitive advantage. In such scenario, are emerging new spaces of action and interactions based on tangible and intangible elements that influence learning and knowledge processes and dynamics. These innovative learning spaces include a

combination of elements enhancing the learning process, with a strong technological component. In such a context, how to manage and assess the effectiveness of learning spaces, especially based on advanced technologies, has become a key topic. Despite that, to date, how to assess the effectiveness of learning spaces remains under-investigated. This study proposes a conceptual framework that highlights the relevant variables and dimensions to assess in a learning space. For this purpose, the study adopts a systematic literature review approach. The theoretical findings suggest specific variables and dimensions to consider in assessing learning spaces, especially the ones supported by advanced digital technologies. Moreover, the paper provides managers with a conceptual framework supporting the decision-making process in managing and assessing LS.

**Paper type** – Academic Research Paper

## 1 Introduction

In the current complex and uncertain socio-economic scenario, and thanks to the new challenges and opportunities of the digital revolution, organizations have to know how to boost more and more their innovation processes and anticipate changes, in order to maintain their competitive advantage. In such scenario, learning spaces are acquiring growing importance. (Alstete and Beutell, 2018) A LS is a space of action and interactions based on tangible and intangible elements that influence learning and knowledge processes and dynamics.

Before the pandemic, public and private organizations mostly used physical learning spaces, even if digital transformation was already taking hold. Pandemic has acted as an accelerator, resulting in the adoption of virtual methods or digital technologies, basic and advanced by most organizations.

Innovative learning spaces include a combination of elements enhancing the learning process, with a strong technological component. Recently, public and private organizations have experimented more advanced technological tools, such as virtual reality, augmented reality, artificial intelligence and metaverse.

Given the new emphasis on the relevance of these kind of spaces, how to assess their performances and effectiveness has become a key topic that is gaining growing attention. (Karam et al., 2021; Krishnamurthy, 2020; Grigol et al., 2014).

Despite this, performance assessment of learning spaces remains under-investigated. In this vein, this study proposes a conceptual framework that highlights the relevant variables and dimensions to assess in a learning space.

In particular, the study tries to answer the following research question (RQ): What are the dimensions of a learning space? For this purpose, from a methodological point of view, the study carries out a systematic literature review aimed at filling the dimensions of the spaces with the components to consider for the evaluation. A conceptual framework is then developed, with a specific focus on the technological dimension.

The framework's purpose is to guarantee and enhance the effectiveness of a LS, and specifically a learning space based on advanced technologies. In this vein, it supports the identification of the relevant dimensions of a LS that should be evaluated in an ex-post perspective.

The model, indeed, includes five main pillars, composing the infrastructure of a LS i.e. i) physical setting; ii) technological dimension; iii) organizational resources; iv) actors and interactions and v) culture and atmosphere.

The research results synthesize data and knowledge gathered from the systematic literature review and offer implications and insights both for theory and practice. The findings suggest specific variables and dimensions to consider in assessing learning spaces supported by advanced digital technologies.

The paper is organized as follows. In the next section, the methodology of analysis is described. Then, the essential dimensions to consider for a holistic assessment of LS based on advanced digital technologies are identified and described. Finally, theoretical and practical implications, as well as future research directions are illustrated.

## **2 Research Methodology**

The management literature provides a vast amount of data and articles and analyzing them is a challenging task, especially in the phase of systematization and summary of the contributions and one of the responses is to undertake an extensive analysis of the contributions in the literature. In particular, for the purpose of this study, a systematic literature review has been carried out, adopting the approach proposed by Tranfield et al. (2003), which is a scientific and transparent process, reported in sufficient detail to permit the replication. (Tranfield, 2003), and balanced in terms of specificity and sensitivity (The

Cochrane Collaboration, 2017). With a SLR approach, insights and evidences from the literature have been found, synthesized and evaluated (Calabrò et al., 2019; Cillo et al., 2019).

Tranfield et al. (2003) proposed three main phases (planning the review, conducting an inspection, reporting and disseminating) and outlined nine sub-phases.

In the first stage, keywords and searching terms have been established to carry out the SLR. The search strings were defined according to the research question: "What are the dimensions of a learning space?".

Given the plurality of terms used interchangeably to refer to learning spaces and dimensions, a broader selection requirement has been adopted to include all the significant studies. The key selected research strings are "learning space" OR "learning environment" AND "components" OR "characteristics" OR "dimensions" OR "features". The search strings chosen in this specific case are wide enough to allow the understanding of the level of knowledge and contributions in this field and to identify the areas to explore.

Generally, there are different paths for searching data using strings and keywords through an appropriate algorithm; i) choosing a single database (Cillo et al., 2019); ii) choosing multiple databases (Hossain, 2019) or iii) focusing on the existing literature of the article selection and engage experts that suggest significant works to be referred to (Crossan and Apraydin, 2010).

With the scope of building a holistic and comprehensive understanding of the dimensions of learning spaces, the approach proposed by Hossain et al. (2019) has been adopted. Specifically, the multiple databases considered were Web of Science (WoS) and Scopus, acknowledged as complete databases for academic papers (Falagas, 2008). The final set of works to be considered has been defined, identifying all relevant articles and removing duplicate papers.

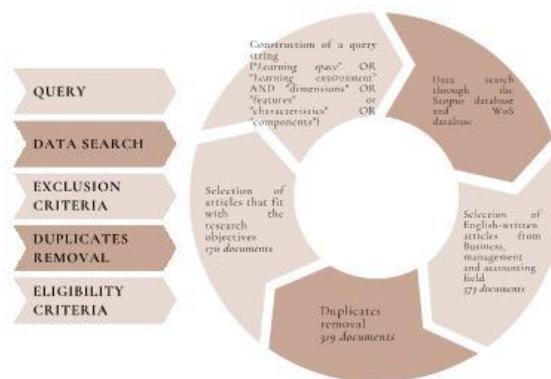

Fig. 1 - Steps of the research process and number of selected papers

Predetermined criteria were chosen to decide what literature to include or exclude: filters were applied to include articles already published in journal from 2009 to 2023, the research field of interest was *Business, Management and Accounting*. Conference papers, articles not written in English, book chapters, and special issue editorials were excluded. All duplicate papers from different sources were identified and removed.

Titles, abstracts and keywords of the remaining 373 articles were analysed to include contributions aligned with the aims and focus of the analysis.

In fact, other exclusion criteria are chosen after a first scan of the essential article source information, and concern the consistency between the article topics and the research questions.

Figure 1 depicts the steps of the systematic review process and the number of selected studies on each step. Following our interpretative lenses to synthesise the extracted data, the insights extracted by the articles were organised according to the different dimensions of a learning space emerged from the literature.

### 3 Analysis of the results

#### 3.1 Background: learning spaces based on advanced technologies

Learning spaces are physical or virtual place where people interact cooperatively, to generate, manage and exchange knowledge, acquire skills and encourage opportunities for brainstorming, idea generation and problem-solving that may trigger innovation dynamics. The goal of a learning space is to support processes of skills development, triggering the development of an innovative

capacity through the management of knowledge and learning dynamics. Therefore, the concept of learning space may be associated with all those organizational and territorial contexts aimed at developing the organizational basic, distinctive, and dynamic skills. It is a multidimensional space that includes different factors, characteristics and dimensions, such as physical, social and cognitive characteristics, and technological, cultural, emotional, intellectual, and relational dimensions. (Dleikan et al., 2020; Jens and Gregg, 2022)

The reorganization of spaces oriented towards the learners and the learning process, gave emphasis to the diffusion of LS supported by advanced tools.

Specifically, the pandemic has forced public and private organizations to shift from in-person to virtual teaching and learning. COVID-19 has altered the educational and training landscape and forced learning and training environments to quickly evolve to meet new unexpected challenges and to fully exploit digital technologies and advanced digital technologies. Indeed, the digital transformation in education and training and the creation of more advanced learning spaces are not new, the pandemic has just given a new emphasis on their usefulness. (Karam et al., 2021; Krishnamurthy, 2020). A learning space based on advanced technologies does not guarantee effective learning processes per se; learning and knowledge dynamics must be integrated with the choice of suitable technological tools. In this regard, new digital technologies have the potential to become powerful and potential changing agents and strategic allies for sustainable and inclusive development of innovative, cheaper and more user-friendly learning spaces and effective knowledge creation and exchange. But the technological dimension is not the only one to consider for managing and assessing a learning space. There are other dimensions, such as the relational one, that involve actors having heterogeneous skills, and the atmosphere that promotes cooperation between the actors and should be free of hierarchical constraints and judgment. These infrastructural dimensions have to sustain learning and knowledge dynamics, with the aim to positively influence the innovative capacity of the organization. In conclusion, according to the researchers, these spaces enable and catalyze knowledge and learning dynamics, supported by a tangible and intangible infrastructure and a strong technological component that enables open, honest, and receptive interactions among the stakeholders involved. In conclusion, a learning space represents a distinctive element for public and private organizations, and it is a factor enabling innovation dynamics. Today's companies need more and more to improve and

foster their processes of knowledge creation, sharing and transfer and properly managing learning spaces. (Nonaka and Takeuchi, 2019)

In this vein, the dimensions characterizing a learning space and their components, are analysed more in depth in the following. The output is a conceptual framework. The framework has a dual purpose, descriptive and prescriptive, and aims to guarantee and enhance the effectiveness of an innovative learning space. In this vein, it supports the identification of the relevant dimensions that should be evaluated in an ex-post perspective.

### **3.2 Infrastructure of a learning space**

As already mentioned, learning spaces enable and catalyze knowledge and learning dynamics, supported by a tangible and intangible infrastructure that fosters open, honest, and receptive interactions among the stakeholders involved. (Delgado et al, 2020)

#### *3.2.1 Physical setting*

Learning spaces emerge as places where learning and knowledge dynamics are activated and supported. The management literature has highlighted the influence that the physical setting has on dynamics, interactions, and processes, as well as on individuals' skills development and behavior definition. In consequence, attention to detail is essential to positively impact the learning space's effectiveness.

The physical setting of a learning space refers to the physical space or spaces in which learning happens. (Sankari et al, 2018)

The physical setting includes individual and common spaces. Scholars have discussed some key characteristics of such spaces which are furniture, seating arrangements, lighting, temperature, decorations, and acoustics. (Sasson et al, 2021) Furniture facilitating the interactions between actors, tools, and the environment is preferred while the quality of the air, luminous color, and light can help develop a favorable and stimulating learning space. (Dleikan et al., 2020; Jens and Gregg, 2022)

Generally, the design of an effective learning space favors engagement, creativity, and collaboration with a high level of comfort and flexibility. All the design elements characterizing the space must merge into a synergistic whole.

(Heiskanen & Heiskanen, 2011)

### 3.2.2 Technological resources

The technological resources dimension contemplates a combination of technological tools and infrastructures that contribute to the enhancement of the learning and knowledge processes and dynamics. Different technological tools can foster or prevent impacts on the learning processes. In consequence, the design and management of a learning space must be associated with the choice of the appropriate tool to use, to exploit their potential and maximize the value added. (Delgado et al, 2020)

According to the literature, the technological dimension is considered a key factor in the success of learning space, as it enables learners to access a wide range of educational content and resources and to engage in active, experiential, and collaborative activities. They provide individuals with means for representing knowledge in multiple ways. (Sasson et al, 2021)

The literature discussed the use of various technological tools; in particular supporting and basic tools and advanced and 4.0 technologies. Examples of basic technological assets and software supporting learning and knowledge dynamics are platforms, computers, mobile phones, tablets, projectors, eReader, 3D printers, headphones, digital watches, digital whiteboards, and so on. (Latrous & Khadraoui, 2020)

Concerning more advanced technologies, they can contribute to the enrichment of learning, enhancing the learning strategy and institutionalizing continuous learning and the protocol for sharing and transforming knowledge. Some representative examples pointed out in the literature are Artificial intelligence, Internet of Things (IoT), augmented and immersive reality, digital platforms, metaverse, sensors, algorithms, adaptive learning platforms, and other smart technologies, that facilitate interaction and collaboration in the learning process. (Abdalina et al., 2022; Diaz Tito et al., 2021)

One of the latest and recent development in this direction is Metaverse, that was born from the convergence of two ideas, specifically VR and second life. Within a Metaverse, actors can interact, meet, socialize and work through digital avatars or holograms.

Learning spaces based on advanced technologies can have different benefit as well as several barriers to consider to maximize the potential of the digital tool implemented. Some example of potential benefits are:

1. the immersive nature of the experience;

2. the ability to work virtually in remote or unsafe environments;
3. the flexibility of the approach;
4. a remarkable, amazing learning experience that may be exciting, fun and enjoyable. (Snieder and Zhu, 2020; Hines and Netland, 2022)

However, different researchers also acknowledge the limitations of technology, such as the need for effective data processing, the potential for technology to create a sense of isolation and disconnection among learners and negative effects on the user such as dizziness or headaches. In this vein, the individuals involved in a learning space have to best integrate the technologies into the functioning mechanisms of the space. (Snieder and Zhu, 2020; Hines and Netland, 2022)

### 3.2.3 *Organizational resources*

This dimension includes the tangible and intangible resources that support learning processes and knowledge dynamics, within a learning space.

Specifically, it includes methodologies, contents, materials, and resources available to support learning. Learning methodologies are systems of practices and procedures that providers of knowledge employ to develop a learning process. Some examples of methodologies may be project/problem-based learning, design thinking, storytelling, collaborative communities, web-based videos, narrated stop-motion animation, modeling, gamification, simulation, flipped classrooms, content-driven processes etc. (Filippou et al., 2018;; Maheshwari & Seth, 2019)

According to the literature, a key aim for the development of new learning spaces is to understand what methodologies support and favor the introduction of technologies.

On the other hand, topics are themes, concepts, and facts, often grouped into subjects, that are expected to be learned. (Aggarwal, 2017; Akhmetshin et al., 2019)

Schobel & Scholey, (2012) identify other important organizational resources that are economic resources and specifically the financial strategies adopted. The authors argue that learning spaces with well-defined financial strategies are linked to positive outcomes and are well-positioned for success.

### *3.2.4 Actors and interactions*

The success of a learning space strongly depends upon the actors, how they are engaged within the facility, and how they interact with each other.

The nature of people or users involved in learning spaces is vast. According to the literature, two types of knowledge actors can be identified in a learning space: providers of knowledge and learners. Learners can be an internal or external target, some examples are students, managers, organizations, employees, and staff. On the other hand, providers are people supporting learners, acting as coordinators who facilitate the interactions and the exchange and development of knowledge. This role may coincide with teachers, professors, transformative leaders, innovation managers, researchers, mentors, entrepreneurs, facilitators, organizers etc. (Stern et al, 2020; Pawlowsky et al, 2020; Nonaka and Takeuchi, 2019; Sankari et al, 2018)

The actors' interaction concerns the system of interactions between internal and external actors that take place in the learning environment. According to the literature, the design of the learning space has to promote positive relationships and a sense of belonging. (Abuhassna et al., 2022)

Learners and providers continuously engage with each other and with the learning space. The interactions can be horizontal, vertical, and external. Horizontal and vertical interactions can take various forms, such as verbal communication, written communication, scaffolding, collaboration activities, feedback, and reflection. In a physical setting, interactions may occur through face-to-face discussions and group work, whilst in an online learning environment, interactions may occur through discussion forums, video conferencing, and other digital communication tools.

Effective interactions require active participation, mutual respect, and a willingness to engage in constructive dialogue and feedback. (Delgado et al, 2020)

### *3.2.5 Culture and atmosphere*

This dimension identifies the mood, attitudes, expectations, practices, norms, and sensorial qualities distinguishing a learning space. It influences the effectiveness of the space, increasing or preventing motivation, attention, creativity, and the level of involvement of people. A learning space includes constructs concerning the experiences lived by the individuals involved,

influenced by their own behavior. The quality of a learning space is strongly influenced by the nature and orientation of the actor's culture. (Pawlowsky et al., 2020) A positive learning environment promotes open-minded culture, flexibility, and willingness to engage in innovative activities. It provides opportunities for learners to explore new ideas and concepts, and to develop critical thinking and problem-solving skills. (Burusic, 2019) Together with the actor's culture, also development of a strong knowledge culture is a key determinant of the learning space's effectiveness. (Abuhassna et al., 2022; Csizmadia et al., 2022; Karkoulian et al., 20132)

The atmosphere of a learning space refers to the shared values, beliefs, attitudes, and behaviors of the individuals who participate in the learning process. It includes the norms and expectations that guide interactions among learners and instructors, as well as the creativity, the level of collaboration, respect, and inclusivity that is fostered within the learning space. (Jung et al., 2018)

A favorable culture and energy translate into the behavior of people who appear involved, focused, and engaged in the learning processes and dynamics.

#### **4 Conclusions and future research**

In the current scenario, learning spaces are acquiring growing importance. (Alstete and Beutell, 2018) The literature suggests that learning spaces are places where knowledge is created, shared, and applied; they may be described as spaces of interaction between individuals, their behaviors, and the external environment. Recently, public and private organizations have experimented more advanced technological tools in learning spaces, such as virtual reality, augmented reality, artificial intelligence and metaverse. Understanding how to implement digital tools in learning processes and to support the dynamics of knowledge exchange and transformation is crucial to exploit their potential and maximise their added value. In order to use the different tools effectively and consistently with the learning objectives, it is important to understand the enabling and hindering factors that can maximise their usefulness or act as barriers.

Given the new emphasis on the relevance of these kind of spaces, how to manage them, assess their performances and effectiveness has become a key topic that is gaining growing attention. (Karam et al., 2021; Krishnamurthy, 2020; Grigol et al., 2014).

In such a prospect, based on a systematic review of literature, this study provides a clear and holistic understanding of infrastructural dimensions characterizing a learning space, to support management and assessment of these spaces in educational and organizational contexts.

In consequence, the systematic literature review has provided a consistent background for the development of a theoretical framework.

Learning spaces are characterized by;

1. physical setting;
2. technological dimension;
3. organizational resources;
4. ctors and interactions;
5. culture and atmosphere.

The components of each dimension are pointed out in fig. 2.

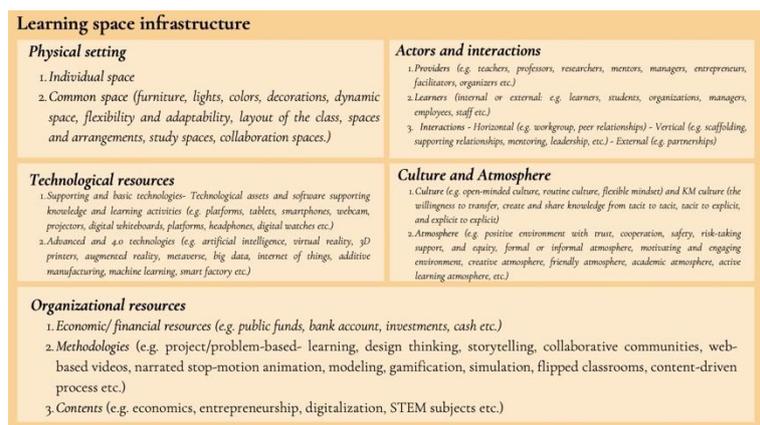

Fig. 2 – Conceptual framework representing a learning space

The research results synthesize data and knowledge gathered from the literature review and offer implications and insights both for theory and practice. From a theoretical viewpoint, the paper contributes to the further development of the literature about LS, providing a definition suitable to different levels of application. Moreover, given the growing attention on LS, the study identifies specific variables and dimensions to consider to support innovation dynamics within a public or private organization.

In conclusion, considering future research avenues, it may be useful to develop a matrix that highlights the added value that technologies (especially the most advanced ones) can bring to learning processes, highlighting which are the most

suitable, which factors enable or hinder their use and which are the most effective strategies and methodologies for their implementation. Moreover, the research highlights the importance of developing measurable key performance indicators to integrate within the theoretical framework to assess and manage LS performance effectively.

## Abstract

The paper discusses the impacts of Quantum Computer (QC) technology in Industry 5.0 scenarios by focusing attention on application fields such as production management in manufacturing and business modelling. The analysed literature allows for comprehending possible QC implementations and integration in technological architectures. Specifically, the work highlights QC impacts on organization, production and marketing and defines QC perspectives, advantages and possible limitations. The study also addressed the design of workflow modelling production protocols in Industry 5.0 environments implementing QC processes.

The analysis of the impacts, together with the technological aspects and the QC process management, are the main topics of the proposed paper. The paper is structured as follows. In section 1, an outline of the main QC applications and potential impacts is provided. Section 2 proposes a framework to explain the role of QC in the technological integration of Industry 5.0 production systems. Section 3 introduces a Business Process Modelling and Notation (BPMN) workflow embedding QC processes and oriented on standardising industrial production protocols. Finally, the conclusion summarizes QC advantages, perspectives and limits matching with the performed analysis.

**Keywords** – Quantum Computing, Business Models, Industry 5.0, BPMN

**Paper type** – Academic Research Paper

## 1 Introduction

Quantum Computer (QC) technology is a challenge to optimise the passage from Industry 4.0 to Industry 5.0 industrial production systems and, in general, to improve company business performance and update business intelligence models. Specifically, different advantages are involved in the QC digital transformation of production platforms, such as the increase of the economic value, the formulation of innovative solutions improving the competitive advantages, the speedups of business problems, the finding of optimal trading trajectories, the optimization of the machine fault monitoring (predictive maintenance), and the improvement of cybersecurity (Bova et al., 2023). QC plays an important role also in the complete control of production in advanced manufacturing Industry 5.0 production systems (Massaro, 2023): QC is proper to support and optimise Artificial Intelligence (AI) calculus by processing comprehensive data volume and to interface other advanced technologies such big data and AI edge computing systems. The use of QC technology implies different impacts of different typologies, such as:

- **organizational impact:** the use of a high-speed technology (low informatics computational cost) providing new results implies a new production velocity, flexible management of human resources (HR), a new approach to analyse the change management, and a dynamic business strategy, thus requiring a fast change of organizational management processes;
- **production management impact:** the improvement of production monitoring and the predictive maintenance through the QC calculus (the fundamental unit of QC is the Qubit associating the information on the Bloch sphere (Nielsen et al., 2004)) implies optimization of the production by formulating new quality assessment procedures and production Key Performance Indicators (KPIs); production impact is in all the supply chain sectors including logistics and raw materials management; another aspect related to production impact is the integration of the QC technologies into the information infrastructure of the company;
- **business impact:** QC enables new business models opened to a new concept of strategic marketing and new dynamic marketing trajectories, thus defining innovative and advanced business

intelligence analyses processing a large number of variables in the field of customer care, financial, micro-economic and macro-economic sectors; the business impact involves a new approach to analyse the company risks.

The analysis of the impacts, together with the technological aspects and the QC process management, are the main topics of the proposed paper. The paper is structured as follows. In section 1, an outline of the main QC applications and potential impacts is provided. Section 2 proposes a framework to explain the role of QC in the technological integration of Industry 5.0 production systems. Section 3 introduces a Business Process Modelling and Notation (BPMN) workflow embedding QC processes and oriented on standardising industrial production protocols. Finally, the conclusion summarizes QC advantages, perspectives and limits matching with the performed analysis.

## 2 QC Topics Matching with Industry 5.0 Applications and Impacts

QC applications are in different industrial fields. Below are some case studies and research topics in the literature that define possible QC impacts and implications in Industry 5.0 environments.

- **Data-driven in production systems** (Massaro, 2023): an advanced QC data-driven engine implies a reskill and an upskilling of HR mainly in QC programming, a new methodology of machine parameter reconfiguration, and the optimization of Machine Learning (ML) model hyper-parameters for hybrid QC/ML approaches of data analytics (Lentzas et al., 2019).
- **Energetic improvements**: smart factories are based on energy optimization also integrating renewable energy sources and interconnecting the production plants with smart grids (Ahn et al., 2022; Giani, 2021); possible impacts in production are in the energy optimization requiring digital twin decision-making engines based on prediction (Sleiti et al., 2022) and new intelligent processes managing energetic consumption.
- **Predictive maintenance**: new maintenance procedures are correlated to new production and organizational models managing maintenance, thus ensuring complete continuity of production, avoiding machine failures, product defects, and improving the product quality

assessment method (Bova et al., 2021; Bova et al., 2023); impacts are mainly in the reengineering of the maintenance processes to decrease machine costs.

- **Life cycle:** the software life cycle analysis (Weder et al., 2020) and quantum technologies (Van Erp et al., 2022) certainly require new organizational models of HR and new processes oriented on the adaptation of policies in sustainability.
- **Logistics and transport** (Hamdy *et al.*, 2022; Hernández et al., 2022): applying QC in logistics requires new organizational models managing optimized logistics fluxes and just-in-time services: a capillary logistics network requires complex models simulating and predicting transport fluxes (high organizational impact managing logistics).
- **Customer care and marketing** (Ukpabi et al., 2022): QC introduces new business models which need new skills, such as advanced customer care data analysts and data scientists having the goal to update customer care strategies; inclusion of customer management in a QC framework also involves other different areas such as business and finance, manufacturing and renewable energy.
- **Cybersecurity** (Raheman, 2022): advances in QC cybersecurity require new data security professional skills based on the knowledge of innovative QC security systems (high impact in specific QC knowledge focused on cybersecurity); the goal in cybersecurity is the adoption of Zero-Vulnerability Computing (ZVC) secures computers, especially for companies offering cloud web services (secure cloud frameworks managing services).
- **Data processing performances** (Huang et al., 2021): the matching between QC and ML approaches necessitates new developers skilled in data processing and data testing; the learning of HR is mainly in using suitable testing platforms and scalable frameworks linked to big data systems.
- **Risk Assessment and Risk Management** (Wilkens et al., 2023; Woerner et al., 2019): the QC adoption introduces new organizational procedures for selecting data to process for risk assessment and risk management; this enables new openings in data analysis about financial risk measurement and risk management (high impact concerning financial risk assessment in capital investment transactions);

QC could provide new algorithms processing *hidden production information* (typically unstructured data, collected in local databases and not processed, also named as '*dark data*' (Banafa, 2022)) thus optimizing the risk analysis.

### **3 QC Technological Integration in Industry 5.0 Production Systems**

Integrating QC technology into the company information system is essential concerning production management impact. QC technologies should be integrated into industrial platforms made by hardware and software facilities. Fig. 1 illustrates an architecture scheme of a possible QC integration with other technologies by distinguishing software, hardware, cloud and external energy sources. The framework of Fig.1 is supposed for manufacturing industries implementing a scalable Industry 5.0 approach. QC software is executed in parallel to ML algorithms supporting ML hyper-parameter optimisation. The ML algorithms are traditionally executed by standard Central Processing Units (CPU) but could be embedded in scripts of QC software, thus decreasing their computational cost. The data to process could be collected into local servers or in cloud big data systems (a synchronised data migration process could optimise the data volume locally available). The local server is typically installed inside the indoor company layout. As for manufacturing industries, data are detected in the production fields through Internet of Things (IoT) technologies and digital production machines or robots which could be powered by renewable energy sources optimizing electrical power consumption. Cloud access security could be guaranteed by adopting a QC internet access control (improvements in cybersecurity approaches).

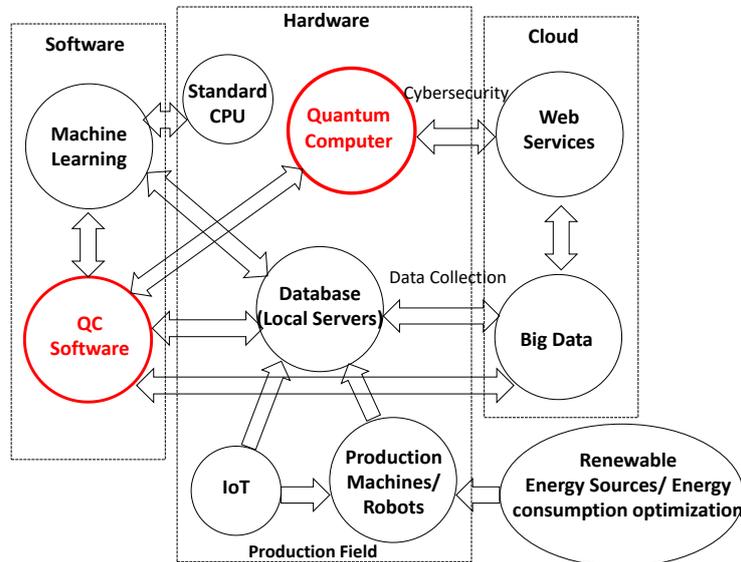

Figure 1. Architecture describing QC integration in a supposed Industry 5.0 technological framework suitable for manufacturing industries.

### 3 BPMN Approach and Standardization of Industrial Production Protocols

An approach to designing new processes integrating QC decision-making is the BPMN model. This section is designed as a workflow representing the main processes involved in manufacturing systems using QC facilities. In particular, the workflow of Fig. 2 illustrates an example of an operation model executing the main processes enabled by QC, such as business intelligence, predictive maintenance and HR management processes (see red boxes). The BPMN workflow represents an example of an Industry production protocol. We observe that in Industry 5.0 scenarios, decision-making of processes are improved by AI engines as for Process Mining (PM) models automatizing production control and actuation (Massaro, 2022). Following this aspect, in the proposed BPMN workflow, the AI engine is considered to strengthen the predictive maintenance and the business analytics matching with QC data processing. According to the workflow of Fig. 2, the manufacturing production process starts enabling simultaneously the three QC processes (QC Predictive Maintenance, QC Business Intelligence, QC Human Resource Management) controlled by three checkpoints (modelled by the 'Exclusive Event based' gateway indicating the decision making logics and

highlighted in yellow in Fig. 2). The logic functions of the checkpoints are the following:

- if the production check provides a positive rank, then the production continues simultaneously with the production monitoring process, otherwise are activated specific maintenance interventions are updating the predictive maintenance plan;
- if the HR management is efficient, then the production and the monitoring process continue, otherwise, the HR organization is changed by applying new procedures managing HR (different HR allocations, activation of training plans, new employee hires, etc.);
- suppose the application of the business model provides good results (revenue increase, new customers, etc.). In that case, the production is *in line* with the company's marketing strategy (the production remains the same), otherwise are performed some production adjustments (are the production of other products or other accessories requested by the market, increase of production volume of strategic products, switching of production according to the requirements of the dynamic market, etc.).

The execution of the QC processes will induce to formulation new Knowledge Management (KM) (Schiuma et al. 2008; Schiuma et al. 2015) models (formulation of new knowledge assets) based on a new concept of change management.

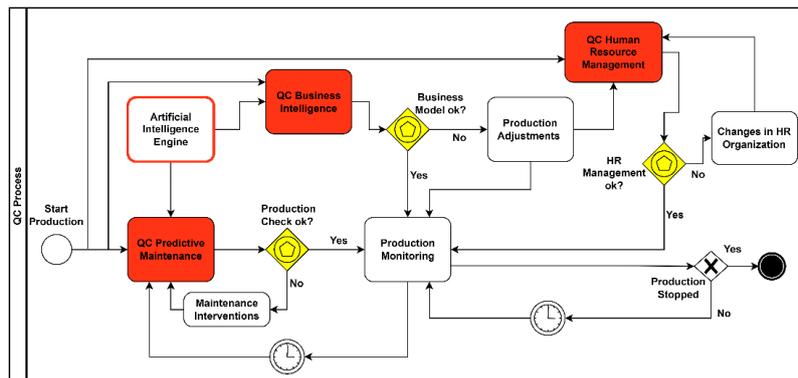

Figure 2. Example of a production Industry 5.0 protocol integrating QC decision making: BPMN workflow integrating QC operations.

## 4 Conclusions

The introduction of QC in the actual industrial scenario enables different changes in technological integrations and the management of resources generating different impacts because the QC behaves as a 'reactor' accelerating production and activating advanced business models and data processing. This has a high impact mainly on organizational, production and business processes. The QC outputs could differ from traditional analytics algorithms, including AI calculus. Furthermore, QC offers a great capacity to process more information and hidden data quickly, even present on the web, thus optimizing risk analysis and data processing. The proposed paper aims to define QC application fields matching with impact analysis and technological integration in advanced manufacturing industrial platforms suitable for Industry 5.0 frameworks where the integrated QC technologies are considered part of an Industry 5.0 production framework. Furthermore, the work discusses a BPMN model that addressed integrating QC processes into a standard production workflow simulating an advanced Industry 5.0 production protocol. The performed analysis enhances that the QC facilities offer different advantages such as:

- an economic advantage in formulating innovative business intelligence models;
- an expansion of production layouts optimizing monitoring processes;
- the increase in product quality;
- the optimization of customer services and customer care models;
- the optimization of logistics and transport fluxes;
- the running of a calculation thousands of times faster if compared with the traditional calculus in data analytics (traditional algorithms, including AI ones);
- a solution to complex problems characterised by a large number of variables;
- the optimization of the prediction of production fault conditions;
- the definition of new sustainability criteria about production perspectives;
- the formulation of new KPIs based on a complex calculus;
- an improvement of the risk assessment predicting financial scenarios;
- the simulations of complex systems (including networks, marketing trajectories and chemical structures);

- the optimization of ML models (optimization of the hyper-parameters);
- the optimization of energetic consumption and energetic management;
- the introduction of novel approaches to strengthen cybersecurity.

QC perspectives are mainly in integrating technologies by adopting flexible information infrastructures and cloud big data systems supporting QC calculus. Furthermore, QC will define new change management and KM models based on a new concept to process information (re-design of all supply chain processes integrating QC decision-making and QC knowledge): new processes defining the production protocols and procedures will be designed taking into account new decision-making logics based on QC outputs gaining the knowledge. Concerning limitations, an initial bottleneck is the specific learning of the future informatics developers, which should be upskilled '*with precision*' in developing ML/QC algorithms. Another limitation is the still high cost of QC technologies, even if the market is already moving towards cost reduction by proposing standalone solutions.

### Abstract

The main objective of this research article is to briefly present the current state-of-the-art about the emerging innovation and entrepreneurial dynamics and the impact of the digital transformation in the Creative and Cultural Industries (CCIs) and to delineate potential future research directions.

The paper combines a deductive and an inductive approach.

The research outlines the needs to addressing in a more specific way the dimensions of innovation, the role played by digital transformation and the potential paths of entrepreneurship in CCIs.

The value of the article mainly resides in its attempt to identifying and clarifying relevant themes and unanswered research questions about innovation and entrepreneurial dynamics in CCIs to be effectively declined and investigated according to an interdisciplinary perspective.

**Paper Type** – Academic research paper

## 1 Introduction and overview

In the recent years the notion of Digital Transformation (DT) has largely emerged in the scientific and business debate. Accordingly, various scholars have analysed its impact on different managerial variables, such as work organisation, products and services, supply chains, levers of marketing and sales, business models (Boulton, 2018; Berger et al., 2019; Cennamo et al., 2020; Porter and Heppelmann, 2014, 2015; Raff et al., 2020; Svahn et al., 2017).

In this vein, Appio et al. (2021) and Hanelt et al. (2020) provide effective reviews, highlighting the relationships between DT and traditional industries (Iansiti and Lakhani, 2019; Venkatraman, 2017), the role of the DT for the creation of new multisided platforms and knowledge ecosystems (Cozzolino et al., 2018; Elia et al., 2021; Fraser and Ansari, 2020; Nambisan and Baron, 2019; Parker et al., 2017), on the change that DT brings to the innovation processes (Lu and Ramamurthy, 2011; Ransbotham et al., 2016; Reibenspiess et al., 2020; Sedera et al., 2016). Despite the great resonance of the themes and the connections with DT, managerial literature highlights at least three significant limitations. The first one refers to theoretical issues and, in particular, the failure to incorporate comprehensive approaches beyond the information systems streams and to adopt a more interdisciplinary view of management fields (Appio et al., 2020; Nambisan, 2019; Nambisan, 2017; Kallinikos et al., 2013; Yoo et al., 2010).

The second limitation is related to the limited attention to the antecedents of the digital transformation (Broekhuizen et al., 2021; Hanelt et al., 2020; Vial, 2019) as well as to the enablers of the digital transformation at the organisational level (Appio et al., 2021).

The last limitation is rooted in the great focus paid by theory and practices on applications and impact of DT in large companies and traditional manufacturing industries while limited studies have paid attention in a rigorous way to the wide world of the Creative and Cultural Industries (CCIs).

This is rather surprising since it appears as not aligned with the great emphasis and attention that both academia and local, national and international policies have recently provided about these industries. In order to fill these gaps, this paper aims to stimulate a debate about why and how inspiring and leading innovation, DT and entrepreneurial dynamics in CCIs. For these motivations, a research agenda is proposed by focusing on three broad themes related to

entrepreneurial development and digital transformation in CCI by positioning them around three different levels of analysis, i.e. macro, meso and micro.

Our hope is that the identification and the discussion of a set of open issues may address future research efforts in order to decline and inform entrepreneurial development and DT practices in CCI more coherently and effectively.

## **2 Innovation, digital transformation and entrepreneurial dynamics in cultural industries: where do we stay? Perspectives of analysis**

A set of issues capable to play a grounding role for a new research agenda aimed to identifying and analysing the emerging trends, opportunities, and challenges related to the innovation, the entrepreneurial development and the digital transformation in CCI has been elaborated. Of course, these themes are not the only ones relevant in the context of analysis. Moreover, our aim is not to provide an exhaustive analysis or commentary on these issues. Still, we hope to highlight the relevance of developing a research agenda built on common themes characterising CCI. After a brief introduction and definition of CCI, the research issues are presented and discussed.

### ***2.1 Cultural and Creative Industries (CCI): introduction and definition***

CCI are extensively defined as "those industries which have their origin in individual creativity, skill and talent and which have a potential for wealth and job creation through the generation and exploitation of intellectual property" (DCMS UK 2001, p. 4) as well as producing "experience goods with considerable creative elements and aim these at the consumer market via mass distribution" (Peltoniemi, 2015, p.41).

As highlighted by different researches (Landoni et al., 2020; Coblenz and Sabatier, 2014; Eikhof and Haunschild, 2007), it is possible to link the growing interest in management studies on CCIS to different aspects, such as their idiosyncratic characteristics, the nature of traded goods and the existence of tensions between artistic orientation and financial balances (Foss and Saebi, 2018; Durand and Jourdan, 2012), extremely unpredictable demand (Caves, 2000), the chronic resource constraints and growth issues, a very articulated value chain (De Bruin, 2007; Henry, 2007), the capabilities and experience of entrepreneurs

(Sundbo, 2011), the particularity of their business modelling (Schiuma and Lerro, 2017).

In this vein, attention on CCI is furtherly increased in the last years due to the new challenge of change instilled by the current DT. In fact, as discussed by Landoni et al. (2020), the wide toolkit to be referred to digital technologies is fostering innovation opportunities in CCIs (Iansiti and Lakhani, 2014), reducing the time needed to create and launch new products and solutions (Marion et al., 2015), and facilitating pervasive change in business models (Feng Li, 2018; Nambisan, 2017). However, dynamics and effects still need to be effectively and rigorously identified and declined to be extensively generalized, also considering pre-conditions, enabling and hampering factors, territorial contexts, real insights deriving by the empirical evidences.

### ***2.2 The macro-level: the scenario analysis***

At the macro-level, the focus is on the scenario analysis and the challenges determined by COVID-19. On the commission of the Wallace Foundation (2020a, b), AEA Consulting recently attempts to delineate possible avenues for the CCIs, highlighting emerging opportunities and challenges across areas such as organisational planning, programming, income generation, audience engagement, workforce and leadership development, physical infrastructure and lobbying and collaboration. In this vein, particular attention is paid to *i*) the increased digital engagement, in terms of proliferation of new creators and platforms focused on digital production and consumption and development of new business models and regulatory frameworks specialised for the digital sphere and to *ii*) the decreased government and/or philanthropic support determining a need for innovation in earned income generation digital-enabled as well as the development of channels to support artists and creators directly.

### ***2.3 The meso-level: new forms of collaboration***

At the meso level, the focus is on how CCIs may revise and structure their products, services, processes, also in response to DT. In this sense, characteristics such as new modes of collaboration and integration with traditional businesses and review of the internal and external organisational boundaries represent

significant emerging building blocks on how creative and cultural organisations may restructure their dynamic capabilities to embrace DT.

New emerging streams of academic research argue that creativity, design, culture, arts and, more generally, the cross-fertilisation of ideas are increasingly needed in business, science and technology as well as their spread through and across all the above systems and contexts (Adler, 2006; 2010a, b; 2011; Andersen *et al.*, 2011; Darsø, 2004, Hall and Johnson, 2009; Lerro *et al.*, 2016; Savino *et al.*, 2017a).

In this view, Schiuma (2011) and Schiuma and Lerro (2017, eds.) show more systematically how arts and creativity-based assets and processes have been increasingly recognised as potential catalysts and levers to support organisational change management programmes, to inspire new entrepreneurial behaviours, frame new business models, improve practices and stimulate the innovation capacity of the whole organisation.

Evidence-based on SME and extensive company activities (e.g., Stuart and Podolny, 1996; Benner and Tushman, 2002; Siggelkow and Levinthal, 2003; Messeni Petruzzelli and Savino, 2014; 2015) shows that innovativeness and entrepreneurial dynamism can be enhanced when industry and technology domains are open to a broader range of influences, including interfaces and learning from other types of industry and organisational systems (Santarsiero *et al.*, 2021; Savino *et al.*, 2017b).

There are indirect and direct impacts on management and working practices virtual and internal team processes, leading eventually to improvements in new added-value products and services. With this perspective, organisations and firms operating in the CCIs can act as key partners. Indeed, they can inspire and support entrepreneurs and managers to innovate high-tech products and services, frame new organisational processes and business models, reconsider human resources, and draw on new approaches and instruments to tackle emergent business challenges (Pratt and Jeffcutt, 2009; Cannarella and Piccioni, 2011; Paltoniemi, 2015; Schiuma, 2011; Schiuma and Lerro, 2017).

In this vein, also training and education spheres are revisiting their models, trying to define a future of common projects between technique and history, archaeological culture and science, humanities and advanced scientific research on new materials, in particular, addressed to museums and heritage and cultural domain.

## **2.4 The micro-level: Digital transformation and business model innovation**

At the micro-level, attention is paid to how DT may impact business model innovation and, consequently, entrepreneurial dynamics. Digital technologies and related tools are transforming the CCI and fostering the emergence of new entrepreneurial models as well as business models (Al-Debei and Avison, 2010; Gordijn and Akkermans, 2001), although research till now remains somewhat elusive and poorly understood (Spieth *et al.*, 2014, Visnjic *et al.*, 2016).

Feng Li (2017) effectively examined how digital technologies have facilitated business model innovations in the creative industries. Moreover, it also explores the potential role of the creative industries in stimulating innovation and entrepreneurship across different sectors of the economy. Landoni *et al.* (2020) have recently analysed the business modelling of three highly successful companies operating in the mobile gaming industry, highlighting how the business model innovation in CCI follows the life-cycle of the organisations and showing reputation, new distribution paradigms, and extension of product portfolios as drivers of business model innovation.

These research considerations seem to be confirmed by real experiences elaborated and developed practically by museums and arts institutions worldwide in response to the COVID-19 pandemic. Most of them have changed both the modes through which artistic and cultural manufactured goods are generated, acquire value and are offered and, above all, the relationship with the passionate people. They have successfully developed social-based activities, virtual tours, live streaming, new educational programs, and augmented reality experiences to let the living of arts in a more immersive way. The evidence gathered in this short analysis suggest, then, the broad and different potential prospects of innovation and entrepreneurship across a range of future unknowns.

## **3 Innovation, digital transformation and entrepreneurial dynamics in cultural industries: what's next?**

The analysis briefly developed tries to shed new light on different phenomena regarding CCI, entrepreneurial development and digital transformation and their intersections. Research highlights a missing unified perspective and a general framework capable of summarising theoretical and empirical efforts.

Accordingly, much remains to be done in future research. Firstly, at the macro-level, more research is needed to define the institutional, economic, and social conditions that can stimulate and enhance entrepreneurial development within the CCIs. This is also related to better framing the specific characteristics and peculiarities of the jeopardised world of the CCIs, above all at the light of the "new normality" determined by the COVID-9 pandemic. Second, at the meso-level, the collaboration with traditional business and the relationships with social and public players play a fundamental role to be addressed in the future research. Third, given the increasing adoption of new business models, new research is needed to deeply analyse and quantitatively assess whether the renewed modelling supports organisations' financial sustainability, innovation processes, value and quality of products and services and stakeholders orientations and discover new business models yet not fully emerged. It is obvious that our highlights are just a small part of the potential research to be addressed, taking into account that the speed of change of the digital technologies let analysis, debates and effects really unpredictable in the medium and in long term.

#### **4 Innovation, digital transformation and entrepreneurial dynamics in cultural industries: first empirical evidences in Basilicata region**

In order to support and enrich the theoretical framework, an exploratory empirical research has been designed and partially implemented to collect direct insights and draw managerial and policy implications regarding the current state of the creative and cultural organizations based in the Basilicata region, in the South Italy. The first empirical evidences – collected referring to a sample of museums - show that their innovation processes and initiatives of digital transformation are not still generating real benefits and opportunities for the economic and social growth as well as a new and a better employment for a territory like Basilicata.

It is possible to state that in Basilicata there are examples of various projects aimed to apply DT tools in museums and historical parks: for example the videogames *Invention*, created for the Archaeological Park of Venosa, and *Hold the Hut*, promoted by the project "Tutela e Valorizzazione dei resti di un'antica capanna" and the temporary exhibition "Tiresia il mito nelle tue mani" created by the National Archaeological Museum of Matera. Despite these experiences, the projects appear spot, not easy to scaling-up in their application and limited at

territorial levels. These concerns seem to be integrated with other limitations such as the lack of managerial, technological and digital skills; or to the lack of pre-conditions not allowing the normal use of cultural heritage according to a modern and technology and digital-driven perspective.

### Abstract

Sustainability is becoming a crucial research area, not only considering industrial contexts, but also managing healthcare, environmental, and social issues, adopting a holistic, multidimensional, and multi-stakeholders' approach.

In a world where economic growth has been the primary objective in all the industries, the need to integrate environmental and social sustainability into business strategies first and then into daily activities is strongly emerging.

Sustainability could be declined in three main pillars: economic, social, and environmental, traditionally in all the industrial and organizational settings, but this could generate peculiar instances also in the healthcare field.

Being sustainable is becoming an urgent priority for the development of worldwide population. This unmet need should be addressed in any settings of the healthcare context, considering macro (i.e., healthcare system), meso (i.e., hospital) and micro (i.e., process) levels. Healthcare services are necessary for sustaining and improving human well-being, but the environmental impacts and the carbon footprint generated by these services, contributing to environment-related threats, are high.

Assuming the One Health approach (Atlas, 2013) and referring to the health, environmental and social dimensions as closely interconnected, the importance of investigating the link between technology and sustainability emerges.

To achieve this goal, a systematic literature review was conducted, including 86 articles that were divided into three different clusters considering papers devoted to technological aspects, models, assessment frameworks' development, and telemedicine. An analysis of the research areas interested was performed considering a double perspective, assessing environmental and social issues.

From the literature evidence, a strong relevance of technologies as the principal driver to guide the sustainable transition and an impulse to define quantitative indicators and assessment tools, emerged, also considering the necessity to support the decision-making process and the stakeholders' knowledge, to guarantee a green and sustainable development of healthcare systems.

The results included in the review demonstrate a significant diffusion of performance measurement models and systems, especially in relation to the environmental aspects, also considering innovative processes and technologies. The analysis of the social aspects is still limited, particularly in relation to the corporate social responsibility topic.

Therefore, this contribution would highlight the need to define multidimensional assessment models, integrating the different pillars of sustainability, also into the technological governance process.

**Keywords** – Sustainability, Healthcare, Technology, Model, Environment

**Paper type** – Academic Research Paper

## 1 Introduction

Sustainability is a broad and umbrella term, representing a debated topic and a priority for the sustainable development of worldwide population (Sachs, 2012).

The concept of sustainability has been defined and applied differently (Walugembe et al., 2019) in generating evidence under different perspectives of analysis. Traditionally, sustainability could be framed into three different dimensions: economic, social and environmental (Purvis, 2019). Pursuing these

three pillars helps healthcare facilities not only to improve health outcomes for patients, but also to enhance the attention to natural environment, supporting healthy communities with equal access to care, and guaranteeing the achievement of economic sustainability.

There is a growing interest in understanding how to shift toward economically, socially, and environmentally viable healthcare systems (European Commission, 2016; Chiarini & Vagnoni, 2016), that are ones of the major emitters of pollutants (Eckelman & Sherman, 2018).

However, healthcare sustainability is still presented as a multifaceted theme that also embrace social and environmental dimensions with the economic one. **Social sustainability**, which relates to the hospital's role in promoting sustainable development and providing healthcare facilities able to guarantee equal access to healthcare services, high-quality of care, and equitable distribution of healthcare resources among patients, also considering specific categories of patients, peculiar diseases and disadvantaged geographical conditions (Kamranfar et al., 2022).

This aspect also encompasses the hospital's impact on the community it serves, and the well-being of the patients taken in charge and the working staff.

**Environmental sustainability** is a significant contributor to environmental degradation: thus, sustainable practices, in this context, must be developed to minimize the carbon footprint, addressing issues, such as the climate change (Scherman et al., 2020). Hospitals, and healthcare organizations in general, could prioritise investments in energy-efficient technologies, implementing waste management programmes and recycling policies, to address these concerns. Additionally, sustainable healthcare approaches could positively impact public health strategies, making healthcare services more accessible and improving overall healthcare quality. Effective leadership and health policies are crucial, for achieving sustainable healthcare systems, also promoting the adoption of telemedicine and telehealth solutions.

Moving on from these premises, the present review aims at investigating how social and environmental sustainability is assessed in the healthcare context and if frameworks and/or models could be applied to healthcare sustainable processes and practices. According to the One Health approach (Atlas, 2013), a paradigm of action and analysis in which health, environment and social aspects are strictly interconnected, is necessary for future implementations.

A holistic perspective integrating social and environmental dimensions is underway (Pereno & Eriksson, 2020) and for this reason the research focused on these dimensions.

The final goal is to provide both practical and theoretical contributions. In practical terms, this paper aims at encouraging healthcare organizations and policy makers to develop more sustainable healthcare systems and services (by providing empirical evidence for its implementation and assessment) able to keep in account both dimensions. At theoretical level, this study clarifies the boundaries of the concept of sustainability in the healthcare sector and opens avenues for future research.

In pursuing this aim, this paper focuses also on the use of innovative technologies for improving social or environmental sustainability in healthcare. In 2017, OECD highlighted the importance of new technologies in pursuing the economic sustainability in healthcare sector (OECD, 2017). However, innovative technologies could have a crucial role also in pursuing the social and environmental sustainability. This is relevant since the concepts of "digital" and "innovation" are emerging as more and more pervasive, in the healthcare world (Basri et al., 2021). Digital and innovative technologies are the main enabler in controlling the carbon footprint and reducing the pollutants emissions (Linkov et al., 2018), as well as in achieving the United Nation's Sustainability Development Goals (SDGs) (Asi&Williams, 2017). When a technological solution is affordable and accessible, its ability could be detailed in terms of increasing the systems' productivity and efficiency, in an industrial context, but also in the healthcare sector, identifying reductions in emissions and waste. Furthermore, digital technologies such as big data, artificial intelligence (AI) and cloud computing could be used to support the production and delivery of essentials such as safe and reliable energy, food, infrastructure, and transportation, also for healthcare organizations.

The research questions that were identified to achieve the outlined objectives are as follows.

*RQ1) Which are the fields of application within the healthcare context in which the environmental and social sustainability has been assessed so far?*

*RQ2) What are the methodology/models/frameworks that have been used to assess environmental and social sustainability within the healthcare setting?*

*RQ3) Which technologies play a key role in sustaining environmental and social sustainability?*

*RQ4) In which settings do these technologies have applications to drive the process of sustainable transformation?*

## **2 Methodology**

To answer the research questions, a literature review approach was implemented to define a critical evaluation and synthesis of state-of-art and current studies (Webster & Watson, 2002).

Focusing on healthcare sustainability and its environmental and social impact, also including the technological development and the possibility to assess all the impacts in a multidimensional perspective, helps to identify gaps in knowledge and research, evaluating current practices, and inform policy decision-making processes. Additionally, this methodological approach could also provide insights into the effectiveness of existing healthcare sustainability programs and initiatives, supporting the decision-making process with high-level implications also for the healthcare managers and for all the stakeholders.

For the achievement of the above-mentioned objectives, a structured literature review (Denyer et al., 2009) was conducted, using three different data sources: PubMed, Scopus and ABI Inform.

Starting with the literature review, following the principles of transparency (Matalonga et al., 2020) and defining a synthesis that could be considered replicable and updatable, the search strategy included all the combinations of the following keywords: "Healthcare", "Sustainab\*", "Environment", "Social", "Impact" and the results containing the reference to economic topics were not considered. Economic factors are undoubtedly important in the context of healthcare sustainability, but for the purposes of this literature review, the focus of analysis has been placed exclusively on environmental and social sustainability, basing the decision on several factors. This focus is decided also following the One Health approach, which states the necessity to define and monitor social and environmental aspects in relation to the health issue, as two factors that could impact in a positive or negative way on the patient's health status.

In addition, due to the specific nature of RQs, there was a significant body of literature already published and discussed over the years on the economic aspects of healthcare sustainability, only discussing this dimension of interest.

This great attention is due to the healthcare field necessity to develop new solutions and public policies, re-engineering processes and finding new approaches, having as principal objective to properly manage severe economic constraints and correctly handle with the scarcity of resources.

Moving from these premises, the aim of the present research is to provide a different perspective by focusing on less discussed other dimensions, which equally play a relevant role, balancing the resources' consumption topic, guaranteeing the health and care needs of individuals and populations, also safeguarding the natural and environmental landscape.

As stated in the introduction section, "digital" and "innovation" are considered as two important drivers for the sustainable transition within the healthcare sector. They are not strictly included in the search strategy as keywords, considering that often, focusing on technological aspects, innovative and digital components are crucial for the topic discussed, but not explicitly mentioned in the paper.

During the review process, only the papers published after 2010 were considered, also including in the screening only the following types of documents, as a selection criterion: articles published in international journals, conference papers, conference proceedings, and reviews. In addition, two different classifications (ABS and AiIG ranking) were used to assess the quality of the business and management publications. International and national classifications have been used during a literature review to confirm the valuable source of the scientific evidence gathered during the review process, providing important insights about quality, reputation and academic institutions and research outputs' impact. ABS ranking, an international rating defined in the management field to evaluate the quality of the scientific publications, and the AiIG ranking, defined by the Italian Industrial Engineering Association, were applied to assess the quality of the evidence, according to the quality level recognised and accepted in this research field.

However, the rankings were not used as substitutes and a critical evaluation of individual studies or sources was conducted by a panel of five experts in healthcare field (4 management engineers and 1 economist).

The screening was conducted by selecting each paper according to the research area of reference, the dimensions of sustainability declined in the study, any possible geographical scope, the methodology, as well as proposing a

classification of the papers, considering three different clusters of reference (telemedicine, technology, and models), dependent on the contents covered.

The brainstorming technique was useful to provide a definition of the inclusion criteria and a double-blind review process was performed considering that some experts read the papers chosen by the others, to confirm the inclusion of the evidence in the review.

Papers approaching topics not related to sustainability, or topics related to sustainability, but not presenting evidence on the defined possible impacts, as well as papers discussing only organizational aspects, operations, and education issues were excluded from the analysis, because considered out of scope.

### 3 Results

Providing a robust synthesis of the literature evidence, the guideline defined by Briner et al. (2012) was followed, as reported in the Figure 1.

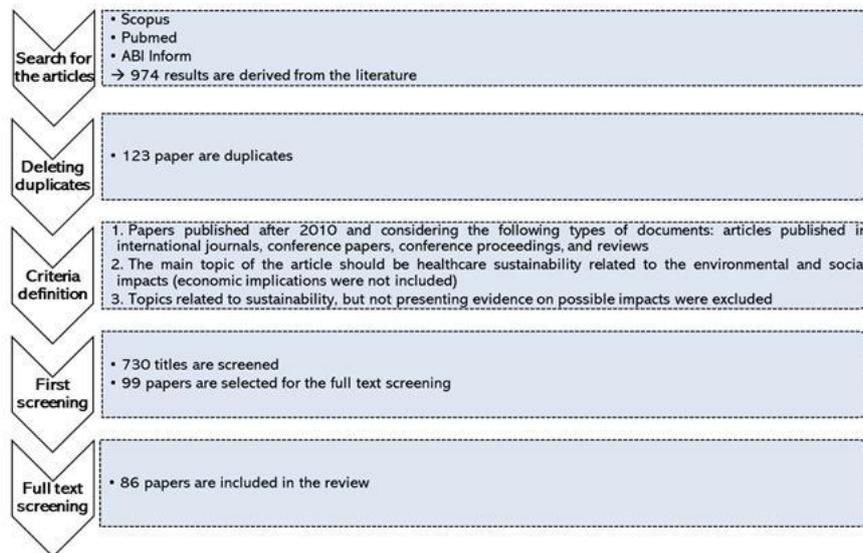

Figure 1: Literature review process

A total of 974 scientific publications were initially identified in the literature and then, after the duplications' removal, 730 papers were screened performing the screening process as detailed above. At the end, a total of 86 articles were included in the review.

Results showed that literature evidence studied sustainability in healthcare setting, analysed within different research areas related to the healthcare setting, could be described as a broad subject linked to social, environmental, and economic aspects while in other papers the topic is developed in relation to European sustainability goals (inclusion, reducing inequalities, access to essential healthcare services) proposed by the United Nations within the European program known as Agenda 2030.

Focusing only on social and environmental aspects, as stated as inclusion criterion for the review, the papers' majority results related to the environmental sustainability (51%) and only 6 papers (7%) are focused on social themes and implications. 36 papers (42%) present a double declination of the sustainability evaluating both the environmental and social impacts, combining two points of view within the declination and description of the topic.

From the results, emerged the interdisciplinary nature of the studies that also revealed the necessity to monitor and assess economic implications. In 44 papers (51,2%) the economic theme, as a declination of the sustainability concept, is presented. More studied reported indicators in the model, considering the economic sustainability as one of the dimensions within the complete model, or costs analysis as the consequences of sustainable actions applied in the healthcare setting. In 42 papers, the economic dimension is not included in the analysis and results.

Table 1: Sustainability declinations in the literature

<b>Sustainability declinations</b>	<b># Papers</b>	<b>%</b>
Environmental sustainability	<b>44</b>	51%
Environmental and social sustainability	<b>36</b>	42%
Social sustainability	<b>6</b>	7%
<b>86 papers included in the review</b>		

Considering all the declinations of sustainability, the circular economy theme is presented in the majority of the papers as the ideal model to reach and implement within the healthcare setting, also a consequence to the implementation of a new patient-centred paradigm.

Despite this, different studies provided definitions of healthcare sustainability from many perspectives and all the authors agreed to state that a green transition could be considered as a new system of behaviour, knowledge and mindset, assuming an integrated approach that also embraces the innovation field and the possibility to act a cultural change into the healthcare setting (Porter-O'Grady, 2010). The green transition is a cultural and operational change in performing daily activities and reaching the objectives and, considering this pathway, also the management rules and the business models must change (Porter-O'Grady, 2010).

The breadth of the concept is demonstrated also from the analysis of the research areas most interested with regard health sustainability studies as reported in the Table below (Table 2).

Table 2: Research areas

Research areas	# Papers	%
Waste management	16	18,6%
Smart and digital solution	10	11,6%
Performance measurement	9	10,5%
Supply chain management	9	10,5%
Building assessment	7	8,1%
Adoption of innovation	7	8,1%
Environmental Impact Assessment	5	5,8%
Technological governance	5	5,8%
Resources management	4	4,7%
Operational excellence	3	3,5%
Facility location and network design	2	2,3%
Human Research Management	2	2,3%
Social enterprise	2	2,3%
Other research areas (decision making, organizational model, public health, quality assessment and sustainability assessment)	5	5,8%
<b>86 papers included in the review</b>		

Most of the papers are related to waste management, performance measurement and supply chain management. Environmental implications could be analysed considering the emissions and the pollution generated by healthcare organizations, not only conducting their operational and daily activities within their physical perimeters but also considering the entire supply chain and the possibility to create a sustainable network in which all the players are involved,

facilitating green supplies and deliveries, complying with the ISO 14000 certification, promoting eco-friendly designed healthcare products and services with also the support of green packaging of pharmaceutical and essential items (Hossain et al., 2022). The performance measurement systems or models are relevant to guide and monitor the definition of green supply chains, also considering the social implications related to their implementations (Anilkumar et al., 2022). In addition, the transition could be supported also by innovative technologies (Jin et al., 2021; Hellstrand et al., 2021), smart solutions' development (Espinosa et al., 2021; Lo Presti et al., 2019), organizational changes (Vaishnavi et al., 2022) and industrial systems (Faramondi et al., 2020; Kumar et al., 2014).

The research effort in relation to the topic of sustainability, even in very different fields, was also driven by the recent pandemic period, with the necessity to develop the vaccines supply chain and also the increase in the waste production due to a growth in the use of disposable personal equipment, revealed the key issues that healthcare organizations have to face, also considering the sustainable development (de Aguiar et al., 2021). Furthermore, the adoption of sustainable practices, related to energy efficiency, water use reduction or devices' end of life management, improves healthcare performance, which consequently could generate a positive influence on circular economy (Daù et al., 2019).

During the review process, three clusters were adopted to classify the results and to understand the main contributions found in literature search. The clustering analysis allows to divide the scientific evidence according to the focus or not on a technologies and innovative devices. In addition, we have given a specific attention to telemedicine. Against this backdrop, the classification is the following: scientific studies in which models and assessment frameworks were proposed (57 papers, 66,3%), papers related to technologies and innovative devices (26 papers, 30,2%), and, at least, articles devoted to present and discuss telemedicine programmes and solutions (3 papers, 3,5%).

#### *Cluster 1: models/framework for assessing sustainability*

Assessment frameworks and indicators should be designed according to a holistic perspective of sustainability and applied for the related evaluation (Sherman et al., 2020).

To assess sustainability, models, and frameworks were defined and applied in the literature, considering waste management (Li et al., 2021), buildings and facilities (Castro et al., 2017), such as human resources and supply chain practices, with the support of performance indicators and other tools as balance scorecard (Leksono et al., 2019). 58 papers (67%), out of the 86 papers, included in the present review, are focused on models, that are classified considering the following declinations, as reported in the Table 3.

Conceptual framework as a definition was used to categorize papers in which the expected relationship between variables, and also the impact on environmental or social sustainability within the healthcare setting, is modelled. Instead, some papers are devoted to present quantitative indicators and measures (performance measurement) and the combination of these two components allows to classify the model as a complete model. All the literature evidence in which significant variables impacting on healthcare sustainability are presented, without defining a framework, was attributed to the cluster related to the antecedents.

Table 3: A focus on the papers related to models and assessment framework

<b>Model declinations</b>	<b>#</b>	<b>%</b>
Conceptual framework	29	50,0%
Performance measurement	13	22,4%
Complete model (framework + performance)	9	15,5%
Literature review	5	8,6%
Antecedents	2	3,4%
<b>58 papers</b>		

Half of the studies are focused on conceptual frameworks even if also performance tools and complete models are structured to evaluate the sustainable development. Conceptual frameworks could be based on fuzzy logic approaches (Tseng et al., 2020; Erjaee et al., 2022; Li et al., 2021), mode and effect analyses (de Ridder et al., 2022) and life cycle assessment (Thiel et al., 2017; Nagai et al., 2021). An intense relevance is devoted to defining framework to evaluate and assess the introduction of innovative technologies that could support the sustainable transition in organizational and clinical settings, not only with a direct contribution on the emissions' decrease and a positive impact on the patients'

experience (Hellstrand et al., 2021) but also contributing to the waste reduction (Chen et al., 2021), combining three dimensions of interest.

Frameworks are developed in the literature evidence also to study and analyse the barriers occurring in the healthcare setting for the sustainable development, both on the environmental perspective (Kazançoğlu et al., 2021) and on the social one (Hussain et al., 2019).

Performance indicators, within the area of performance measurement, are developed with multiple approaches supported by structured technique useful to organize and guide complex decisions such as the ANP, Analytic Network Process (Buffoli et al., 2013; Leksono et al., 2019), and quantitative parameters are defined to assess sustainable performance in terms of operational and strategical decisions, covering also different dimensions of the sustainability, to support decision making during the design of a healthcare building (Castro et al., 2017).

Complete models are developed, also considering the human rights, assuming the patients' perspective, with the definition of a set of indicators useful to assess the quality and sustainable development in healthcare at the micro system level, involving quality, economic issue, environmental impact, social implications both at the institutional-macro and at the hospital-meso level (Moldovan et al., 2022). Social issues are investigated also due to the implementation of structured models applicable to healthcare supply chains (Khosravi et al., 2019), home-care network (Goodarzian et al., 2021) and, in a more comprehensive way, for the decision-making process (Li et al., 2020).

#### *Cluster 2: technologies and innovative papers*

In an organizational context in which the digital sphere is becoming increasingly pervasive, also technologies could be considered as enabler for the sustainable transition (Espinosa et al., 2021). For this reason, during the review process, a grouping of the results is conducting to underline and highlight the technological improvement devoted to transform the healthcare setting, in a green and sustainable one.

27 papers are related to technological aspects: technologies are presented as a possibility to transform the healthcare setting through a sustainable approach, also considering the possibility to introduce biomaterials to decrease the medical devices' environmental impact (Salvatore et al., 2020). Digital tools and Artificial Intelligence (AI) algorithms could also allow to reduce waste and the carbon footprint (Damoah et al., 2021), notably considering disposable devices and

personal protective equipment, as emerged during the COVID-19 emergency, as above mentioned.

Table 4: A focus on the technological solutions able to support the sustainable transition

Technological cluster	# Papers belonging to the cluster	Examples
Devices	9	Marine collagen, inhaler devices, wearable sensors, robotic hand, custom pack, disposable instruments
Smart solutions	10	Telecare services, AI solutions, drones, Internet of Things (IoT) systems, cloud computing systems
Equipment	4	Technologies for waste treatment, medication management automated systems
Energy equipment	3	Nanogenerators, storage technologies
Diagnostic equipment	1	Magnetic resonance imaging
Drugs	1	Drugs for rare diseases
<b>27 papers</b>		

Technologies are strictly related to the sustainable development, considering the environmental declination of the concept, for their nature but also evaluating the capacity to activate and support the green transition of processes and organizations (Godbole et al., 2021). IoT applications, in terms of sustainable development, represent a great opportunity to prevent diseases and pandemics worldwide, supporting drug manufacturing, logistics but also health population planning and management, with the possibility to generate high volumes of data (Espinosa et al., 2021) and to monitor patients at home (Lo Presti et al., 2019).

Meanwhile, innovative technologies are recognised as a driver for enhancing the economic sustainability, decreasing for instance costs to transfer of care, from hospitals to home-care settings, improving safety (Tsagkaris et al., 2021).

Hence, to guarantee high-quality services, and the use of adequate technologies, multidimensional and multi-professional approaches are necessary to the implementation of sustainable programmes, with integrated models: *"e-Health services can give rise to innovations that are relevant to the transition but not self-sufficient"* (Pereno & Eriksson, 2020).

However, referring to the technological implications, a significant relevance nowadays is devoted to innovative materials (i.e., as marine collagen, dental materials, degradable bacterial cellulose for oral healthcare) to support the green transition and the decrease in the waste production (Jin et al., 2021; Salvatore et al. 2020).

In addition, digital technologies could also impact on social sustainability as demonstrated by the definition and application of home-care services and telemedicine approaches (Yellowlees et al., 2010).

Analysing the sustainable approaches, technological and innovative solutions could be also studied considering the healthcare context of reference. The included results demonstrated that the main interest about sustainability could be emphasized within the organizational settings and in particular, the hospital one, with a focus on some operational unit or processes. Laboratories (Fragão-Marques et al., 2022), primary care centres (Morell-Santandreu et al., 2021) and operating rooms (de Ridder et al., 2022) could experience advantages applying waste and lean management principles to reduce the environmental impacts and supporting a high level of quality and assistance. Also, healthcare industries operate to support the green transformation of the sector using environmental-friendly materials for their device and acting with a multi-perspective approach among the entire supply chain, supported also by informatic integrated systems. Only some studies were implemented in the context related to patients' home, in case of telemedicine approach and implementation.

Clinical setting as the rare diseases (Saviano et al., 2019), the cataract surgery (Thiel et al., 2017) or the oral health (Martin et al., 2021; Mulligan et al., 2021; Jin et al., 2021) are presented as contexts in which technological advances and innovative materials could reduce the carbon footprint and the pollutant emissions.

#### **4 Conclusion**

The evidence reported in the literature demonstrated that healthcare sustainability is a wider theme, characterized by an elevated level of novelty, which could be declined in different research areas or fields of application, thus answering to the first research question (RQ1). Some authors stated possible definitions for healthcare sustainability but also addressed the issue from different perspectives, defining a relationship between sustainability, both from

an environmental and social perspective, and technological improvements within the healthcare sector.

The analysis pointed out the possibility to stratify the results concerning some literature streams mostly related to different technologies (i.e., medical devices and digital tools as IoT or artificial intelligence algorithms) and models, responding to respectively the third and second research question (RQ3 and RQ2).

Despite this, some models and technologies were defined or used considering applications on local data and/or settings, giving a reply to the fourth research question (RQ4): many studies are based on data collection conducted at hospital level or due to the enrolment of a national panel of experts. This could generate replication and generalization issues in the evidence proposed.

Valuable framework for identifying and prioritizing the key factors affecting sustainability in the healthcare facilities or, extending the horizon of analysis, at the healthcare systems' level, could also be used by healthcare professionals and policymakers to develop strategies and policies to improve sustainability, guiding the sector into a sustainable transformation, promoted at all the national and international levels.

Furthermore, all the literature streams underlined during the analysis pointed out the necessity of integrating sustainability into the value-based approach used in the healthcare contexts, notably, in the hospitals (Falivena & Palozzi, 2019).

As detailed above, in the literature evidence, various environmental indications related to sustainable management and green healthcare are presented, but there is still a great need of research for supporting policymakers and healthcare practitioners in addressing the problem of healthcare pollution (Sherman et al., 2020). Furthermore, the COVID-19 pandemic has pinpointed the relevance of the social sustainability by highlighting the COVID-19's impacts on patients (and worldwide population) health and quality of life (Ranjbari et al., 2021).

The review is a first attempt to systematise the evidence presented in the literature considering the strong relationship between technologies and sustainability, also highlights the models developed to assess the degree of sustainability, both from a social and environmental point of view.

Considering managerial implications, among all the industrial settings many companies are currently interested in declining this topic into their activities, transforming their business from a close perspective to a circular economy model, cooperating with other stakeholders and reaching high performance levels.

Also, healthcare industries and organizations, in particular hospitals, have started to change their paradigms of action and this new and green approach should be supported and encouraged also by scientists and scholars to collect and analyse data, through robust and systematic models.

Many models and assessment tools could be identified in the literature evidence, especially in relation to performance measurement, in comparison with studies dealing primarily with technologies: the applications of these models are still lacking in the real-world practice. In addition, the current studies related to technological aspects focus especially on digital devices and solutions.

The evidence coming from the review highlighted that the scholars have been able to provide models and conceptual frameworks, while, on the other hand, the practitioners have not yet significantly applied these models to evaluate the innovative solutions and procedures sustainability.

Therefore, there emerges a gap which may be explored to understand whether the lack of applications is driven by the novelty and complexity of the models or whether the nature of the technologies requires other tools of evaluation, because the proposed actual frameworks are not suitable for the specific technology stage or life cycle. In addition, there might be a sort of gap in terms of the acceptability of the frameworks proposed to be applied in the real practice, and the economic dimension could weigh strongly as a decision-making dimension, especially in the technology governance and management, but also considering the sustainability assessment process.

In conclusion, future contributions could be devoted to defining how to bridge this gap, integrating all the sustainability dimensions and assuming a multidimensional perspective.

### Abstract

The goal of stakeholder theory, which was primarily developed in the field of business ethics, is to examine the interactions between the company and all of the actors in its ecosystems. Despite the growing recognition of the significance of communication strategies focused on internal and external stakeholders, the role of marketing has been largely neglected. In this research we propose an empirical assessment of a marketing-based theoretical framework. The analysis is aimed at analysing how the components of

stakeholders' engagement (recognition, support, and dialogue), and knowledge exchange, affect stakeholders' response and firms' outcomes (financial performance, risk, and reputation).

**Keywords** – Stakeholder engagement, Strategies, Marketing, Knowledge exchange

**Paper type** - Academic Research Paper

## 1 Introduction

Stakeholder theory was largely developed in the field of business ethics with the aim of analysing the relationships enabled by the firm with all the actors in its ecosystems (Philips et al., 2003). More recent, it posits that corporations should pay attention to provide benefits not only to their shareholders, but also to internal and external stakeholders that may influence a firm's long-term profitability and sustainability (Hillebrand et al, 2011; Hult et al., 2011; Miles and Ringham, 2018; Sloan, 2009). This process led to value the needs and desires of several stakeholders, determining the development of "knowledge for value cocreation", which in turns may impact favourably on firm innovativeness and reputation (Wiesmeth, 2020, p. 310). However, despite the increasing importance recognized to communication strategies directed to internal and external stakeholder, marketing scholars limited their attention to customer engagement, as a primary source of firms' performances (Freeman et al., 2010; 2018).

Considering this, Aksoy et al. (2022) proposed a new stakeholder engagement framework that acknowledges the role of marketing communication strategies. Their framework is based on three dimensions of firms' stakeholder engagement, namely stakeholder recognition, support, and dialogue, impacting firms' retaliation or stakeholder contribution, that in turn influence firms' profitability from a financial, reputational, and risk-wise point of view.

The first driver included in the framework proposed by Aksoy et al. (2022), that is stakeholder recognition, refers to rights, feelings, and traditions experienced by a given group of stakeholder; the second driver (i.e., stakeholder support) regards the direct actions and resources destined by the firm to guarantee stakeholders' well-being; the last driver (i.e., stakeholder dialogue) accounts for the mutual exchange of information, and ideas between the firms and the stakeholders. These three variables may impact the stakeholder perceptions in a positive

(stakeholder contribution) or in a negative way (retaliation) that may subsequently lead certain consequences in terms of profitability.

Despite the effort paid by Aksoy et al. (2022) to build a theoretical framework that emphasizes the role of marketing communication, less empirical attention has been devoted by marketing literature to analyse the impact of stakeholder engagement practices on firms' performances. To fill this gap, we propose an empirical study that assess the impact of stakeholder recognition, support, and dialogue on firm' performance, highlighting the mediating role of stakeholder responses (stakeholder contribution to the firm or retaliation). In addition, we show how stakeholder engagement practices may facilitate knowledge exchange by the sharing of information about firms' procedures thereby improving organizational learning initiatives.

This research posits the relevant role for marketing in the development of strategies able to effectively engage different groups of stakeholders. There are several reasons behind this. As the marketing function is responsible for communication destined to both internal and external stakeholders, it is of paramount importance for improving brand equity and to avoid possible reputational risks connected to the activity of the company. In addition, it is fundamental to understand the firm's competitive environment, as well as the need of all stakeholders with the final aim of offering them products and services that make them more satisfied.

Our results provide indications for managers and practitioners of multinational companies informing how they could adapt the marketing communication to cultural norms, and informal arrangements held by stakeholder groups belonging to different countries.

## **2 The stakeholder theory**

Strategic management and organization theory both saw a rise in interest in stakeholder theory. Recently, different contributors have incorporated the stakeholder theory into the field of business ethics (e.g., Valentinov and Chia, 2022). The social responsibility component of stakeholder theory allowed the integration of social issues in management and more lately, it has started to take part in the discussion of sustainable development. (e.g., Steurer et al., 2005).

Stakeholder theory has been around for a while, but Freeman's work is largely responsible for its development. In response to growing globalization, increased

competition, and the complexity of business operations, the goal of his work was to outline an alternate style of strategic management. Due to public interest, increased media attention, worries about corporate governance, and its adoption as a policy within the context of the "Third Way", the stakeholder concept has grown in significance over time (Greenwood, 2008).

Companies, institutions, non-governmental groups, and the mainstream media all use the phrase "stakeholder" frequently. Despite the term's widespread use, many users fail to explain what they mean when they use it or give a particularly precise definition of what a stakeholder actually is. There is no one, clear-cut, widely-accepted definition of the term "stakeholder" despite the fact that various definitions of it have been proposed, even in the academic context.

Although researchers define the concept in a different way, they generally reflect the same principle—that the company should take into account the needs, interests, and impacts of individuals and organizations that either have an effect on or could have an effect on its policies—to a degree that differs from each definition.

In this framework, the interactions between the business and its stakeholders are bilateral and autonomous (Frooman, 1999). Fassin (2009) asserts that the Freeman (1984) model was possibly influenced by sociological aspects that indicates the incidence of relationships between individuals or groups. The classic capitalist view had an impact on the model's structure. Under this paradigm, the firm is solely tied to 4 group categories: suppliers, employees, shareholders, and the customers, who are the recipients of firms' production. Freeman (1984) however included other group categories that were impacted by business operations and viewed the firm as the hub of a number of interconnected interactions (Crane and Matten, 2004).

Freeman (1984), in his ground-breaking book "Stakeholder Management: A Stakeholder Approach", was the first to provide a definition of the stakeholder framework. To develop a stakeholder strategy, Freeman considered different academic works, including those on corporate strategy, systems theory, and CSR. He argued that both internal stakeholders (owners, clients, employees, and suppliers) and external stakeholders were experiencing these environmental "shifts". Based on this evidence, he advised managers to "consider all of those groups and individuals that can affect, or are affected by, the accomplishment of the business enterprise" as a result (Freeman, 1984, p. 25). He also suggested that stakeholders should be categorized, their interests should be better understood,

and their behavior should be predicted using marketing segmentation methods. To supplement Porter's list of general business strategies, he provided four generic stakeholder management strategies: exploit, defend, swing, and reinforce.

Freeman et al. (2010) particularly contend marketing may contribute significantly to the stakeholder theory. Indeed, compared to other fields, marketing has the tendency to express a greater consideration for external stakeholders. As a result, it is well-positioned to address issues related to managing and interacting with such stakeholders (Bhattacharya and Korschun, 2008).

### **3 A marketing approach to the stakeholder theory**

Building on the relevance attributed to marketing, Aksoy et al. (2022) developed a new stakeholder engagement framework that acknowledges its role in the stakeholder theory. This framework grounds on three pillars, i.e., stakeholder recognition, support, and dialogue. These dimensions are likely to affect firms' retaliation or stakeholder contribution, that in turn influence firms' profitability from a financial, reputational, and risk-wise point of view.

#### **3.1 Stakeholder recognition**

Preliminary insights into the role of marketing in stakeholder recognition mainly regarded how stakeholders may react to marketing efforts and specifically to segmentation and targeting. These marketing strategies recognize some differences among consumers, and lead to differentiate communication strategies that signal how some categories of consumers are valued more by the company. Early studies and practice in this field were largely concerned with finding the firm's most valuable customers and crafting messages to appeal to them (Iyer et al., 2005).

The emphasis has typically been on matching the offering's usefulness and price to the user's demands. Yet, a limited concentration on customers and revenues frequently corresponds with disputes and moral issues, leading to negative stakeholder reactions. Reduced consumer spending is one result, but others include bad publicity, expensive restrictions, divestments, and boycotts (Herhausen et al., 2019).

Based on these premises, Aksoy et al. (2022) defined stakeholder recognition as a firm's consideration for emotions, well-being, and rights of a stakeholder group.

### **3.2 Stakeholder support**

Depending on how each stakeholder group assesses the firm's initiatives, stakeholder reaction may be positive or negative. Stakeholder support captures marketing initiatives that provide monetary returns to various stakeholder categories. According to Wagner et al. (2009), stakeholders frequently evaluate the sincerity of a company's generosity or dishonesty in corporate communications when evaluating the company's programs. A possible factor influencing consumers' unfavourable reactions, according to Vila and Bharadwaj (2017), is mistrust in the firm's intentions. Practices like "greenwashing", which involves companies claiming that their products are environmentally friendly, or "brown washing" which involves companies being overly modest about their sustainability practices to draw attention away from potentially contentious activities, can have a negative impact on stakeholder response (e.g., negative WOM).

### **3.3 Stakeholder dialogue**

Customers are the primary focus of current studies on stakeholder interaction, which can help us comprehend marketing's function in stakeholder dialogue. Consumers are frequently seen as fictitious marketers for the company who assist to crucial marketing activities like WOM or C2C communication for post-purchase assistance. It acknowledges that customers have a value for the firm that go beyond their financial expenses (Harmeling et al., 2017), and therefore useful in spreading the company's ideas within their communities since they are extremely convincing among other customers.

Marketing strategies that promote stakeholder interaction frequently employ a range of financial and non-financial rewards, as well as building an environment that promotes this kind of communication. For instance, businesses create communities to promote customer-to-customer C2C dialogue to promote consumers' feedbacks on product offerings. Even though the conversation on interaction can provide insight into how businesses communicate with their major stakeholders, this has generally concentrated on two of them: the consumer and, more lately, the employee (Kumar and Pansari, 2016).

Stakeholder communication has gradually evolved into open forums with a company, made possible by internet-based technologies and services. Several

studies have confirmed that these open discussions can draw different stakeholder categories' interest or take place immediately among businesses and other stakeholder groups (Hewett et al., 2016). Hence, marketing programs that inspire, facilitate, and increase stakeholder engagement may either promote positive or negative stakeholder reactions with repercussions for the company. In conclusion, marketing significantly contributes to stakeholder participation through activities that increase their visibility to stakeholders, and subsequently encouraging them to support and promote discussions.

### ***3.4 The mediating role of stakeholder response***

Stakeholders' assessments of the company's conduct and their capacity to influence the achievements of the business through stakeholder reactions are key factors in determining the effectiveness of stakeholder participation. According to Freeman et al. (2007), a company's interactions and relationships with one stakeholder group can exert an impact on those relationships with other interested parties. The extent to which a company's behavior coincide with or depart from such principles, in addition to if the stakeholder views the company's activities as ethically appropriate, might depend on variations in personal values within stakeholder groups. These evaluations are prescriptive in nature because they assess whether stakeholders think how the company should behave.

If firms and stakeholders' beliefs are not aligned such activities may result in stakeholder retaliation, which then impacts the company' current results. If there is alignment, companies might anticipate favorable reactions from a certain stakeholder, such as resource donations. Such consumer reactions positively influence firms' profitability from a financial, reputational, and risk-wise point of view.

### ***3.5 The moderating role of knowledge exchange***

In this paper, we tried to extend the framework proposed by Aksoy (2022) considering the potential role of stakeholder engagement practices at affecting knowledge exchange between the stakeholders and the company.

The firms should promote stakeholder information sharing and mutual learning, opening novel perspectives and creative solutions for solving issues and pursuing future business potential (Jiang et al., 2020). Intimate ties make it easier

to transfer knowledge, especially tacit knowledge that is difficult to explicitly transfer across business borders. Effective knowledge transfer and reciprocal learning support organization' innovative repurposing of existing knowledge and novel idiosyncratic resources. Following this reasoning, Garcia-Sánchez et al. (2018) discover that paying attention to numerous stakeholder categories has a positive effect on business development.

For this kind of reasons, it is possible to hypothesize that knowledge sharing may reinforce the impact of stakeholders' engagement activities on firms' profitability.

#### **4 Method**

The present research has the objective to empirically tests and extends the theoretical framework proposed by Atsoy et al. (2022).

As we are at a very preliminary stage of the research, data collection will be divided in two phases.

At the first stage of the research, a focus group will be organized to develop useful measures to assess the examined constructs. Because of the absence of well-established measures for the components of stakeholders' engagement (i.e., recognition, support, and dialogue), we will develop three different scales. In the focus group, we will ask to academic experts and managers to identify some items to assess stakeholder recognition, support and dialogue. Based on this evidence, the authors of this research will develop the items of the scales. In doing so, similar items will be considered together and an item purification procedure will be applied to obtain a set of items for each construct.

As for stakeholder response, we will consider the six items scale developed by Gregoire and Fisher (2006) to assess customer retaliation; whereas, stakeholder resource contribution will be assessed with a new scale as for the components of stakeholders' engagement. The moderating variable, i.e., knowledge sharing, will be assessed by adapting the four-items scale by Holste and Fields (2010).

As for the outcomes, firms' financial performance and risk will be assessed by using balance sheets ratios; whereas, the reputational risk will be based on secondary data.

#### **4.1 Findings and conclusions**

The sample is made up of Italian companies listed in the stock exchange, and the empirical analysis conducted through Structural Equation Modelling (SEM). Grounding on Anderson and Gerbing's (1988) two-step procedure, we will first conduct a Confirmatory Factor Analysis (CFA) to assess the reliability of the scales adopted, and then a structural analysis to test possible relationships among the examined variables.

In terms of results, we expect that the components of stakeholder engagement may affect stakeholder response even though at a different extent (also by considering different stakeholders' types). More interestingly, we expect that the stakeholder response may mediate the effect of the components of engagement on specific outcomes. Indeed, it is possible that stakeholder recognition may affect firm reputation, but not the financial performance. Moreover, it is also reasonable that the relationships between the predictors and the dependent variables may be attenuated or amplified by knowledge exchange.

Based on the results of this study, it could be possible to improve our current understanding of how marketing strategies may contribute to the stakeholder theory. From a managerial point view, the results of this study could help managers and practitioners to identify useful strategies to involve more effectively specific types of stakeholder, by preventing retaliation and promoting firms' profitability.

### **Abstract**

The purpose of this research is to understand how Institutions influence the knowledge creation process in the agri-food sector. Based on Knowledge Creating theories we aim to examine how institutions shape knowledge creation processes in the Italian context. We employ a qualitative approach by conducting a document analysis that includes several organizational and institutional reports, survey data, and various public records. Our study is carried out in the Italian scenario in which the agri-food business represents a milestone of the Made in Italy economy worldwide, to create meaningful insights. From a theoretical view, this paper will extend knowledge management theories by providing an institutional perspective that will shed light on the important role of institutions in knowledge creation process. On the practical side, the results will be used by agri-food companies to promote new organizational frameworks capable of supporting knowledge creation processes in non-knowledge-intensive contexts, enhancing collaboration with institutional bodies, governments, and regional entities.

**Keywords** – Knowledge Economy, Knowledge management, Agri-food business, Knowledge creation process, Institutional theory

## 1 Introduction

According to Marcus Tullius Cicero, human knowledge has uncertain forms. It is impossible to have a global knowledge of reality. One should not lose awareness of the possibility of falling into error, even after researching knowledge for a while. Several authors define the modern economy as a Knowledge Economy (KE) to emphasize the importance of researching knowledge in its different forms: they consider knowledge as a primary, intangible asset for producing value, increasing productivity, and facilitating innovation. These scholars have frequently linked the KE concept to high-tech industries, highly skilled workers, and contexts that would foster the development of intellectual performance rather than physical. Machlup (1962) stated that in a knowledge-based economy, the role of knowledge has assumed greater importance over natural resources, physical capital, and low-skilled labor. Similarly, Powell & Snellman (2004) argued that the key component of a KE is a greater reliance on intellectual capabilities than on physical inputs or natural resources. These definitions apparently exclude sectors that are mainly typified for achieving significant competitive advantages through physical inputs and natural resources.

Our literary review showed that while organizational researchers have extensively investigated the KE area by examining knowledge-intensive sectors (Smith, 2000; Alvesson, 2004), rather less attention has been paid to those businesses that employ a low-skilled workforce and in which knowledge creation processes may look as less impacting. Since knowledge creation is a dialectical process, in which various contradictions are synthesized through dynamic interactions among individuals, the organization, and the environment (Nonaka & Toyama, 2002) we aim to investigate how institutions, t can contribute to fostering such interactions in the agri-food sector. The agri-food sector represents a suitable scenario to conduct our analysis since 1) natural resources and physical capital are key factors 2) it is a sector that frequently employs a low-skilled workforce 3) it is undergoing profound changes that are affecting the need for innovative knowledge creation processes, displaying new opportunities and

challenges (Lowry, Avellan & Gilbertson, 2019). Our study will be realized through an institutional lens, to deeply understand how institutions affect the knowledge creation processes in agri-food organizations. We argue that investigating this phenomenon from an institutional perspective is crucial given that this sector, which has tended to be recognized as non-knowledge-intensive, is going through a phase of profound knowledge renewal that needs to be supported by the institutional framework. In institutional theories, organizations are influenced by normative pressures, sometimes arising from external sources such as the state, other times arising from within the organization itself (Zucker 1987). As per Hamdouch, & Moolaert, (2006) institutions and their policies contribute significantly to coordinating the different actors in the knowledge infrastructure and to the initiation of collaborative arrangements among them, along with the provision of significant funding and administrative and technical support for innovation and knowledge activities.

With this regard, we aim to uncover which is the role of institutions in the earliest phase of knowledge creation process within agri-food organizations.

Our research question is as follows:

*How do institutions affect knowledge creation process in the agri-food business?*

To address our research question, we decided to carry out our analysis in the Italian context, where the agri-food sector represents one of the driving forces of the Italian economy abroad, spreading the "Made in Italy" brand worldwide (Montanino et al, 2021).

We argue that from a theoretical perspective, this paper will extend knowledge management theories by providing an institutional perspective that will shed light on the important role of institutions in knowledge creation processes. Moreover, the managerial implications of this study may add novelty to KM theories by highlighting the importance of considering the institutional influence in strategic choices. On the practical side, the results will be used by agri-food companies to promote new organizational frameworks capable of supporting knowledge creation processes in non-knowledge-intensive contexts.

## 2 Theoretical Background

The knowledge creating theories are deeply rooted in the field of Knowledge Management (KM). KM area deepens the role of the explicit and systematic management of vital knowledge - and its associated processes of creation, organization, diffusion, use and exploitation, in pursuit of organizational objectives (Skyrme, 1999). With this regard, KM activities are process-oriented: knowledge is supposed to flow within the organization following a predefined and iterative pattern in which knowledge creation represents the first strategic objective. Nearly all approaches to KM emphasize the process character with inter-linked knowledge processing tasks or core activities (Mertins et al, 2000). However, these processes seem to be more important for companies working in dynamic contexts, where rapid changes in the technological paradigm require that knowledge can be catalyzed quickly within different organizational levels.

Our literature review uncovers a massive body of materials that suggest that in knowledge-intensive sectors - which are characterized by the need to process and use knowledge on a daily basis in order to remain competitive - the knowledge creation process is formalized for both small-medium enterprises (Baptista Nunes et al, 2006; Durst & Runar Edvardsson, 2012) and big enterprises (Jiménez-Jiménez, Martínez-Costa, & Sanz-Valle, 2014). At the same time, our research reveals that scholars did not provide sufficient insights into those sectors in which the knowledge paradigm seems to be less prominent. For these reasons we decided to conduct our analysis in the agri-food sector which has been characterized by the dominant role of natural and physical resources.

The main contributions in this area combine different analyses that are not focused on a specific level of the KM process but refer to KM processes as a whole: Boshkoska et al. (2018) identify knowledge boundaries in agricultural value chains, Howland et al. (2015) understand attitudes, skills, and practices of fruit growers and define the necessary conditions for effective information sharing. Similarly, Meijer et al. (2015) built an analytical framework combining extrinsic and intrinsic factors in farmers' decisions to adopt new agricultural technologies. The valuable contribution of these studies underlines that knowledge is a critical enabling factor for healthy agri-food systems and is required to generate contextual information and processes to improve productivity, increase profitability, reliability, and resilience (Qaim, 2017). Analogously per Nonaka & Toyama (2003) the knowledge-creating process is necessarily context-specific in

terms of time, space, and relationship with others. Knowledge cannot be created in vacuum, and needs a place where information is given meaning through interpretation to become knowledge. To avoid terminological ambiguities, in this study, while mentioning the term “knowledge” we will refer to the concept of explicit knowledge proposed by Nonaka & Konno (1998). While tacit knowledge is deeply rooted in an individual’s actions and experience as well as in the ideals, values, or emotions he or she embraces, explicit knowledge can be expressed in words and numbers and shared in the form of data, scientific formulas, specifications, manuals, and the like. This kind of knowledge can be easily transmitted between individuals in a formal and systematic way. This definition represents a crucial point in this work because institutions, following the same logic, may play a role in transmitting the same information and knowledge within organizations in a formal and systematic way in order to support KM processes in each phase. The theoretical purpose of our study is to investigate how the institutional framework influences agri-food business sectors at the specific level of the knowledge creation process (Fig.1).

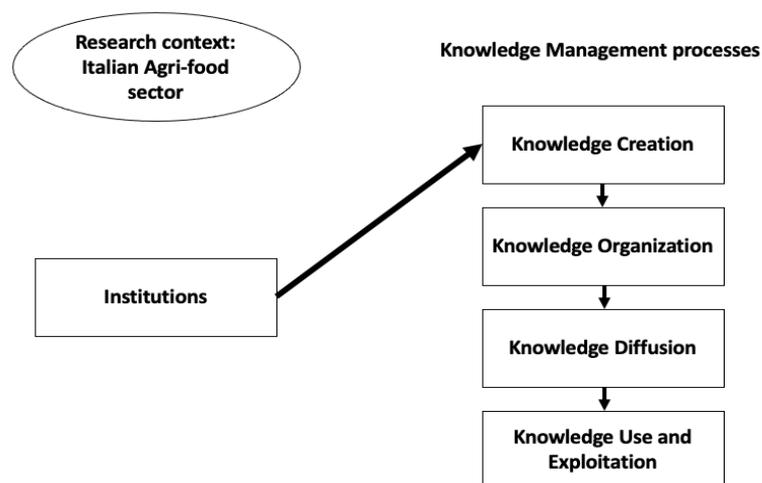

Figure 1: Proposed conceptual model as an application of Skyrme, 1999 (Source: Author)

### 3 Methods

The paper employs a qualitative approach by presenting a document analysis. We decided to choose the Italian agri-food sector for three main reasons. First, the Italian scenario represents one of the main competitors in the agri-food

business worldwide (Istat, 2023). Second, the extended agribusiness supply chain represents the leading economic sector in this country with a turnover of more than 500 billion euros and nearly 4 million people employed (Montanino et al, 2021): because of the strategic importance of this sector, our insights might be dense in significance both on a theoretical and practical level. Third, it competes in a high-technology industry that necessitates intensive cooperation between teams. In doing so, the company's WD had to strongly consider working relationships, interactions between different teams and different functions within the company. The unit of analysis is the knowledge creation process in the agri-food business. Data has been collected through documents, which include organizational and institutional reports, survey data, and various public records: these items represent our units of observation. Since there is no specific evidence of institutional effects on knowledge creation processes, these documents have been purposefully selected: purposeful sampling is a technique widely used in qualitative research for the identification and selection of information-rich cases for the most effective use of limited resources (Patton, 2002).

We defined two sampling criteria to collect our documents:

1. Documents were selected in a period of time going from 2020 to 2023.
2. Institutional reports were collected from all the public and semi-public agencies and political bodies (institutions as well as representatives) that intervene directly or indirectly in matters or domains linked to higher education, R&D and innovation, science and technology or industrial and regional development. Following this logic, we aim to build our data analysis on the definition given by Hamdouch, & Moulaert (2006). In their study institutions are considered as regular and lasting collective norms of behaviour and interaction play a crucial role for innovation and knowledge creation/accumulation/diffusion processes within a specific geographical space.

To support our analysis, data triangulation has been employed: this technique involves the use of different sources of data to examine phenomena across settings and at different points in time (Denzin, 1970). The documents have been analyzed in Italian language and then translated into English. Subsequently, a content analysis has been realized: this technique makes replicable and valid inferences from data to their context (Krippendorff, 1989) and moreover, it is reproducible with the document analysis methodology which is often used in combination with other qualitative research methods as a means of triangulation

(Bowen, 2009). Afterward, descriptive, and interpretive encoding has been performed using the software for qualitative analysis MAXQDA 2020. Emerging themes have been analyzed and discussed among the authors to present our results in the finding section. This approach was employed to explore emerging factors affecting Skyrme's (1999) theoretical framework and knowledge creating process as a whole.

The results of the case study are presented in a narrative form, in the next section.

#### 4 Findings

Our findings are summarized in this section. They emphasize three different institutional levels of impact and three emerging themes for each code:

1. **Sustainable Level:** support and education projects on sustainable topics; reducing food and water wasting; encouraging renewable energies.
2. **Digitalization Level:** absence of investment in e-commerce platform for small-medium enterprises; aligning digital competencies and investments; food traceability; food traceability (Logistics and Blockchain).
3. **Contingent Level:** institutional support size-based; institutional sustainability; special focus on Mezzogiorno Regions.

Table 1: Sustainable Level

Type of Document, Name, Year	Text	Code
Institutional report; Obiettivo 2030 Earth Day Italia; 2022	The project support 60 farms in the Siense territory in a process of growth and introduction of new precision agriculture tools for sustainable development in the areas of viticulture, olive growing and cereal growing.	<b>Support and education projects on sustainable topics</b>
Online Journal Bologna Today; Nasce 'Food-ER': atenei e imprese insieme nell'università dell'agroalimentare; 2023	'Food-ER, Emilia-Romagna International Network for Education and Industrial Research on Food and Beverage' is the network wanted by the Region that brings together first and foremost the four regional universities, the founding partners: of Parma - project leader -, Modena and Reggio Emilia, Bologna, Ferrara.	

Online Journal Agrifood.tech; Innovare il settore agrifood con il digitale per indirizzare le sfide globali di sostenibilità, tracciabilità e sicurezza; 2023	NRP, which allocates 1,200 million euros to the chapter "Supply Chain and District Contracts," setting itself the goal of reducing the use of pesticides; boosting organic farming; and reducing food losses and waste.	<b>Reducing food and water wasting</b>
Institutional report, Investimento 4.3 - Investimenti nella resilienza dell'agrosistema irriguo per una migliore gestione delle risorse idriche; 2022	The objective of this measure is to increase the efficiency of irrigation systems through the development of innovative and digitized infrastructure for a more sustainable agricultural sector that is better adapted to climate change. The investment will consist of converting irrigation systems to more efficient systems; upgrading distribution networks to reduce losses; and installing technologies for efficient use of water resources, such as meters and remote-control systems. For each intervention on distribution networks, meters enabling the measurement of water uses must be provided or installed as part of the financed investment.	
Report Istat; Economia e Legislazione agricola: L'agricoltura non aggancia la ripresa ma può contare su misure straordinarie; 2022	The Agrisolar Park aims to encourage the production of renewable energy through the modernization of rooftops of buildings for productive use in the agricultural, livestock and agro-industrial sectors, thereby increasing sustainability, resilience, green transition and energy efficiency in the sector.	<b>Encouraging renewable energies</b>

Table 2: Digitalization Level

Type of Document, Name, Year	Text	Code
Institutional report; Obiettivo 2030 Earth Day Italia; 2022	Only 30 percent of companies had invested in the e-commerce channel. The phenomenon of digital transformation is affecting any market: agribusinesses should also turn to online sales channels.	<b>No investment on e-commerce platforms for Small-medium enterprises</b>
Video interview Dr. Stefano Firpo, Chief of Cabinet of the Minister of Digital Transition; "PNRR E DIGITALIZZAZIONE DELLE PMI, QUALI OPPORTUNITÀ PER L'AGROALIMENTARE"; 2021	For our best companies we need to act on two fronts to have a greater capacity to absorb technologies and a greater capacity of our people to have the culture and skills adapted to the undergirding of these technologies because without these two things together we create bottlenecks. The national resilience recovery plan seeks to address this dual asset by investing heavily in technology as well to the mentioned some pillars for small and medium enterprises.	<b>Aligning digital competences and investments</b>

Online Journal Agrifood.tech; Innovare il settore agrifood con il digitale per indirizzare le sfide globali di sostenibilità, tracciabilità e sicurezza; 2023	It is noted that the areas most affected by 4.0 are those of production, logistics and food traceability; in which projects based on technologies such as Blockchain are spreading, to which agrifood is increasingly looking at with greater interest. In this regard, Corbo points out that globally, agrifood remains one of the sectors with the greatest presence of blockchain projects, testifying to how this technology can bring value to the sector.	<b>Food traceability (Logistics and Blockchain)</b>
Ministerial decree, Sviluppo logistica agroalimentare nelle aree portuali, 2022	Logistics development for agribusiness, fishery and aquaculture, forestry, floriculture and nursery sectors, with special reference to the purpose of agribusiness logistics development in port areas, to which resources amounting to 150 million euros are dedicated from PNRR funds.	

Table 3: Contingent Level

<b>Type of Document; Name; Year</b>	<b>Text</b>	<b>Code</b>
Ministerial decree; Contratti per la logistica nei settori agroalimentare, pesca e acquacoltura, silvicoltura, floricoltura e vivaismo; (D.M. 13 giugno 2022)	Aid intensity to strengthen logistics and storage systems, reduce environmental and economic and support productive processes is determined according to the Company size.	<b>Institutional support size-based</b>
European Regulation; Regulation (EU) No 651/2014 in the field of research, development, and innovation; 2022	Aid exempted in the field of research, development, and innovation. Higher maximum aid intensity for small and medium-sized enterprises than for large enterprises	
Video interview Franco Garofalo Managing authority PSR Umbria 2014-2022; Dialoghi con le Istituzioni: i focus sul CSR per l'Umbria 2023 - 2027 ad AgriUmbria 2023; 2023	We must not forget another kind of sustainability, the "institutional sustainability", that type of sustainability that puts the institutions - in particular the region of Umbria in building a program always closer to the citizens, always closer to the farmers. Clear rules and simple ones that can be somewhat welcomed and favorable in some way by the agricultural entrepreneurs in our region.	<b>Institutional Sustainability</b>

Institutional report; Gazzetta ufficiale della repubblica italiana 18/08/22 Tab 2A; 2022	Investment aid in the processing of agricultural products and commercialization of agricultural products. Maximum facilitation to Less Developed Regions and all regions whose gross domestic product (GDP) per capita during the period from January 1, 2007, to December 31, 2013, was less than 75 % of the EU-25 average for the period but greater than 75 % of the EU-27 average GDP	<b>Special Support to “Mezzogiorno” Regions</b>
Ministerial decree; Contratti per la logistica nei settori agroalimentare, pesca e acquacoltura, silvicoltura, floricoltura e vivaismo; (D.M. 13 giugno 2022)	Aid intensity is determined according to the Location of investment. Basilicata, Calabria, Campania, Apulia, and Sicily receive 10 % more than the other Italian regions	

#### **4.1 Sustainable level**

At this level, data (Tab.1) suggest that institutions play a key role in the knowledge creation process. First, by supporting existing and entrenched agri-food companies by directly adopting different technologies *in situ*. Second, by creating high-level training pathways for younger generations: the transition to sustainability, moreover, makes it necessary for emerging courses in higher education institutions to be contextualized at the sectoral level so that knowledge can be catalyzed within the organization. In fact, according to Istat (2021) a targeted education also greatly affects company innovation in the Italian scenario. In the case of a company led by people with a secondary education degree with an agricultural focus, the incidence of innovation is more than twice as high (23.9%) as the average value, and three times higher in the case of tertiary education degree specializing in agricultural subjects (30%). In addition, issues of wasting water and food must be part of the initial strategic objectives, and investments in instrumentation that can simultaneously increase product quality while reducing waste - and implementing renewable energies - follow this logic.

#### **4.2 Digitalization level**

The results, at this level, are ambiguous (Tab.2). On the one hand, the difficulty of small-medium enterprises in following the pace of large companies in terms of process digitization clearly emerges. The role of institutions in supporting knowledge creation processes takes the form of providing distinctive skills to

students and workers to avoid dangerous bottlenecks. This phenomenon had a significant impact during the pandemic period, creating substantial performance differences between small and large companies, and between companies in northern and southern Italy. Supporting our analysis, Istat (2021) report underlines the spatial distribution of IT equipment continues to penalize the Mezzogiorno Regions, (in this paper Mezzogiorno is composed by Basilicata, Calabria, Campania, Molise Puglia, Sicilia, Sardegna) which still suffer from a large gap compared to the Center, the Northwest and especially the Northeast part of Italy. Government support is maximum in the field of Blockchain, moving along the entire agri-food chain to encourage product traceability, avoiding the phenomena of "Made in Italy" brand counterfeiting, as well as ensuring increasingly high-quality standards.

#### **4.3 Contingent level**

It seems clear, as reported in the last section, that support from institutions concerning grants and financing takes on different values depending on whether small or large enterprises and between northern and southern enterprises (Tab.3). Aid moves on the spectrum of creating a balance at the country-level. Despite these interventions, it must be reported that according to Istat (2021) Italian agri-food sector is experiencing a reduction in absolute numbers of companies but a larger average size. Furthermore, while in previous sections we have emphasized the importance of aligning workers' skills with regulatory interventions according to a top-down approach, an interestingly different perspective emerges. Our findings extend the concept of institutional sustainability proposed by Brinkerhoff & Goldsmith, (1990) in their study on agricultural and rural development. These two authors define institutional sustainability in the ability of these entities to provide stakeholders with a continuing stream of benefits: our study emphasizes the importance of building subsidy measures on the concrete ability on the part of agri-food workers to clearly take in, at the beginning of the knowledge creation process, regulatory provisions and inputs from the external environment.

## 5 Discussion and conclusions

This research will contribute to the field of KM on both a theoretical and practical level.

First, this research advances our understanding of the influence of the institutional frameworks on the knowledge creation process in the Italian agri-food sector. Second, it emphasizes the importance of extending the knowledge creating theories by applying an institutional lens that can contribute to finding new emerging themes in order to apply this theory to the investigation of the antecedents of SEIs. Third, it will be beneficial to supply and motivate other studies and research in complementary fields, where our findings may be useful to respond to similar socio-economical contexts that received substantial support from the institutional framework in the knowledge creating process. Furthermore, through our research policymakers will be able to study ad hoc steps to enhance worker competencies: although higher education institutions are designing educational frameworks to create more and more trained professionals, it is clear that there is a lack of sufficient interventions aimed at supporting small and medium-sized enterprises in building workers competences in line with today's digital transition - rather than sustainable transition - that they risk being swallowed up by the larger ones because they cannot access specific know-how.

Several limitations exist in the research. First, the scarcity of data combining knowledge creation processes and institutional theories in the agri-food business does not allow in-depth analysis to be conducted. Second, given the exploratory character of the study, the authors' data collection and interpretation may be vulnerable to criticism and prejudice. Third, it is difficult to isolate institutional influence on the knowledge creation process without exploring how institutions affect the subsequent stages of knowledge management process framework reported by Skyrme (1999) given the high interdependence between these stages. However, these limitations provide opportunities for further research.

Future research can 1) motivate our studies in this area, adopting an institutional lens to the other phases of KM processes 2) conduct the same analysis in the EU area in which the institutional frameworks might be different 3) realize a longitudinal study to understand how KM processes, and more specifically the knowledge creation processes have been changed in the last decade.

### **Abstract**

The present paper intends to advice readers about the potentialities of aluminium roofing systems in terms of general sustainability, recyclability, and achievement of energy requirements. The use of metal sheet panels for buildings roofing and cladding has been progressively increasing since the very beginning of the last century. Nowadays, several different products are available on the market, either basic or even highly engineered, in different materials, shapes, colours and, of course, prices. Among these, aluminium alloy

systems play a major role thanks to the material's inherent characteristics. For what concerns sustainability, aluminium production allows to use high contents of recycled material resulting in a reduction even over the 95% of the energy required in the process compared to the bauxite ore extraction and raw metal production. The total and theoretical infinite and degradation-less recyclability of aluminium when compared to other metals used in the roofing systems industry makes it easily preferable overall. Such solutions can either concern new roofs covering or refurbishment of existing ones. In the latter case, lots of construction waste is usually generated and eventually ends up in landfills. Instead, aluminium alloy roofing systems allow to be fully recycled and reused at the end of the service life, which is already longer than other non-metallic products, eventually reducing waste transferred to landfills. In fact, the higher cost of such material is largely compensated by its service life expectancy, which is among the longest lasting roofing materials and can reach up, in certain conditions, even to a hundred years. For this reason, complete replacement interventions are still quite uncommon, which favourably contributes on the final environmental impact of the roofing system. In this respect, aluminium alloy systems are particularly suitable, especially when compared with other different solutions, towards design for recyclability. Furthermore, aluminium systems are also indicated for rainwater harvesting purposes, as their surface retains less pollutants than other traditional porous materials and is less likely to give place to mold or concentrated collection of polluting particulates.

## 1 Introduction

With a view to improving the overall quality of building, they are also required to be efficient and functional over their whole service life to fulfil sustainable requirements, where a key aspect is the selection of materials, which must be of high-quality while non-toxic, recyclable, cost and energy-efficient and functional (Radlbeck et al., 2018). Among many different solutions available for buildings roofing or cladding, the use of metal sheet panels systems has been progressively increasing since the very beginning of the last century due to their good compliance with such requirements and the perfect compliance with flat or curve surfaces (Figure 1). Nowadays, several different products are available on the market, either basic or even highly engineered, in different materials, shapes, colours and, of course, prices. Among these, aluminium alloy systems play a major role thanks to the material's inherent characteristics.

Figure 1. Technogym headquarter in Cesena, Italy (source: Arketipo).

In fact, for what concerns sustainability, aluminium production allows to use high contents of recycled material (generally >85%), resulting in a reduction even over the 95% of the energy required in the process compared to the bauxite ore extraction and raw metal production (Radlbeck et al., 2018), which also results in a heavy reduction of water and air pollution (considering  $SO_x$ ,  $NO_x$  and  $CO_2$  emissions) up to the 95% (The Aluminium Association, 2023). The total and theoretical infinite and degradation-less recyclability of aluminium, when compared to other metals used in the roofing systems industry (such as steel, copper, zinc alloys, etc.), makes it easily preferable overall. In this regard, recycling is widely assumed to be environmentally beneficial, although the collection, sorting and processing of materials into new products could also entail significant environmental impacts (Craighill and Powell, 1996), thus they must be carefully considered.

In the view of energy performance optimisation, such solutions are also perfectly suitable to allow for the integration of photovoltaic modules (see Figure 2 and 5), either in co-planar or tilted configurations (Scrinzi et al., 2022), without perforating panels and instead using specific anchor clamps provided by manufacturers. This makes the use of such systems particularly intended for large, flat roofs or long slopes, also ensuring an efficient maintenance and an optimum reliability in terms of fire safety.

*Figure 2. Fiera Milano exhibition centre (Rho-Pero, Milano, Italy) pavilions provided with roof-top tilted photovoltaic modules strings.*

Roofing interventions can either concern new roofs covering or refurbishment of existing ones (Scrinzi et al., 2022). In the latter case, lots of construction waste is usually generated and eventually ends up in landfills. Instead, aluminium alloy roofing systems allow to be almost fully recycled and reused at the end of the service life, which is already longer than other non-metallic products (The Aluminium Association, 2023), eventually reducing waste transferred to landfills (Figure 3). In fact, the higher cost of such material is largely compensated by its service life expectancy, which is among the longest lasting roofing materials and can reach up, in ordinary conditions with extremely limited maintenance, even to a hundred years. For this reason, complete replacement interventions are still quite uncommon for projects realised in the last decades.

*Figure 3. Demolition of Heathrow Terminal 2 (source: Stacey, 2015).*

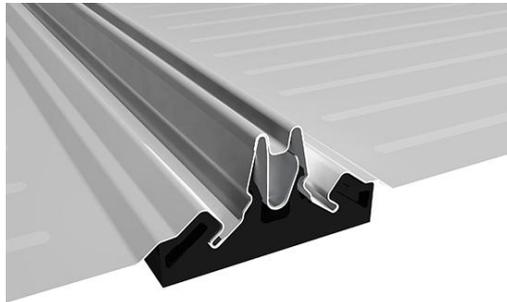

Furthermore, aluminium systems are particularly suitable to be used for rainwater harvesting purposes, as its surface retains less pollutants than other traditional porous materials (Mendez et al., 2010) (e.g., clay or stone tiles, asphalt shingles, etc.) and is less likely to give place to mould or concentrated collection of polluting particulates.

All the characteristics mentioned above make the use of aluminium a sustainable solution for roofing (also in general for construction) and particularly favourable towards the achievement of energy/sustainability certifications of buildings such as LEED (Leadership in Energy and Environmental Design), WELL (certification developed by the International WELL Building Institute), BREEAM (Building Research Establishment Environmental Assessment Method).

## **2 General characteristics of aluminium alloy roofing systems**

Aluminium roofing systems have extremely interesting potentiality in terms of sustainability, recyclability, and achievement of energy or environmental impact requirements, which made the use of metal sheet systems for roofing has become more and more common over the years for buildings of any kind and size (Lucchini, 2000).

The most common systems are those referred to as "standing seam", which are made of metal sheet coils profiled to obtain slender panels, generally with the same length of the slope. For aluminium alloys, depending on the roof usage, the environment and the in-service stresses, the sheet thickness generally ranges between 0,7 and 0,9 mm. Such panels can be anchored to the support using screws or equivalent connectors applied along the seam overlap (only for small roofs) or by special clips, specifically shaped to fit the panels profile, in turn screwed to the structural support. The latter category represents a necessary evolution of the basic plain metal sheet panels fixed onto a structural support, quite effective for small simple structures but less suitable to be used on large surfaces with significantly long slopes or complex buildings as they are not enough reliable for that purpose. Systems made of panels connected to the support by clips have had a wider application as they easily comply with different support types and envelope shapes (Bellini, 2012). Support clips, depending on the project requirements, are generally made of low-friction resin or aluminium alloy. In the latter case, they are fully recyclable as well.

*Figure 4. Example of a 3-pieces snap-lock standing seam roofing system components (source: ISCOM SpA).*

The most innovative and well performing solutions available on the market adopt a snap-lock seam (two or three pieces) that provides the underlapping edge with a draining duct which guarantees an additional protection against water leading it to the eave in the case of small penetration through the panels seam, reasonably due to minimal production defects or to the wind pressure, also acting as a wind decompression chamber. Hence these are particularly suitable to be installed even on very low slope roofs (Scrinzi et al., 2022).

As stated before, aluminium alloy roofing systems easily allow for the installation on their top of coplanar or tilted photovoltaic strings. Photovoltaic modules are generally installed in both cases on aluminium frames, in turn attached to the roofing panels by using specific friction anchor clamps (Figure 5) without need of drilling and therefore avoiding any potential water seepage issues.

*Figure 5. Example of tilted PV strings attached onto a flat standing seam roof.*

### **3 Aluminium alloy roofing systems and sustainability**

High-efficient buildings with low or zero energy consumption result nowadays to be way more environmentally impactful in the extraction of raw materials, production, transportation and end of life demolition and disposal stages, rather than in their service life. Therefore, it should be investigated how to achieve a reduction in such impact. The “Design for Disassembly” (DfD) is a principle applied during the design process that results in the detailing of reversible joints, connections and attachment mechanisms between building materials and components, thus enabling future reconfiguration, relocation, reuse and recycling. DfD approach eventually offers the opportunity to reduce the environmental impacts associated with both resource consumption and solid waste generation (Cruz Rios and Grau, 2020).

Aluminium roofing systems meet the DfD concept very well. In fact, the systems are designed to facilitate future changes and dismantlement (total or partial) for recovery of systems, components, and materials, thus ensuring a recycle as efficient as possible at the end of their lifespan. As described in chapter 2, a typical aluminium standing seam metal roof is installed on a structural support using a combination of metal/resin clips, fasteners, metal flashings, and of course metal sheet panels: all these components can be easily disassembled and therefore, if disposed properly, only a small fraction of the roofing waste will end up at the landfill.

Moreover, it should be highlighted that, for example, considering other typical roofing systems for residential projects, clay tiles and asphalt shingles roofs have a typical life span, respectively of about 30-40 and 15-20 years, while metal roofs can last even up to 100 years. The long-life span also means that an aluminium metal roof can result in a lower life-cycle cost. Usually, a metal roof is more expensive than roofs made with clay tiles or asphalt shingles but considering the savings due to its low maintenance requirements and durability, the total cost over its life span can be significantly less. While clay tiles and asphalt shingles could be recycled to be used as a filling compound and road hot mix asphalts, they still often end up in landfills. The recyclability of aluminium facilitates instead a closed-loop material flow.

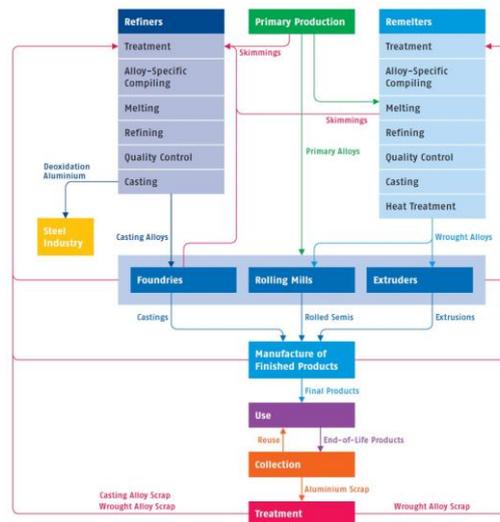

Within an LCA, there are two approaches for assessing the benefits of recycling:

1. the recycled content method;
2. the end-of-life recycling method.

The recycled content method analyses where a material was sourced and measures waste diversion with the aim to promote a market for recycled materials which use is slightly diffused and often uneconomic. In 2006, all the metals industries recommended the end-of-life recycling method as the most appropriate for materials that fully maintain their material qualities when recycled time and time again (Atherton, 2007).

The end-of life recycling method is instead based on a product life cycle and material management perspective, assessing the destination of such products after their service life and the resultant material output flows.

The energy saved in the processing of new products thanks to the use of high ratios of recycled material can be recognized and rewarded in significant projects. For example, LEED rating considers the recycled content of the materials used. This recycled content is defined as the "Post Consumer" recycled content plus half the "Post Industrial" recycled content of building materials. Under the LEED program a building receives 1 point if the average recycled content of all the building materials used in the project is at least 5%, and 2 points if it is at least 10%. Since metals and particularly aluminium alloys can generally contain high volumes of recycled material (Figure 6), way higher than the average content in most of construction products, they may be helpful in obtaining specific environmental certifications.

\* Wrought alloys used by remelters have a different chemical composition from those used by refiners

Figure 6. Stages in the production of aluminium components, including recycling (source: Stacey, 2015)

In order to investigate the impact and the possible advantages of aluminium alloy systems, the LCA (Life Cycle Assessment) methodology (Roy et al., 2022; European Aluminium, 2023) should be used. LCA is a standardized and internationally recognized method for the environmental effects evaluation of a product, process, activity or service. A complete LCA should include all phases of the life cycle (in the construction sector: production of elements/components, transport to the construction site, building construction, building use/maintenance, demolition and waste disposal/reuse/recycle), requiring a considerable amount of time and economic resources. For this reason, the LCA can be limited to a few phases, by specifying the considered system boundaries and the neglected processes. In this regard, the following possibilities can be considered:

- *from cradle to gate*, i.e. from the raw materials extraction to the final product leaving the production plant;
- *from cradle to grave*, which is the entire life cycle of the product, from raw materials extraction to the end of life;
- *from cradle to cradle*, when the product disposal at the end of its life is a recycling process;
- *from gate to gate*, therefore limited to the production phases, from the entrance gate to the exit gate of the plant;
- *from gate to grave*, from the plant exit gate to the end of life.

The methodology standardization introduced by ISO 14040 and ISO 14044 enables to perform and certify a LCA and guarantees the completeness, reliability and reproducibility of the analysis. The most complex and delicate part of the LCA is the data collection, since it is hard to find reliable and updated information regarding the analysed processes. However, in recent years, some databases have been created by different Research Institutes, collecting international, national or local data regarding the production of different materials and products. Moreover, producers themselves have started endowing their products with environmental certificates, such as the Environmental Product Declaration (EPD). These documents certify the environmental impact of the product or system analysed.

The life-cycle stages are identified by the standards in the following way:

- A1-A3, product stage;
- A4-A5, construction process stage;
- B1-B7, use stage;

- C1-C4, end of life stage;
- D, resource recovery stage.

For instance, Figure 7 shows the impacts expressed in terms of GWP (Global Warming Potential), PERT (Primary Energy Renewable Total) and PENRT (Primary Energy Non Renewable Total) of an aluminium alloy roofing system related to the stages A1-A3, C1-C4, D. Stages B1-B7 are not included since the product does not require any maintenance, repair, replacement, refurbishment, if correctly designed and installed. Regarding phase C, the system is disassembled with the use of an electric screwdriver and a crane, then the metal panels are sent to recycling directly without any processing, while the locking system is sent to landfill. Module D calculates the potential environmental benefits of the recycling or reuse of materials. The Net Value is the sum of the impacts of all the stages and represents the final impact of the product considering the whole life cycle.

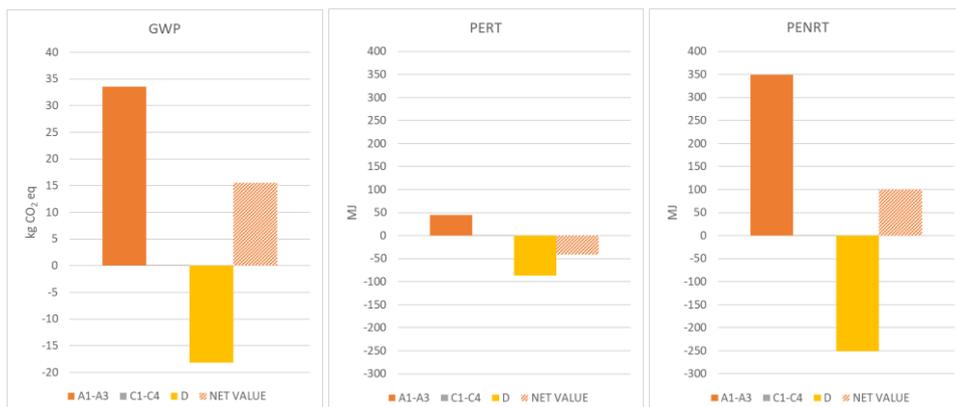

Figure 7. GWP (Global Warming Potential), PERT (Primary Energy Renewable Total) and PENRT (Primary Energy Non-Renewable Total) of aluminium alloy roofing systems related to the stages A1-A3, C1-C4, D. The net value is the sum of the impacts of all stages (source: ISCOM, 2022).

#### 4 Conclusions

As presented above, standing seam roofing systems made of aluminium alloy present optimum characteristics in terms of recyclability and general sustainability. Recycled material content in newly manufactured aluminium products can reach over 85%, resulting in a 95% reduction of the process energy demand and the water and air pollution considering SO<sub>x</sub>, NO<sub>x</sub>, and CO<sub>2</sub>.

emissions. Moreover, the recycling process is theoretically infinite and degradation-less.

The service life expectancy for such systems just with basic maintenance duty is one of the highest among roofing materials, reaching up in optimum conditions even to a hundred years. They are also capable to easily allow for the integration of photovoltaic power plants in different configurations with good aesthetic results and without compromising at all the roof durability over years.

Rainwater harvesting is also possible and particularly indicated for such systems due to the minor pollutants collection on metal panels' surface and the less likelihood to give place to mould.

The use of such systems is particularly encouraged even in complex projects, either for flat or curve roof geometries, in order to comply with specific certification (such as LEED, WELL, BREEAM) requirements.

Standing seam roofing systems are also perfectly meeting the "design for disassembly" principle, as construction joints are fully reversible and not permanent. In this way, metal panels can be easily detached, reduced in smaller parts and transferred to recycling facilities, as well as support clips in case they are made of aluminium alloy too, eventually drastically reducing the quantity of materials conferred to landfills.

The material production stage (A1-A3) is the most impactful phase in terms of GWP and Primary Energy (PERT+PENRT) use. However, by considering the whole product life-cycle, a reduction in the global impact is achieved thanks to the material recycling, with approximately 55% and 85% decrease in GWP and Primary Energy consumption, respectively.

### **Abstract**

The research identifies the essential fintech solutions available in the Islamic nations and the shaping factors that are classified based on the economic growth. For accomplishing the goals of the current study, a qualitative secondary research survey is conducted. The study involves collection of 30 research journals from the leading Islamic web sites. Data have been analyzed for shaping perspectives of economic development as per Sharia Law. The results indicated that there is a need for development of existing services and enhancing the use of fintech technologies. The proper regulation of cryptocurrency based on Sharia compliance was analyzed and the study findings indicated that Islamic entrepreneurship needs to emphasise more on the technology development and marketing. The overall shaping prospects and regulations parameters for the Islamic digital economic system are processed as per the Sharia law and the beliefs of Muslim people. The study states that the Economic factors such as Fintech, Cryptocurrency, and Entrepreneurship must be more transparent, cost-effective and must provide effective customer satisfaction.

## 1 Introduction

Financial technology (Fintech) has gained immense popularity and is considered as a developing segment of the modern finance industry. In the banking and financial sectors, financial technology has gained immense traction and is the quickest expanding technology. Fintech refers to the use of cutting-edge technology in the financial world. Fintech effectively adopts the disruptive innovative technologies to provide financial services. It can be defined as a form of financial solution to the economic issues that are relevant in context of the advanced technologies and helps in addressing the investors' demand for enhanced safety by creating unique and efficient financial products. Another important reason for Fintech's popularity is the demand for more economical payment systems that provides flexibility and speed (Anikina et al., 2016).

Through open accessibility, reduction in cost, elimination of intermediaries and quicker availability of financial statistics, fintech seems to have a positive impact on the quality of existence. In fact, fintech services emerge as a potential solution to connect all those individuals who are not represented by traditional financial services. The 2008 global financial crisis was the primary reason that evoked the development of financial technology (Haddad, 2018) and provoked the Islamic economic technology to emerge as a medium for economic crisis rehabilitation. Consumers made wrong financial decisions during the Global Recession and, consequently, the need for solutions that provide consumers with much more certainty in regards to financial investments emerged. The majority of Chinese banks and financial institutions are concentrating on enhancing the technological and financial services, by investing in domains like artificial intelligence, blockchain, and big data. Fintech has grown significantly as a result of the widespread adoption of digitalization. The financial technology business has displayed immense advancement since 2011.

Fintech additionally assists in the collection and distribution of Islamic social finances including infaq, sadaqah, and waqf (Alam, 2019). Financial services give the Islamic banking system and other shariah-compliant financial organisations the optimal potential to grow in magnitude and depth by utilising technology advancements, boosting revenues, and offering clients and customers with comfort and efficiency in business operations. Fintech could assist Islamic Finance Institutions (IFIs) to compete on a global scale and consequently acquire more customers. Although, a small portion of individuals prefer to conduct business in

a physical location. As a result, Islamic finance considers the possibilities of conducting business through the online platform.

Fan et al. (2019) asserted that even though Islamic economic nations have a lot of economic inclusivity, nations with traditional finance have a huge amount of financial technology consumers. Fintech is used to provide Shariah-compliant services and operates as per the consumers' convenience, is swift and much more affordable over other options because it is supported by technological innovations (Todorof, 2018). As defined by Navaretti (2018), Fintech includes four categories: (i) investment management systems, such as trade; (ii) insurers; (iii) credits, deposit, and wealth facilities; and (iv) transactions, clearance, and settlement services which includes virtual currencies.

Cryptocurrency is an emerging new virtual payment method that is startling the banking world with its global spread. Since 2008, cryptocurrency has grown in popularity, with over 1,000 distinct currencies presently in circulation and an ever-increasing market valuation as a result of its purported rising popularity (Gantori et al, 2018).

In 2009, Satoshi Nakamoto issued a policy statement discussing the significance, approach, and programme code for blockchain technology implementation (A brief history of cryptocurrency, 2018). For first time, a program enabled unrelated transactions to transfer virtual currency on a real-time basis without a potential source was developed. Following this, the nodes in the network register the transaction inside a distributed public repository known as blockchain (Biella and Zinetti, 2016).

Virtual currencies were the creation of such a Block Chain Management System (BMS) that is a conscious framework for exchanging numeric data from one address to another. It may appear difficult for the currency to be erased in transmission among the different wallets and for these transactions to be double-spending. Although, the emergence of cryptocurrencies has grown throughout the globe, there have been a diversity of regulatory responses. Because restrictions vary from country to country, there is a great deal of variation in the availability of bitcoin. Countries such as China and the Philippines have prohibited the use of cryptocurrencies, while some countries have allowed full access to cryptocurrency trading. Moreover, other countries have regulated the use of cryptocurrency (Hua and Zheng, 2019). Islamic banking offers a variety of customer details, one being foreign currency trading, also known as al-sharf. Currency exchange trade is already regulated under Islamic banking regulation.

The global commerce of products or services between states has given rise to international trading activities.

Every nation has certain laws and it varies from one another in respect to the deviations in the markets between these nations, leading to exchange rate evaluations. Although it is usually necessary to exchange currencies (Al-Sharf), typically among the same currencies, either between separate means of payment or for a distinct range of elements as specified by Rivai (2011). As the Islamic Finance industry develops, there is a high chance for the emergence of new technologies. In this context, one of the most exciting developments that have had a major influence is the emergence of Cryptocurrencies. Moreover, with the emergence of Blockchain technology, a new approach for Islamic banking and finance based on Shariah or Islamic Law has emerged. Islamists are more concerned about entrepreneurship, that is regarded as the most crucial aspect in the financial survival and growth of organizations. Entrepreneurship is the most important factor in the development of the economy and expansion. Governments with a strong entrepreneurial culture see rapid expansion in all areas, including occupation, revenue, technical advancement and balanced wealth distribution, stability and socio-economic sustainability. Moreover, in order for companies to operate effectively, knowledge management needs to be supported by technology. Knowledge management can be enhanced by technologies that creates innovative techniques, methods, processes, and strategies in order for the creation, dissemination, sharing, and applying of new knowledge, anywhere, anytime, across internal and external teams, and/or organizations, particularly to their stakeholders, suppliers, partners, users, etc. Because of the extensive importance of entrepreneurial behavior in economy and culture, Islam proposes the idea of entrepreneurship as a religion. In comparison with traditional entrepreneurship, Islamic entrepreneurship is more dynamic and holistic (Shinkafi and Ali, 2018). In contrast to the traditional entrepreneurs, that relied exclusively on financial gains, the aspect of Islamic entrepreneurship targets socio- economic growth. The primary aim of the current study is to identify the significant prospects for the Islamic digital economic system as a result of proper regulation of cryptocurrencies, fintech and entrepreneurship.

The rest of the paper discussed as follows: chapter 2 deals with the relevant literature review on the adoption of FinTech, blockchain, and cryptocurrency among Islamic Entrepreneurs as well as how these technologies have impacted the economic development of Islamic finance sector; chapter 3 deals with the

methodology that this study adopts; chapter 4 discusses with the analysis and findings of the current study; and the final Chapter 5 provides the conclusion for the study.

## **2 Literature Review**

### **2.1 Islamic-based Fintech adoptions**

Throughout the Islamic nations, Islamic finance, particularly, the Islamic FinTech has displayed a positive future and influential impact. The emergence of financial technology in such countries has been encouraged by the evolution of smart and digital assistant technology (Hua and Zheng, 2019). According to Brian et al. (2017), such possibilities hold immense risks. The major challenge for Islamist financial services is a lack of strong and solid studies in the field, as well as inadequate laws. According to another study conducted by Firmansyah (2018), the existence of Muslim Fintech startups could effectively assist entrepreneurs. Although it is a significant benefit for fresh graduates, few firms offer Sharia-compliant funding to extremely competent financing prospects.

Since 2008, financial services have grown at twice the rate in the European area, nearly triple the rate in Silicon Valley. During 2011, the number of financial technology operations within the UK increased, accounting for more than half of all international transactions (Skan, 2014). There's still an opportunity for future fintech businesses that can be realized across a financial service provider and client respect. It is important for the formation of financial organizations and banking institutions for the growth and development of Fintech startups could provide consumers with the opportunity of using both banking services and innovative new support offered by financial institutions (Gomber, 2018). Financial services companies have allowed existing banking sectors a chance to offer low-cost digital financial services. Islamic financial technology is built on Sharia's values and ethos that have the capacity to influence the global financial sector. The most significant benefit of Islamic Financial technology is that it's open, easily available and simple to use (Laldin, 2018).

Due to the obvious features of Islamic finance that have evolved as a substitute for traditional financial services, the global economic crisis had no impact on the financial process of the Islamic banking system. With such a rise of Sharia financial technology, Islamic financial institutions have the ability to improve the financial

world and establish themselves as independent financing with increased accountability and high ethical standards (Satyawati et al., 2017). As examined by Arize et al. (2018), technological advancements are simply the beginning of what is to follow in the banking and financial industries. Islamic financial institutions must be willing to test and adopt new things. Sharia-compliant Islamic Finance has the opportunity to encourage 150 million new clients over the next 3 years (Wonglimpiyarat, 2017).

Moreover, this is estimated to rise even more as analysts predict a rise in Muslim population expansion, also with the population of Muslims were expected to exceed three billion by 2060 (Cooper, 2018). According to research conducted by Cooper (2018), Indonesia, Malaysia, and the United Kingdom presently occupy the top 3 positions in terms of Islamist financial institutions. Another study conducted by Rusydiana (2018) highlighted a shortage of skilled human specialists as the most important hurdle to the introduction of Islamic financial technology. The number of economic service centers wherein Islamist financial technology could be related, for instance, cryptocurrency, blockchain technology as well as other fields like cross-border transactions could be related to the success of Islamic financial technology. Muslim Financial services have to adapt to the rapid growth in the traditional financial sector. Since the primary assumption of financial technology investment is in accordance with the standards established under Sharia law, Islamic banking offers more possibilities than financial services.

Islamic Financial services share the same fundamental beliefs and principles as Islamic Banking and finance (Alam, 2019). The rise of Muslim financial services expands opportunities for developing countries by providing a cost-effective alternative to the banking system. Conversely, it puts regulatory agencies on notification in order to maintain stability and protect individuals and organisations from unethical commercial practises (Saba, 2019). An effective mechanism must be established amongst university graduates who are employing technology to ensure that Islamic Financial Services flourish responsibly (Saad, 2019). Financial services should be inventive and it has to stay viable in the long term, as financial technology implementation by Islamic banking institutions influences not just the Islamic population but also non-Muslims, as well as the entire financial services sector (Irfan, 2019).

Fintech firms could be more conscious about the significant change happening the reputation in the industry, because that will have an effect on business, but

they should develop methods of dealing with all these developments (Lee and Shin, 2018).

### ***2.2 Impact of big data-related fintech on Islamic economic development***

FinTech solutions in Islamic finance must respect Islamic standards in transaction data, including transparency, avoidance of cheating, justice and fairness, deception, fraud, and so on. Authorities also should address the Compliance with shariah of financial technology functions and operations to minimize the risk of non-compliance and ensure that financial services function in a secure setting (Laldin, 2018). Technology in Islamic banking and finance must follow the same Shariah compliance standards as all other financial transactions. Financial technology solutions involve its unique system of rules to supervise the operations and processes in order to retain the integrity of Shariah-compliant financial stakeholders, satisfying societal demands to consequently reach Maqasid Shariah compliance. Given the potential of blockchain systems and the risks associated with their proper implementation as both time- and cost-saving, one of the various alternatives accessible in Islamic banking and finance is to use innovation as a motivator to build up organisations and improve efficiency (Ng and Kwok, 2017).

### ***2.3 Impact of bitcoin and cryptocurrency in the Islamic economic development***

A cryptocurrency is a form of digital currency that could be used as an exchange medium instead of fiat currency. This makes use of blockchains that creates a safe, traceable and permanent foundation for monetary transactions. According to the blockchain, the creation of extra resources is similarly regulated (Polansek, 2016).

According to Allison (2015), cryptocurrency systems, with the exception of standard central banking technologies and networking currency such as Amazon cash, should not have a centralised transmission system. Double spending is a major issue that each virtual money transfer system encounters. The term "double spending" refers to a business repeatedly spending the same amount of money. A base station maintains the account information in a digitized cash settlement system in order to prevent double-spending (Appelbaum, 2021). Virtual currency

networks do not have a centralised structure; instead, they are a decentralised system. As a result, the duty for maintaining a record and archive of every transaction, as well as all remittances, must be shared by peers, eliminating the potential of double-spending (Ameer, 2018).

The cryptocurrency payment process contains a component of gharar, since the true significance of such currencies is uncertainty, price levels are unpredictable, but there is variability within the measure of value and a proper approach for the desired value. Since the core concepts of banking indicate that gharar is also against the sharia law and therefore haram, gharar is described as ambiguity, dishonesty, and uncertainty (Abu Bakar, 2017). Gharar was an Arabic term for "selling something that does not already exist" (Ahmad, 2008). Other research on Bitcoin and other cryptocurrencies realized that because bitcoins seem to have no core value and are not regulated by a banking system, it could be easily exploited. Cryptocurrency also was regarded to be about Islam and must be banned since this undermines the central premise of the Islamic economic system which is economic equality. For such factors, bitcoins are regarded to be against Shariah and must be banned (Meera, 2018).

A large variety of digital currencies are now in circulation. Such virtual currencies might take a variety of shapes and employ a variety of algorithms. Furthermore, for such a cryptocurrency's long-term viability, legal compliance norms must be met. In this regard, a significant disadvantage of cryptocurrencies in the economy is that customers would lose money due to a lack of regulation. Each cryptocurrency must agree to and keep all essential requirements to be a protracted cryptocurrency (Billah, 2019).

Ibrahim (2017) found that the development of an Islamic virtual currency is viable. Cryptocurrencies are prohibited in parts of the world's major economies, including China and Russia, due to safety and insecurity (Siswantoro, 2020).

In Arab nations, virtual currencies face a different challenge: Shariah law compliance. Islamic countries such as Algeria, Pakistan, Morocco and Egypt had partially or entirely prohibited cryptocurrencies. The causes for such cryptocurrency's partial or full prohibition are such compatibility with Shariah Law and Religious education, about which different researchers have conflicting opinions. As a result, the purpose of acquiring cryptocurrency is an important factor in assessing whether it is permitted or restricted (Sami and Abdallah, 2020). Scholars typically believe it permissible if the major goal for inventing cryptocurrencies is to use them as an exchange medium. The researchers

investigated the greatest profit or loss achieved for the various virtual currencies that are permitted while keeping Islamic Sharia Law compliance in view.

#### **2.4 Evolvement of entrepreneurship in the Islamic finance**

According to Ramadani et al. (2015), Islam as a religion encourages all Islamists to be dynamic and productive, which are the qualities of successful professionals and entrepreneurs. Islam's primary principles support economic success by implementing correct use of the wealth provided by Allah. As a result, Shariah Law makes the distinction between what is halal and what is haram for Muslim people. According to Islam, mankind is the easiest technique of production as compared to other species, as revealed in the Holy Quran, and has been appointed as the protector of both the worlds, to not injure or cause any environmental damage.

In summary, Islamist entrepreneurship is according to Islamic law and values, as well as any business executives that follows these laws and concepts in their totality are regarded as a "Muslimpreneur" (that is a Muslim-entrepreneur). According to Gümüşay (2015), a study examining the role of spirituality in entrepreneurs and administration is lacking. Sharia entrepreneurship is a comparatively recent issue. Because of its importance in economic development and growth, it has attracted a lot of attention from scholars, academics and entrepreneurs. Prophet Muhammad believed that "Righteous business people will be the first to enter heaven," and "A truthful merchant will be raised on the Day of Judgment among the truthful and martyrs" (Azmi, 2017). Before declaring himself as a prophet, the Prophet was a businessman, a great successful entrepreneur based on honesty, integrity, trust and wisdom. Muslim women and men are highly encouraged to engage in authorized business endeavors, according to Islam. Prophet Muhammad's wife, Sayidatina Khadeejah bint Khuwaylid, was an example of a successful businesswoman. Islamist enterprise has received a booming reaction from business executives, academicians, entrepreneurs, researchers and policymakers, owing to serious concerns about environmental risks and public welfare. Islamic entrepreneurship not only helps businesses grow, but it also helps individuals trade while doing trade with people from different cultures (Shinkafi and Ali, 2018).

The value of assets held by Islamic banks was 1.7 billion US dollars in 2017; by 2023, it is expected that this figure will rise to 3.8 billion US dollars. Increasing

sharia-compliant product demand in emerging Islamic countries is the primary driver of this expansion, and the sector is getting better at meeting that demand. FinTech broadens financial access globally and, according to studies, will have a significant impact on Islamic financing. Despite the significant growth of the Islamic Fintech ecosystem, peer-to-peer lending has focused on meeting the critical demand for making Shariah-compliant funding more accessible to businesses and consumers (Panel and Gateway, 2019).

### **3 Methodology**

The present study uses qualitative research and has conducted secondary survey research from the leading journals in order to shape the economic factors. The study involves collection of 30 research journals collected from the leading websites (Science direct, Web of Science, Research scholar, Google scholar) and also 10 articles that are collected from the leading Islamist sites (Islamic fintech alliance, SPCRD, Leveraging Islamic fintech). The data collected from the relevant sites is then analyzed for the shaping perspectives of economic development as per Sharia Law.

The economic prospects are shaped by analyzing the financial aspects to achieve the objectives of this study. Furthermore, the study also explains the regulatory provisions surrounding cryptocurrencies, financial technology and entrepreneurship programs.

The current research aimed to systematically respond to all the sequenced research question that helps to structure the conceptual research framework to achieve legally correct rules and regulations concerning the cryptographic digital currencies, impactful guidance for entrepreneurial businesses and the adoption of fintech depending on the existing economic and technical data. To frame a positive reliable assessment of such framework of generating the rational ruling and influencing the economic outlook of Islamists, systematic research questionnaires in the pertinent system started with core problems and then moved into information related to encoded virtual currencies, the application of fintech solutions, and the impact of entrepreneurialism.

Some of the research questions for shaping the economic prospects of the Islamists are:

- What is the impact of cryptocurrency on Islamic finance development?

- Are cryptocurrency and virtual currency are legalized by Islamic countries?
- How much the Islamic entrepreneurship influences economic development?
- What are the difficulties in the Sharia compliance on entrepreneurship?
- Why the adoption of Fintech solutions is lagging in Islamic economic views?

## **4 Analysis and Findings**

The descriptive strategy is proposed for achieving the research objectives in the qualitative study based on the secondary survey. The methodological survey questions and data are studied in order to shape the economic growth of Islamic nations through fintech, cryptocurrency, and entrepreneurship.

### ***4.1 Benefits and Threats of Islamic Fintech implementation***

The implementation of financial technology in the Islamic religion based on the shaping prospects of economic development are stated below:

- Establish, promote and enforce the frameworks in order to encourage Islamic banking and finance technology to promote participation and confidence;
- Support a network of inventors broaden the scope of Sharia compliance and impact of Islamic society in financial innovation;
- Acceptance of nine important fintech technologies: artificial intelligence, quantum computing, big data analytics, open banking, mobile payments, peer-to-peer financing, blockchain technology, cybersecurity, and cloud adoption;
- Consider externalities as a cause of financial market failure that should be regarded as a failure of commitment and should be avoided. The institutions and regulatory bodies should enact legislations that recognise the expenditure of rules as an external burden.
- Sharia compensation, as well as a comprehensive and principle-based approach to Fintech regulation, should be examined to address and alleviate challenges that financial authorities face when supervising financial enterprises during the economic downturn.

- By considering Sharia Law, to achieve a balance between the benefits of regulation and the risk it represents in addition to the greater threat;
- Need for an effective regulatory structure that does not overlap with current legislation (Hui et al., 2019).

#### ***4.2 Shaping prospects of Islamic economy by concerning cryptocurrency***

Due to the lack of centralised regulation, cryptocurrencies differ from traditional currency and thus, all Islamic country needs build its own crypto legislation in order to effectively use cryptocurrency in the country. Eventually, the common regulation for the Gulf countries is much more important for economic development. Fraud and illegal activities should be prohibited in order to overcome negative ideology and feedbacks;

Furthermore, Sharia Law and Muslim Law relates to the evolving of cryptocurrency as a legal tender for the economic wealth of the nation. Therefore, any misconduct of a country's legislation, as well as the uncertainty regarding cryptocurrency adoption, should be regulated globally. It is not allowed to know the purpose of accumulating or investing in cryptocurrencies under Sharia law. Based on the principle and nature, the individual cryptocurrency must be analyzed before entering into the virtual currency market. The regulations are the most important perspective for effective economic development in the case of cryptocurrency (Shinkafi and Ali, 2018).

#### ***4.3 The importance of entrepreneurship in the shaping perspective***

Islamic entrepreneurship is more delegated to the development of the economic prospects of the Islamic nations.

For successful entrepreneurship, access to market analysis, business information, and connections are required. Moreover, Customer activities, operational processes, efficient marketing, appropriate communication, and distribution of data are the most important aspects of entrepreneurship (Hoque et al., 2014). To focus on shaping the entrepreneurial perspective, it is necessary to reduce the cost of internal process operations and improve customer connections and partnerships. In fact, effective entrepreneurship necessitates the development of a new platform as well as the adjustment of an existing platform.

#### **4.4 Knowledge Management in Islamic Digital Economic System**

Finding trends that will result in competitive and innovative products and services, which will then spur development and profitability, requires a significant financing in research and development as well as market research. Due to the existing macroeconomic situation, banks should have the ability to convert data into knowledge which will be taken into account when developing plans. So that the proper course of action may be taken, this information can be employed. This has been an essential action in the knowledge management industry. Knowledge management ideas have been adopted in state financial institutions by the governors of numerous central banks of Islamic nations. They came to the conclusion that the fundamental reason for putting knowledge management into practise is to facilitate the communication and information-sharing among bank personnel. The World Bank demonstrated greater success in knowledge transfer than other institutions; however, it faces several challenges due to a lack of effective knowledge integration. This can be partially caused by the challenges associated with gathering and combining various data sources. The knowledge management concept which has seen banking organisations development strategy is still in its infancy. It has further intended that knowledge management will enable workers to share information or ideas, participate more actively, and feel more empowered to find solutions to issues (Cader et al., 2013).

Raising the quality and quantity of product innovations of Islamic banking is one method to put knowledge management into practise. Further, enhanced research and training are been helpful to Islamic banking to show improved performance. This is due to the fact that the knowledge management complexity in Islamic economic system has been influenced by factors such as integrated and synthesizing knowledge factors, openness of corporate boundaries, knowledge viewpoint, and knowledge quality (Nurdin et al., 2018). Since good business value, human resources, innovation, and knowledge management, are all strongly correlated, bank digital system must engage with research organisations and share their knowledge, rather than only relying on what is already known. They must also experiment to get novel information and data and get insights from other financial institutions (Alomari et al., 2020).

Technological assistance has been crucial for knowledge management in a banking organisation. When a business has a sophisticated IT infrastructure in place and is using it, knowledge management initiatives frequently succeed. The

knowledge management process is supported by various IT infrastructures, including decision support system, document management, email, workflow software, and data warehousing. Knowledge management can also include data warehousing, brain storming applications, group goods and workflow systems, information retrieval engines, document management systems, and intranets (Nurdin, 2016).

Prior to sharing, saving, using, and improving knowledge, Islamic FinTech organizations must include knowledge management within Islamic legal principles and norms. To create a solid organisational environment, information resources have been essential (Nurdin & Yusuf, 2020). The creation of a solid organisational environment, however, depends heavily on knowledge resources. Management and organisations, however, are challenged with the challenge of navigating the information sea as knowledge and information grow and become more and more accessible via the internet. In the current banking industry, knowledge management systems have been the essential instrument. It has been crucial to stress the necessity of integrating knowledge management systems with competencies and resources if firms are to gain a sustainable competitive benefit. The development and maintenance of a sustainable competitive advantage through the innovation of products and processes requires both of these factors. Learning and resource development processes should be facilitated and updated by knowledge management systems in order to transform learning skills and core competencies into sustainable excellence (Bakar & Hashim, 2011).

#### ***4.5 Sustainable aspects of Islamic FinTech***

A commitment to environmental, social, and governance (ESG) initiatives has governed Islamic FinTech firms in their conduct as well as shaped their services. The use of sustainable investment and green financing has become more prevalent in Islamic nations (Ismail & Shaikh, 2017). Capital conversion must be promoted in sustainable ways to protect future generations, which will be reflected in the environmental determinants of capital conversion (Al Breiki & Nobanee, 2019).

A focus on integration of social determinants has also influenced Islamic FinTech, with investments made for promoting conflict and crisis management, facilitating access to healthcare, creating employment opportunities and maintaining and promoting education. Islamic FinTech has created management

audits in terms of governance initiative to measure performance based on social impact rather than profits alone. The development of new ideas and methods that are required to direct investments towards sustainable initiatives are made possible by Islamic digital economic system. The sustainable investment possibilities can be offered by using techniques like artificial intelligence, big data analytics, and similar. Moreover, the UN Sustainable Development Goals are becoming more widely known, and FinTech companies are capitalising on this awareness by articulating them in ways that are compatible with the financial and contextual requirements of Islam (Ismail & Shaikh, 2017).

## **5 Conclusions**

This study studies the qualitative data on shaping factors and perspectives of the Islamic nations by considering Fintech, Cryptocurrency and Entrepreneurship. The innovation and adoption are considered to have a positive impact on the financial services of the Gulf Islamic nations. The shaping prospects of cryptocurrency, fintech and entrepreneurship are extremely important in the Islamic world. There are efficient fintech opportunities currently processing in the development of Islamic finance. The Fintech technologies are directly related to the entrepreneurship programs that enhance the economic growth. In comparison to conventional banking and finance, Fintech technologies are much more cost-effective in banking (Lestari et al., 2020). Considering the Islamic Fintech, Cryptocurrency and Blockchain technology provide an innovative and a secure way of performing effective transactions. The Blockchain transactions are visible and transparent to every customer. Sharia Law compliance partially allows cryptocurrency regulation. The regulated cryptocurrency is accepted in all Islamic countries. In the future years, the importance and evolution of Islamic entrepreneurship will expand. Islamic entrepreneurship has received excellent feedback from business practitioners, researchers, entrepreneurs, governments, and academics.

### Abstract

Innovation capacity is considered a distinctive driver, for organizations, to face the challenges of the current, increasingly complex, scenario. In such perspective, several researchers emphasized the importance of learning orientation, knowledge sharing, and learning environment as key determinants of innovation capacity. In this vein, developing learning spaces and learning environment fostering knowledge and learning dynamics, become a key objective of public and private organizations.

In this prospect, this study aims to provide a comprehensive and holistic view of the distinguishing dimensions of a learning spaces, enriching the findings emerged from the literature review that, through the lens of a conceptual descriptive framework, identify dimensions and features that characterize effective learning spaces supporting the development of innovative capacity. The research is carried out through a multiple case study, involving learning spaces designed and developed in Finland. The findings provide an integrative picture of a descriptive conceptual framework that supports the identification of the relevant dimensions to manage and evaluate. Specifically, in terms of theoretical implications, it aims to guarantee and enhance the effectiveness of a learning space supporting the development of more effective and impactful guidelines for management and decision-making. Then, in terms of managerial and policy implications, the analysis of the conceptual model developed and discussed can be helpful to different actors aimed at developing effective learning spaces to foster innovation capacity of public and private organizations.

**Keywords** – Learning space, technology, knowledge-management, innovation capacity.

**Paper type** – Academic Research Paper

## 1 Introduction

Nowadays, public and private organizations appear increasingly committed to fostering skills necessary to deal with the challenges of the current scenario by enhancing their learning capacity. The current scenario is increasingly complex and characterized by uncertainty and volatility, therefore, organizations need to develop innovation capacity, considered a key driver for survival, competitiveness, and long-term growth and success. (Hamidi et al., 2019)

The innovation capacity is influenced by a range of factors and most of the factors are related to the processes of learning and knowledge. In fact, for an organization, learning and knowledge processes and dynamics represent the engine for the development of the capabilities for sustainability in the new business age. (Nonaka and Takeuchi, 2019; Hamidi et al., 2019)

In such perspective, several researchers emphasized the importance of learning orientation, knowledge sharing, and learning environment as key determinants of innovation capacity. (Yildiz et al., 2021)

A learning environment or learning space refers to the physical, virtual, social, and cultural context in which learning takes place. In this vein, according to the literature, new spaces to foster innovation and boost learning and knowledge dynamics are acquiring increasing importance, becoming key objectives for public

and private organizations. (Yildiz et al., 2021; Morris, 2020; Hamidi et al., 2019) The literature suggests that learning spaces are places where knowledge is created, shared, and applied; they may be described as spaces of interaction between individuals, their behaviors, and the external environment.

Different factors influenced the evolution of the learning spaces, specifically, the reorganization of spaces oriented towards the learners and the learning process, gives emphasis to the diffusion of LS supported by innovative and digital tools. (Karam et al., 2021).

The pandemic has altered the landscape and forced spaces supporting knowledge and learning dynamics to quickly evolve to meet new unexpected challenges and to fully exploit digital technology for training purposes. (Karam et al., 2021; Krishnamurthy, 2020). Therefore, LS are integrating strong technological components, to enhance the learning process and knowledge dynamics.

Despite their growing importance, the literature is fragmented and there is a gap concerning a comprehensive and holistic view of the distinguishing dimensions of the learning spaces. (Csizmadia et al., 2022).

In this prospect, this study aims to enrich the findings from the literature review that, through the lens of a conceptual descriptive framework, identify dimensions and features that characterize effective learning spaces supporting the development of innovative capacity.

The research is carried out through a multiple case study, involving learning spaces designed and developed in Finland, aimed at answering the research question (RQ): "What are the dimensions of a learning space?". The study aims to provide an integrative picture of a descriptive conceptual framework that supports the identification of the relevant dimensions to manage and evaluate. Specifically, it aims to guarantee and enhance the effectiveness of a learning space.

The paper is organized as follows. In the next section, the conceptual framework derived from the literature review is presented and the dimensions of a learning space are briefly pointed out. Then, the theoretical data are triangulated with evidence gathered from the case studies analysis. Finally, theoretical and practical implications and future research directions are illustrated.

## 2 Conceptual framework: the learning space infrastructure

Spaces supporting learning and knowledge dynamics, to boost organizations' innovative capacity are acquiring growing importance in public and private organizations but, despite this, the literature does not provide a comprehensive and holistic view of the distinguishing dimensions of these spaces. (Csizmadia et al., 2022). In this study, the analysis was developed according to a multidimensional approach (see Figure 1), which starts from the dimensions of a learning space derived from the literature review and then enrich and strengthen the conceptual model proposed.

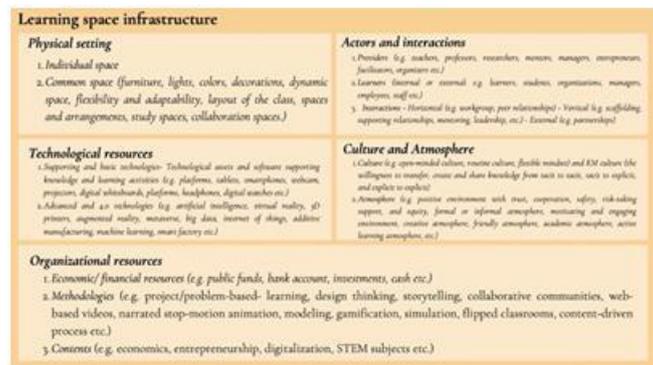

Fig. 1. Conceptual model - learning space infrastructure

### 2.1 Infrastructure of a learning space

Learning spaces enable and catalyze knowledge and learning dynamics, supported by a tangible and intangible infrastructure that fosters open, honest, and receptive interactions among the actors involved. (Delgado et al, 2020) In the following, the infrastructural dimensions of a learning space are briefly described.

### 2.2 Physical setting

The physical setting of a learning space includes individual and common spaces. Scholars have discussed some key characteristics of such spaces which are furniture, seating arrangements, lighting, temperature, decorations, and acoustics. (Sasson et al, 2021)

### **2.3 Technological resources**

The technological resources dimension contemplates a combination of technological tools that can foster or prevent impacts on the learning processes. In consequence, the design and management of a learning space must be associated with the choice of the appropriate tool to use, to exploit their potential and maximize the value added. (Delgado et al, 2020)

The literature discussed the use of various technological tools; in particular supporting and basic tools and advanced and 4.0 technologies. Examples of basic technological assets and software are platforms, computers, mobile phones, tablets, projectors, headphones, digital whiteboards, and so on. (Latrous & Khadraoui, 2020) Concerning advanced 4.0 technologies, some representative examples are Artificial intelligence, Internet of Things (IoT), augmented and immersive reality, digital platforms, metaverse, sensors, algorithms, adaptive learning platforms, and other smart technologies, that facilitate interaction and collaboration in the learning process. (Abdalina et al., 2022; Diaz Tito et al., 2021)

### **2.4 Organizational resources**

This dimension includes methodologies, contents, materials, and resources available to support learning. Some examples of methodologies may be project/problem-based learning, design thinking, storytelling, collaborative communities, web-based videos, narrated stop-motion animation, modeling, gamification, simulation, flipped classrooms, content-driven processes etc. (Filippou et al., 2018; Maheshwari & Seth, 2019)

Schobel & Scholey, (2012) identify other important organizational resources that are economic resources and specifically the financial strategies adopted.

### **2.5 Actors and interactions**

The success of a learning space strongly depends upon the actors, how they are engaged within the facility, and how they interact with each other.

According to the literature, two types of knowledge actors can be identified in a learning space: providers of knowledge and learners. Learners can be an internal or external target, some examples are students, managers, organizations, employees, and staff. On the other hand, providers are people supporting learners, acting as coordinators who facilitate the interactions and the exchange

and development of knowledge. (Stern et al, 2020; Pawlowsky et al, 2020; Nonaka and Takeuchi, 2019; Sankari et al, 2018)

The interactions include the system of relationships between internal and external actors that take place in the learning environment. According to the literature, the design of the learning space has to promote positive relationships and a sense of belonging. (Abuhassna et al., 2022) The interactions can be horizontal, vertical, and external. In a physical setting, interactions may occur through face-to-face discussions and group work, whilst in an online learning environment, interactions may occur through discussion forums, video conferencing, and other digital communication tools.

## **2.6 Culture and atmosphere**

This dimension identifies the mood, attitudes, expectations, practices, norms, and sensorial qualities distinguishing a learning space. It influences the effectiveness of the space, increasing or preventing motivation, attention, creativity, and the level of involvement of people. A positive learning environment promotes open-minded culture, flexibility, and willingness to engage in innovative activities and knowledge culture drives and encourages coding, transfer, and application of knowledge, to promote learning and innovation. (Abuhassna et al., 2022; Csizmadia et al., 2022; Karkoulia et al., 2013)

## **3 Methodology**

From a methodological point of view, according to the aim of the study, a multiple case study approach (Yin, 2009) has been rigorously elaborated and developed to provide empirical insights supporting the evidence emerging from the above proposed conceptual model.

Generally, a qualitative management research allows to capture intangible factors that create higher value for the literature. Furthermore, according to Yin (2009; 2013), the conducted case studies aim to gather valuable insights, through literal replication of real-life situations and allow cross-comparisons between different realities by identifying and defining critical learning points related to the fields of analysis that will result in helpful empirical guidelines for both scholars and practitioners.

In order to develop the study, an extensive documentary research and in-depth interviews were carried out with the leaders of each LS. All the interviews were

recorded and transcribed. This allowed to have a reliable information base that perfectly reflected the interviewees' thoughts.

#### 4 Cases analysis and findings

To better empirically investigate the field of learning spaces, enriching and strengthening the conceptual model proposed (see Fig.1), the study involved four learning spaces developed and managed in Tampere, Finland. They are *Tx*, *Hx*, *Dx* and *Kx*. The names have been changed for confidentiality reasons.

The rich body of data collected was fundamental to cross-compare the different realities and to explore in-depth the processes and the dimensions characterizing real learning spaces.

Table 1 provides a short description of the 4 learning spaces under analysis.

Table 1 – Mission of the learning spaces under analysis

<b>Tx</b>	Tx (City of Tampere) is a community space, a unique place in Finland. They are an open community for people that want to sell their ideas and find interesting partners. The aim of the space is to unite actors dedicated to serve Tampere startup and entrepreneurial ecosystem such as individuals, industries, entrepreneurs and companies.
<b>Hx</b>	Hx is a learning space situated within the university of Tampere. It offers the opportunity to expand entrepreneurial expertise and find solutions to the real-life challenges of an organisation by creating teams of students who have different backgrounds. Their approach encourages experimentation and stimulates an open mindset and innovation skills. Hx is a unit of entrepreneurship, they offer studies on entrepreneurship and sustainable entrepreneurship.
<b>Dx</b>	Dx is the leading co-creation learning space that aims to boost transformative and innovative dynamics in Finland and beyond. It is an innovation platform bringing together professionals, organizations, shareholders, researchers and co-creation facilitators. Dx's role is to help companies resolve challenges related to high-risk research activities, disruptive business transformation, and capability development needs by offering focused co-creation services. The most important purpose is the vision about the future. They aim to make people agree on a shared vision of how the future will be or should be. And then they develop a roadmap, highlighting how everybody will benefit from the results achieved.
<b>Kx</b>	Kx is a learning space that offers its members selected services to support collaboration and networking. It provides several facilities around three campuses and access to an international scientific community and talent pool. For companies, membership provides an opportunity to build brand visibility and strengthen their employer image at Tampere Universities community.

Several reasons motivated the choice of the case studies as a convenient sample:

1. despite the different specific aims of each LS, their general mission is to enhance and stimulate the innovation capacity of the actors and organizations involved as well as the whole city and region, as a source of growth and wellbeing;
2. the programs have been held with the cooperation of the academic context and the local ecosystem, and therefore they represent excellent contexts to apply and validate all the items of the proposed framework;
3. the existence of a significant amount of data and the direct involvement of the authors provided a unique opportunity to dig deeper into understanding.

In consequence, the analysis of the 4 learning spaces offers an articulated and rich picture of their dimensions. In the following, the main findings from the joint examination of the case studies are described.

Validity and reliability were secured by following the guidelines proposed by Yin (2009). In particular, multiple methods (document analysis, and in-depth interviews) were adopted to investigate the phenomena and collect data allowing construct validity. Moreover, validity was also increased by the choice of using a multiple case study approach, with cases developed in an international context. On the other hand, reliability can be demonstrated by storing of all the data collected and recorded.

In the following, each of the dimensions identified with the conceptual framework is enriched with the results derived from the joint analysis of the case studies.

#### **4.1 Physical setting**

The learning spaces involved in the analysis are developed within the Tampere University campuses and in similar knowledge repositories, such as accelerators, incubators, collaborative platforms and labs. The different cases have distinct features, but the key common characteristics are flexibility and friendly and informal space.

Two learning spaces own more places within the Tampere University campuses, whilst the other two are developed in a single place.

Regarding the setting, the LSs are built as open community spaces or co-working spaces. Those kinds of settings are relaxed meeting spots, for example, for team meetings, for naps and relaxation or for stimulating creativity and learning. There are sofas and easy chairs situated in a flexible and colored setting, with decorations, lighting and moveable chairs and furniture to create an informal atmosphere.

From the joint analysis of the case studies, the components derived, characterizing individual and common spaces, are:

1. flexible furniture (e.g. moveable chairs, desks and tables);
2. gym equipment;
3. kitchen space (e.g. coffee machines, microwave, dining table);
4. relax space (e.g. sofa, easy chairs, television);
5. common networking spaces (e.g. desks for teamwork, post-its, memo board, blackboard);
6. stage

#### **4.2 Technological resources**

The cases under analysis use different digital technologies, mostly to allow a hybrid or virtual approach. Concerning more advanced tools, that may enrich the learning processes and knowledge dynamics, two leaders stated that they actually employ them for some specific lectures or projects in cooperation with specialized labs.

According to the results of the analysis, the technology may help achieve the LSs' objectives but nowadays their potential is not fully exploited, despite the pandemic fostered their use and demonstrating that situations can evolve really fast. Before Covid-19 people did not use technologies as much as they do now, they needed time to learn and to overcome routine habits.

Examples of basic technological tools employed in the learning spaces under analysis are:

1. screens and digital whiteboards for in-events and lecturers;
2. virtual platforms for distance meetings and lectures;
3. digital boxes to enhance collaboration and creativity;
4. app and software used to support relationships building.

Concerning more advanced tools, from the interviews it emerged the use of methods and tools, such as AI and virtual reality, to make pilots, mockups, proof

of concepts and demos in a fast and simple way. Moreover, it has been highlighted the importance of big data, machine learning and autonomous technologies. Technologies need data that come from digital platforms and spaces. Making the customers willing to share their data and knowledge is fundamental to identifying new opportunities and benefits from existing data achieved.

Another topic derived from the analysis of the interview is the use of computing solutions to improve cyber security or reduce CO2 emissions. For example, manufacturing 3D printers and big data emerged as key tools to reduce CO2 emissions.

According to the leaders, a method to train people within a learning space and make them willing to use and employ digital technologies is to make their potential clear, diffusing information about best practices and effective outcome examples achieved thanks to the technologies implementation.

One of the leaders interviewed stated that, in its learning space, they are trying to build their own platform, suiting the needs of heterogeneous participants, whilst the others leaders are planning to implement advanced technologies in the near future. These efforts need energy and resources but, most of all, they need a change of habits. In Finland, they can effortlessly access effective and innovative devices and technologies that are easy to use, but they need strong training and culture, which emerged as the most influencing factors, according to the analysis of the interviews.

### ***4.3 Organizational resources***

From the joint analysis of the case studies it emerges that the leaders of the learning spaces, to reach their aims, proposed several methodologies and ways to support the development of competencies and innovation capacity through learning and knowledge dynamics. Specifically, it emerged the proposal of different kinds of programs, arranged remotely or physically:

1. Seminars and support sessions for people involved within the space;
2. Group coaching programs;
3. Matchmaking events;
4. Networking events;
5. Innovation Challenges;
6. Brainstorming, seminars and workshops;

7. Innovation Festivals;
8. Intensive courses, with video, links and lessons;
9. learning by doing and learning by developing;
10. discussion forums;
11. gamification that is becoming more and more typical because young people entering the working life are comfortable with digital games.

Generally, from the interviews it emerged a willingness to use methodologies that guide learners toward a certain aim, questioning them, show them the ways to work. It has been highlighted the need to adopt different learning approaches, stimulating different kinds of learning experiences, because traditional learning alone is not enough anymore. To meet learners' needs, most of them propose different kinds of methodologies, chosen for individual learners and teams on a case-by-case basis, by coaches and mentors.

Concerning the economic and financial resources, all the leaders claimed the importance of choosing the right financing methods to enhance the effectiveness of the space and decide in what dimensions invest more. Hx and Kx developed the spaces within the University of Tampere, which are financed by public funds, while the other two participate in public tender notices.

#### **4.4 Actors and interactions**

People operating within and outside the learning spaces have a key importance for the effectiveness of the space. Each of the spaces under analysis has a heterogeneous group of actors involved as learners or knowledge providers.

From the analysis of the results, the learners involved are:

1. students (at different educational levels);
2. individuals on their startup journey;
3. people from companies, mostly employees, managers and entrepreneurs.

Generally, target groups are from different kinds of companies, from global multinational companies to small startups.

On the other hand, different knowledge providers are included, such as:

4. mentors and facilitators;
5. top managers;
6. experts;
7. researchers;

8. professors.

Researchers, professors and academic institutions are integrated also with the aim to share knowledge and ideas and understand if they have a shared vision about the future and how to cooperate, optimizing activities and resources.

Moreover, they also have operational teams consisting of active people, who work together on a daily basis to maintain and develop their activities and services. Some examples are the board, volunteers, fellows, partners and collaborators.

The main idea that emerged is to integrate all the actors involved and work together to reach common aims.

The missions of the learning spaces under analysis are developed around the concepts of network, cooperation and community. Specifically, two of them serve the entire Tampere startup ecosystem by uniting startups, driving individuals and organizations to take action and building a thriving startup community.

Knowledge transformation and sharing are favored and encouraged in all the cases under analysis, with internal and external trustful relationships that the participants cultivate to collect social capital. Internal continuous and open interaction relationships are facilitated and encouraged by coaches and mentors as well as the development of trust and reflection in learning and project teams.

On-site and virtual events and team working activities are organized to strengthen internal interactions, human contacts, interactions and exchange of knowledge. In this perspective, relationships, team, building and team skills are developed through collegiality and a relaxed and friendly atmosphere.

On the other hand, external interactions are favored by authentic experiences with companies, the use of team agreement and seminars about group learning (e.g. principles of dialogue, tasks of a learning team, three-layered learning, significance of trust in teamwork etc.). Different institutional actors cooperate with the learning spaces under analysis, such as Tampere startups or the city of Tampere. They all want to strengthen these external relationships, also from an international perspective, to build a stronger innovation ecosystem.

#### **4.5 Culture and atmosphere**

The cultural dimension is considered the most important one by all the leaders involved in the interviews. In their opinion, culture shapes almost every decision, what value to achieve, which tool to use, what kind of program to implement, and

how to develop social values and be more open. Motivation and flexibility are the key characteristics highlighted by the results obtained from the interviews. Despite this, developing this kind of culture and atmosphere is not always easy because people are motivated by different factors. Understanding what people desire and selling them exactly what they want is the way to keep a motivating atmosphere.

Moreover, in their opinion, the most important competence is the ability and willingness to share and transform knowledge.

Concerning the atmosphere of the learning spaces, according to the leaders, a friendly and informal climate may help people express their opinions and feelings.

## **5 Conclusions**

This paper has analyzed the learning spaces' dimensions in a structured and holistic manner. From a review of the literature, five infrastructural dimensions of a learning space have been derived, in particular: i) physical setting; ii) technological resources; iii) organizational resources; iv) actors and interactions; v) culture and atmosphere. The findings derived from the practical application supported and enriched the theoretical assumptions.

In particular, the findings derived from the case studies proved the usefulness of the conceptual framework in supporting learning spaces' leaders and other stakeholders in identifying and categorizing the critical dimensions and their interdependence, fostering the definition of strategies for improving the effectiveness of the space. Moreover, from the interviews, it emerged the high importance given to the actor and interactions dimension. In fact, it has been proven that fostering high-quality relationships means facilitating knowledge exchange, transfer and creation and, in consequence, innovation capacity.

The research provides both theoretical and practical implications. In terms of theoretical implications, the paper provides a conceptual framework capable of fostering a specific research stream and carrying out a first holistic perspective of the dimensions of learning space to develop more effective and impactful guidelines for management and decision-making and to support the assessment and the improvement of the specific spaces.

On the other hand, in terms of managerial and policy implications, the analysis of the conceptual model developed and discussed can be helpful to different

actors aimed at developing effective learning spaces to foster the innovation capacity of public and private organizations.

The main limitations of the study reside in the lack of a deep analysis of the impacts generated from the learning space, in terms of short and long-run outcomes and in the limited sample under investigation. The limitations represent opportunities for future research in order to reinforce the conceptual framework, the findings' generalizability as well as to collect more pieces of evidence and further rigorous and valid insights to derive guidelines from managing and assessing effective learning spaces for innovation capacity.

### Abstract

Covid 19 has increased the need to integrate the service chain by imposing transformation processes on healthcare organizations, challenged by the complexity of the demand for health and the evolution of the service chain (public and accredited private). This process increases the need for integration between parts of the health system, such as the social-health district. Alongside the need for integration, "navigability" is developing between operators and users, especially among chronic population targets with greater socio-medical complexity. All this determines a growing demand for connection which sees in the care models in transition a new form of job specialization that requires new role profiles, relationship skills and dialogue between operators, operational management tools relating to the service chain of territorial services, specific information collection, and management systems. In this context, change is activated by Knowledge Management (KM).

**Keywords** – social-health care, relationship, home care, change, and knowledge management.

## **1 Introduction**

The KM represents the application of the change management approach model to support change processes through the exchange of experiences and the dissemination of knowledge results, but also the comparison with benchmarking systems capable of stimulating professionals through the comparison with experiences that lead to positive emulation. KM assumes the task of promoting and developing, with adequate training, incentive, and communication tools, the ability to learn within the organization, generating a culture open to continuous comparison, measurement, and discussion of results (Havens & Knapp, 1999, Du Plessis, 2005). The processes of change are based on the exchange of experiences, on the dissemination of results and knowledge between internal/external administrations to the system, which often activates, according to participatory logic, intense interactions creating networks, partnerships, and networks (from legislation to knowledge management).

This contribution aims to analyze the relationships between the actors of the regional governance system to observe their different governance models in the national context, compare the home care systems, and define the possible processes of change, through the exchange of knowledge, with the introduction of ICT in home care processes. More specifically, the study observes how the integrated social-health management of chronicity through ICT tools is to implement an effective, integrated, and sustainable home care model for the chronic user hospitalized for one or more high-impact chronic diseases (e.g., diabetes, COPD).

The common opinion is that healthcare reorganization passes through the territorial network's reorganization.

In our country, the path of decentralization of taking care of patients from the hospital to the territory is realized with the implementation of a homogeneous and easily accessible territorial network; as of today, still incomplete and fragmented, despite being a process that started many years ago. This evolution implies the need to reorganize and strengthen the activities of the territory or those related to primary care not only at a regulatory level but also at an operational level, with the implementation of new organizational models and the use of ICT.

Strengthening the territorial network means creating a health system closer to the population, characterized by a greater capillarity, adhering to a model of

proactive taking charge, both in the interventions of prevention as well as diagnosis and treatment, and from the integration and continuity of assistance in the various settings in the context of emergency. What matters most is the supervision of the territory and the taking charge of the single person and of the communities, also including the "hard-to-reach" and "invisible" (hidden population) groups, for reasons related to the sometimes the social and economic situation in which they find themselves living. So, one of the biggest challenges will be combining health with social.

After a literature review, the explorative case study is presented, and then the authors' conclusion.

## **2 Theoretical framework**

Healthcare is going through profound changes, and ICT is a strategic asset and essential for the success of healthcare organizations in turbulent, dynamic, and complex environments. ICTs are a necessary strategic resource for the success of healthcare organizations in the new socio-economic scenario. Especially for the public health sector, there must be more room for combined organizational and technological innovation. Due to the characteristics of the processes and the service offered by the healthcare sector, ICT could help to achieve wide margins of effectiveness.

The social-health sector is undergoing a process of change; the increasingly rapid and continuous development of applied technologies and the growing acquisition in the scientific field makes it possible to reach, particularly in medicine, levels of diagnostic and therapeutic accuracy hitherto unthinkable and to treat pathologies previously considered incurable and thus the average life span lengthens. However, at the same time, social ties fragment, disposable income decreases, and parental solidarity is reduced; many people, especially older people, and chronic diseases, find themselves increasingly alone and needing care. Therefore, health promotion cannot disregard relationship paths in which it appears essential that, alongside technical-professional skills, we know how to listen to needs by reading them correctly and formulate a network of listening and sharing, which allows combining the humanization of care with high technology, specialization, and scientific expertise. (Bonomi, 2019).

Social involvement in healthcare systems means interventions in which the community is involved to achieve health objectives that can be organized with

different approaches, depending on the characteristics of each intervention and on the other degree of community involvement: technological innovation, social innovation, knowledge sharing may depend on the scope of the public administration and all healthcare ecosystems. The main strands identified in the literature can be summarised as community participation, community development, community empowerment, community-centered approaches, community building, community organizing, community-based initiatives, and community engagement (Longo & Barsanti, 2021).

Community engagement is a generic term encompassing a continuum of approaches to engage local communities and interest in improving population health and reducing health inequalities (Popay et al., 2007). This process of participation and involvement facilitates the inclusion of several other actors into the co-creation chain of the value of the health service: caregivers, social care systems, and reference communities (disease-specific associations) and the acquisition of new practices that can then be transformed into protocols (Botti & Monda, 2020). Value co-creation among service participants includes external stakeholders as another piece of the co-creation process. One could talk about distributed management, given that a new managerial path is defined between the actors of the care process and the management process (Lo Presti et al., 2019). In the evolution of the healthcare ecosystem, caregivers become ever-more part of the healthcare facility community, changing the relationship between internal (doctors, nurses, patients) and external (caregivers, caregiver associations, patient associations) stakeholders in the hospital (Spagnoletti et al., 2015).

To understand and explain the type of relationship that exists between an organization and its stakeholders, the concept of involvement plays a role close to that of "corporate social responsibility" and "long-term sustainability" of the health service (Testa et al., 2017; Aldossary, 2017). From an even broader perspective, one can speak of sustainable health service development where stakeholder involvement mediates conflicts arising from differing expectations (Pereno et al., 2020).

### **3 Methodology**

An empirical analysis, a qualitative investigation conducted based on exploratory research, was used in this work to investigate a problem that needs to be clearly defined.

For such research, we started with a general idea and used this research to identify issues that may be the focus of future research. The problem is at an early stage. A qualitative research approach is the most suited to handle this type of inquiry because this study revolves around a 'how' question and because the scientific research in this field in addressing healthcare challenges is still in its infancy (Edmondson et al., 1994).

The first phase focused on the model by collecting and analyzing material and organizational documents. For literary research, sources may include newspapers, magazines, books, government agency documents, topic-specific articles, literature, and annual reports. The second phase is the evaluation carried out following the execution of surveys, about 40 minutes each, that collect information from a predefined group of interviewees on the governance model of the region. Among those interviewed were the Board of Directors, the Management (General Manager, Administrative Director, and Health Director), and the Managers of the ASL concerned.

The annual financial statements and the financial results were also studied together with the governance and regulation mechanisms of the main welfare processes: procedures, manuals, regulations, certifications, information systems, accounting systems, governance (by-laws and corporate agreements), management reports, service, organizational models, etc. In the last phase, the study of the collected data and the semi-structured interviews have produced a final evaluation report on the various territorial government models.

As researchers examine the collected data, ideas or concepts become apparent to them researchers. These ideas/concepts are said to "emerge" from the data.

These categories can become the basis of a hypothesis or a new theory.

From this perspective, the work is to help provide a public health sector focus not only on ICT as a production technology tool but also as a technology organization.

#### **4 Integrating social health and sustainable home care model: the case “Initiative medicine,” state of the art.**

It is called “Initiative medicine,” a new approach that “goes to meet” the citizen before the pathologies arise or worsen. It has been designed to respond effectively to the aging population trend. It aims to the prevention and improvement of the management of chronic diseases at all stages and concerns all levels of the health system. As opposed to waiting for medicine, which works on demand on a single citizen, initiative medicine studies *ex ante* the aggregate data of the population to identify target citizens to call and engage proactively. Scientific evidence points to the importance of reorienting health care and policies towards chronicity that sees a central role of primary care systems, not only reactive to punctual requests for assistance but able to anticipate, and stratify the individual condition in the wake of the natural history of the disease, the specific needs of the subject, plan care pathways, and address the chronic patient in an individualized way, thus building a person-centered system of care. These principles are reaffirmed in the Italian PNC (Plan for National Chronicity), which, linking up with the National Prevention Plan, provides, for the fight against chronicity problems, a combined and integrated approach between community strategies (oriented towards health promotion, intersectoral and by setting), and strategies aimed at the individual (prevention and early diagnosis).

Initiative medicine requires the inclusion of three additional functions/processes in each area of the NHS:

- the aggregate study of big data by groups of patients (determinants, consumption, adhesions, outcomes, etc.) to select the targets to solicit;
- proactive recruitment and, therefore, direct communication to citizens who have at least
- one needs potential but hasn't necessarily expressed a question yet;
- patient case management to accompany their fruition processes over time to support their adherence, check the results to possibly alert the appropriate service network node in the event of necessity (non-adherence or unexpected outcomes).

These three competencies and functions (local big data analytics, recruitment, and case management) must become the cultural heritage of all services and all professional components. Ideally, they should be based on digital and automated tools, capable of generating direct contact with the citizen if data analysis

identifies sentinel elements or exceeding thresholds considered risky to strengthen compliance or invite him to service. An information infrastructure is, therefore, the key to enabling access to stratification profiles of patients with MCNT and realizing the alert function, proactively detecting subjects at greater risk, planning the necessary clinical actions, and verifying that what has been undertaken is congruent with the evaluation indicators envisaged for pathologies.

The operation of some of these processes can be partially centralized and delegated to some specific settings or corporate roles. Still, the logic of initiative medicine must operate at an overall level. For example, a service corporate central can digitally monitor medication adherence and may also automatically report low levels of compliance directly to the citizen or his caregiver. Any subsequent, direct intervention must occur at a decentralized and capillary level by the service in charge of the patient (e.g., community nurse, contracted specialist, nurse, or hospital ward doctor). The Community Houses and the various intermediate care settings represent the privileged places for centralizing some functions of initiative medicine, both in the field of primary prevention (e.g., primary prevention of cardiovascular risk in a healthy population) and pathway management care of chronic or frail patients, incredibly if clinically not too complex. The information provided by predictive models would be very effective in aiding the design of intervention strategies based on the real needs of the user and his family/caregiver. For patients who are clinically very complex, the same logic should be implemented at a hospital specialist level, with the opportunity to refer the patient to the Community House closest to his home as a decentralized place of delivery. The starting point for outlining and activating a strategic change is sharing the need to change. Clarify and communicating the context, through the presentation and discussion of the reasons and objectives to "do," is in itself the most robust possible action to activate change, to the extent which provides all company players with the same "lens" through which to understand the priorities for action and the consequent organizational dynamics. Good corporate-level change management should, therefore, always start with a "narrative" that emphasizes the deeper reasons for the change proposed, as connected first of all to the corporate mission, to the production of "value," to mean "social," and only after the existence of institutional obligations or indications, which certainly can be binding, but must not enforce the change itself by way of fulfilment. The institutional framework is one "bank" on which the organization's management leans to build the framework within which to place

the building a sense of urgency and awareness of the need to change and innovate. But the whys cannot be derived only or mainly from the outside but rather be connected to the company's own ambitions same organization. In this perspective, the immense theory of organizational change can first be traced to a modelling that identifies three main stages through which to proceed:

1. the phase of becoming aware of the need and urgency to change and innovate, otherwise called "organizational unfreezing";
2. the exploration of alternatives to change and innovate, with the adoption of the path and contents specific to carry forward;
3. consolidating the change and the innovative state with actions to reinforce the new processes, identification of implementation responsibilities, and strengthening of routines that redefine the normality of work according to the new set-up/model.

## **5 Discussion and conclusion**

The spread of telemedicine now involves the entire National Health System. Accelerators of this process have been the Covid- 19 emergency and the National Plan for Resistance and Resilience (PNRR) that emerged from Covid-19. The PNRR considers telemedicine to be one of the main drivers of innovation in the health service and a necessity to care for citizens suffering from chronic diseases and the elderly needing constant services. This plan aims to keep patients in-home care or home for as long as possible to avoid unnecessary hospitalization. The case analysis provided a broad context for the doctors' clinical evaluation and an analysis of the behaviour of patients, caregivers, and operators at the introduction of the service.

However, the results can be further expanded by repeating the survey after the consolidation of the service (the survey covered the first six months) and collecting patient testimonies to obtain other points of view. The case analyzed confirms the importance of patient engagement in accompanying the digital transformation in healthcare organizations to improve the effectiveness and efficiency of care. However, a complete analysis of internal and external stakeholders could also be appropriate to explain better the participation model of all actors in the service, such as patients, caregivers, hospital top management, and suppliers of telehealth devices. The use of telemedicine also reduces the need for hospitalization while simultaneously improving the health system's economic

management by creating autonomy in the practical management of pathologies. At the same time, building a shared engagement model to support this process is essential, which is found in the shift from patient to community engagement. It is no longer only patients but the whole community that makes the wealth of knowledge and information available to all those involved in the treatment process. The value of this phenomenon is that it embraces entire communities and overturns the care model, moving from the hospital to quasi-medical treatment facilities in the territory (Community Homes) or the homes of patients themselves. Finally, several factors motivate further telemedicine research. First, the world's population is aging, as well as the increasing need for e-health. There is a need to ensure the safety of the elderly and treat them in settings that integrate them into society rather than isolate them in chronic hospitals. Second, while the centrality of the patient in health care processes has allowed for personalized care, the centrality of communities means definitively opening up the health service towards socio-medical integration (health ecosystem). Placing the person at the center has given humanity to health services, and the community focuses on society as a whole and its health needs.

### **Abstract**

Using a sample of 76 Italian publicly listed firms for the year 2019, this paper investigates the association between the presence of a critical mass of women directors on the board and the firm's CSR performance. It also examines whether the family firm status moderates this association.

The OLS regression analysis shows that the presence of a critical mass of female directors positively influences the CSR performance. In addition, the empirical analysis shows that

the family firm status has a negative direct effect on CSR performance, but has a positive interaction effect with a female critical mass.

Overall, these findings support the conclusion that the effect of female directors on CSR performance is influenced by the family ownership structure. This finding contributes to both the literature on board gender diversity and to the literature on family firms by providing evidence on the role of family ownership as a contingency variable that positively moderates the effect of a critical mass of female directors on CSR performance. With regard to practical implications, this research calls the attention of board nomination committees on the key role of appointing a critical mass of female directors for achieving a better CSR performance.

## 1 Introduction

In the last few decades, one of the most relevant developments that has materially impacted the strategic focus of firms is the increased commitment to environmental, social, and governance practices, often referred to as Corporate Social Responsibility (CSR). In this regard, companies have started to embrace more responsible capitalism by improving their non-financial performance and making a positive contribution to the community (Garcia-Sanchez et al., 2014; Helmig et al., 2016; Issa and Hanaysha, 2022).

From the scholarly standpoint, the commitment to CSR is rooted in the stakeholder theory, which suggests that firms should satisfy the needs of all stakeholders to maximize firm value (Parmar et al., 2010; Dodd et al., 2022). Indeed, research highlights that a greater attention to CSR can affect firm performance (Albuquerque et al., 2020; Awaysheh et al., 2020; Huang et al., 2020).

Although prior studies point out that a wide range of factors can contribute to increasing CSR outcomes, (Gillan et al., 2021), they overall suggest that a pivotal role is played by the board of directors (Rao and Tilt, 2016; Shatnawi et al., 2022). In fact, this governance body is responsible for monitoring managers' actions (Hillman and Dalziel, 2003; Saidat et al., 2019) and for providing advice on how to manage the challenges from the external environment (Pfeffer, 1972; Pfeffer and Salancik, 2003; Hillman et al., 2009). More specifically, the board of directors is in charge of setting corporate strategies (including CSR strategies), while monitoring

managers in order to satisfy the needs of different stakeholder groups (Adams et al., 2011; Jain and Zaman, 2020).

Thus far, the academic debate on the board-CSR relationship has mainly examined the influence of board composition in terms of independence, size, gender diversity, CEO duality and minority directors (Béji et al., 2021; Rouf and Hossan, 2021; Khoo et al., 2022; Amorelli and García-Sánchez, 2021; Voinea et al., 2022).

In particular, concerning the role of female directors (Gurol and Lagasio, 2023), the existing literature posits that there are significant differences between men and women that might have implications for CSR. It is argued that women are more likely to hold a positive view and more empathy toward stakeholders' expectations and sustainability (Birindelli et al., 2019; Samara et al., 2019), that they can reduce conflicts and increase cooperation, that they are more sensitive to social events (Eagly et al., 2003) and less keen to accept unethical behaviours (Loukil and Yousfi, 2016; Ho et al., 2015). Additionally, compared to men, women would be more sensitive to CSR issues not least because they consider CSR as a means to improve their reputation and thereby improve their position of power within the firm (Hyun et al., 2016; Amorelli and García-Sánchez, 2020).

However, the implications for CSR of having a critical mass of women on board is still at issue (De Masi et al., 2021). Research suggests that boards with a critical mass of at least three or more female directors can positively affect CSR, not only in terms of CSR disclosure (Fernandez-Feijoo et al., 2014; Cabeza-García et al., 2018) but also in terms of CSR outcomes (Post et al., 2011; Bear et al., 2010; Kassinis et al., 2016; Cambrea et al., 2023).

Aside the implications of the critical mass for CSR performance, it is also interesting to shed additional light on how this effect might differ depending on the firm's ownership structure, which has been suggested as a potential driver of the presence of female directors on the board (Saeed et al., 2016; Ben-Amar et al., 2013). This may be especially the case for family ownership because research has shown that gender diversity differently affects the CSR performance according to the family firm status (Gavana et al., 2023; Beji et al., 2021; Cruz et al., 2019; Veltri et al., 2021; Cordeiro et al., 2020). However, the existing studies have not provided conclusive results, nor have they assessed the specific impact of a female critical mass.

Therefore, this paper not only focuses on the relation between a critical mass of female directors and CSR performance, but it also analyses whether the family firm status has a moderating role on this relation.

This research uses a sample of 76 Italian publicly listed companies for the year 2019. To test our hypotheses, we perform an OLS regression approximating the firm's CSR performance with the environmental, social and governance (ESG) score provided by the Refinitiv Eikon database. This score is a percentile rank scoring, which integrates information on the environmental, social and corporate governance dimensions of firm performance (Ricci et al., 2020).

The empirical findings show that the presence of a critical mass of female directors positively influences the CSR performance. In addition, results show that the family firm status has a negative direct effect on CSR performance, but has a positive interaction effect with a female critical mass. Overall, these findings support the conclusion that the effect of female directors on CSR performance is influenced by the family ownership structure.

Our study has scholarly and practical implications. From a theoretical standpoint, it advances the debate on the effects of female directors for firm outcomes by enriching the existing empirical evidence on CSR performance. At the same time, it enriches the research on the determinants of the ESG rating as a proxy measure for CSR performance. In addition, by investigating the moderating role of family ownership, the study takes a step forward in our understanding of the conditions under which this governance mechanism influences the firm's CSR performance. In terms of practical implications, this research calls the attention of board nomination committees on the key role of female directors as a critical mass in enhancing the CSR performance.

## **2 Literature review and hypotheses development**

Scholars argue that women on board are more sensitive to CSR issues and are characterized by a strong commitment to CSR practices (Cook and Glass, 2018) for a number of reasons (Rao and Tilt, 2016; Bear et al., 2010; Hyun et al., 2016). Some studies suggest that female directors own extensive expertise in soft-related issues such as CSR (Zelechowski and Bilimoria, 2003). Other research highlights that women top managers are particularly cautious of CSR as they are characterized by both professional and reputational motivations that lead them to pay strong attention to such matters (Hyun et al., 2016; Velte, 2016; Fahad and

Rahman, 2020). Indeed, following the gender socialization approach, research claims that, while men have a more competitive attitude, women leaders own more ethical behaviour (Ryan and Haslam, 2007; Boulouta, 2013) due to differences in the social expectations and career path (Cook and Glass, 2018; Mavin and Grandy, 2016). Empirical studies show that the appointment of female directors has positive implications for CSR outcomes. For example, Galbreath (2016) and Hafsi and Turgut (2013) find that women on board positively affect CSR outcomes. Similarly, Zhang et al. (2013) and Byron and Post (2016) document that gender diversity due to the presence of female directors improves the firm's social performance. Besides, also Bear et al. (2010) highlight that the CSR ratings are positively associated with an increase in the numerousness of female directors.

However, it is worth noting that it is the presence of a critical mass of women on the board rather than the mere appointment of female directors that matters for CSR performance. In this regard, scholars emphasize that the contribution that female directors can provide to board decisions can be limited when they act as minorities and "out-group" board members (Bunderson and Sutcliffe, 2002; Lückerath-Rovers, 2013). Indeed, literature suggests that the appointment of women on the board as 'tokens' limits their ability to exchange ideas and opinions and hampers their input to decision-making, as they tend to face resistance by the majority group members (Cook and Glass, 2018). Conversely, having a critical mass of female directors improves their influence on company decisions (Torchia et al., 2011). According to the critical mass theory (Kanter, 1977a, b), when women directors reach a certain threshold (i.e., at least three), not only can better cooperate with the majority group members (Bear et al., 2010; Cook and Glass, 2018) but they can also affect the decisions of the overall group. Thus, when there is a female critical mass on the board, female directors can better express and protect their opinions (Arena et al., 2015), thus offering a meaningful contribution to the board discussion (Adams and Kirchaier, 2013; Schwartz-Ziv, 2017).

On the backdrop of these arguments, research shows that boards with a critical mass of female members results in better CSR. Indeed, some studies find that the presence of a critical mass of at least three female directors increases the CSR disclosure (Fernandez-Feijoo et al., 2014; Cabeza-García et al., 2018). Similar conclusions can apply to CSR outcomes. Bear et al. (2010) report that having a critical mass of women on the board improves the CSR ratings of the world's

most admired companies. Post et al. (2011) document that having three or more female directors on the board improves the environmental strength score of electronic and chemical companies in the US. Similarly, Kassinis et al. (2016) show that more gender diverse boards lead to greater environmental sustainability in US publicly listed companies. In a similar vein, Cambrea et al. (2023) find that a critical mass of at least three female directors is associated with a higher ESG performance in a sample of Italian listed firms.

Based on these previous findings, we expect that the appointment on the board of a critical mass of female directors may positively affect the CSR performance of our sample firms. Thus, we state our first hypothesis as follows:

*H1: A critical mass of female directors is positively associated with CSR performance.*

While the above arguments may explain why a women critical mass can positively influence the CSR performance, it is important to shed light on how this positive association might differ according to the firm's ownership structure, which is considered as a possible driving factor of the appointment of female directors (Saeed et al., 2016; Ben-Amar et al., 2013).

In particular, as regards the family ownership structure, literature suggests that the appointment of female directors is often instrumental for family owners to improve firm success, avoid conflict and favour family harmony, thus improving both family and business image (Samara et al., 2019). Research suggests that board gender diversity may differently affect CSR performance according to the family firm status, although without providing conclusive results. For instance, Gavana et al. (2023) report in a panel of companies listed in five European countries that the presence of women on the board increases family firms' social commitment. Likewise, Beji et al. (2021), analysing a sample of French listed firms, document that board gender diversity is positively related with CSR performance especially in family firms. Similar results are reported by Cordeiro et al. (2020), who find in a sample of US companies that the effect of board gender diversity on environmental performance is higher in family firms. However, Cruz et al. (2019), on a sample of publicly held US family firms, show that the increase of CSR performance associated with the presence of women directors occurs only when the latter are family insiders. By contrast, Veltri et al. (2021), covering Italian listed firms, find that female directors have a negative and not significant effect on the CSR performance of family firms.

Furthermore, it is still unclear whether family firms are more likely than non-family firms to implement CSR practices and different theoretical frameworks provide alternative predictions. Some studies suggest that, due to the second type agency problem, family firms are more prone to achieve and satisfying family owners interests, while devoting less attention to other stakeholders needs, thus reducing investments in CSR activities (Veltri et al., 2021). According to this view, the 'amoral familism' would lead family firms to behave in a self-serving way, reducing their commitment towards the improvement of the long-term well-being of external stakeholders, and therefore limiting their CSR efforts (Gavana et al., 2023; Morck and Yeung, 2004). In contrast, studies based on the Socio Emotional Wealth (SEW) approach suggest that family firms pay more attention to the interests of external stakeholders as they perceive them not as a threat but as an opportunity to protect and increase family reputation (Labelle et al., 2018; Cennamo et al., 2012). Thus, from this alternative perspective, family firms are more likely to adopt CSR practices because this might improve their SEW (Gomez-Mejía et al., 2011; Berrone et al., 2012).

In light of these competing arguments, we state the following non-directional hypothesis:

*H2: The family firm status influences the firm's CSR performance.*

As regards the role of female directors in family firms, we find again competing arguments in the literature, that reflect the alternative views referred to above. From the SEW perspective, scholars suggest that family owners are likely to appoint women directors to support and advance their CSR agenda (Cordeiro et al., 2020). Thus, when a critical mass of women on board is appointed, they will likely support the commitment of family owners towards CSR, using their influence on the board to place CSR issues at the centre of the board debate and decision-making (Li et al., 2017; Lu and Herremans, 2019; Post et al., 2011; Walls et al., 2012). This may be especially true if we consider that women directors are often appointed as 'family delegates' to support the preferences of family owners through their influence on strategic corporate decisions, including those relating to CSR (Abdullah, 2013; Rodríguez-Ariza et al., 2017). Cordeiro et al. (2020) provide evidence for this claim, showing that family ownership interacts with board gender diversity to positively influence CSR performance.

Conversely, other scholars argue that the positive association between board gender diversity is less pronounced, if not absent, in family firms (Veltri et al., 2021), which may appoint family-affiliated women directors for other reasons

such as nepotism, dynastic management (Gonzales et al., 2020) or for mere 'tokenism' to comply with quota regulations. In the absence of unique personal assets to justify their appointment on the board, female directors who are affiliated with family owners might be deemed token.

Still others argue that both family and nonfamily female directors might hold a preference for CSR activities, even though not all female directors possess the same power and legitimacy to push a CSR agenda that fits their preferences (Cruz et al. 2019). Again, given the competing perspectives on the issue, we state the following non-directional hypothesis:

*H3: The family firm status moderates the impact of a critical mass of female directors on CSR performance.*

### **3 Research methodology**

#### **3.1 Sample**

Our initial sample comprised all firms listed in the Italian stock exchange in the year 2019. Data were collected from multiple sources. The corporate social responsibility (CSR) scores were collected from the Refinitiv Eikon database. Financial and accounting data were sourced by AIDA. Corporate governance data such as the number of female directors, independent directors and CEO duality were hand-collected from the corporate governance reports. To test our contingency hypothesis (H3), we differentiate the sample firms between family and nonfamily firms using a dummy variable. Following prior family business research, we classify as family firms those where 1) a dominant family owns, either directly or through holdings, the 30% or more of company shares (Anderson and Reeb, 2004; Miller et al., 2014); and 2) one or more family members are involved in the Board of Directors (Culasso et al., 2015). The 30% threshold is considered a suitable proxy for family control in prior studies on listed firms and even more so for the Italian stock exchange given its features both in terms of average size and average stock ownership (Minichilli et al., 2016). In order to detect the family identity of board members, we relied primarily on surname commonality with the owning-family as indicated in corporate governance reports, but also on publicly available information from company websites, directors' profiles on their web pages and professional social networks and specialized press articles. Thus, the Family Firm dummy is coded 1 if both conditions 1) and 2) are met, and 0

otherwise. Defining family firm status with a dummy is consistent with the argument that the influence of family owners may not be uniquely a function of their ownership stake but is also contingent on their internal and external power, prestige and visibility as major owners (Dow and McGuire, 2016).

After removing firms with missing data, we were left with a final sample of 76 firms. This is mainly due to the limited number of ESG scores available on Refinitiv Eikon for Italian listed firms.

### **3.2 Variable measurement**

Our dependent variable, the corporate social responsibility (CSR) performance, is measured using the aggregate environmental, social and governance (ESG) score provided from the Refinitiv Eikon database. The Refinitiv ESG score measures the firm's ESG performance based on publicly reported information. It captures and calculates over 630 firm-level ESG measures, of which a subset of 186 of the most comparable and material per industry inform the overall scoring process. The underlying measures are based on considerations around comparability, impact, data availability and industry relevance that varies across each industry group.

The ESG score embraces ten categories (resource use, emissions, innovation, management, shareholders, CSR strategy, workforce, human rights, community, and product responsibility) weighted proportionately and rolled up into three pillar scores, i.e., the environmental, social and corporate governance scores. The ESG score ranges from 0 to 100, based on the data points that Refinitiv Eikon assigns to the above ten categories.

The independent variables of interest are two. The first one is the presence of a critical mass of female directors, which we capture using a dummy variable coded 1 if there are at least three female directors on the board, and 0 otherwise. The second one is the family firm status as described above.

Following prior research (Beji et al., 2020; Cordeiro et al., 2020; Veltri et al., 2021), we control for other corporate governance variables that may affect the CSR performance such as board size, CEO duality and the percentage of independent directors on the board.

We control for the impact of board size because, according to neo-institutional and stakeholder theories, large boards may balance the interests of diverse stakeholders and, therefore, they may increase the firm's involvement in CSR

activities. Previous studies such Beji et al. (2020) and Veltri et al. (2021) find a positive association between board size and CSR performance. As for the effect of independent directors, scholars argue that boards with more independent directors have more information and knowledge for monitoring the firm's CSR performance (de Villiers et al., 2011). Studies such as Shaukat et al. (2016) and Harjoto et al. (2015) provide evidence that independent directors have a positive impact on CSR.

Finally, based on prior studies, CEO duality is expected to reduce the firm's commitment to CSR activities. The rationale is that entrenched CEOs, under shareholders' pressure, could prioritize short-term financial performance to the detriment of long-term strategic investments such as CSR ones. Beji et al. (2021) and Gong et al. (2021) find evidence of this negative effect of CEO duality.

As additional control variables at firm level, we include firm size, the debt-to-equity ratio and the return-on-assets (ROA) ratio. The control for firm size is particularly important, because ESG scores can be subject to firm size bias (Drempetic et al., 2020) as bigger firms may use economies of scale to enhance ESG performance. We use the natural logarithm of total assets as a proxy for firm size. The debt-to-equity ratio is used as a proxy for firm leverage to control for the impact of financial risk on firm ESG performance (Simnett et al., 2009). As more profitable firms are more likely to have better ESG performance, we also control for firm profitability using the ROA ratio (Liang and Renneboog, 2017). Industry effects are also accounted for.

Table 1 summarizes the definition and measurement of all the variables used in the econometric analysis.

Table 1. Variables definition and measurement

<b>Variable</b>	<b>Description</b>	<b>Source</b>
ESG	Environmental, social and governance scores	Refinitiv Eikon
Family firm	It equals 1 if the company is a family firm; equals 0 otherwise	Corporate Governance Report
Critical mass	It equals 1 if there are 3 or more than 3 female directors on the board; it equals 0 otherwise	Corporate Governance Report
Independent	The percentage of outside directors on the board	Corporate Governance Report
CEO duality	It equals 1 if the CEO and chairperson are the same person; it equals 0 otherwise	Corporate Governance Report
Board size	Log-transformed of number of members on the board	Corporate Governance Report
Firm size	Log-transformed of total assets	AIDA Database
ROA	The percentage of return on assets	AIDA Database
Leverage	Total debt/total assets	AIDA Database

## 4 Results

In order to test our hypotheses, we estimate the following model by using an ordinary least squares (OLS) regression, where the critical mass of women on the board (Critical mass), the family firm status (Family firm) and the interaction term between the Critical mass variable and the family dummy (Critical mass\*Family firm) are the main variables of interest:

$$\text{CSR Performance (ESG)} = b_0 + b_1 \text{ Family firm} + b_2 \text{ Critical mass} + b_3 \text{ Family firm} * \text{Critical mass} + b_4 \text{ Independent} + b_5 \text{ CEO duality} + b_6 \text{ Board size} + b_7 \text{ Firm size} + b_8 \text{ ROA} + b_9 \text{ Leverage} + \text{Industry} + \varepsilon$$

Table 2 presents the descriptives statistics and pairwise correlations between the variables. The average value of the CSR performance, as measured by Refinitiv ESG scores, is 64.74 with a standard deviation of 16.20 which indicates a large variation in this performance measure. Family firms account for more than 40 percent of the sample. More than three-quarters of firms (77%) have at least three female directors on the board. The board size is 11 members, which is in line with recent research covering Italian listed firms (Veltri et al., 2021; Cambrea, 2023).

The results of the correlation analysis show that the 'Critical mass' variable has a positive and significant association with the ESG variable, providing some initial support to our first research hypothesis. The 'Family firm' variable is negatively correlated to ESG, which would suggest that family firms are less engaged in CSR than nonfamily firms, even though the correlation is not statistically significant. Regarding the other firm-level controls, only firm size has a positive and significant correlation with ESG, which is consistent with the argument that there may be economies of scale in CSR activities.

The correlations between the explanatory variables are generally low. The highest correlations are 0.66 between the Critical mass and Board size variables, and -0.31 between CEO duality and Firm size, which are still below the commonly accepted cut-off of 0.70 to detect multicollinearity. Furthermore, as the VIF values are well below the warning value of 10 (Myers, 1990), we can conclude there are no significant multicollinearity issues in our regression.

Table 2. Means, standard deviations, VIF, and pairwise correlations

	Mean	SD	VIF	1	2	3	4	5	6	7	8	9
1. ESG	64.74	16.2		1.00								
2. Family firm	0.42	0.50	1.88	-0.08	1.00							
3. Critical mass	0.77	0.42	2.87	0.08*	-0.05	1.00						
4. Independent	0.67	0.19	1.40	0.03	-0.14	0.096	1.00					
5. CEO duality	0.16	0.37	1.52	-0.03	0.07	-0.11	-0.14	1.00				
6. Board size	11.18	4.76	2.24	0.12	0.11	0.66*	-0.07	-0.08	1.00			
7. Firm size	14.01	1.72	2.05	0.59*	-0.22	0.02	0.20	-0.31*	-0.04	1.00		
8. ROA	2.98	6.14	1.64	0.07	-0.01	-0.11	-0.15	0.10	0.07	-0.16	1.00	
9. Leverage	0.67	1.29	1.47	0.02	-0.01	0.00	0.13	-0.08	-0.05	0.23*	-0.07	1.00

\*\*\*, \*\*, \* indicate significance at 0.1% and 1% and 5%, respectively. In parentheses are t statistics.

Table 3 presents the estimation results of our econometric model with and without the interaction effect of the family firm status. Our first hypothesis (H1) predicts that having a critical mass of at least three female directors leads to improving CSR performance. As Model 1 shows, the regression coefficient on the 'Critical mass' variable is positive and significant ( $\beta = 5.71, p < 0.001$ ). This would mean that, compared to firms with less than three women on their boards, firms with a critical mass of female directors have a better CSR performance. Hypothesis 1 is thus supported. This result is consistent with previous research (e.g., Kassinis et al., 2016; Gong et al., 2021; Cambrea et al., 2023), that also finds a positive association between a critical mass of at least three female directors and CSR performance.

Table 3. Multiple regression analysis with main and interaction effect

	ESG performance	
	Model 1	Model 2
Family firm	-11.31*** (-4.38)	-12.11*** (-12.35)
Critical mass	5.71*** (7.19)	3.45*** (4.52)
Critical Mass*Family firm		14.33*** (13.51)
Independent	6.46*** (5.44)	2.15** (2.05)
CEO duality	-0.82 (1.21)	-2.88*** (4.77)
Board size	3.90*** (6.66)	2.80*** (5.44)
Firm size	9.13*** (55.65)	5.95*** (41.40)

ROA	0.47*** (12.02)	0.28*** (7.91)
Leverage	-1.76*** (-10.06)	-2.42*** (-15.81)
Industry	Yes	Yes
Constant	-77.37*** (-27.69)	-17.54*** (-7.16)
N	76	76
R <sup>2</sup>	0.54	0.58

\*\*\*, \*\*, \* indicate significance at 0.1% and 1% and 5%. In parentheses are t statistics.

Turning to our second hypothesis (H2), results show that the coefficient on the 'Family firm' dummy is negative ( $\beta = -11.31, p < 0.001$ ) indicating that family firms present a lower level of CSR performance compared to their nonfamily peers. This is consistent with the findings of Veltri et al. (2021), who also cover the Italian listed firms distinguishing between family and nonfamily firms.

Our third hypothesis (H3) predicts that the family firm status positively moderates the association between a critical mass of women on the board and CSR performance. The positive coefficient on the interaction term 'Critical mass\*Family firm' in Model 2 ( $\beta = 14.33, p < 0.001$ ) lends support to this hypothesis as well. We interpret this result as being consistent with the argument that family owners who are more prone to engage in CSR activities will appoint a critical mass of female directors to advance their CSR agenda (Cruz et al., 2019; Cordeiro et al., 2020).

As regards the control variables at board level, we find that board size has a positive association with ESG, which supports the argument that large boards may boost the firm's CSR performance because they are more effective in balancing the interests of diverse stakeholder groups. The coefficient estimates on CEO duality and independent directors also have the expected sign.

As for the firm-level control variables, we find that firm size is positively related to CSR performance, suggesting that the larger the firm size, the more likely the firm is to engage in CSR activities. The coefficient estimates on ROA and leverage are respectively positive and negative, consistently with some previous findings (e.g., Bruna et al., 2021).

## 5 Conclusions

Our study aims to examine the impact of the critical mass of female directors on CSR performance and whether the family firm status has a moderating role on

this relationship. Based on a sample of 76 Italian publicly listed firms for the year 2019, the empirical analysis provides evidence that having a critical mass of female directors increases the CSR performance as measured by ESG rating. This supports the conclusions of prior studies suggesting it is not so much the appointment of female directors (Birindelli et al., 2019; Samara et al., 2019; Loukil and Yousfi, 2016), but rather the presence of a critical mass of women that has implications for CSR (Fernandez-Feijoo et al., 2014; Cabeza-García et al., 2018). Specifically, this finding corroborates prior evidence highlighting that having boards with a critical mass of at least three female directors improves CSR also in terms of outcomes (Post et al., 2011; Bear et al., 2010; Kassinis et al., 2016; Cambrea et al., 2023). In addition, the empirical analysis shows that the family firm status has a negative direct effect on CSR performance, but has a positive interaction effect with a female critical mass. Overall, these findings support the conclusion that the effect of female directors on CSR performance is influenced by the family ownership structure (Gavana et al. 2023; Beji et al., 2021; Cruz et al., 2019; Veltri et al., 2021; Cordeiro et al., 2020). Specifically, on the one side, results suggest that family firms are overall more likely to behave in a self-serving way, reducing their CSR efforts (Morck and Yeung, 2004). On the other side, results suggest that, when a critical mass of women is appointed on the board, the commitment of family firms with CSR improves, because a female critical mass fosters the probability that CSR issues are placed at the centre of the board's debate and decision-making (Li et al., 2017; Cordeiro et al., 2020) with positive consequences for CSR performance.

Our paper makes several contributions to the literature on gender diversity and family business and provides implications for practitioners as well. First, by focusing on the role of the critical mass of female directors, it integrates the research on the implications of women on board for company performance by providing empirical evidence on its effect on CSR performance. Second, it advances the scholarly debate on the determinants of ESG rating as proxy for CSR outcomes. Third, by exploring the moderating role of family ownership for the relationship between the critical mass of female directors and CSR performance, our article sheds light on how this governance mechanism is able to affect firm outcomes in terms of CSR. Finally, from a practical standpoint, by highlighting the importance of women directors, our study advises the board nomination committees on the importance of appointing a critical mass of female members to improve CSR outcomes.

In spite of its potential contributions, this paper presents some limitations that provide opportunities for further research. A first limitation is related to the employed sample, which only includes Italian listed firms. Future studies might investigate alternative settings, e.g., enlarging the analysis to other European countries characterized by different gender quota rules, so as to assess whether the effect of the critical mass on CSR performance differs according to the institutional setting. A second limitation relates to our measure to capture the family business status (i.e., dummy variable). In this regard, future research might better disentangle family firms' heterogeneity by analysing, for instance, the share owned by the family, the generational stage or the composition of the family group on the board. Finally, while we use the critical mass as a key independent variable to assess the impact of board gender diversity, future research ought to focus on the roles covered by female directors (e.g., independent, CEO, CFO, chairman) and on the specific human and social capital they bring to the boardroom (Hillman and Dalziel, 2003), so as to investigate whether and how their roles and intellectual capital shape the reported relationship between the female critical mass and CSR performance.

### **Abstract**

The United Nations and the Agenda 2030 have clearly recognized the role of for-profit organizations in boosting sustainable development and reducing inequalities. This process has led to a profound change in International Development Cooperation (IDC), where private enterprises are called to develop Inclusive Businesses (IB) aligning business values with social impact, following responsible environmental, social, and governance standards. This result is often reached through the creation of *Hybrids*, combining different organizational logics (e.g., social and commercial). In this research, we will focus on this last aspect (sustainability). Using interviews and focus groups, we aim at highlights those elements of tensions that derive from hybrids and sustainability goals. Hybridization involves a mix of different organizational logic (e.g., commercial vs. social) that may have different outcomes (e.g., innovative patterns or challenges and disagreement); therefore, we aim to understand how hybridization has been reflected in Knowledge Management practices between local and international dimensions. Moreover, as businesses are asked to submit a project proposal to get access to funds by AICS (in line with Lundin et al., 2015), we aim to explore how organizational logic is affected by the institutional framework and social goals (Sabini and Alderman, 2021) provided by IDC (e.g., what elements differ from a traditional pattern of internationalization), and whether such

tensions due to hybridity can be reconciled through sound knowledge management practices.

While during the years, the former (inclusive and sustainable models) has experienced a growth in numbers and quality of the proposal, the latter (HR Management) seems confined to traditional practices that do not take into consideration the peculiarities of the local dimension, showing an increasing tension between business and social (and sustainable) goals.

## 1 Introduction

A growing awareness of corporations' impact on the global value chain and globalization has been paired with wider attention towards sustainability and sustainable development. This has contributed to envisioning new ways of business-making, especially for marginalized areas of the globe. International Development Cooperation (IDC), which was once conceived as the trigger in the hands of developed northern countries to accelerate the development of poorer world countries, has undergone a profound change, and the role of for-profit organizations has been boosted. This process is meant to stimulate positive social change – PSC (Stephan et al., 2016), in light of a cooperative advantage (Morioka et al., 2017). Business, society, and the environment are interdependent (Porter and Kramer, 2006; 2011), and the Creation of Shared Value (CSV) is possible and needed in developing countries (Reinecke and Donaghey, 2020; Jamali and Karam, 2016; Cafferata, 2009). This process produced several concepts and approaches (Corporate Social Responsibility, Triple Bottom Line, Corporate Social Entrepreneurship, Shared Value Creation, Global Corporate Citizenship) that highlight the opportunities that emerge from the engagement of the private for-profit sector in IDC. An increasing global understanding envisions the private sector as part of the global IDC system in reducing inequalities (Deloitte, 2018) and alleviating social and environmental issues (Santos et al., 2015, Haigh et al., 2015). Corporations may pursue inclusive growth, diminishing trade-offs between growth and inequality (George et al., 2012). The market is shifting to the periphery by means of "sustainability-driven" commercial initiatives (Haigh and Hoofman, 2012), stressing the importance of corporate citizenship (Deloitte,

2018). In 2015, the UN 2030 Agenda for Sustainable Development recognized this role explicitly (i.e., Paragraph 67 of the Declaration of Resolution A/RES/70/1). Since then, many donor agencies have embraced the concept of “Profit for Development”, igniting and promoting inclusive and sustainable business models (UNDP, 2008).

## **2 Aim of the research**

Recent research has highlighted the positive nexus between Social Entrepreneurship, Inclusive Business, and SDGs (e.g., Wang et al., 2020; Günzel-Jensen et al., 2020; Eichler and Schwarz, 2019; Littlewood and Holt, 2018; Quiroz-Nino and Murga-Menoyo, 2017; Doherty, 2018). There is also evidence that Hybrid Organizations play a relevant role in achieving the SDGs in domestic (Horne et al., 2020) and foreign issues (Conway et al., 2019). However, SDG applicability is still challenging for enterprises since it depends on quantifiable outcomes that reach SDGs targets and indicators. Not all firms can measure the plethora of benefits they bring to society (Tabares, 2021). Moreover, hybrids are subject to many counter-effects, such as mission drifts, when the organizational mission is insufficiently institutionalized, and the organizational mandate is not fully reflected in the business model (Ramus and Vaccaro, 2017). Thus, it is still unclear whether a new pattern of private engagement in IDC could effectively substitute the non-sustainable patterns of internationalization or whether the drifts and hybridity threats could challenge the outcome of inclusivity and sustainability.

In this research, with the use of interviews and focus groups, we aim at highlights those elements of tensions that derive from hybrids and sustainability goals. Hybridization involves a mix of different organizational logic (e.g., commercial vs. social) that may have different outcomes (e.g., innovative patterns or challenges and disagreement); therefore, we aim to understand how hybridization has been reflected in Knowledge Management practices between local and international dimensions. Moreover, as businesses are asked to submit a project proposal to get access to funds by AICS (in line with Lundin et al., 2015), we aim to explore how organizational logics are affected by the institutional framework and social goals (Sabini and Alderman, 2021) provided by IDC (e.g., what elements differ from a traditional pattern of internationalization), and

whether such tensions due to hybridity can be reconciled through sound knowledge management practices.

### **3 Inclusive Business and HRM**

Diversity and an inclusive workforce are crucial drivers of innovation and critical components of global success. Enterprises have to be culturally sensitive (Forbes, 2011) since there are many specific human resource system development characteristics in various countries and under different conditions (Chlivickas, 2014). Human capital development policies require culturally sensitive and creative solutions designed for specific contexts, being respectful of exogenous factors such as laws and regulations, language, and cultural barriers that vary from region to region (Forbes, 2011). Therefore, companies may face strategies and methodologies of doing business very different from those they are accustomed to. Therefore, an effective combination of local and global knowledge is needed (George et al., 2012). This is especially true in the case of Inclusive Business (IB): embracing shared value creation and diminishing trade-offs between growth and inequality (George et al., 2012; UNDP, 2010). An Inclusive and Sustainable Business (ISB) embraces shared value principles by aligning business values with social impact, following responsible environmental, social, and governance standards. Nevertheless, only if businesses put a transformative power and genuinely embrace sustainable development agendas, the threats of avoiding further entrenching the neoliberal mechanisms that have contributed to societal inequalities (Scheyvens et al., 2016). A vast literature has referred to these businesses as hybrids (e.g., Holt and Littlewood, 2015; Schoneveld, 2020). These are organizations combining different organizational logics (Alexius and Furusten, 2019), where "the distinction between social and commercial entrepreneurship is not dichotomous but rather [...] a continuum ranging from purely social to purely economic. Even at the extremes, there are still elements of both" (Austin et al., 2006, p. 372). In IDC, a dual process of hybridization has taken place: Efficiency for NGOs, and "Humanization" for Private for-profit Enterprises.

Among the policies that people management entails, recruitment is surely one of the most impacting the execution on any business model, and especially a business model that aims at inclusivity, sustainability and innovation. In fact, selecting the right persons that share values and attitudes with the organization is

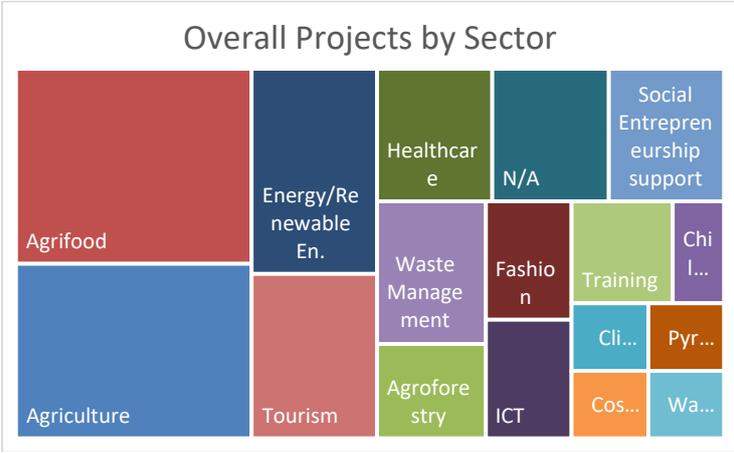

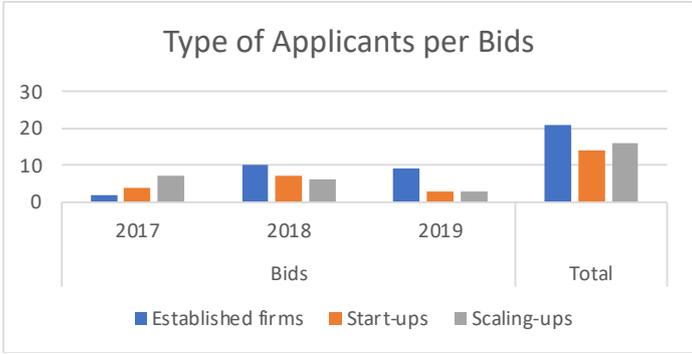

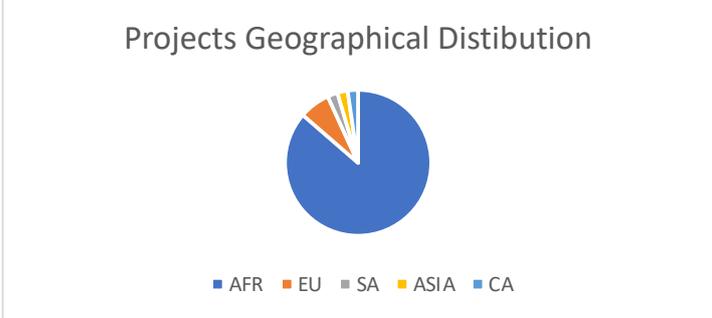

mandatory to set up a good work environment where the objectives of inclusive business can be pursued. Although also in traditional business the criteria for selecting workers are satisfied by objective data (curricula vitae; letters of presentation; previous experience; technical skills acquired, etc.), as well as psychological profile, this is particularly crucial in the inclusive business. In these cases the candidate's technical-productive skills might also be less important than her values and psychological profile, and how congruent this is with the needs of the company and its culture. Therefore, the objective methods based on curricula screening (which assesses the suitability of candidates in accordance with objective requirements such as the languages known or the level of education), must be integrated with other assessment methods. The internal organization of companies that undertake an inclusive business project should not be centred only on factors of technical and economic rationality (as in the for-profit company) or "formal" rationality (as in public administrations) but on the exaltation of role and subjectivity of people who use technical, economic and formal rationality, but are not subordinate to it.

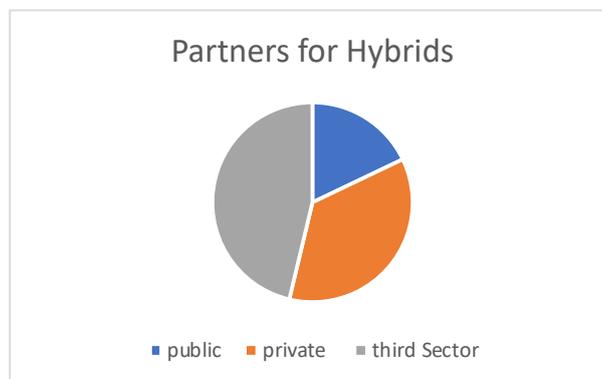

### **3.1 Italian Development Cooperation Bids**

#### *3.1.1 IDC, Hybridity and HRM*

Our empirical setting focuses on Italy. As a precursor in the international setting, the Italian reform of Development Cooperation in 2014 (law 125) anticipated the objectives and principles of the 2030 Agenda, especially as regards the role of the private profit sector, recognizing its role as a development actor (art. 27). The reform has also allowed the establishment of the Italian Agency for Development Cooperation (AICS), which has to date published 3 calls for cooperation for private companies. Being engaged in action research with AICS since 2017, the research team has already been analysing the hybridity of the projects based on inclusive and sustainable business models that have been funded over the years by AICS, with a focus on the Human resource management practices that have been entailed within the projects.

The following graphs show the picture offered by the projects' applications analysed.

As the graphs show, sectors of applications are quite different, and identifying a single model of Inclusive Business is out of the scope of this paper. However, we focus on two dimensions that emerged as common to all: 1) Human Resource Management (HRM), in particular, recruiting; 2) the elements of tensions between the requests of the bids and entrepreneurs' attitude towards the challenges and rewards offered by the implementation of an Inclusive Business (IB).

1. With regard to the HRM, the local workforce was involved just in physical production, while the rest of the operations were performed by local offices managed by an Italian staff or project managers that were trained in Italy. Recruitment was generally assigned to local staff intermediation services using traditional business tools. The training and re-training was a process directly managed by the company as well, since in most cases workers' skills were not in line with needs because of a lack of methodological knowledge or knowledge of using, for example, the appropriate machinery. In general, the level of specialization has rarely been rated satisfactory by companies. As in

the case of recruitment, the practices and tools of training activities did not differ much from the usual ones of domestic businesses, if not in the very difference in the specialization of workers and farmers, in the different work culture, and conceiving an economic activity.

2. With respect to the elements of tensions between the requests of the bids and entrepreneurs' proposals, here are the followings:
  - The concept of development cooperation presents elements of confusion with internationalization, which emerges as the second main reason to be engaged in the bids.
  - Criticality in adapting the traditional scheme of the business plan to the innovative and sustainable business model required by the AICS, in particular considering the uncertainties of the local contexts;
  - The vast majority of applicants believe their enterprise is prepared to deal with the request and criteria of the bid;
  - Need of networking with realities in third countries.

#### **4 Conclusions**

While during the years, inclusive and sustainable models have experienced a growth in numbers and quality of the proposal, HR Management seems confined to traditional practices that do not take into consideration the peculiarities of the local dimension, showing an increasing tension between business and social (and sustainable) goals.

The entrepreneurial system seems not ready yet to address the organizational challenges implicit in the "Profit for Development" paradigm: the creation of inclusive businesses and/or hybrid organizations to create shared value. Many projects were in line with the principles of IDC, but in some cases, they were just projects of internationalization.

In some cases, the applicants were not familiar with hybrid models, and this poses a serious concern regarding a managerial gap to be solved for creating hybrid organisations and workforce management, which cannot be recruited and trained with traditional frameworks.

Through the analysis of the projects presented to the Italian Agency for Development Cooperation, we show that traditional enterprises still lack the mindset and required competencies to engage and manage hybrid partnerships

that put together for-profit and not-for-profit organizations at both national and international levels. This is testified by the conservative approach in human resources management (HRM) strategies and policies.

### **Abstract**

Society 5.0 and Industry 5.0 concepts are gaining more importance in the academic and political debate, going beyond the boundaries of the policy brief, and becoming growth models interesting for other countries (Fukuyama, 2018; Carayannis, 2021). These new paradigms start from different focuses, one on society and another on the industry, but there are many common elements.

Our interest in this paper is to highlight the common point of this element, with the intent to identify the "Context 5.0". This Context 5.0 involved many actors, including government, industry, and Civil Society. As Management and Entrepreneurship scholars, in studying this new context our focus is on the role of industries.

In this paper, we aim to understand how Corporate Entrepreneurship can support companies that want to do business in line with the imperative of Context 5.0 and finally

open a debate based on the possibility of integrating the theory of Humane Entrepreneurship with Corporate Entrepreneurship.

**Keywords** – Society 5.0, Industry 5.0, Corporate Entrepreneurship, Humane Entrepreneurship.

**Paper type** – Academic Research Paper

## 1 Introduction

We are not living in an epoch of change; we are living in an epochal change. Pandemics, wars, social inequalities, and environmental disasters are some of the dramatic events that have characterized the entire course of humanity. Today, however, we live in a globalized world, in which the challenges affect everyone in different ways, and are too great to face individually. The good news is that we have technologies and tools that are redefining the concept of space-time limits and boundaries, giving us unprecedented opportunities to face and overcome global challenges. In every country, in every sector, and in every market, innovation, not only technological, is generating new ways of creating value (Kuratko, 2009). However, individual technologies and strategies are not enough, we need to develop new strategies based on cooperation between government, industry, and civil society, aiming at sustainable growth models (Carayannis et al., 2012; 2021; 2022).

Society 5.0 and Industry 5.0 are just that: strategies for sustainable development. Developed by the Japanese government and the European Commission respectively, these are aimed at solving the challenges of our time through a systemic approach, and the development of human-centered and innovative solutions. As highlighted by many scholars (Eisenhardt, Brown, and Neck 2000; Covin, Slevin, & Heeley, 2000; Kuratko, 2009), Entrepreneurship and Innovation are the approaches to sustain the process of creating value and obtaining competitive advantage and success in organizations of all types. In this context, as Management and Entrepreneurship scholars, in studying these "5.0 strategies of sustainable growth", our focus is on the role of industries. Our interest lies in understanding how business needs and dynamics may well coincide with the imperatives imposed by societal development models. Literature on business and organization highlighted that there are several reasons why companies should decide to pursue social and environmental objectives

through their business. As shown by Orlitzky et al. (2003), there is a positive relationship between the pursuit of social and environmental responsibility results and financial performance, especially when considering long-term financial results (Chatterji and Toffel, 2010). In addition to the impact on financial performance, Sharma and Vredenburg (1998) demonstrated how companies that adopt proactive environmental strategies can develop organizational capabilities that create competitive advantages, including improved stakeholder relations, enhanced technological capabilities, and increased innovation. Other scholars (Rupp et al., 2006; Turker, 2009), on the other hand, have shown that companies that engage in socially responsible initiatives are more motivating for employees, who tend to be more committed, more loyal and find greater satisfaction from their work, especially when the company's values are in line with their values.

Many scholars are pointed out how corporate entrepreneurship can be a method to achieve high levels of organizational performance in this global and challenging world (Kuratko 2009; Morris et al. 2011; Kuratko, Hornsby, and Hayton, 2015; Audretsch et al., 2015). However, to our knowledge, there are no studies that highlighted the role that CE can assume in the context of Industry and Society 5.0. In this paper, we aim to understand how Corporate Entrepreneurship can support companies that want to do business in line with the imperative of "Context 5.0". Especially we want to answer this research question:

*RQ1: How can Corporate Entrepreneurship support the development of Industry 5.0 and Society 5.0?*

*RQ2: What contribution can Humane Entrepreneurship make to Corporate Entrepreneurship?*

The novelty of the phenomena under observation requires us to take a methodological approach based essentially on the study of policy briefs and the little literature currently available on Industry 5.0 and Society 5.0, an analysis of the recent developments in the literature on Corporate Entrepreneurship, and finally the opening of a debate based on the possibility of integrating the theory of Humane Entrepreneurship with Corporate Entrepreneurship.

Remarkably, the article is structured as the following. The first section discusses the topic's relevance and highlighted the intersection and common elements between the concept of Society 5.0 and Industry 5.0, to identify the elements of Context 5.0. The second section reviews the development of Corporate Entrepreneurship literature, to understand how CE contributed to the company dynamics and the third session analyzes which role the CE can be in Context 5.0.

In the fourth section based on the Humane Entrepreneurship model, we debate how the development of a Humane Corporate Entrepreneurship approach can support the transition of the company in Context 5.0. Our framework adds value to the ongoing scientific debate about I5.0 and S5.0, proposing a broad conceptual model to design the future role of companies in Context 5.0, especially to refer to the role of Corporate Entrepreneurship. Finally, implications, limitations, and future research directions are presented.

## **2 Literature review**

### ***2.1 From analysis of Industry and Society 5.0 to the definition of Context 5.0***

The concept of Society 5.0 is gaining more importance in the academic and political debate, going beyond the boundaries of the Japanese government's strategic plan "The Investment for the Future Strategy 2017: Reform for Achieving Society 5.0 (Cabinet Office, 2016) and becoming a growth model interesting for other countries (Fukuyama, 2018; Carayannis, 2021). Society 5.0 describes the next level of Society that follows the current 'Information Society' (Harayama, 2017). In this concept, digital technologies are used systemically, and cyber and physical space is merging to face and solve the profound sustainability challenges in a broad sense (Keidanren, 2017; Deguchi & Karasawa, 2020). Unlike other models (e.g., "Industry 4.0" or "Made in China 2025") in which digital technologies mainly support industrial activities, in Society 5.0 they are used to address the environmental and social challenges to build a human-centered society (Fukuyama, 2018; Holroyd, 2020; Carayannis, 2022). To implement the concept of Society 5.0 it is necessary for industry, politics, and civil society to work in synergy (Deguchi and Karasawa, 2020) and is necessary to integrate several dimensions, among them the entrepreneurial spirit and the entrepreneurial skills (Carayannis, 2021 about Yousefikhah, 2017). The willingness to integrate Industry 4.0 technologies, for the development of solutions capable of generating a positive impact on society, is also the concept behind the new industrial paradigm called 'Industry 5.0' (Carayannis, Canestrino, Magliocca, 2023). Industry 5.0 is the strategic plan developed by the EU following the Covid-19 shock. The effects on the economy and society were such that the EU had to rethink its industrial model and develop a plan to repair, protect and transform European society and economy (Renda et al., 2022). As stated in the Policy brief, the goal is to build on

the lessons learned and develop a new model of economy and Society that is people- and planet-centered, resilient, digital, and sustainability-oriented.

Both these paradigms, start from the assumption that the industry 4.0 model is a techno-centric model, which therefore does not consider humans and the environment as central (Longo et al., 2020; Müller et al., 2018). As highlighted by Carayannis (2023) Industry 4.0 is not a human-centric initiative "It lacks the necessary dimensions to enable systemic transformation and to guarantee the necessary decoupling of resources and their employment from negative environmental, climate, and societal impacts". The two paradigms are based on using the same technologies as Industry 4.0; however, they consider them as tools to realize economic, social, and environmental goals, in line with other strategies above all the Sustainable development goals.

A joint reading of the reference policy briefs ('The Investment for the Future Strategy 2017: Reform for Achieving Society 5.0' and 'Industry 5.0, a transformative vision for Europe: governing systemic transformations towards a sustainable industry') emerge as Society 5.0 and Industry 5.0 are both concepts that aim to integrate advanced technology with human society to create a more efficient, sustainable, and prosperous future. Here are four common elements between the two paradigms:

- Human-centric approach: Both paradigms focus on placing humans at the center of technological innovation. They prioritize the needs and well-being of people over purely economic or technological objectives.
- Integration of technologies: Both concepts rely on advanced technology to achieve their goals. Society 5.0 envisions a future where cutting-edge technologies such as AI, IoT, and robotics are seamlessly integrated into society to improve quality of life, while Industry 5.0 emphasizes the integration of new technologies such as AI, automation, and the Internet of Things (IoT) in industrial production processes, to the aim obtain a more sustainability and resilient production process.
- Sustainability: Both concepts emphasize the importance of sustainability in creating a better future. Society 5.0 aims to create a sustainable society where economic growth and environmental protection go hand in hand, while Industry 5.0 focuses on developing sustainable manufacturing processes that reduce waste and carbon emissions.

- Collaboration: Both concepts rely on collaboration and cooperation among different stakeholders, including government, businesses, civil society, and individuals. These paradigms aim to create a collaborative model of industry and society where various actors work together to achieve common goals. These paradigms consider not only the collaboration between different stakeholders but also highlighted the importance of collaboration between humans and machines. Both concepts aim to develop a new space for industry and society, without boundaries between cyber and physical space.

Overall, both Society 5.0 and Industry 5.0 seek to harness the power of technology to create a better future for humanity. They share a common goal of improving people's lives through innovation, while also addressing pressing social and environmental challenges. Through the analysis of policy briefs and the prevailing literature on the topics (Demir et al., 2019; Longo et al., 2020; Fukuda, 2020; Deguchi et al., 2020; Xu et al., 2021; Carayannis et al.; 2021; 2022; 2023), the main indications for companies emerge, regarding actions to be implemented and behaviours to be adopted to operate in line with the objectives of Context 5.0. To contribute to achieving the goals of Industry

5.0 and Society 5.0, companies are called upon to:

1. Rethink their business models, giving sustainability a central role in supporting growth strategies.
2. Developing human-centered and sustainable products and services using digital technologies.
3. Redesign process reshoring to reduce the overall environmental footprint.
4. Redesign value chains to embrace the new possibilities offered by technology and realize the economic and social well-being of the various stakeholders.
5. Adopt metrics and indicators to measure progress toward social impact and sustainability goals.
6. Develop a mindset at all company levels, putting the concepts of sustainable development and social challenges at the center of the value creation process.

As pointed out by Bansal and Roth (2000), companies engage in sustainability imperatives not only to comply with regulatory pressures but also to meet stakeholder demands and create a competitive advantage. The objective of

companies in Context 5.0 is to realize at the same time the business goals, and contribute to developing a more ethical society, which using Digital Transformation and Smart Technologies, can solve the complex environmental, economic, and social challenges, implementing a broad sustainability approach capable of offering all humans a happy life (Parente et al., 2021). This paper aims to highlight of Corporate Entrepreneurship can support the company's transition to Industry 5.0.

## **2.1 Corporate Entrepreneurship**

CE is recognized as a strategic approach that supports corporate growth (Goodale et al. 2011), through the adoption of an ongoing process of entrepreneurial actions to achieve a competitive advantage (Kuratko and Morris, 2018). According to the study of Zhara et al. (1995; 1996, p.1715) here we define the CE as "the sum of a company's innovation, renewal, and venturing efforts". Innovation refers to the innovation of products, production processes, or organizational systems. Renewal refers to the process of revitalizing business operations, either through a change of activities, competitive approaches, or the acquisition and implementation of new capabilities. Venturing refers to the company's entry into new businesses. We decided to follow the Zahira approach and focus on the relationship between CE and innovation capability because as highlighted by Covin and Miles (1999) innovation is the central common theme underlying all forms of CE. Kuratko (2017) has brilliantly taken a picture of the development of CE literature over the last 50 years, pointing out that the three major domains are: corporate venturing, entrepreneurial orientation, and strategic entrepreneurship. According to Morris et al. (2011) the CE be manifested in companies either through two main categories of activities: corporate venturing and strategic entrepreneurship. Corporate Venturing regards the activities of innovation carried out through the creation of new businesses, internal or external to the company (we told of internal or external corporate ventures). Corporate venturing activities are pursued for at least three main reasons: 1) To improve and expand the competencies of the company to increase its innovative and entrepreneurial capabilities. 2) To expand the boundaries of the company's business in areas of possible strategic importance. 3) To generate financial returns (Tidd and Taurins, 1999; Miles and Covin 2002; Narayanan et al., 2009). Strategic entrepreneurship is a broader concept, in-fact it is possible to include in all

entrepreneurship initiatives, that the company decides to pursue to create wealth in a broad sense (Hitt et al., 2001), and not involve the creation of new business (Morris et al., 2011; Kuratko et al., 2015). These include innovation activities at different levels: product, process, business model, organization, competencies, and strategies (Ireland & Webb, 2007; Hitt et al., 2011; Kuratko and Audretsch, 2013).

As highlighted by Kuratko (2017) the theme of Entrepreneurship Orientation is central to the research on CE. This concept was coined by Covin and Slevin (1989) and Covin and Slevin (1991), who posited the existence of a continuum of a firm's strategic behavioral proclivities. A company is considered more entrepreneurial on the spectrum when evidenced by innovativeness (the introduction of new products, processes, and business models); proactiveness (actively entering new product/market spaces and seeking market leadership positions); and risk-taking (a willingness among strategic decision-makers to contribute resources to projects with uncertain outcomes).

Of course, scholars refer to the innovation activities driven by corporate entrepreneurship, when corporate venturing and strategic entrepreneurship activities don't are episodic events but are expressions of behavioral patterns that are recurring, and these are linked to the Entrepreneurial orientation domain of corporate entrepreneurship (Kuratko, 2017). In fact, according to Covin and Slevin (1991, p. 8), "Organizations with an entrepreneurial posture are those in which particular behavioral patterns are recurring." Companies judge the value of innovation to the extent that it becomes a corporate strategy to create a sustainable competitive advantage (Vanhaverbeke & Peeters, 2005). Companies that innovate by adopting a Corporate Entrepreneurship approach do so to pursue an entrepreneurial opportunity by taking the risk that innovation entails. In this sense, Ireland, Covin, and Kuratko (2009) define a corporate entrepreneurial strategy as "a vision-directed, organization-wide reliance on entrepreneurial behavior that purposefully and continuously rejuvenates the organization and shapes the scope of its operations through the recognition and exploitation of entrepreneurial opportunity" (p. 21). In summary, we can say that companies have adopted CE as an approach to innovation to establish sustainable competitive advantages (Hornsby et al. 2009) sustain profitable growth (Kuratko et al. 2001) and so improve financial performance (Zahra,1991). However, the rules of Context 5.0, is that the logic of the competition is game-changing fast, and so companies are beginning to realize that sustainable

competitive advantage requires a new approach (Kuratko, 2009), and in this new context also evolving the role of Corporate Entrepreneurship (Kuratko et al., 2015).

### **3 The contribution of CE to support the business in Context 5.0**

CE has been adopted by companies to restructure their activities at different levels to cope with Significant changes (Zahra, Kuratko, and Jennings, 1999). The innovation generated by an approach of CE can support the company in fundamental changes (Kuratko and Audretsch, 2013). Corporate venturing and strategic entrepreneurship involve both simultaneous opportunity-seeking and advantage-seeking behaviors (Ireland et al. 2003). As highlighted in the introduction, pursuing social and environmental impact through corporate business activities can generate better financial performance and improve employee engagement. Therefore, we believe that doing business following the logic of context 5.0 is consistent with both the pursuit of business opportunities and the pursuit of competitive advantage. In the second paragraph, we identified the six main challenges for companies that want to operate in the 5.0 environment. Now for each of the challenges, we will try to analyze how and whether CE can be a useful approach.

**Rethink the Business Model:** Business model innovations are one of the most significant elements in strategic entrepreneurship (Ireland et al.2003). In fact, through CE initiatives, companies design new business models or innovate previous ones to exploit specific market opportunities and build competitive advantage (Eckhardt 2013) and obtain a better performance (Cucculelli et al., 2013).

**Developing human-centered and sustainable products and services:** Kuratko (2009) highlighted how CE represents a guiding light approach to companies that want to innovate e develop new products that create real value for customers and obtain a sustainable competitive advantage. Product and service are one of the five areas of strategic entrepreneurship approaches (Morris et al., 2011), however, as highlighted by Zahra (1991), sometimes, through product innovation established firms create new businesses.

**Redesign process:** As observed by Zahra (1991) formal and informal activities that characterize the CE, can be aimed to realize the innovation of processes. According to Ireland & Webb (2007), process innovation is a sub-category of

internal organizational innovation, realized through strategic entrepreneurship initiatives.

**Redesign value chains:** According to Kuratko, Hornsby, and Hayton (2015), it is time for managers to focus on CE initiatives to innovate the value chain, following the approach of strategic thinkers (Govindarajan and Trimble, 2005). As shown by Kanbach and Stubner (2016), CE currently begins to support the emergence of new businesses and products that can have a positive impact on the company's value chain.

**Adopt metrics to measure the impact:** The development of impact measurement models and metrics is one of the fields of interest that has attracted the most interest from scholars in CE fields (Hornsby et al., 2002; Ireland et al. 2006; Morris et al., 2011; Covin and Wales, 2012). However, according to Kuratko (2017), corporate entrepreneurship as a strategy must be measured for its actual impact, and models and metrics have been a stronger theme to the challenge of CE in the 21st Century.

**Develop a company mindset:** As pointed out by Kuratko (2017), the entrepreneurial mindset is one key element in the implementation of EC initiatives, as it is strongly linked to the ability to identify entrepreneurial opportunities and risk-taking, elements that characterize all EC activities (Morris, Kuratko, & Covin, 2011). Zahra (2016) also highlighted a strong link between the achievement of the objectives of CE activities and the presence of a widespread entrepreneurial mindset among company managers.

Starting from the analysis of the challenges that industries face within the 5.0 context, we have highlighted here how Corporate Entrepreneurship initiatives could support companies that want to innovate and seize the opportunities offered by this paradigm shift. However, our reasoning lacks a fundamental element. For CE activities to concretely support the innovation processes of companies in the 5.0 context, the company must adopt an entrepreneurial posture consistent with the vision and values of the 5.0 context.

#### **4 Towards a possible model of Corporate Humane Entrepreneurship**

Already Burgelman (1984) pointed out that senior managers play a key role in the development and success of CE initiatives. Indeed, the role of top-level managers is central in defining the corporate strategy and thus the strategic and structural context within which entrepreneurial behaviour can take place (Ling et

al., 2008; Hornsby et al. 2009). Top-level managers are responsible for creating the conditions for carrying out initiatives that fall within the domain of strategic entrepreneurship (Hornsby, Kuratko,

Shepherd e Bott, 2009). At the same time, they are also responsible for structuring the organization in a way that facilitates the development of new entrepreneurial initiatives (Kuratko and Morris, 2018). However, it's through interactions and support of middle- level and first-level managers, they influence and shape the operationalization of the firm's corporate entrepreneurial strategy (Kuratko, Ireland, Covin, and Hornsby, 2005). Top management can instigate the strategy, but top management cannot dictate it (Kuratko, 2009), and a crucial role in the success or not of a Corporate Entrepreneurship strategy within an organization is at middle and lower ranks (Hornsby et al., 2009). In fact, without a strong and sustained commitment from all levels of the organization, entrepreneurial behavior will never be a defining characteristic of the organization (Kuratko, 2009). We can therefore conclude that, for the company to decide to pursue a CE approach in line with the goals of Context 5.0, senior managers need to adopt a new entrepreneurial posture and one that reflects values in which middle managers and first- level managers are also reflected, which are central for such a posture to become widespread throughout the company (Ireland et al., 2006). Here we can propose a new possible approach to define Corporate Entrepreneurship in line with Context 5.0: The Corporate Humane Entrepreneurship.

The need to rethink the concept of entrepreneurship has been addressed by the scientific community of management scholars which since 2016 (Kim, 2016) developed the concept of Humane Entrepreneurship (Parente et al., 2018; 2020; Kim et al., 2018; Vesce, 2018; Kim et al., 2021). HumEnt theory, expanding the Entrepreneurial Orientation theory advanced by Covin and Slevin (1989; 1990) and suggests a new entrepreneurial strategic posture (ESP), called Humane Entrepreneurial Orientation (HEO), defined by the integration of three dimensions: entrepreneurial orientation (EO), sustainability orientation (SO), and human resource orientation (HRO). Humane entrepreneurship is based on the idea that entrepreneurs should extend their priorities beyond their profit margin, toward their employees, people, environment, and society (Kim, 2016). HumEnt represents a new entrepreneurial strategic posture (ESP) that presupposes the pursuit of profit but considers it equally fundamental that the firm generates value by taking care of the interests of the environment, people, society in

general, and human resources. operating in the firm. Recently Parente et al. (2021) highlighted like Humane entrepreneurship can be a strategic approach to the development of Society 5.0 because shares with it the centrality of human value and achieves sustainability in a broad sense (Parente et al., 2021). Also, recently Kim et al. (2021), presented a model that demonstrates how Humane Entrepreneurship plays a role in the corporate/organizational entrepreneurship process.

According to the definition by Covin and Slevin (1991, p. 8), "Organizations with an entrepreneurial posture are those in which particular behavioural patterns are recurring." Therefore, for companies to decide to pursue a business approach in line with the needs of the 5.0 context through CE initiatives, they must adopt an entrepreneurial posture in line with the goals of the 5.0 context, we believe this can be the Humane Entrepreneurial Orientation, for several reasons.

- Humane Entrepreneurship build on the principle that entrepreneurs ought to broaden their focus beyond their financial goals, looking toward their employees, people, environment, and society's needs (Kim, 2016). Humane entrepreneurship can contribute to the development of a model of corporate entrepreneurship by emphasizing the importance of stakeholder engagement. This means adopting a stakeholder approach in the decision-making process and working with customers, suppliers, and local communities in the process to develop new solutions through CE initiatives. By doing so, companies can ensure that their activities are aligned with the real needs of all stakeholders, which can also help build trust and foster long-term relationships.
- As highlighted by Parente (2018), new digital technologies will contribute to making firms "houses of glass", open to their consumers and stakeholders and in this sense, the companies will better adopt a kind of entrepreneurial strategies, also at the corporate entrepreneurship strategy level, that is in line with the guiding values of 'Context 5.0. And in this sense, Humane Entrepreneurship, enhances social responsibility either internally to the organization's boundaries or externally to the organization's boundaries, because at the same time through innovation aim to create value for the clients to "meet the needs of the present without compromising the ability of future generation to meet their own needs" (UN, 1987, Section 49).

- Many scholars have studied the relationship between Human Resource Management activity and CE initiatives (Morris and Jones, 1993; Hornsby, Kuratko, and Montagno; 1999; Hayton et al., 2005; 2006; Montoro-Sánchez et al., 2011). One common thread in these studies of HRM practices and CE is the need for HR systems to support informal employee contributions, encourage cooperation, and avoid unnecessary bureaucratic constraints on behaviour (Hayton, 2005). How show the model developed by Kim et al. (2021), a model of CE based on Humane Entrepreneurship enhances organizational capital (human and social) and produces an innovative workplace culture based on enablement, empowerment, equity, and empathy.
- As highlighted by Carayannis (2022), the innovation process in complex environments should require the involvement of all players in the ecosystem, and this necessary openness fits well with the logic of Context 5.0 (Carayannis et al., 2022). Many studies have pointed out that the complexity of our time requires a systemic approach to innovation, which is based on the dynamics of relationships.

We believe that the open and systemic approach that characterizes the posture of Humane Entrepreneurship can well support an EC management that realizes the imperatives of the Quintuple Helix (Carayannis et al., 2022; 2023), which to date seems to be the best way to achieve the imperatives of "Context 5.0".

## **5 Conclusions**

Starting from an analysis of the literature and policy briefs, in this paper, we analysed the common elements of the 'Industry 5.0' and 'Society 5.0' paradigms, arriving at an initial definition of Context 5.0. We focused on the challenges facing industries within Context 5.0. We highlighted how corporate entrepreneurship, especially Strategic entrepreneurship, can support companies to innovate and grow within Context 5.0.

In the last section, we analysed the theory of Humane Entrepreneurship, highlighting how the adoption of this entrepreneurial posture can support companies in adopting a CE strategy in line with Context 5.0 and facilitate integration with the Quintuple Helix approach, which seems to be the beacon to drive companies' innovation in the complex context of the 21st century. This study lacks empirical analysis, so the future research step is to verify through

empirical research whether and how this model their Corporate Humane Entrepreneurship is applied.

## **Biophilic Architecture to Promote Environmentally Sustainable Behaviour in Children: The Project for the New School in Rionero in Vulture**

---

Marco Laterza

Department of European and Mediterranean Cultures,  
Environment, and Cultural Heritage  
University of Basilicata  
Via Lanera 20, 75100 Matera, Italy

### **Abstract**

This paper aims to examine how biophilic architecture can be considered a key tool for promoting environmentally sustainable behaviour in children through the analysis of a case study. The first part expounds on the key principles of biophilia and the effects that a daily relationship with nature can generate on our mental and physical well-being. The paper explores the applications of biophilia in the field of architecture, as well as strategies to enhance the restorative experience that living spaces can have through the use of biophilic design.

The second part examines the case study of the project for the new secondary school in Rionero in Vulture, developed as part of the doctoral research on architecture and biophilia for the "Aree Interne" of Basilicata, currently being carried out at the University of Basilicata. The project developed in collaboration with architect Matilde Suarez Ruiz, came out as the winner of the "Futura" design competition organised by the Italian Ministry of Education, applies design strategies based on the 14 patterns of biophilic design (Terrapin bright green, 2014) and on major environmental psychology theories such as Attention Restoration Theory (Kaplan, 1995) and Stress Recovery Theory (Ulrich, 1981). Through the use of biophilic design and restorative design strategies, the aim is to create spaces that help prevent attention deficit problems and learning disorders, promote psychophysical well-being and the development of eco-sustainable behaviour.

Finally, the third part of the paper will focus on the knowledge management process in architecture with special reference to the design competition system and the case study under consideration.

**Keywords** – Biophilic design, Restorative design, Eco-sustainable behaviour, Architectural knowledge management

**Paper type** – Practical Paper

## **1 Introduction**

This paper aims to examine how biophilic architecture can be considered a key tool for promoting environmentally sustainable behaviour in children through the analysis of a case study. The first part will expound on the key principles of biophilia, its applications in architecture and related knowledge management and sharing systems.

The second part will examine the case study of the project for the new secondary school in Rionero in Vulture, developed as part of the doctoral research on architecture and biophilia for the "Aree Interne" of Basilicata, currently being carried out at the University of Basilicata. The project developed in collaboration with architect Matilde Suarez Ruiz, came out as the winner of the "Futura" design competition organised by the Italian Ministry of Education.

Finally, the third part of the paper will focus on the knowledge management process in architecture with special reference to the design competition system and the case study taken into consideration.

## **2 The biophilia hypothesis**

Biophilia literally means "love of life" and in a broader sense "love of all living things." The concept was popularised by entomologist Edward O. Wilson's 1984 book of the same name and is defined as the innate biological need of human beings to be connected to natural systems. In the same year, Roger S. Ulrich's famous publication "View through a window may influence recovery from surgery" appeared in the journal "Science," which suggested that a view of a natural environment in hospital patient rooms could have a restorative effect on patients. In research carried out in a Pennsylvania hospital between 1972 and 1981 in fact, Ulrich showed that for several patients undergoing the same type of surgery those who had a room with a view toward greenery had less need for pain medication and much shorter postoperative recovery times than patients who had a room with a view to a brick wall.

The possibility that contact with nature could have such powerful effects on our mental and physical well-being has generated a remarkable body of scientific experiments and demonstrations that have shown how constant and direct exposure to natural contexts has a decisive influence on our ability to concentrate, creativity, regulation of stress levels, blood pressure, and the

prevention and reduction of states of anxiety and depression. (Barbiero Berto, 2005. Barbiero and Berto, 2016. Harting, 2021)

In particular, two mutually complementary theories, the Stress Recovery Theory (SRT) developed by R.S. Ulrich and the Attention Restoration Theory (ART) elaborated by S. and R. Kaplan, show how contact with nature acts positively on the recovery of our cognitive abilities and well-being.

## **2.1 Biophilic Architecture**

That the presence of trees, flowers, plants, water and natural materials in living spaces is a pleasant factor may seem almost taken for granted. But the studies cited in the previous paragraph show that daily contact with natural elements is not only pleasant but also necessary for our health.

“Seen as an amenity, nature can easily be replaced by any technological artifice. Seen as an essential link between human beings and the rest of the living world, natural environments have no substitute” (Kaplan and Kaplan, 1989).

Biophilic architecture is a field of study that seeks to systematise the application of biophilic findings to the design of inhabited spaces at all scales, from urban and landscape design to furniture objects. The research of Stephen Kellert and Terrapin Bright Green has explored the various possibilities of the relationship between the built environment and the natural environment (direct and non-direct connexion with nature, presence of water, biomimicry, presence of natural materials, fractal structures and patterns, connection with natural systems) identifying the beneficial and regenerative qualities for each of them (lowered blood pressure and heart rate, impact on cognitive performances, concentration and mental engagement, reduced systolic blood pressure and stress hormones, dopamine response, ...). The open source publication “14 patterns of biophilic design” (Terrapin Bright Green, 2014) translates the results of those researches in design strategies.

With reference to the educational context, a direct relationship between poor school outdoor environments and higher incidence of attention disorders has been demonstrated (Grahn et al., 1997). Wells (2000), on the other hand, showed that the same kind of impact is also caused by the quality of urban green space in the area of children's residence.

In 2019, a collaborative study between Craig Gauden Davis, Morgan State University, The Salk Institute for Biological Studies and Terrapin Bright Green

presented comparative data collected in a biophilic classroom (views of natural environments, dynamic and diffuse daylight and biomorphic patterns) and a traditional control classroom. The results show a direct impact of biophilic design on students' and teachers' stress levels, concentration, and a marked improvement in students' academic performance. Among the research data, for example, it was found that 35% of students in the biophilic classroom perceived their stress to be high compared to 67% of students in the control classroom. Over a period of 7 months, the improvement in average maths test scores was more than 3 times higher in the biophilic classroom when compared to a control classroom (Determan et al., 2019).

## ***2.2 Biophilic Architecture and Knowledge Management***

The field of study of biophilic design presents a complexity due to the fact that it involves different disciplines such as architecture, ecology, neuroscience and environmental psychology. A proper classification and hierarchy of knowledge becomes very important for designers in order to share possibilities given by the applying biophilic design strategies. The 14 patterns are a very useful tool to facilitate the decision-making process for designers and the sharing of such choices with all stakeholders in the architecture process.

A series of studies made by Terrapin Bright Green between 2015 and 2017 created detailed case study sheets that analyse in the form of diagrams, graphs, and text the use of biophilic strategies implemented by selected best practices. Those open source studies are another key tool for designers to manage and share knowledge on biophilic design.

## ***2.3 Relation between education, biophilia and environmentally sustainable behaviour***

Policies put in place by national and supranational governmental structures show that environmental education (EE) and education for sustainable development (ESD) are the key elements in promoting sustainable behaviour.

The European Union published in 2022 a "European Nature Conservation Toolkit" designed especially for educators and children between the ages of 13 and 16. It is a tool created to share resources and tools to encourage discovery of nature in children: "letting students be inspired by their surroundings can be a

real first step to meaningfully engage them in respecting nature." Raising awareness of the issues of climate change and biodiversity loss involves gaining awareness and understanding of the natural environment, recognizing the importance of our behaviours toward nature, and understanding the impact of human activities on those changes.

Stimulating knowledge and respect for nature turns out to be of crucial importance to positively influence environmentally sustainable behaviours in children.

The relationship between biophilia and the development of eco-sustainable behaviours has been investigated by recent experimental experiences (Bellini 2021, Mancini, 2023) and Giuseppe Barbiero's research on the concept of "affective ecology". The latter is understood as a need to establish an emotional connection with nature in order to generate a deeper understanding of it and an attitude of respect :

"Knowing Nature is a necessary condition. But appreciating Nature - and appreciating ourselves in Nature - relates to the emotional sphere of the person. That is why it is necessary that alongside Cognitive Ecology, which is what I call the science of ecology with its epistemological status and theoretical corpus, there is also Affective Ecology, an ecology that educates the person to contact Nature, to immerse himself in it, finding there the energies that only a proper relationship with Nature allows to recover" (Barbiero 2011).

School represents one of the privileged environments for overcoming attitude behaviour gaps. In particular, during the secondary school period involving the age group of 11 to 14 years, the adolescent develops the cognitive structures of hypothetical-deductive thinking (Piaget, 1967) and, therefore, it represents a key stage for deepening and raising awareness of affective ecology.

The daily experience of a biophilic school then, by encouraging opportunities for daily contact with nature, becomes a decisive strategy in promoting environmentally sustainable behaviours. Indoor space, its relationship with the near and far environment, and the design of outdoor spaces as true "outdoor learning environments" can be thought of as part of the educational process toward eco-sustainable sensibilities.

These principles have driven the project for the new secondary school in Rionero in Vulture, winner of the "Futura" design competition organised by the Italian Ministry of Education. The project applies design strategies based on the

14 patterns of biophilic design and on major environmental psychology theories such as Attention Restoration Theory and Stress Recovery Theory.

### **3 The case study - A biophilic school in Rionero in Vulture**

The project for the new secondary school in Rionero in Vulture proposes an innovative approach to the concept of a traditional educational space that involves the entire building in which to live, recognize oneself in a community, and reconnect with the surrounding natural environment.

The site where the new school will be built is set on a slight slope towards the "Fosso delle Fontanelle" with a privileged view of Mount Vulture, an extinct volcano that characterises the territory of the northern Basilicata region.

The location of the project site allows the design of spaces that generate a strong connection with the landscape-territorial values of the city of Rionero: Mount Vulture and the hydromineral resources represented by the Monticchio lakes and mineral water springs. The volume of the new building and the body of water in the entrance plaza create a duality intended to echo these values.

From the point of view of spatial insertion, the new architecture gives its back from the present provincial road upstream by using nature-based solutions for noise pollution shielding and opens to the landscape downstream.

The new urban arrangement defines a road system that organises parking spaces for vehicles, bicycles and buses and a square that will become the hub of relations between the new school and surroundings. The new square is designed to safely manage the entry and exit of students but also as a true protected and welcoming social space for the entire neighbourhood.

A second access on the north side facilitates use of the building outside school hours. A number of indoor (gymnasium, informal learning area, creative workshop) and outdoor (sports area and arena) spaces capable of hosting a range of activities, events, and meetings for the life of the neighbourhood have been placed in this area. To facilitate this kind of hybrid use this area of the school has a movable separation that allows it to be used independently from the rest of the learning spaces, and a plant system that can be used independently.

The school is not understood as a sum of classrooms but is extended and integrated into the social context.

*General plan of the project.*

### **3.1 Micro-city**

The architectural layout of the new school is inspired by the traditional urban morphology of the area, which is rich in complex and diverse shared relationship spaces in order to let the genius loci of the city of Rionero breathe into the school environment.

Space is not defined by a concrete form but by the relationship between elements: full/empty, transparent/opacity, mineral/vegetal. Instead of a monolithic block, 5 interconnected volumes are proposed to open the school to the view of the surroundings and create a series of courtyards and patios that foster a constant relationship between the outside and the inside. This organic concept creates angles and curves that introduce shade, visual depth and a dynamic living experience.

The architecture fosters one of the fundamental principles for the development of children in this age group: the ability to manage their privacy by providing intimate spaces, passageways that encourage casual encounters, meeting points and gathering spaces.

*Axonometric view of the project.*

### **3.2 The school**

If on an urban scale the building opens up to the neighbourhood, once inside the architecture becomes introverted, creating an interior world of interconnected spaces and secret gardens. The sequence of patios let natural light into the classrooms and views toward the gardens, making the space comfortable and familiar. The 5 main bodies organise the school into a play-educational area (extendable classrooms, laboratories, gymnasium, locker rooms) and services (entrance, administration, offices). Classroom spaces abandon the static concept of a frontal teaching setting in favour of a modular, adaptable and flexible space idea to foster dynamic and innovative learning processes.

Each classroom has a direct relationship with an appurtenant garden. This outdoor space is designed as an extension of outdoor educational activities to promote motor skills, ensure optimal radiation values and a daily relationship with the natural environment that help prevent learning and attention deficit disorders, promote psychophysical well-being and the development of eco-sustainable behaviour.

The proposal for the new school encourages a visual and physical connection with the natural elements through the interior gardens and views of the distant landscape: non-rhythmic sensory stimuli set the stage in the spaces for climatic and environmental variations (large windows to observe rain in the inner courtyards, spring sunshine, blossoms, falling tree leaves), dynamic and diffuse light present everywhere but in a filtered way to avoid glare and overheating of

the spaces, the presence of water that will also allow reconnection to the values of the hydromineral resources of the local landscape heritage.

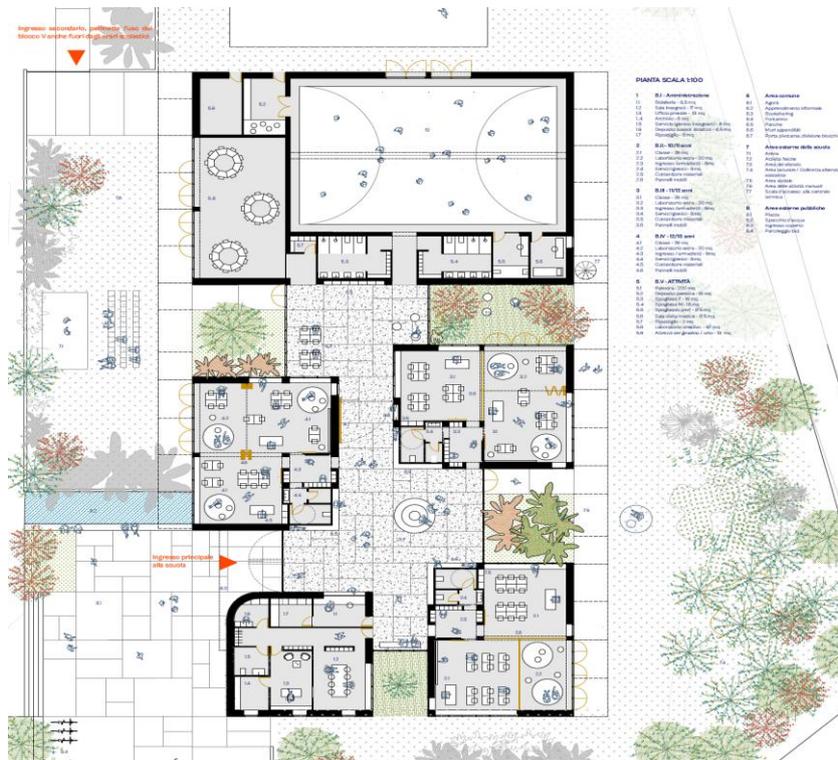

The common areas and the interior of the classrooms feature custom-made details and furniture made of FSC-certified wood, with a focus on spaces that encourage tactile and olfactory contact with the material such as benches, the booksharing library and fixtures.

Different natural cork-based materials will be used (screeds, plasters, interior finishes) from the supply chain of Italian industries that are experimenting with different applications of cork as a material that guarantees excellent qualitative performance as well as a significant reduction in the carbon footprint compared to the materials normally used in construction.

The same intentionality is also addressed to the outdoor areas. In addition to the gardens connected to each classroom the rest of the outdoor area is divided into 7 specific thematic areas with the specific task of fostering the correct development of the children's personalities by evoking, motivating and inspiring individual needs and requirements, and by raising asymmetric empathy and the development of eco-sensitivities:

- Manual activities area: to encourage craft activities and self-construction, customization and appropriation of school spaces, a key aspect of self-definition at this stage of development.
- Arena: for theatrical and musical activities, performances or simply outdoor gatherings on nice weather days. The latter two areas are deliberately in close proximity to the creative workshop to foster fruitful functional interference.
- Physical activities: to encourage the development of motor skills, designed in direct connection with the gymnasium and equipment storage.
- Silence area: for painting, reading and relaxing, near the informal learning area and booksharing area.
- Natural area: for moments of more direct contact with nature. They can be fostered by the creation of a vegetable garden or by gardening activities and raising awareness of environmental issues. Storage of garden materials is an indispensable support for these activities.
- Social area: a quiet area for conversation and interactions of children and teachers, an outdoor continuation of the "agora".

- Sensory area: not a specific area but a focus on the design of indoor and outdoor spaces to encourage exploration and discovery through the senses with the integration of different native plant species, rain garden, and floor and wall materials with different textures (water, stone, wood, gravel, earth, grass).

Ground floor plan.

### 3.3 A school for the neighbourhood

The school's energy system not only serves as a demonstrator of good practice for the students and residents of Rionero in Vulture, but also lays the foundation for its subsequent development as the nucleus of an energy-conscious and self-sufficient community.

On the roof of the gymnasium, an area of about 150 square metres is planned for the installation of the photovoltaic system with a capacity of 20 kW, useful for meeting the needs of the entire building, the new electric car charging stations planned in the car park, and for lighting the outdoor areas. In addition, the

proposal for the new school suggest to the municipality of Rionero in Vulture a subsequent development of the project that, with a further investment, could equip the plant with storage batteries that would allow the new school to become the hub of an eco-sustainable energy community based on the sharing of resources and self-consumption.

The assessment of the climatic risk and vulnerability of this area of the Basilicata region leads one to argue that it is imperative to implement effective stormwater management strategies and rationalise the use of water resources and mitigate the runoff phenomena that cause frequent disasters due to flooding.

As an adaptation strategy to climate change, a system was designed to treat and manage first rainwater by creating a "rain garden": a feature formed by a slight depression in the ground covered by greenery that is very effective in managing meteorological runoff in a sustainable and natural way.

The recovery of rainwater falling on the roofs will make it possible to accumulate a water reserve in an underground cistern and, after suitable treatment, reuse it for drains, irrigation and the fire-fighting system tank.

The design choices are intended to convey a series of values to ensure that living in the school space is part of an educational process understood in a broad sense, extended to the entire local community. The architectural form becomes the tool for transmitting the pedagogical idea of a school open to the outside world and capable of generating and transmitting eco-sustainable behaviour and directing the choices and behaviour of the community that lives there on a daily basis.

#### **4 Knowledge Management in Architecture**

The last part of this paper aims to analyse the process of knowledge management in architecture and particularly with reference to the architectural competition system and the case study under consideration.

Architectural Design Decisions (ADDs) is recognized among the highly relevant knowledge management processes for which a system to classify and share the different stages of the decision-making process is very important (Tang et al., 2010). Comparative research has shown that several interesting experimental tools have been developed in the last decade but to date there are no tools on the market that support the Architectural Knowledge process (AK) (Capilla, 2021)

However, the procedure of selecting design ideas through design competitions presents a decision-making and methodological organisation by successive steps that is very interesting from the point of view of evaluation and sharing the knowledge management process.

#### **4.1 Design competition and knowledge management**

In January 2023, the "FUTURA - la scuola per l'Italia di domani" project promoted by the Ministry of Education - Mission Unit for the EU-funded PNRR (National Recovery and Resilience Plan) - Next Generation EU, selected 212 projects for innovative schools to be built by 2026. The case study of the new middle school in Rionero in Vulture presented here is part of this selection that took place through the procedure of "2-degree design competitions."

In architecture, design competitions represent a virtuous system in terms of the transparency of the decision-making process, possibility of access to public contracts, and fosters the development of innovative ideas through intellectual competitiveness. Moreover, in this case, they represent an effective strategy for transferring the sustainable development goals set by the European Community to the national and local authorities, to professionals and involved communities.

For the interest of the system of knowledge management and sharing between policymakers and stakeholders, the different steps that composed this process are briefly set out here.

An initial phase initiated by the ministry selected the 212 project sites, from among those nominated by local governments, that best aimed to meet the objectives of the ministry's "green revolution and ecological transition" plan for achieving goals such as sustainable resource and water use, circular economy, pollution reduction, and protection of biodiversity and ecosystems.

For each of these sites, the local authorities, in collaboration with school communities and stakeholders, produced a dossier containing surveys, geological studies and analyses of the buildings' functional, energy, structural, and educational supply needs. These dossiers, which were made available to all groups participating in the competition, had as one of their main objectives to make explicit the analysis of the programmatic alternatives that motivated the choice of either rehabilitating an existing school building or demolishing it by reconstructing it (as in the present case study).

With these starting data, the two-degree design competition was initiated. With the first degree, with open participation, the 5 best proposals were selected and were asked to further investigate the design ideas. Finally, the winner was asked for further elaboration through the preparation of a "technical and economic feasibility project" (PFTE). In this last phase, the architects further explicated urban and environmental insertion choices and compliance with the sustainable development objectives required by European directives: principle to Do Not Significant Harm (DNSH), Life Cycle Assessment (LCA), Carbon Footprint of the building and compliance with CAM (minimum environmental criteria).

From the first phase of selecting schools for funding to detailed project developments, this process has focused on the strategic goals of sustainability, combating and adapting to climate change by creating a sharing of intent and knowledge transfer from the macro political scale to detailed project choices. The impact on informing, educating and then promoting environmentally sustainable behaviour will be measured on future school users but has already involved a whole range of administrators, professionals and stakeholders.

The 5 ideas selected for each of the 212 sites represent a wealth of more than 1000 projects that share the common denominator of reflections on the theme of innovative sustainable and resilient schools. The exhibition and publication to be organised by the Ministry of Education will represent a huge compendium on the state of the art of school design in Italy. It would be very important to be able to return not only the graphic tables of the design ideas but all the studies and documents produced and the motivations expressed by the juries for each phase of the competition, including the selection of the project sites proposed by the local authorities. Indeed, this repository would become an enormously valuable tool for policymakers, stakeholders, and designers.

## **5 Conclusions**

The studies examined in this paper show how biophilic design enables the design of spaces that promote people's psychophysical well-being. In addition, the experience of these types of spaces can be considered a formative process capable of raising users' awareness of respect for nature and ecosystems. This can be instrumental in encouraging the development of eco-sustainable behaviours.

Finally, emphasis was placed on how the selection of design proposals through the instrument of design competitions is the tool that allows the development

and sharing of innovative ideas and visions for the kind of society of the future that we want to build.

### **Abstract**

Advancing globalisation processes entail that businesses increasingly have to orient themselves internationally in order to remain competitive. Growing labour mobility and international economic networks imply a rise in intercultural contacts, and thus a rising demand for intercultural competence. However, the relevance of intercultural competence is often underestimated outside of the academic community. In order to elucidate the significance, the necessity and areas of application of intercultural competence, an explorative (primarily qualitative) study was conducted with students and professionals

with and without a migration background. The central objects of study were the experience-based attitudes of students and professionals. In this qualitative study, 61 structured interviews were examined using a content analysis. After the presentation of a definition of the construct, the interviewees were asked about aspects of intercultural competence. The aspects mentioned most frequently was a general open attitude, followed by impartiality, self-reflection of one's own culture and person, and lastly, culture-specific knowledge. Regarding the areas in which intercultural competence is needed, respondents mentioned the education sector most frequently, followed by references to business, as well as internationally operating companies.

These results provided indications for the development of a measurement instrument of intercultural competence and related constructs. Therefore, another qualitative study was conducted with 249 interviewees to identify aspects of both, general intercultural competence, and culture-specific competence in a German cultural environment. Eleven dimensions of general intercultural competence, relating to personality traits, relational attitudes, and skills, were identified in a content analysis of the interviews. Further, six culture-specific aspects were derived from the interviews, containing culture-specific knowledge, norms, and communication skills. Based on the responses, three scales were generated: two graded response scales for general intercultural competence and culture-specific competence, and a culture-specific situational judgement test.

The resulting measuring instruments were thereafter validated in a quantitative study with a total of 6338 participants, including students, professionals, and unemployed, each with German background, international background, refugee background, or emigrated. The scales' and subscales' reliability and validity were tested in the individual subsamples, using methods from both classical test theory and item response theory. The items were reviewed twice, based on the calculated item characteristics, as well as on results from a focus group with immigrants and expert discussions.

The present paper thus contributes to a differentiated understanding of cross-cultural and culture-specific aspects of intercultural competence in an increasingly culturally diverse global society.

**Keywords** – intercultural competence, intercultural contact, specific intercultural competence, measuring intercultural competence, international cooperation

**Paper type** – Academic Research Paper

## 1 Theory

The significance of intercultural competence is increasing. Globalisation processes are advancing despite international crises, with a multitude of implications for living and working in the European Union. Intercultural competence, which refers to abilities to communicate and act effectively and appropriately in intercultural settings, is of pivotal importance for the cooperation between countries and cultures, as the different culturally determined ways of

thinking, feeling, and acting often inhibit efficient and effective collaboration and communication. Intercultural competences are of particular importance for international joint ventures, for example to cope with global challenges, such as the Corona pandemic or the current energy crisis. Furthermore, in view of international mobility and increasing economic linkages, intercultural competence plays a crucial role for businesses, as teams that work together, as well as management positions, are increasing in cultural diversity in European countries, and multinational collaborations are specifically supported within the EU.

For measuring intercultural competence, several models exist, some of which were created within the humanities as early as the 1980s (during the Cold War) (Deardorff, 2009; Genkova, 2019). However, many models lack a clear differentiation from other constructs (Schnabel et al., 2015). Newer psychological measurement instruments have a higher construct validity, but many of them were developed only in specific cultural settings. Therefore, the validity of these instruments in other cultures cannot be presupposed. Established measurement instruments, such as the Multicultural Personality Questionnaire (MPQ, van Oudenhoven & van der Zee, 2000) or the Cultural Intelligence Scale (CQS, van Dyne et al., 2009), defined intercultural competence as a specification of established concepts, namely intelligence and personality, yet fail to map intercultural competence holistically. Furthermore, the mentioned scales showed low reliabilities in other cultures in some cases. Additionally, there was evidence of measurement invariance, suggesting that not the same construct was measured in different cultural contexts (Genkova and Schreiber, 2019, 2021; Genkova, Schreiber, and Gäde, 2021; Genkova, Schreiber, and Schneider, 2021; Schnabel et al., 2015).

## **2 Research Question and Method**

Due to the mentioned dependence on cultural contexts and areas of application, three studies were designed.

A first explorative qualitative study (Study 1) was conducted among 61 students and professionals with German and migration background to assess cross-cultural and culture-specific aspects of intercultural competence, as well as areas, in which intercultural competence is deemed necessary.

Based on the results of this study, a model was developed which separates a general, cross-cultural intercultural competence from a culture-specific

competence – analogous to the model of a general and a specific intelligence. Based on this model, two more studies were designed to explore how intercultural competence can be operationalized, so that it encompasses both general, cross-cultural aspects and culture-specific competence: A qualitative study (Study 2) aimed to identify dimensions of general intercultural competence and culture-specific competence, and to generate hypothesis regarding the conceptualization and operationalization of intercultural competence. A quantitative study (Study 3) contained the generation, revision, and validation of a scale to measure general intercultural competence and culture-specific competence.

Study 1: In the first study, 61 structured interviews were used and examined by means of content analysis according to Mayring (2019). In order to define intercultural competence for the interviewees, the definitional consequence of intercultural competence, namely the ability to communicate appropriately and successfully with people from other cultures, was presented to the interviewees. Then, the interviewees were asked about aspects of intercultural competence, and areas in which they see intercultural competence as necessary.

Study 2: In the second qualitative study, 249 semi-structured interviews were conducted with people from eight target groups (students, employees, unemployed people, and experts who work with interculturality; each group consisting of one national subgroup and one subgroup with migration background). Among other, the study investigated what is understood by intercultural competence and in which situations intercultural competence is needed. In addition, the distinction from similar constructs, such as social competence, communicative competence and culture-bound competence, was examined.

Study 3: A quantitative study was conducted among a total of 6338 participants, including students, professionals, and unemployed, each with German background, international background, refugee background, or emigrated. The aim of Study 3 was to review the items, to test the construct, the aspects and the items for generalizability across different cultural backgrounds, to verify the defined model, and to test the generated scale's reliability and validity.

The development of an instrument for measuring culture-specific German competence aspects enables the later examination and promotion of the competence status (with regard to the German culture) of individuals who did not grow up in Germany. (For these individuals, the designation "internationals" was

ultimately used, as very strong latent and explicit concerns about other designations emerged during the interviews. The term internationals proved to be a useful term to group together people with a migration background, expatriates, international students and people who recently immigrated, as, for example, refugees, or foreign employees, while avoiding negative meanings, such as stigmatization).

### **3 Results of the Qualitative Studies**

Study 1: Asked about aspects of intercultural competence, the interviewees most frequently mentioned a general open attitude (approx. 85% of the interviewees referred to it), which interviewees partially associated with an interest in other people and cultures. About 44% of the participants referred to impartiality, including the act of consciously putting aside one's own prejudices. About one third of the respondents described self-reflection of their own culture and person as a further aspect of intercultural competence, thus addressing an aspect that is rather rarely found in the research literature. Beyond these and further cross-cultural aspects of intercultural competence, more than half of the respondents referred to culture-specific knowledge.

Regarding the areas in which intercultural competence is needed, respondents mention the education sector most frequently (approx. 70%), followed by references to business (approx. 42%; including HR departments and marketing), as well as internationally operating companies (approx. 26%). The breadth of these results has high heuristic value. On the one hand, surveying the prevalence of certain understandings of intercultural competence makes it possible to examine the fit between an experience-based everyday understanding and a scientific definition of intercultural competence. On the other hand, aspects mentioned by the respondents provide relevant insights into the necessary width of the desired scientific definition of intercultural competence. These results provide important indications for the development of measurement instruments of intercultural competence, as well as for constructs that should be correlated with intercultural competence.

The second qualitative study was conducted among 249 students, professionals, and unemployed, with German and international background. A qualitative content analysis (Mayring, 2019) was used to create a large number of categories that reflect aspects of intercultural competence. The categories under

which most of the aspects (mentioned by participants) were subsumed, were, for general intercultural competence:

- Personality traits: openness, agreeableness, and extraversion.
- Relational attitudes: lack of prejudice / equal treatment, understanding, tolerance, acceptance, respect, (active) listening, helpfulness, perspective taking, patience and reflection
- Skills: communication skills, adaptability, empathy, flexibility, conflict handling skills, and sensitivity.

For culture-specific competence, the categories under which most of the aspects mentioned by participants were subsumed, were:

Knowledge of foreign languages, knowledge about cultural specificities, food habits and table manners, punctuality, religion, clothing, work ethic, being organised, customs, rules and laws, types of communication, direct versus indirect communication, and speaking volume.

#### **4 Results of the Quantitative Study and Discussion**

Based on these categories, a research team of experts generated items for a questionnaire. From these, several items were selected after expert evaluations. The selected items operationalised cognitive, affective, and conative aspects of intercultural competence. Reversed items (for which agreement with a statement corresponds to a low expression of the construct) were also created, to counteract response biases. In the next phase of the study, the measurement characteristics of the items were tested, using different samples. These samples were: international students, students without migration background, students with migration background, expatriates, refugees, employees, unemployed people. As a result of these analyses and revisions, 214 items were retained.

The items for surveying general intercultural competence were assigned to the following dimensions, on the basis of statistical and content fit:

- Interest in other cultures
- Openness to people from different backgrounds
- Agreeableness (incl. active listening and responsiveness to others)
- The ability to deal with conflict
- Empathy, perspective taking
- Respect, tolerance
- Flexibility

- Reflection on own and other cultures
- Ambiguity tolerance
- Self-confidence
- Extraversion

For the items surveying culture-specific competence, the following dimensions were formed, on the basis of statistical and content fit:

- Structure and formalities
- Laws and customs
- Manners, conviviality, and values
- Forms of communication, including German language skills
- Punctuality and time management
- Equal rights for women and men

As an additional way to measure culture-specific competence, a Situational Judgment Test consisting of 37 items was generated.

The quantitative study was conducted to verify the scales regarding the measured construct, the identified dimensions, and the generated items, and included methods from classical test theory (KTT) and item response theory (IRT).

The separation of culture-specific competence from general intercultural competence was supported by exploratory factor analyses and multidimensional scaling on item and dimension level. Correlation analyses including the generated scale, as well as the MPQ, CQS, the test for measuring intercultural skills (TMIKS, Schnabel et al., 2015), and the sociocultural adaptation scale (SCAS, Ward & Kennedy, 1999), confirmed the scales' construct validity. The values are shown in table 1.

Table 1: Bivariate correlations of scales for intercultural competence

		1	2	3	4	5	6
1	General		.606**	.616**	.686**	.560**	.427**
2	Culture-specific			.349*	.467**	.336*	.240
3	TMIKS				.630**	.621**	.513**
4	MPQ					.560**	.480**
5	CQS						.610**
6	SCAS						

Comments: \*\*  $p < .01$ , \*  $p < .05$ .

The effects were controlled for demographical data, as well as for participants' international experience, quality and quantity of intercultural contact, language skills, and cultural distance.

Cronbach's Alpha was calculated to determine the scales' and dimensions' reliability, for each sample. The subscales showed acceptable Cronbach's Alpha values (ranging from .65 to .97).

Differential item functioning (DIF) tests were conducted to examine whether the items were generalizable across cultural groups. For the general intercultural scale, DIF was calculated for the group factors German – International, and for the culture-specific competence scale, DIF tests were conducted for comparisons between refugees and non-refugees, between immigrants that stayed more and less than two years in Germany, and between the different cultural groups with which the international participants were affiliated. To further verify item generalizability, KTT item characteristics mean-based difficulty, item-subscale-correlation, item-total scale-correlation, and monofactorial EFA score were correlated for the different samples included (students, professionals, unemployed; German and international each). Likewise, the situational judgement test was analysed and reviewed by conducting DIF, by calculating item difficulty and discrimination parameter, and graphical model checks.

After the revision of the scale, the remaining items all showed mean-based item difficulties between 20 and 80, item-subscale-reliabilities  $> .3$ , and their deletion did not raise Cronbach's Alpha (for critical cut-off-values of the item characteristics, see Moosbrugger & Kevala, 2012). Further, all remaining items had significant contribution to the respective dimension in monofactorial CFAs. A few items were tagged for DIF, yet showed functionality in the graphical check of the item response functions in the subsamples.

Furthermore, post-hoc analyses were conducted to identify effects on intercultural competence that need to be considered in individual diagnostics. Substantial effects were found for occupational status (studying – working – unemployed), and sex. The measurement instrument is currently further examined and standardized, based on large samples of different populations. The further examinations include tests of the extent to which intercultural competence aspects are statistically normally distributed.

In summary, our results suggest that general intercultural competence and culture-specific competence should be assessed separately. The aspects of general intercultural competence and culture-specific competence substantially

contribute to measure the respective construct. The initial version of the generated instrument in the German language proved generalizable among German speaking groups, regardless of their cultural background or migration history, and was found to be a reliable and valid instrument to measure intercultural competence. The module structure of the test suggests the development of further culture-specific scales that can be combined with the general intercultural competence scale. The feedback from both Germans and internationals in both the qualitative studies on the separation of culture-specific competence from general intercultural competence was positive. This separation was perceived as innovative, since something comparable has not yet been constructed.

Finally, intercultural competence continues to gain importance in the current times of crisis and due to increasing globalisation. Thus, a differentiated and validated measurement of intercultural competence – which separates general intercultural competence from aspects that are culturally specific – is highly relevant for its promotion and evaluation. The project presented here contributes to this important endeavour.

## **Abstract**

The pandemic emergency due to Covid-19 represented a relevant exogenous shock that profoundly changed people's work activities and social lives. The pandemic emergency made it possible to take a new and different view of the possibility of replacing traditional forms of work with more innovative ways of working linked to technological tools (Briggs et al., 2021; Bolisani et al., 2020; Foss, 2020). This has also been made possible by the significant digital transformations of the last decades.

Indeed, the role played by new technologies has been crucial during the pandemic, accelerating the ongoing trend towards the developed forms of work that make remote working easier: one of these is smart working (Todisco et al., 2022; Yarberry & Sims, 2021; Rainero & Modarelli, 2020).

Smart working, however, differs from traditional ways of working not only in the way it is carried out, which is not constrained by defined time and space limits in the performance of the tasks assigned to employees, but also in the different approach by which the organization is designed, linked to projects and objectives, and on how human resources are managed (Bednar & Welch, 2020; Torre & Sarti, 2019; Ellerton, 2015).

Several authors have identified three key dimensions of analysis for the diffusion and implementation of smart working: (1) the technological factor; (2) the redesign of physical spaces (3) a new vision of Human Resources in the organization. In addition to the three dimensions identified, other aspects must be considered to understand whether its deployment in the organization is taking place effectively. The first factor identified is the employee acceptance of this change in working methods and, therefore, the shift towards a more fluid and goal-oriented organization (Rainero & Modarelli, 2021). For example, the spread of smart working during the pandemic represented an essential change for the public sector, as well as an opportunity to implement those reform paths that have redesigned public administration in recent decades to make it more effective and efficient (Pollitt & Bouckaert, 2011; Tomo, 2018).

The other factor identified is employees' willingness to accept new technologies (Bunker, 2020; Jämsen et al., 2022) and the effective one of digital platforms (Agostino et al., 2021). As mentioned above, smart working represents a significant opportunity for change in public administration. While on the one hand, it represents an opportunity to guarantee the delivery of services to citizens (Edelmann et al., 2021), on the other hand, it could be critical in several aspects, opening windows of reflection on the impacts this way of remote working could demonstrate affecting employees' lives. Having to deal with such a disruptive change and the impact of technology on employees' lives has challenged certain aspects, such as planning, assigning tasks, and holding meetings that allow people to share and create organizational knowledge. These aspects of smart working represent a significant challenge for public managers, whose main task is to finalize the creation and management of knowledge.

This research aims to evaluate and highlight the architecture of established working behaviours and practices based on the change in the working model imposed by the pandemic emergency in the public sector. So, the research investigates how smart working, and its impacts alter the processes of sharing organizational knowledge, according to the introduction and application of technologies in the working life of public employees. After the intervention of an exogenous shock, such as the pandemic, the related availability,

perceived usefulness, and ease of use can change considerably in this regard. Starting from the Technology Acceptance Model (TAM) and, in parallel, the Theory of Planned Behaviour (TPB), the authors intend to interpret reality through the lens of multifaceted aspects, reasoning in detail by a perspective based on complexity and non-linearity featured periods. Specifically, the authors investigate: i) how the perception of the use of digital tools in the workplace has changed from the pre-pandemic to the post-pandemic period in the public sector ii) how and in which way digital tools continued to be used after the critical phase of the Covid-19 health emergency.

**Paper type** – Practical Paper

## 1 Introduction

The pandemic emergency due to Covid-19 represented a relevant exogenous shock that profoundly changed people's work activities and social lives. The pandemic emergency made it possible to take a new and different view of the possibility of replacing traditional forms of work with more innovative ways of working linked to technological tools (Briggs *et al.*, 2021; Bolisani *et al.*, 2020; Foss, 2020). This has also been made possible by the significant digital transformations of the last decades.

Indeed, the role played by new technologies has been crucial during the pandemic, accelerating the ongoing trend towards the developed forms of work that make remote working easier: one of these is smart working (Todisco *et al.*, 2022; Yarberry & Sims, 2021; Rainero & Modarelli, 2020).

Smart working, however, differs from traditional ways of working not only in the way it is carried out, which is not constrained by defined time and space limits in the performance of the tasks assigned to employees, but also in the different approach by which the organization is designed, linked to projects and objectives, and on how human resources are managed (Bednar & Welch, 2020; Torre & Sarti, 2019; Ellerton, 2015).

Several authors have identified three key dimensions of analysis for the diffusion and implementation of smart working: (1) the technological factor; (2) the redesign of physical spaces (3) a new vision of Human Resources in the organization. In addition to the three dimensions identified, other aspects must be considered to understand whether its deployment in the organization is taking

place effectively. The first factor identified is the employee acceptance of this change in working methods and, therefore, the shift towards a more fluid and goal-oriented organization (Rainero & Modarelli, 2021). For example, the spread of smart working during the pandemic represented an essential change for the public sector, as well as an opportunity to implement those reform paths that have redesigned public administration in recent decades to make it more effective and efficient (Pollitt & Bouckaert, 2011; Tomo, 2018).

The other factor identified is employees' willingness to accept new technologies (Bunker, 2020; Jämsen *et al.*, 2022) and the effective one of digital platforms (Agostino *et al.*, 2021). This aspect is particularly relevant since the relationship between individuals and technologies enables effective knowledge management within an organization to support projects' sustainability. As mentioned above, smart working represents a significant opportunity for change in public administration. While on the one hand, it represents an opportunity to guarantee the delivery of services to citizens (Edelmann *et al.*, 2021), on the other hand, it could be critical in several aspects, opening windows of reflection on the impacts this way of remote working could demonstrate affecting employees' lives. Having to deal with such a disruptive change and the impact of technology on employees' lives has challenged certain aspects, such as planning, assigning tasks, and holding meetings that allow people to share and create organizational knowledge. These aspects of smart working represent a significant challenge for public managers, whose main task is to finalize the creation and management of knowledge.

This research aims to evaluate and highlight the architecture of established working behaviors and practices based on the change in the working model imposed by the pandemic emergency in the public sector. So, the research investigates how smart working, and its impacts alter the processes of sharing organizational knowledge, according to the introduction and application of technologies in the working life of public employees. After the intervention of an exogenous shock, such as the pandemic, the related availability, perceived usefulness, and ease of use can change considerably in this regard. Starting from the Technology Acceptance Model (TAM) and, in parallel, the Theory of Planned Behaviour (TPB), the authors intend to interpret reality through the lens of multifaceted aspects, reasoning in detail by a perspective based on complexity and non-linearity featured periods. Specifically, the authors investigate: *i) how the perception of the use of digital tools in the workplace has changed from the pre-*

*pandemic to the post-pandemic period in the public sector ii) how and in which way digital tools continued to be used after the critical phase of the Covid-19 health emergency.* The authors submitted to ten public managers at a local level in the Italian context a series of semi-structured questions originated by the TAM. The aim is to verify and provide valuable insights into some particularly relevant aspects of the knowledge dissemination and sustainability of projects in the public sector, evidencing a virtuous cycle that emerged from a need, framed by knowledge, and solved by a strategical view based on this latter. Primarily, the authors' intention moved from the objective to understanding how public managers' motivation and working habits have changed under the lens of complexity and urgency due to the impact of the adoption of new technologies for web-mediated work environments. In this, change is perceived as a tension-generating shock, and the social and organizational community tends to refute that, particularly in the public sector. Secondly, the authors aim to answer the question related to the perception and the use persistence of digital tools within the working environment during the post-pandemic period (after the emergency as a structured practice).

In this way, TAM vehiculated by a knowledge strategy for acceptance, triggered by the urgency sentiments and the readiness of a technology functional to a relatively neglected way of work (tele/agile/smart working), would reserve and demonstrate surprising and unexpected results in terms of willingness to remain in this operational frame, despite a regulatory modulation recently emerged at the end of the health risk.

The perceived usefulness (mediated by the urgency sentiments) and ease of use (mediated by the readiness of technology and web-mediated collaborative platforms), structured habits based on a highly positive perception based on these variables able to go beyond the state of emergency and reticence inherent the sector (Cinar *et al.*, 2019).

## **2 The new ways of work in the “New Normal” era**

Over the last few decades, the topic of new ways of working brought about by new technologies has become central to the organizational debate (Appelbaum, 2013; Engeström, 2004). These new forms of work should be seen in the context of profound social transformations in which technologies have changed relationships and shared values. According to Jackson (2021), these

transformations have led contemporary society toward the destruction of society's archaic values in terms of mutual social and economic balance (Rainero & Modarelli, 2021). In this context of profound change, new technologies modify the relationship between humans and organizations on a double level: a broader one that concerns the human-machine-society relationship; and a second level where people's work is involved in the human-organization-human-machine-society relationship (Bahri *et al.*, 2021). Teleworking is one of the first new ways of working that have spread related to the use of technology. Teleworking represents a technology-supported organization of work that allows people to work from home. Teleworking has also been dubbed "working from *home*." These changes considerably impact people's lives and their way of working and being in society, significantly impacting motivation and happiness (Layard, 2011). Therefore, to build a society with as much happiness and as little unhappiness as possible, there can only be a new balance in society through the dissemination of knowledge dictated by new technologies. This factor assumes a central role in a period such as the current one in which rapid digital transition has occurred. This historical phase has seen generalized access to knowledge with the advent of the Internet and new enabling technologies (Delany, 2022). At the same time, however, following the Covid-19 pandemic, this digital transformation path meant that individuals had to quickly accept new technologies to adapt to new ways of working. For this reason, the issue of knowledge in organizations, which is closely linked to the effective use of new technologies since the 'New Normal,' is a more complex and challenging exercise than we have observed recently in economies characterized by structural optimism and constant underestimation of risks. Moreover, the diffusion of knowledge within organizations can only pass through accepting new technologies. Starting from these assumptions, the authors intend to focus on one of the new ways of working, smart working, considering different temporal phases of investigation: a) pre-pandemic, b) during the pandemic, c) after the pandemic). In *detail*, the authors focus on the public sector, where the use of smart working before the pandemic was marginal compared to face-to-face work. This is useful from an academic perspective to identify the speed of acceptance of technology use and change within an organization. In this regard, through semi-structured interviews with ten public employees in organizational positions in the Italian local public administration, a preliminary analysis of the acceptance of the digital transition and the reduction of reluctance to change is proposed for the public sector in terms of the

application of the FKTKS (Rainero & Modarelli, 2021), especially in the presence of complexity, non-linearity, uncertainty and unpredictable exogenous shocks such as the Covid-19 pandemic.

### **3 A new form of work: the smart working**

Over the past decades, numerous exogenous events have impacted environments and negatively affected the social life of individuals. As in the case of the pandemic emergency of February 2020, epidemics and pandemics must be considered an event belonging to exogenous events that are impossible to predict. During the most critical phases of its spread, Covid-19 made it challenging to carry out office activities in presence, paralyzing society on an individual and organizational level (Alipur *et al.*, 2021; Bolisani *et al.*, 2020). The pandemic emergency, as mentioned above, changed several aspects of work organization and individual work patterns. Most work activities have shifted to remote (Oosthuizen 2022; Todisco *et al.*, 2023). The pandemic has favoured overcoming work performance predominantly in presence, favouring work logic linked to the Bring Your Own Device (BYOD) strategy (Papagiannidis *et al.*, 2020).

Technology has played a crucial role in responding to the need to continue to operate and ensure the smooth running of work activities and services to users. Added to this has been the need to frame and understand the phenomena of technological acceptance by employees in support of new ways of conducting remote work linked to new technologies (Rainero & Modarelli, 2020). In this scenario of change in working methods, a way of carrying out work that goes by smart working has found diffusion. According to several authors (Gastaldi *et al.*, 2014; Hu, 2020), smart working is a mode of work performance based on broad autonomy in the choice of time and place of work to improve individual well-being and organizational efficiency. Usually, the spread and implementation of smart working take place around three key dimensions: (1) *the technological factor*; (2) *the redesign of physical spaces*, and (3) *a new vision of Human Resources in the organization*.

The first dimension of the smart working analysis is the effective use of digital technologies to support work activities. The development of new digital platforms and increasingly high-performance technologies has enabled workers to do their work more effectively and efficiently. In the past, several authors have pointed out how new technologies positively impact employees' productivity and well-being.

On the other hand, the spread of smart working during the pandemic emergency has also drawn attention to other aspects, namely how technologies can increase the feeling of isolation and work overload, neutralizing the benefits of smart working.

Over the years, therefore, attempts have been made to structure different models to address best the application of smart working, implementing appropriate standards to obtain the benefits of this new way of working (Lake, 2016). The second dimension of analysis related to smart working concerns redesigning the workplace. The shift to flexible organizational structures has changed the traditional concept of the 'workplace' (Yang *et al.*, 2023). Smart working means redesigning physical spaces and reconfiguring the impact of physical spaces on employees and economic and environmental sustainability. It represents an organizational upheaval of people's relationship with workplaces, impacting individual well-being and the meaningfulness of the concept of work itself (Dingel & Neiman, 2020). Finally, smart working can only be realized if cultural and managerial approaches to human resources management are redefined. The role of management in this aspect is crucial because smart working is only possible with an increased focus on the growth of professionals in both specialized knowledge and skills and in transversal and relational skills (Brunetto & Beattie, 2020). With the new technologies available, discussing the development and spread of smart working is possible. The use of technology can be viewed from two different perspectives: On the one hand, it facilitates real-time interactions between employees, which impacts the meaningfulness of work.

On the other hand, the use of new technologies redefines the processes of knowledge diffusion through new technologies, which, if well used, help people and companies to increase efficiency and reduce the impact of presence in the workplace.

## **4 Research design and context**

### ***4.1 Theoretical framework: the technology acceptance to improve knowledge diffusion in organizations.***

The following work-in-progress paper takes the opportunity to understand the acceptance of technology from a knowledge diffusion perspective. The authors refer to a theoretical framework complemented by the strategic view TAM and

FKTK considered to define and shape the way human beings (through social factors, psychological elements, and individual qualities) consider choices and decisions. The choice falls on q for two reasons: the technological dimension is pervasive in social life and ready to be widely applicable to work.

In this sense, perceived usefulness and ease of use would be verified (TAM-validated variables). In this direction, the influence of media and urgency, combined with the managerial perspective and the individual's ability to create knowledge, can foster knowledge creation (self-induced, internally, or externally induced), validating the objectives of the FKTK strategy. In this sense, the urgency represented by the development of Covid-19, the intention/motivation (Bunker, 2020) to deal with the emergency shifted subjective norms and individual control based on personal/collective readiness to use technologies (attitude) toward the behavioural acceptance of changing work habits in a socially organized and generalized manner.

#### **4.2 Context**

The context chosen was that of the Italian public administration, where smart working represented a significant novelty during the pandemic. The Italian regulatory framework on smart working was defined by law no. 124/2015 (art. 14), as well as by the law n. 81/2017 (articles 18-24) Regarding the Italian public sector, the Directive of the Presidency of the Council of Ministers DL n. 3/2017, which has begun to outline the regulatory framework and the behaviours to be identified for smart working in the Italian public administration. With the first pandemic wave of March 2020, a sudden transposition of work activities into smart working became necessary. Therefore, with the DPCM of 1 March 2020, a simplified implementation procedure was introduced, which remained in force until 31 August 2022. Finally, with the law n.122/2022, which converted the D.L. 73/2022, there has been a further change to the legislation on smart working. Smart working, therefore, for the public sector, represented during and after the pandemic an opportunity for a significant change compared to the old organizational paradigms, both from the point of view of managerial choices for the management and dissemination of knowledge and from the point of view of the use of technologies.

### 4.3 Sample

To analyse the acceptance of technologies and the diffusion of knowledge among workers, ten public employees were chosen for this work-in-progress paper as a sample who underwent managerial training on digital transformation issues within a university in southern Italy and who cover organizational positions within their public administrations (table 1). The sample was chosen because these figures, in the context of the Italian public administration, represent figures with managerial skills and the possibility of intervening in disseminating knowledge. The chosen methodology was to apply the TAM model to semi-structured interviews to go deeper into the issue of technology acceptance and knowledge dissemination. In particular, the interviewees were asked ten questions on the use of new technologies, their acceptance, and whether new technologies have allowed a wider diffusion of knowledge before, during, and after the pandemic emergency.

The interviews lasted from 25-30 minutes, and an attempt was made to develop a discussion during the interview on subjects that seemed of greater interest.

Table 1. Overview of participants to the study.

ID	Age	Gender	Education	Public Administration	Length of service
1	29-39	F	Master's degree	Fiscal Agency/Social Insurance Institute	< 5 years
2	>51	M	Master's degree	Fiscal Agency/Social Insurance Institute	> 20 years
3	>51	M	Master's degree	Fiscal Agency/Social Insurance Institute	> 20 years
4	29-39	F	Master's degree	Local Administration	< 5 years
5	40-50	F	Executive Master or PhD	Local Administration	> 20 years
6	40-50	M	Master's degree	Local Administration	> 20 years
7	40-50	F	Executive Master or PhD	Local Administration	> 20 years
8	40-50	F	Master's degree	Fiscal Agency/Social Insurance Institute	> 20 years
9	29-39	F	Master's degree	Fiscal Agency/Social Insurance Institute	> 20 years
10	>51	M	Executive Master or PhD	Fiscal Agency/Social Insurance Institute	> 20 years

## 5 Findings and Conclusions

The interviews demonstrated how the topic of acceptance of new technologies was susceptible for the interviewees. This acceptance has allowed for greater work efficiency. One of the interviewees stated:

*"With the new technologies, both from the point of view of internal technical procedures and the interaction between colleagues, I have improved my work efficiency. I made work activities at home easier than in the office. (participant #2)*

Furthermore, the issue of acceptance of technologies is closely connected to a necessary understanding of their use in smart working.

*"I do not have a particular aptitude for using technologies, but I do it with a view to improvement. It is not a loving relationship, but I know what I need work-wise. I often need a site technician in case of problems that other users might be able to solve on their own." (participant #1)*

Another aspect of particular interest is tensioning towards knowledge through a more effective acceptance of technologies. One of the interviewees says that:

*"Technologies have been an important tool to broaden skills during the pandemic and improve understanding of the tasks assigned while I was in smart working." (participant #8)*

Furthermore, the last three years (2020-2022) have represented a significant social change for workers. This has necessitated adaptation to new technologies to deal effectively with work performance. Just as the necessary diffusion of practical knowledge to understand its use can break down the levels of reticence and resistance to change by pushing workers towards using technology in offices in a perspective of diffusion of knowledge in a perspective of collective learning (Butera, 2017; 2015).

*"Technologies have allowed me a greater possibility of interaction with colleagues, and I have been able to develop work activities remotely with greater ease." (participant #3)*

*"Before the pandemic, smart working was not a viable way of working. We saw it as the only possible way during the pandemic and currently. However, it is good, thanks to the greater awareness of using new technologies. I prefer it over to the office because exchanging more information can give interaction and problem-solving possibilities." (participant #5)*

"The exchange of information was greater during and after the pandemic than in the past. Smart working, from my point of view, has helped this diffusion a lot." (participant #7)

From a managerial point of view, the interviews may be of interest for developing a broader research activity on disseminating knowledge in the public sector. The employees interviewed, being figures of middle managers concerning the main proposed QRs, represent professional figures of particular interest through an analysis of the changes that have occurred in their lifestyles and concerning how they understand the acceptance of technologies in their styles of work through a retrospective perspective, also considering the previous and subsequent perceptions related to the critical period under study, they can provide helpful insights into how the public sector is responding to the challenges of technological changes and the diffusion of knowledge through new technologies. Finally, from a theoretical point of view in this working-in-progress-paper, the TAM conveyed by a cognitive strategy of acceptance, triggered by feelings of urgency and by the readiness of a technology functional to a relatively neglected way of working (smart working), leads to interesting results, intending to transpose a qualitative use of this framework.

### **Abstract**

This paper reports the outcomes of Tanzanian undergraduates and postgraduates' knowledge, attitude, and practice towards Sustainable Development Goals (SDGs). University students from eight universities in Tanzania participated in the study. A set of survey questionnaires based on knowledge, attitude, and practice (KAP) was shared online and 269 responses were obtained to analyse the awareness level (95% confidence level with  $\pm 5\%$  margin of error). Data analysis was performed SPSS Statistics version 20. As per descriptive statistics, respondents had a high level of understanding and a positive attitude toward the SDGs. Spearman's rho coefficient correlation was applied to determine the relationships between students' levels on knowledge with practice and attitude with practice. The results revealed no negative correlation between the knowledge and practice towards SDGs ( $r = 0.021$ ,  $N = 269$ ,  $p = 0.283$ ). furthermore, there is no negligible correlation between the attitude and practice towards SDGs ( $r = 0.091$ ,  $n = 269$ ,  $p = 0.000$ ).

## **1 Introduction**

In September 2015, the United Nations Summit on Sustainable Development in New York established a worldwide agenda for sustainable development until 2030 and defined a list of objectives on which to focus and achieve by the upcoming fifteen years. These objectives were later established as Sustainable Development Goals (SDGs), providing a shared blueprint for peace and prosperity for the people and the planet of today and future generations. It is also known as the 2030 agenda, with "no one left behind". 193 countries agreed to move toward these goals. They agreed on setting 17 Sustainable Development Goals (SDGs), which is imperative to be adopted by all countries over the world immediately. Within the goals, 230 indicators and 169 targets were set to improve global conditions ("17 Sustainable Development Goals", 2019). The goals are interconnected with each other, as achieving on one will accelerate the growth of tackling common issues within the goals. Here it is identified that eradicating poverty and other deprivations must go together with strategies that improve health and education, reduce inequality, and offshoot economic growth, while simultaneously tackling climate change and preserving oceans and forests ("Sustainable Development Goals", n.d.). The SDGs are a striving step to bring the view of sustainability upon the people in places that have never been achieved before, yet implementation of the changes among the people is a major concern (Fleming et al., 2017). The enactment of the SDGs requires constant participation of all individuals.

### ***1.1 Role of education to sustainable development goals implementation.***

The role of education (with SDGs enlightenment as its central focus) is central to achieving the SDGs. just as Health Education is central to Primary Health Care. The United Nations' Educational and Scientific and Cultural Organization (UNESCO) recognizes that education is a major key to sustainable development with its statement "Sustainable development cannot be achieved by technological solutions, political regulation, or financial instruments alone. We need to change the way we think and act. This requires quality education and learning for sustainable development at all levels and in all social contexts.

In order to achieve these goals of global scope, the majority of the population is expected to know about the SDGs, to recognize their importance and to find application for such goals in any professional context, as well as in

personal lifestyle. Nevertheless, the involvement of governments, public and private organizations, as well as academic, scientific, and educational institutions is essential.

This commitment must be translated into global partnerships reflecting the multisectoral cooperation and involvement of society at any level, with a specific mention of a required shared course of action on education, health, and gender equity. Expert groups and academic institutions can assume a pivotal role as catalysts in achieving the SDGs, by promoting fight against inequality, definition of lifestyles, healthy work environments and universal healthcare coverage.

The ultimate result would be an acceleration in the fulfilment of the 2030 Agenda and in the achievement of its goals to promote awareness as well as knowledge and attitudes towards the SDGs in tertiary education. The establishment of partnerships with universities represents a unique opportunity to give birth to a virtuous positive interaction between creation and dissemination of knowledge, hence also assuring the acquisition of required technical skills to develop and maintain a sustainable society interconnected from an economic, healthcare, social and environmental point of view.

The first premise to realize such involvement is represented by adequate competences concerning sustainability themes and the 2030 Agenda's purposes, and, as every individual can have a role in the implementation strategies to realize the SDGs, an intervention from stakeholder professionals of any field is required, as they are able to elevate sustainable development as a national and supranational priority. As affirmed by UNESCO, the role of a proper education, and more specifically of postsecondary education, for the interpretation and implementation of the SDGs is essential to realize 2030 Agenda.

## ***1.2 Background of Tanzania and sustainable development.***

The United Republic of Tanzania (Tanzania), which includes the Mainland and Zanzibar, is committed to achieving high-quality, long-term human development for its population. This is engraved in the country's Constitution and in her long-term development visions. There is a strong nation-wide partnership and commitment to implementation, monitoring, tracking, and reporting Sustainable Development Goals (SDGs), backed by a strong political will, collective ownership, integrated planning, and supportive legal frameworks. A "whole-of-society" approach has been adopted, and a robust national SDGs coordination and

monitoring framework, supported by national statistical offices is being developed.

SDGs have been integrated into and are implemented through national medium-term plans, namely, the National Five-Year Development Plan 2016/17 - 2020/21 in the Mainland and the Zanzibar Strategy for Growth and Reduction of Poverty 2016-2020, which also adheres to the three dimensions of sustainable development (economic, social and environment). Tanzania is doing reasonably well in goals 2, 3, 4, 5, 6, 8, 10, 16. Goals 7, 9, 11, 12 are likely to be achieved with stepped-up efforts. Goals 1, 13, 14, 15 17 will need significant local efforts and international support to achieve.

### **1.3 Why the study focused on university students?**

Forming sustainable people and planet is attached to the educational system. Higher education therefore plays a significant role in facing the current agenda by giving education to the agent of change in university then giving birth to the well-educated graduates. Regarding this, the students' awareness and knowledge of 2030 Agenda are said as crucial issues for higher education, this is also what has been a concern for research on sustainability reports disclosed by universities (Ceulemans, Molderez, & Van Liedekerke, 2015). University campuses can be regarded as small towns, and such spaces can be transformed into habitats for the experimental implementation of a new social and technical paradigm that can serve as a focal point in managing sustainability (Ilham et al., 2018b). There are numerous activities that colleges can take to advance the global agenda. The implementation of sustainability at universities can broaden students' potentials and horizons, both on and off campus (Trencher et al., 2014). As a result, it becomes logical to concentrate on students' knowledge, attitudes, and actions toward the SDGs.

## **2 Literature review**

The knowledge, attitude, and practice of university students toward sustainable development was also assessed at the University of Malaya Malaysia (Nusrat Afroz 1 and Zul Ilham, 2020) "*The journal of Indonesia sustainable development planning p.31-44*", where an online and physical questionnaire survey was used to collect data from 382 undergraduate and graduate students. Adopting previous studies conducted by Ahmad and Arifin (2018), Borges (2019), and Omisore

(2019), a knowledge, attitude, and practice (KAP) questionnaire (with a 5-point Likert scale) was designed (2017). The findings revealed a weak negative correlation between knowledge and practice in relation to the SDGs ( $r = -.264$ ,  $N = 382$ ,  $p = .00$ ). There is, however, a strong positive correlation between attitude and practice toward SDGs ( $r = .440$ ,  $n = 382$ ,  $p = .00$ ). This study suggests that knowledge has less of an impact on achieving SDG goals than attitude, that having more knowledge may not guarantee good practice as attitude might, but it did not address the question of how knowledge might affect attitude. The average positive knowledge of students' cross-tabulated by gender revealed that female students' knowledge (87.89%) was higher than male students' (82.65%). In addition, female students had a higher positive attitude than male students (72.2%) (78.35%). Additionally, female students (56.38%) were more likely than male students (48.31%) to practice SDGs. Furthermore, UM science students had more knowledge of the SDGs (science 85.8%, non-science 81.9%), as well as a more positive attitude toward them (science 78.29%, non-science 68.84%), than non-science students. Instead, UM non-science students had a marginally higher percentage of SDGs practiced than their science counterparts (science 53.3%, non-science 54.6%).

Awareness and Knowledge of the Sustainable Development Goals in a University Community in Southwestern Nigeria (Omisare G., et al., 2017), the purpose of this study was to evaluate how well-versed members in the university community were in the SDGs in terms of awareness, knowledge, and attitudes. 450 students and employees from Osun State University in southwest Nigeria were randomly chosen from three of the university's six campuses to participate in a cross-sectional survey. Using a semi-structured questionnaire, data were gathered. SPSS version 20.0 was used to analyze the data. The respondents' average age was 26(10.2) years. Only 4.2% of respondents had a good understanding of the SDGs, and only 43% were aware of them at all. 56.3%, however, had a favorable attitude toward it. More respondents who had in-depth knowledge of the SDGs were academic staff or people who had learned about them personally or through other means. Additionally, being a member of the academic staff, having a high level of education, and being in the middle of your life were all linked to having a positive attitude. This study includes faculty members and other university personnel, including students. It evaluated the sources from which the staff and students acquired their knowledge of the SDGs, finding that most of them did so through self-learning.

## **2.1 Sustainable Development Goals**

The United Nations' 2030 Agenda for Sustainable Development, also known as the Sustainable Development Goals (SDGs), has been a global agenda for a better future. The degree to which people from various nations are aware of and knowledgeable about the SDGs varies greatly. Since the Millennium Development Goals (MDGs) were completed in 2015, the Sustainable Development Goals project has been underway. Some notable outcomes include a decline in poverty, an increase in primary enrollment and equality, a decrease in child and maternal mortality worldwide, and improved access to sanitation. The Sustainable Development Goals (SDGs), which are the successor agenda, have more substantial elements than the previous one because some achievements have not yet reached the initial goal. The 17 goals and 169 targets that make up the SDGs cover ecological, social, and economic issues. While the MDGs were primarily intended for developing nations in order to advance them, the SDGs would apply to all nations on earth, both developing and developed.

United Nation's blueprint that craves better world by 2030 has set the 17 goals to pursue, (1) no poverty; (2) zero hunger; (3) good health and well-being; (4) quality education; (5) gender equality; (6) clean water and sanitation; (7) affordable and clean energy; (8) decent work and economic growth; (9) industry, innovation and infrastructure; (10) reduced inequalities; (11) sustainable cities and communities; (12) responsible consumption and production; (13) climate action; (14) life below water; (15) life on land; (16) peace, justice and strong institutions; (17) partnership for the goals. Although they are comprised of a complex set of objectives, the sustainable development goals all share the greater technological flexibility and lower cost of actions that will be made possible if policy implementation gets underway sooner. The educational system is linked to creating sustainable individuals and a sustainable planet. Therefore, by educating the change agents in universities and producing well-educated graduates, higher education plays a significant role in addressing the current agenda.

## **3 Methodology**

Non-probability sampling, also known as convenience sampling, was used in this study. Convenience sampling is a type of non-probability sampling in which the sample is drawn from a subset of the population that is easily accessible (Sekaran & Bougie, 2010). The validity of a sample survey is determined by its

ability to extract important information from a small number of respondents in order to depict the characteristics of the entire population (Chuan & Penyelidikan, 2006).

An online and questionnaire survey was used to collect data from 269 undergraduate and graduate students. Adopting previous studies conducted by Ahmad and Arifin (2018), Borges (2019), and Omisore (2019), a knowledge, attitude, and practice (KAP) questionnaire (with a 5-point Likert scale) was designed (2017). The questionnaire was divided into six sections. Section 2 discussed the demographics of the respondents. Sections 3, 4 and 5 assessed respondents' knowledge, attitude, and practice in relation to the Sustainable Development Goals, while Section 6 assessed respondents' opinions such as their sources of knowledge on sustainable development. SPSS Statistics version 20 was used to analyse the data.

### **3.1 Data Analysis**

The level of Students awareness was measured using Chi square test and Descriptive Statistics. The software used for this work is the Statistical Package for the Social Sciences (SPSS) program. Spearman's rho correlation coefficient was used for inferential analysis to determine the correlations between variables (knowledge with practice and attitude with practice). Spearman's coefficient was used because we are measuring ordinal data. The connection was not statistically significant at  $p > 0.01$ . Negatively composed items were recoded correspondingly. Table 5 provides the result of the  $r$  value of Spearman's rho correlation to reflect the strength degree of the association between the variables.

## **4 Results and Findings**

### **4.1 Respondent's socio-demographic background**

According to Table 1, a higher percentage of responses (57.2%) are male, the majority of students (89.2%) are between the ages of 15 and 25, and only one student is between the ages of 18 and 25. 29.7% of respondents attend Muhimbili University of Health and Allied Sciences (MUHAS), 25.7% attend University of Dar-es-Salaam (UDSM), and just 4.8% attend Institute of Finance Management. Most

respondents (91.1%) are seeking a bachelor's degree, while only 7% are pursuing a master's degree. The respondents' knowledge backgrounds were separated into two categories: sciences (69.5%) and non-sciences (30.5%). 112 (42.8%) respondents are in their third year of study while only 6 respondents (2.2%) are in their fifth year of study.

Table 1: Demographics: Variables, Frequency and Percentage (n = 269).

<b>Variables</b>		<b>Frequency</b>	<b>Percentage (%)</b>
<b>Gender</b>	Male	154	57.2
	Female	115	42.8
<b>Age</b>	15-25	240	89.2
	26-36	26	9.7
	37-47	2	.7
	48-58	1	.4
<b>University</b>	Muhimbili University of health and Allied Sciences (MUHAS)	80	29.7
	University of Dar-es-salaam (UDSM)	69	25.7
	University of Dodoma (UDOM)	47	17.5
	Sokoine university of agriculture	19	7.1
	St Augustine university of Tanzania	11	4.1
	Ardhi University	13	4.8
	Kilimanjaro Christian Medical University College (KCMC)	17	6.3
	Institute of finance management	13	4.8
<b>Education Status</b>	Certificate	3	1.1
	Diploma	19	7.1
	Bachelor degree	245	91.1
	Masters	2	.7
<b>Faculty</b>	Science	187	69.5
	Non science	82	30.5
<b>Current study year</b>	First year	42	15.6
	Second year	68	25.3
	Third year	115	42.8
	Fourth year	38	14.1
	Fifth year	6	2.2

#### 4.2 Sustainable development goals knowledge level

The knowledge level of Tanzania students is outstanding (Table 3). Table 3 shows that most students, ranging from 69.5% to 98.1%, answered favorably. With a percentage of 98.1%, item KQ4 "Is the overuse of natural resources affecting the wellbeing of future generations?" received the highest number of positive replies (Yes), indicating that Tanzanian students are knowledgeable about the overuse of natural resources affecting the wellbeing of future generations. The phrase "Are healthy Oceans and seas essential to our existence?" which is part of goal of the SDGs, was answered affirmatively by 97.0% of students. Following that, when asked with statement K1 "Have you ever heard about the term "Sustainable Development Goals (SDGs)" before?" the majority of respondents (88.8%) answered "Yes," but when asked if they knew the goals are projected to be accomplished by 2030, the majority of students (30.5%) didn't know about it.

Table 2 shows the percentages of students who have knowledge of the Sustainable Development Goals.

#	Items	Yes%	No%
KQ1	Have you ever heard about the term "Sustainable Development Goals (SDGs)" before?	88.8	11.2
KQ2	Do you recognize that the word "sustainability" means the ability to be maintained at the certain rate or level?	97.8	2.2
KQ3	Are you aware of the fact that Sustainable Development Goals are targeted to be achieved by the year 2030?	69.5	30.5
KQ4	Is the overuse of natural resources affecting the wellbeing of future generations?	98.1	1.9
KQ5	Is it a must for all people in the world to achieve access to good education in order to achieve sustainable development?	79.6	20.4
KQ6	Are Environmental protection, economic growth and social equity the fundamental elements of a nation?	95.5	4.5
KQ7	Are healthy Oceans and seas essential to our existence?	97.0	3.0
KQ8	Can the increased use of renewable resources reduce greenhouse gas emissions?	91.4	8.6
KQ9	Is income inequality a global problem that requires global solutions?	83.6	16.4
KQ10	Is maintaining good relationships with various countries crucial to preserve peace around the world?	97.8	2.2

### 4.3 Sustainable development goals attitude level

Table 3 below depicts the attitude of Tanzanian students towards the Sustainable Development Goals. We can see that all the statements are affirmative and majority of the respondents responded "Agree" and "Strongly Agree". Table 3 highlights favorable attitudes with a grey background. Statement AQ3, "To me, raising awareness on Sustainable Development Goals among the university students is necessary," received the largest number of "Strongly Agree" responses from students (61.0%). This demonstrates that Tanzanian students understand the need to raise awareness on Sustainable Development Goals among the university students. The majority of respondents (45.4%) agreed they conserve the use of electric energy at their place. When asked if males and females should be treated equally in all aspects of life, 29.7% agreed, 8.6% disagreed and 14.1% responded Neutral. Nonetheless, respondents overwhelmingly supported the Sustainable Development Goals.

Table 3. Shows the percentage of students attitudes towards the Sustainable Development Goals.

#	Items	SD* (%)	D* (%)	N* (%)	A%	SA%
AQ1	Reducing poverty and hunger in the world are more important than increasing the economic welfare of the industrialized countries	6.3	4.1	16.4	36.1	37.2
AQ2	To me, society should be provided with the best free basic health services.	4.5	2.6	5.6	32.0	55.4
AQ3	To me, raising awareness on Sustainable Development Goals among the university students is necessary.	3.3	0.7	4.1	30.9	61.0
AQ4	I feel basic environmental courses should be a part of our university curriculum.	3.7	2.2	13.0	39.4	41.6
AQ5	I think in society, males and females should be treated equally in all aspects of life.	7.1	8.6	14.1	29.7	40.5
AQ6	The rise of global temperature has increased water scarcity.	3.7	3.3	6.3	39.0	47.6
AQ7	Environmental problems are a matter of my concern.	4.5	2.2	10.0	38.3	45.0
AQ8	People from varying cultural backgrounds must be treated with the same respect.	3.7	4.8	11.2	24.2	56.1
AQ9	I try to conserve the use of electric energy at my place.	3.0	5.2	21.6	45.4	24.9
AQ10	I try to reduce the amount of waste at home by collecting materials that can be	2.2	6.7	20.4	42.0	28.6

	recycled.					
AQ11	Functioning and resilient infrastructure is the foundation of every successful community.	2.2	1.9	13.8	45.0	37.2
AQ12	The government should take greater account of sustainability within their political decision.	2.2	1.1	5.2	39.8	51.7
AQ13	Research and educational institutions should take greater account of sustainability in their activities and campaigns.	2.2	0.4	5.6	43.1	48.7
AQ14	I believe that participation in a sustainable lifestyle will bring peace and justice globally.	2.2	0.7	10.0	41.3	45.7
AQ15	I am willing to utilize renewable energy.	2.2	0.4	6.7	36.1	54.6

(SD=Strongly disagree, D=Disagree, N=Neutral, A=Agree, SA=Strongly agree)

#### 4.4 Sustainable development goals practice level

Table 4 below depicts the practice of Tanzanian students towards the Sustainable Development Goals. Majority of the students responded "Often" and "Agreed". From the statements, it can be seen that majority of the students often (41.3%) avoid the use of plastic straws at restaurants/cafes, 45.7% agreed that they use their own reusable bag for grocery shopping. 77.3% agreed that they switch off appliances of their homes whenever they are not around. On a scale of 1 to 5, 45.7% are very interested in the environmentally friendly products and also majority of the respondents (39.4%) have slightly few courses related to environmental sustainability that they took.

Table 4. Shows the percentage of student practice towards the Sustainable Development Goals.

#	Items	N* (%)	R* (%)	S* (%)	O* (%)	A* (%)
PQ1	I avoid using plastic straws at restaurants/cafes.	8.6	14.9	13.0	41.3	22.3
PQ2	I bring my own reusable bag for grocery shopping.	8.2	5.2	17.5	23.4	45.7
PQ3	I discard recyclable material (ex: plastic bottles, newspaper, glass) separately at home.	11.5	11.9	16.7	27.9	32.0
PQ4	I conserve the use	1.9	2.6	14.9	16.7	63.9

	of water supply at my place.					
PQ5	I treat people from all caste, creed and religion equally.	1.1	3.3	8.2	14.5	72.9
PQ6	I prefer public transport rather than a private one.	11.9	8.2	15.2	32.0	32.7
PQ7	I switch off electrical appliances of my home that I don't need when I am not around.	1.5	2.2	7.8	11.2	77.3
PQ8	I turn off the air-conditioner and lights of the classroom after the class finishes and gets is empty at my university.	14.9	13.0	7.4	23.4	41.3
PQ9	I avoid using the animal skinned [animal skin] product	18.2	13.0	14.1	30.9	23.8
PQ10	I participate in events (ex: [as] seminar, talk, workshop) that relates to sustainability.	10.8	13.4	9.3	42.8	23.8
PQ11	I talk about environmental sustainability with your friends and family.	9.3	11.2	13.4	40.5	25.3
<b>#</b>	<b>Items</b>	<b>NI<sup>+</sup>(%)</b>	<b>RI<sup>+</sup>(%)</b>	<b>SI<sup>+</sup>(%)</b>	<b>OI<sup>+</sup>(%)</b>	<b>VI<sup>+</sup>(%)</b>
PQ12	On a scale of 1 to 5 please the rate the level of interest to pay more on environmentally friendly products	7.1	4.8	19.7	22.7	45.7
<b>#</b>	<b>Items</b>	<b>SFC<sup>+</sup>(%)</b>	<b>FC<sup>+</sup>(%)</b>	<b>MAC<sup>+</sup>(%)</b>	<b>MOC<sup>+</sup>(%)</b>	<b>SMC<sup>+</sup>(%)</b>
PQ13	On a scale of 1 to 5 please rate the number of courses related to environmental	39.4	8.9	23.0	11.5	17.1

	sustainability that you took.					
--	-------------------------------	--	--	--	--	--

(**N**= Never, **R**= Rarely, **S**= Sometimes, **O**=Often, **A**=Always), (**NI**= Not interested, **RI**= Rarely interested, **SI**= Sometimes interested, **OI**= Often interested, **VI**=Very interested), (**SFC**= Slightly few courses, **FC**= Few courses, **MAC**= Many courses, **MOC**= More course, **SMC**= Slightly more courses).

From Table 5 below, it depicts there is no negligible relationship between student knowledge and SDG practice level ( $r= 0.021$ ,  $N = 269$ ,  $p =0.283$ ). Table 7, indicating that while Tanzanian students might have strong Knowledge of SDGs, their practice level is extremely poor. Students may need to understand how to practice SDG rather than simply having only knowledge about them. Also, there is no negligible relationship between student attitude and SDG practice level ( $r= 0.091$ ,  $N = 269$ ,  $p =0.000$ ), indicating that rather than having good attitude, without practice level, will result in no correlation.

Table 5. Shows the correlation between student Knowledge and practice, Attitude and practice towards the Sustainable Development Goals.

Correlations						
			Knowledge	Attitude	Practice	Inference
Spearman's rho	Knowledge	Correlation Coefficient	1.000	.014	.021	No correlation
		Sig. (2-tailed)	.	.475	.283	
		N	269	269	269	
	Attitude	Correlation Coefficient	.014	1.000	.091**	No correlation
		Sig. (2-tailed)	.475	.	.000	
		N	269	269	269	
	Practice	Correlation Coefficient	.021	.091**	1.000	No correlation
		Sig. (2-tailed)	.283	.000	.	
		N	269	269	269	
**. Correlation is significant at the 0.01 level (2-tailed).						

A detailed cross-tabulation was performed to access knowledge, attitude, and practice level in connection to gender. A cross-tabulation of students' average positive knowledge based on gender and it revealed that 138 male students' knowledge was higher than 101 female students. Similarly, 61 male students had a higher positive attitude than 39 female students. 41 male students were also more likely to practice SDGs than 19 female students.

## 5 Conclusion

In summary, the general level of awareness of SDGs among Tanzanian students is strong, as shown by the percentage of students who have good knowledge and a favorable attitude. Nonetheless, they performed below average in terms of SDG implementation because they have no correlation. There is a no relationship between student knowledge and practice level, indicating that while Tanzanian students have high understanding of the SDGs, their practice level is slightly lower, however this can be increased through the university's strategic initiatives and intervention programs. There is, also, no positive relationship between student attitude and practice level. Further research can be conducted to investigate the methods and approaches which can be employed to provide Sustainable development goals (SDG) education awareness, and additionally to stimulate positive attitudes and improve practice levels at various levels of education, particularly at the highest level, which is universities and colleges.

### Abstract

In recent years, the discussion around virtual influencers has been growing. These virtual personalities have a huge following among young people, with an engagement rate three times higher than that of YouTubers. This has made people realize the business opportunities in this industry. To explore how influencer attributes and perceived characterizations affect consumers' purchase intention, this study uses the S-O-R theoretical framework proposed by Mehrabian and Russell in 1974. The study focuses on three influencer attributes: attitude homophily, physical attractiveness, and social attractiveness, and three perceived characterizations: trustworthiness, parasocial interaction, and brand equity. Perceived characterizations are regarded as a mediator in this study. The research sample consists of 479 people who were sampled from VTubers research groups on social media. The study uses structural equation modeling (SEM) to test the proposed model. The results show that influencer attributes have a significant and positive effect on perceived characterizations. Perceived characterizations, in turn, have a significant and positive effect on consumers' purchase intention. Additionally, perceived characterizations have a significant mediation effect. This research provides valuable insights for VTubers marketers. By understanding the influence of attributes and characterizations, marketers can develop more effective strategies for promoting their products and services through virtual influencers. In conclusion, virtual influencers have a significant impact on consumers' purchase intention, and this study provides important insights into how influencer attributes and perceived characterizations affect consumer behavior. By understanding these factors, VTubers marketers can improve their marketing strategies and better leverage the power of virtual influencers. Text of the abstract

**Keywords** – VTuber, Influencer Attributes, Perceived Characterizations, Purchase Intention

## 1 Introduction

The global virtual influencer industry is rapidly growing due to technological developments, including AI, AR, and VR, and the widespread popularity of the internet and social media. According to HypeAuditor (2021), virtual influencers have engagement rates three times higher than human influencers, with a significant following among females aged 18 to 34, including a significant proportion of Generation Z aged 13 to 17. The unique aspect of virtual influencers is their ability to express their thoughts and ideas, representing disadvantaged groups and creating a human-like connection with their audience. This makes them an attractive option for businesses, as they maintain a positive image and can appear anywhere, anytime.

This study focuses on the commercial operation of VTubers, a type of virtual influencer that has seen exponential growth in recent years. Previous research by Horan (2015), Purnamaningsih and Rizkalla (2020), Masuda, Han and Lee (2022), Chang et al. (2019), and Kurtin et al. (2018) indicates that influencer attributes such as attitude homophily, physical attractiveness, and social attractiveness positively affect parasocial interaction and trustworthiness. This positive image can effectively improve brand image, and social media engagement rates of celebrities, representing social attractiveness, have a significant impact on trustworthiness.

Additionally, Misra and Baetty (1990) found that the connection between spokesmen and brands creates enhanced emotional connections between consumers and brands, thus improving brand equity. Chen and Wu (2017) and Dean (1999) both found that the attractiveness and reputation of spokesmen can effectively enhance brand image and impact society. This study takes attitude homophily, physical attractiveness, and social attractiveness into account as factors affecting trustworthiness, parasocial interaction, and brand equity.

Trustworthiness significantly influences purchase intention, as found by Leung, Sun, and Asswailem (2022) and Bhatti (2017). Hsu, Yu, and Chen (2022) also found that higher perceived trustworthiness of influencers leads to stronger stimulation of purchase intention. Positive brand image and recognition also lead to stronger purchase intention, as found by Huang (2020) and Romaniuk and Sharp (2003). Brand equity positively affects purchase intention, as shown by Rizwan, Al-Malkawi, Gadar, Sentosa, and Abdullah (2021). Additionally, parasocial interaction also influences purchase intention, according to Purnamaningsih and Rizkalla

(2020) and Lin, Pierre, Crowe, and Lee (2021). Shen, Zhao, Fan, and Buhalis (2022) found that audience emotions during live streaming can adjust the impact of parasocial interaction, influencing their purchase intention.

Based on the above research background and motivations, this study aims to explore the relationship between virtual influencer attributes, perceived characterizations, and purchase intention. Specifically, the study aims to discuss the effect of virtual influencer attributes on perceived characterizations, the effect of perceived characterizations on purchase intention, and the mediating effect of perceived characterizations.

## **2 Literature Review**

### ***2.1 Overview of Virtual Influencer Industry***

The virtual influencer industry originated in Japan, referring to a character that combines a virtual image with a real person using motion capture technology. The industry is divided into two categories: independently produced and corporately produced. Hololive Production, a company with 22 VTubers, is one of the most popular and profitable virtual influencer companies. It has entered various overseas markets and reportedly made a yearly profit of over 1 billion yen (ET Net, 2021). The virtual influencer industry is growing rapidly, with over 16,000 VTubers as of October 2021 (UserLocal, 2021). Brands are taking notice of virtual influencers, and more and more are collaborating with them.

### ***2.2 Influencer Attributes***

#### ***2.2.1 Attitude Homophily***

Attitude homophily refers to the similarity of thoughts, values, and attitudes. It is a crucial factor in establishing relationships among individuals. Research has shown that similarity in attitudes and character is more relevant to explain the differences in homophily than traditional demographics (Byrne, Griffitt, and Stefaniak, 1967; Byrne and Nelson, 1965; Byrne and Rhamey, 1965). In addition, individuals tend to connect with each other based on personal perceived recognition and mental characteristics, as well as shared common interests with groups (Blanton, 2001; Palmer, Brewer, Weber, and Nagesh, 2013). Having similar

friends on social media can lead to more supportive interaction and increased satisfaction (Oh, Ozkaya, and LaRose, 2014).

### *2.2.2 Attractiveness*

Attractiveness plays an essential role in establishing relationships among individuals. Physical attractiveness refers to the satisfaction level of one's physical features aesthetically. Socioculturally relevant attributes, particular preferences, and facial symmetry are factors that impact attractiveness. People tend to attribute positive features like wisdom, ability, and enthusiasm to individuals with beautiful faces (Agthe, Spörrle, Frey, Walper, and Maner, 2013). In addition, consumers have a positive impression of attractive celebrities and transfer this attitude to the products they endorse (Debevec and Kernan, 1984). Social attractiveness includes proximity, intimacy, similarity, and complementarity. Proximity, the main reason for interpersonal attraction, refers to the physical or mental closeness between people. Intimate relationships involve physical or emotional relationships characterized by lasting dependence, frequent interaction, emotional connection, and mental satisfaction. People are attracted to those with similar characteristics, goals, and appearance. Those with low self-esteem are more willing to establish complementary relationships (Heine, Foster, and Spina, 2009).

## **2.3 Perceived Characterizations**

### *2.3.1 Trustworthiness*

Trustworthiness refers to the quality of how an individual persuades and how much others believe in them (Singletary, 1976). It consists of reliability and professionalism, which refers to the seller's ability to convey goods or services and fulfill its promise of goods, respectively (Erdem and Swait, 2004). Chen and Wu (2017), Bhatt, Jayswal, and Patel (2013), and Ohanian (1990) divided trustworthiness into three categories: professionalism, reliability, and attractiveness, respectively. Professionalism refers to influencers' professional knowledge of certain products, while reliability encompasses honesty, fairness, and worth-trusting characteristics. Attractiveness refers to influencers' individual attraction. Trustworthiness can impact consumer product comments, the persuasion of products or services, and reflects whether information receivers agree with information spreaders or not.

### *2.3.2 Parasocial Interaction*

The initial concept of Parasocial Interaction was referred to Horton and Wohl (1956), it is also called Parasocial Interaction (PSI), they described this interaction as “Simulacrum of conversational give and take” between audience and performer. In the past, Parasocial Interaction was one-way, but now, it is instant two-way between audience and media. In the words of Zheng, Yu & Wu (2019), Parasocial interaction started from the rise of mass media. Over time, the ways of marketing have been from flyers to television, to social media now, the way of parasocial interaction has changed accordingly. Traditional theory had more focused on the relationship between audience and announcers (Auter, 1992; Rubin and Step, 2000). On the other hand, due to the Internet, the research of parasocial interaction has expanded into consumers. Nowadays, social platforms like YouTube can market or embed advertising or products, in addition to sharing life videos. In addition, online influencers have played an important role in consumers’ life (Zheng et al., 2019). As previously mentioned, this study wants to investigate whether virtual influencers can establish a relationship with consumers and thus have more business opportunities.

### *2.3.3 Brand Equity*

According to Shocker and Weitz (1988), Brand equity consists of impression and loyalty. Aaker (1991) divided Brand Equity into (1) Brand Loyalty: brand preference of consumers, the core of Brand Equity; (2) Brand Awareness: how much consumers remember a brand; (3) Perceived Quality: the whole brand image and quality for consumers; (4) Brand Association: the association generated by consumers through a brand; (5) Proprietary Assets: such as, patent, trademark, and so on. Brand Equity is created from the different reactions of consumers which will express through behavior, recognition, and preference. It can also be said that Brand Equity includes Brand Awareness and Brand Meaning (Berry, 2002). Also, the overall quality of products and purchase intention are used to delegate to Brand Equity (Agarwal and Rao, 1996). The status of the brand, consumers’ attitude toward the brand, and the profit the brand will make also belong to Brand Equity (Keller, 2003).

## **2.4 Purchase Intention**

Dodds, Monroe, and Grewal (1991) defined Purchase intention as the possibility of what consumers are willing to purchase. Spears and Singh (2004) showed that Purchase Intention is that consumers buy something consciously, is created by just having a good impression of merchandise. At the same time, Fishbein and Ajzen (1975) indicated that Purchase Intention consists of the consumers' attitude or comments for brands or products and external factors. Kotler (2016) further defined Purchase Intention as the priority order of purchasing. Purchase intention is often used to estimate consumers' consumption behavior (Jung, Choi and Oh, 2020). Cheng et al. (2021) also proved that Purchase Intention is used as the standard for measuring purchasing behavior. Thus, this study is going to incorporate consumers' purchase intention into the measurement basis for the effectiveness of virtual influencer endorsements. Taking virtual influencer endorsements as a mediator for shaping brand attitudes, after the brand attitude is formed, coupled with the external environment's acceptance of virtual influencers, it determines whether consumers will choose the brand endorsed by virtual influencers from among many brands, which is the formation of purchase intentions.

## **3 Methodology**

### **3.1 Research Framework**

This study adopts the S-O-R model (Stimuli-Organism-Response) proposed by Mehrabian and Russell (1974) to investigate the impact of virtual influencers on brand purchase intention. Stimuli, the first stage, is created by consumer motivation towards virtual influencers and external environment. Attitude homophily, physical attractiveness, and social attractiveness are identified as influencers. In the second stage, organism, consumers' organic perception is shaped after receiving motivation. Perceived characterizations (trustworthiness, parasocial interaction, and brand equity) are shown to be associated with purchase intention. Finally, behavior intention is measured by purchase intention. This study utilizes the three perceived characterizations as mediators for purchase intention. Figure 3-1 illustrates the research framework. In order to explore how the assessment and management of knowledge assets can support NPD process

performance improvements, I have carried out an empirical research based on multiple case studies (Eisenhardt, 1989; Mintzberg, 1979; Mintzberg and Waters, 1982; Yin, 1984).

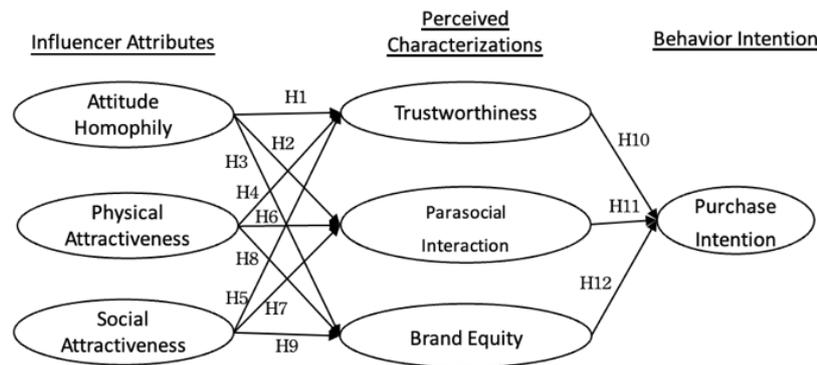

Figure 3-1 Research Framework

### 3.2 Research Hypotheses

#### 3.2.1 The relationship between Attitude Homophily and Perceived Characterizations

Attitude Homophily has a pre-conditioned positive impact on Trustworthiness (Li and Du, 2011; Djafarova and Rushworth, 2017) and Parasocial Interaction (Sokolova and Kefi, 2020). The similarity between consumers and virtual influencers increases consumers' purchase intention (Hook, Baxter, and Kulczynski, 2020; Ki and Kim, 2019; Lee and Watkins, 2016; Schouten et al., 2020), and positively affects brand equity (Schouten et al., 2020). Based on these findings, this study proposes the following hypotheses:

- H1: Attitude Homophily has a positive impact on Trustworthiness.*
- H2: Attitude Homophily has a positive impact on Parasocial Interaction.*
- H3: Attitude Homophily has a positive impact on Brand Equity.*

#### 3.2.2 The relationship between Attractiveness and Perceived Characterizations

Physical Attractiveness has a pre-conditioned positive impact on Trustworthiness (Ert and Fleischer, 2020; Sokolova and Kefi, 2020), and Social Attractiveness positively affects Social Attractiveness (Masuda et al., 2022). Physical Attractiveness and Social Attractiveness have a positive impact on Parasocial Interaction (Lee and Watkins, 2016; Lou and Kim, 2019; Masuda et al.,

2022), and Brand Equity (Dwivedi et al., 2015; Lieven, 2016; Menon et al., 2001). Thus, this study proposes the following hypotheses:

*H4: Physical Attractiveness has a positive impact on Trustworthiness.*

*H5: Social Attractiveness has a positive impact on Trustworthiness.*

*H6: Physical Attractiveness has a positive impact on Parasocial Interaction.*

*H7: Social Attractiveness has a positive impact on Parasocial Interaction.*

*H8: Physical Attractiveness has a positive impact on Brand Equity.*

*H9: Social Attractiveness has a positive impact on Brand Equity.*

### *3.2.3 The relationship between Trustworthiness and Purchase Intention*

Trustworthiness is a significant determinant of followers' purchase intentions (Djafarova and Rushworth, 2017; Erkan and Evans, 2016; Reichelt et al., 2014; Schouten et al., 2020; Sokolova and Kefi, 2020). Thus, this study proposes the following hypothesis:

*H10: Trustworthiness has a positive impact on Purchase Intention.*

### *3.2.4 The relationship between Parasocial Interaction and Purchase Intention*

Parasocial Interaction is positively related to purchase intention (Hwang and Zhang, 2018; Masuda et al., 2022; Shen et al., 2022). Thus, this study proposes the following hypothesis:

*H11: Parasocial Interaction has a positive impact on Purchase Intention.*

### *3.2.5 The relationship between Brand Equity and Purchase Intention*

Brand Equity has a positive impact on purchase intention (Aaker, 1991; Keller, 1993; Tharmi and Senthilnathan, 2011). Thus, this study proposes the following hypothesis:

*H12: Brand Equity has a positive impact on Purchase Intention.*

## **3.3 The sample design and data collection**

The research methodology employed in this study is a questionnaire survey, with the target respondents being individuals who watch or follow virtual influencers. The survey was conducted from November 1, 2021, to January 26, 2022, spanning a period of three months. A total of 504 responses were collected, out of which 479 were deemed valid, resulting in an effective questionnaire rate of 95%.

### **3.4 Measure development**

The measure constructs in this study include Influencer Attributes (Attitude Homophily, Physical Attractiveness, and Social Attractiveness), Perceived Characterizations (Trustworthiness, Parasocial Interaction, and Brand Equity), and Behavior Intention (Purchase Intention). The samples were measured using a Likert 5-Point Scale, with 1 being "totally disagree" and 5 being "totally agree." To measure Attitude Homophily, this study refers to the views of Lou and Kim (2019) and developed three questions based on McPherson et al (2001), Rogers and Bhowmik (1970), and McCormick (2016). To define Physical and Social Attractiveness, this study refers to the viewpoints of Duran and Kelly (1988) and Lee (2010), respectively, and developed seven questions based on Berscheid and Walster (1974), Lee and Watkins (2016), Joseph (1982), Sokolova and Kefi (2020), Batra et al. (2012), and Carroll and Ahuvia (2006). To define Trustworthiness, this study refers to the views of Lou and Kim (2019) and developed three questions based on Reichelt, Sievert and Jacob (2014), Erkan and Evans (2016), and Sokolova and Kefi (2020). To define Parasocial Interaction, this study refers to the views of Rubin and Perse (1987) and developed four questions based on Horton and Wohl (1956), Masuda et al. (2022), and Hwang and Zhang (2018). To define Brand Equity, this study refers to the views of Aaker (1991) and developed five questions based on Keller (1993) and Lofgren and Li (2010). Finally, to define Purchase Intention, this study refers to the viewpoint of Lofgren and Li (2010) and developed three questions based on Zeng (2008).

## **4 Analysis Results**

### *4.1 Descriptive Statistics Analysis*

According to We Are Social's (2021) research on online social communities in Taiwan in 2020, the most popular social media platforms in Taiwan are YouTube (89.6%), Facebook (89.2%), Line (88.0%), and Instagram (59.5%). In addition, OpView's (2022) data from the third media annual report in 2021 revealed that Dcard had the most significant online reputation growth compared to other social platforms, with an increase of 34.4% since 2020. Thus, the study selected Facebook, Line, Instagram, and Dcard, as well as virtual influencer communities on these four platforms, to achieve a higher effective questionnaire rate. A total of

504 samples were collected and tested for participation bias, with 479 being deemed effective, resulting in an effective questionnaire rate of 95% (479/504).

The effective samples were analyzed through Descriptive Statistic Analysis, with male respondents accounting for 70.1%, consistent with the trend observed by STRATE, which found that more males watched VTubers than females in 2021. Furthermore, the majority of respondents were 18 years old (48.0%), followed by 19-25 years old (36.7%), and were mainly students. According to iiMedia Research, at least 70% of the audience falls within the age range of 18 to 23, which also comprises Generation Z. As a result, the majority of the respondents being students (73.1%) and having a disposable income below NTD\$5,000 (53.0%), followed by NTD\$5,001 - \$15,000 (25.1%), is not surprising. The collected samples are thus representative of the current trend.

#### **4.2 Structural Equation Modeling Analysis**

This study utilized Structural Equation Modeling with Amos 26.0. The analysis was conducted using the two-phase method proposed by Anderson and Gerbing (1988). In the first phase, the measurement model was assessed for its validity and reliability. In the second phase, the structural model was tested to determine the significance of the hypotheses.

##### *4.2.1 Measurement Model*

Table 4-1 shows the results of the Confirmatory Factor Analysis for the measurement model. The model fit indices indicate that the model has a good fit. The ratio of  $\chi^2/df$  is 2.503, which falls within the recommended range of 1 to 3 (Hair et al., 1998). The Goodness-of-Fit Index (GFI) is 0.907, which is greater than the recommended value of 0.9 (Bentler, 1983). The Adjusted Goodness-of-Fit Index (AGFI) is 0.874, which exceeds the recommended value of 0.8 (Bentler and Hu, 1999). The Comparative Fit Index (CFI) is 0.936, which also exceeds the recommended value of 0.9 (Byrne, 1994; Bentler, 1995). Lastly, the Root Mean Square Error of Approximation (RMSEA) is 0.056, which is below the recommended standard of 0.06 (Hu and Bentler, 1999). These results indicate that the measurement model is a good fit.

The results for the Factor Loading (FL) indicate that all observable variables have sufficient validity to reflect their corresponding latent variable, with FL values exceeding 0.45 (Bentler and Wu, 1993). The Cronbach's  $\alpha$  values for all constructs

are greater than 0.6 (Nunnally, 1978), indicating good reliability. The Composite Reliability (CR) and Average Variance Extracted (AVE) values also meet the recommended standards of 0.6 (Hair et al., 2006) and 0.36 (Fornell and Larcker, 1981), respectively, indicating good convergent validity.

In terms of Discriminant Validity, the square root of AVE value for each construct exceeds its corresponding variance with any other construct (Fornell and Larcker, 1981), as shown in Table 4-2, indicating good discriminant validity. Additionally, all correlation coefficients have a significant impact, making the research suitable for structural model analysis.

#### *4.2.2 Structural Model*

The results of the structural model analysis are presented in Table 4-3. The study obtained good model fit, as evidenced by the values of  $\chi^2/df$ , GFI, AGFI, CFI, and RMSEA, which meet the established standards (Hair et al., 1998; Bentler, 1983; Bentler, 1995; Browne and Cudeck, 1993). Therefore, the structural model is considered a good fit for the data (Baumgartner and Homburg, 1996).

The standardized path coefficients in Table 4-3 demonstrate that three of the Attitude Homophily (ATH) hypotheses have significant impacts: ATH to Trustworthiness (TW) ( $\beta = 0.289$ ,  $p < 0.001$ ), ATH to Parasocial Interaction (PR) ( $\beta = 0.267$ ,  $p < 0.001$ ), and ATH to Brand Equity (BE) ( $\beta = 0.165$ ,  $p < 0.001$ ). Therefore, hypotheses H1, H2, and H3 are supported. The Physical Attractiveness (PA) hypotheses also have significant impacts on TW ( $\beta = 0.191$ ,  $p < 0.001$ ) and PR ( $\beta = 0.230$ ,  $p < 0.001$ ); thus, H4 and H6 are supported, while the PA hypothesis for BE ( $\beta = 0.050$ ,  $p > 0.05$ ) is not supported (H8).

The Social Attractiveness (SA) hypotheses all have significant impacts on TW ( $\beta = 0.300$ ,  $p < 0.001$ ), PR ( $\beta = 0.349$ ,  $p < 0.001$ ), and BE ( $\beta = 0.571$ ,  $p < 0.001$ ); therefore, H5, H7, and H9 are supported. Finally, the TW to Parasocial Interaction (PI) ( $\beta = 0.139$ ,  $p < 0.001$ ), PR to PI ( $\beta = 0.101$ ,  $p < 0.001$ ), and BE to PI ( $\beta = 0.502$ ,  $p < 0.01$ ) hypotheses all have significant impacts, thus, H10, H11, and H12 are supported. In conclusion, all hypotheses except H8 are supported by the analysis

#### **4.3 Mediating effect**

Based on the results of the structural model, it has been proven that TW, PR, and BE significantly impact PI. Thus, this study aims to further investigate the mediating effect between Influencer Attributes and Perceived Characterizations.

To test this, the study uses the Bootstrapping Method recommended by Preacher and Hayes (2008). According to Zhao et al. (2012), this method is better for testing mediating effects as it takes the research sample as the population and calculates the confidence interval (CI) through 2,000 estimations. If the indirect effect CI does not contain 0, it means that the indirect effect is significant; otherwise, it is not significant.

The results in Table 4-4 show that all mediating effects are significant except for SA-TW-PI and SA-PR-PI under the 95% percentile CI and bias CI. Thus, we can confirm that the indirect effect exists, which means TW respectively plays a mediator between ATH, PA and PI; PR also respectively plays a mediator between ATH, PA and PI, and BE respectively plays a mediator between ATH, SA and PI.

According to the testing process of mediating effects proposed by Baron and Kenny (1986) as shown in Table 4-5, it is noted that the direct effects of ATH-TW-PI, ATH-PR-PI, ATH-BE-PI, and PA-TW-PI are not significant ( $\beta_{ATH-PI} = 0.023, 0.070, -0.077, \beta_{PA-PI} = 0.084$ ), which proves that TW, PR, and BE have complete mediating effects between ATH and PI, and TW has a complete mediating effect between PA and PI. Additionally, taking IV and M to test the impact on DV at the same time in the paths of PA-PR-PI and SA-BE-PI, both IV and M have a significant impact on DV. Thus, it proves that PR has a partial mediating effect between PA and PI, and BE has a partial mediating effect between SA and PI.

Table 4-1. Convergent Validity

Constructs	FL	CR	AVE
ATH	0.56~0.83	0.77	0.53
PA	0.61~0.80	0.78	0.54
SA	0.51~0.79	0.73	0.41
TW	0.48~0.76	0.65	0.39
PR	0.58~0.75	0.76	0.45
BE	0.53~0.82	0.84	0.51
PI	0.60~0.90	0.85	0.65
Fit Statistics: $\chi^2/df = 2.503$ , GFI = 0.907, AGFI = 0.874, CFI = 0.936, RMSEA = 0.056			

Note: 1. ATH= Attitude Homophily; PA= Physical Attractiveness;  
SA= Social Attractiveness; TW= Trustworthiness;  
PR= Parasocial Interaction; BE= Brand Equity;  
PI= Purchase Intention.

Table 4-2. Discriminant Validity

Constructs	Correlation Coefficients						
	ATH	PA	SA	TW	PR	BE	PI
ATH	0.890						
PA	0.433**	0.884					
SA	0.526**	0.549**	0.569				
TW	0.548**	0.467**	0.318**	0.592			
PR	0.558**	0.527**	0.332**	0.566**	0.619		
BE	0.484**	0.408**	0.526**	0.453**	0.538**	0.707	
PI	0.248**	0.264**	0.519**	0.424**	0.358**	0.634**	0.713

Note: 1. ATH= Attitude Homophily; PA= Physical Attractiveness;  
 SA= Social Attractiveness; TW= Trustworthiness;  
 PR= Parasocial Interaction; BE= Brand Equity;  
 PI= Purchase Intention.  
 2. Lower triangle is the Pearson correlation coefficient.  
 3. \* p < 0.05; \*\* p < 0.01

## 5 Conclusions

In this study, the S-O-R Model proposed by Mehrabian and Russell (1974) was used to examine the relationship between Influencer Attribute and consumers' Behavior Intention. The findings revealed significant relationships between Influencer Attribute (Attitude Homophily, Physical Attractiveness, Social Attractiveness) and Perceived Characterizations (Trustworthiness, Parasocial Interaction, Brand Equity). Furthermore, Perceived Characterizations were found to be significant mediators between Influencer Attribute and Behavior Intention (Purchase Intention).

### 5.1 The Impact of Influencer Attribute on Perceived Characterizations

The results of this study suggest that Attitude Homophily has a positive impact on consumers' Perceived Characterizations. This finding is consistent with previous research results (e.g., Li and Du, 2011; Al-Emadi and Yahia, 2020), which suggest that shared values and interests between consumers and virtual

influencers can strengthen the trust relationship between them. Additionally, Physical Attractiveness and Social Attractiveness were found to have a positive impact on consumers' Perceived Characterizations. These findings align with the research of Ert and Fleischer (2020), Sokolova and Kefi (2020), Toma (2014), Masuda et al. (2022), Lee and Watkins (2016), Lou and Kim (2019), Zheng et al. (2020), Hook, Baxter, and Kulczynski (2020), and Schouten et al. (2020), which suggest that the physical and individual attractiveness of virtual influencers can strengthen the trust relationship between them and their audience, enhance the interaction between them, and positively impact the attitude toward the brand influencers endorse. However, this study found that Physical Attractiveness does not significantly and positively influence Brand Equity, which contrasts with previous research results (e.g., Liu and Zhang, 2019; Menon et al., 2001). Nevertheless, the study found that virtual influencers' Social Attractiveness can enhance the brand effectively, which aligns with Masuda et al. (2022) and Lieven (2016).

### ***5.2 The Impact of Perceived Characterizations on Behavior Intention***

The study found that Perceived Characterizations have a positive impact on consumers' Behavior Intention. Specifically, Trustworthiness was found to have a positive and significant impact on Purchase Intention. This finding is consistent with previous research results (e.g., Hsu et al., 2022; Lou and Kim, 2019; Wathen and Burkell, 2002), which suggest that a stronger trust relationship between consumers and virtual influencers can positively impact purchase decisions. Parasocial Interaction was also found to have a positive and significant impact on Purchase Intention, and it has complete and partial mediating effects between Attitude Homophily, Physical Attractiveness, and Purchase Intention, respectively, which aligns with Hsu et al. (2022) and Masuda et al. (2022). This suggests that the interaction between virtual influencers and their audience can positively impact purchase decisions, especially when audiences are attracted by virtual influencers and share similar values and interests. Brand Equity was found to have a positive and significant impact on Purchase Intention, and it has completed and partial mediating effects between Attitude Homophily, Social Attractiveness, and Purchase Intention, respectively, which aligns with Es-Safi and Sağlam (2021), and other research. This finding suggests that the social platform run by virtual

influencers can effectively improve Brand Equity and positively impact purchase decisions.

### **5.3 The mediating effect of Perceived Characterizations**

The results of the mediator test showed that Trustworthiness has a complete mediating effect between Influencer Attributes (Attitude Homophily, Physical Attractiveness, and Social Attractiveness), which is consistent with previous research by Cheng, Chen & Huang (2006) and Soekmawati et al. (2022). This suggests that when audiences share the same values and preferences as virtual influencers, and are attracted to their appearance, their trustworthiness is positively impacted, which in turn affects their purchase decisions.

Additionally, Parasocial Interaction was found to have both complete and partial mediating effects between Attitude Homophily, Physical Attractiveness, and Purchase Intention, as supported by previous studies by Hsu et al. (2022) and Masuda et al. (2022). This suggests that when audiences are attracted to virtual influencers and share the same values and preferences, it motivates interaction between them, which has a positive impact on audience purchase decisions.

Finally, Brand Equity was found to have both complete and partial mediating effects between Attitude Homophily, Social Attractiveness, and Purchase Intention, as supported by previous research by Es-Safi and Sağlam (2021). This suggests that when audiences share the same values and preferences as virtual influencers and are attracted to the social platforms where they are active, it can effectively improve brand equity, further impacting audience purchase intentions.

In conclusion, this study highlights the important role of Perceived Characterizations as significant mediators between Influencer Attributes and Purchase Intention. The findings suggest that virtual influencers should focus on building their trustworthiness, fostering parasocial interaction, and improving brand equity to positively impact their audience's purchase intentions.

### **5.4 Suggestions**

#### *5.4.1 The impact of Influencer Attributes on Perceived Characterizations*

This study shows that Influencer Attributes can effectively improve Perceived Characterizations, with Physical Attractiveness having the ability to increase

Trustworthiness and Parasocial Interaction of Perceived Characterizations. Based on these findings, we offer the following suggestions for Influencer Attributes:

(1) Attitude Homophily

Marketers should identify their target audience and create content that would interest them. They should also link their virtual influencer ambassador to brand identity.

(2) Physical Attractiveness

Marketers can design a virtual influencer that fits their brand image. For example, if it is a sports brand, they can design a virtual influencer with a toned or curvy body. Moreover, marketers could also conduct research on the appearance preference of the target audience to make the best choice.

(3) Social Attractiveness

Marketers must fully showcase the unique characteristics of virtual influencers to stand out from others. They can create a character with interesting background stories to catch the audience's attention.

#### *5.4.2 The mediating effects of Perceived Characterizations*

This study demonstrates that Perceived Characterizations play an important mediator role between Influencer Attributes and Behavior Intention. Hence, we suggest the following recommendations for Perceived Characterizations:

(1) Trustworthiness

Marketers should choose virtual influencers whose content is relevant to the industry of the brand. This would increase the audience's perception of reliability. Additionally, virtual influencers should showcase their expertise, and when the audience recognizes this expertise, it can not only enhance connections between the influencer and audience but also motivate the purchase intention of the audience.

(2) Parasocial Interaction

We recommend that marketers focus on improving the engagement rate, such as paying attention to current trends and frequently interacting with their audience. Furthermore, selecting opinion leader type virtual influencers can improve the interaction with the audience. In comparison to real celebrities with higher costs, having virtual influencers with lower costs can establish a friendship with the audience more easily.

### (3) Brand Equity

Marketers should focus on enhancing brand association by inviting virtual influencers who match the brand image. Marketers could also establish the virtual influencer's image to meet the audience's preferences. Additionally, virtual influencers can show up on brand advertisements or online events to gain public attention and increase brand exposure.

### ***5.5 Limitations of the study and recommendations for future research***

This study provides industries with reference for using virtual influencers as a marketing strategy. However, due to limitations, the study offers advice for future research. Firstly, the survey design was limited due to the lack of resources available on virtual influencers, resulting in the use of studies on celebrities on social media as a reference. Future research should design surveys specifically for virtual influencers. Secondly, the study focused on VTubers, limiting analysis of the virtual influencer industry as a whole. Future research should expand to overseas markets to explore different virtual influencer trends, such as those in the Korean fashion industry.

### **Abstract**

The paper aims to create the conditions to develop a smart model of work organization 4.0 able to generate sustainability and green logic through a multi-sectoral approach that exploits the central role that the working dimension assumes in the life of the urban community and in the organization of the city.

The methodology that we intend to apply is qualitative-quantitative in the sense that we will start with a first desk phase that aims to collect specific information, detailed, useful in the start-up phase and that will then be used to build the survey and will proceed with a longitudinal analysis.

The expected results of the research concern, first of all, the overcoming of the state of inconsistency and weakness on the subject of agile work and also the attempt to rationalize the economic and social impacts that this innovative approach entails.

The importance of this work lies in the possibility of building a structured SW implementation model that takes into account the different implications (economic, organizational and social) that this innovative approach to work generates. Our scientific and operational contribution is based on the possibility of creating new forms of work.

An innovative contribution of this paper appears to be the formulation of proposals and useful indications for change management policies and interventions in terms of new forms of work, in the sectors under analysis.

In particular, the paper, through the results of a qualitative-quantitative analysis will focus on the identification of critical issues encountered by employees in the implementation of SW and its impact in terms of individual and organizational performance.

That is, this dimension transversally intercepts all aspects of personal and collective organization, affecting the lives of individuals and families, the local economy, the quality of the environment, the demand for mobility, consumption, social relations and urban planning.

These aspects allow to consider the change that the SW generates with a logic of combination between the hard aspects of an organization and the soft ones, including the new innovative digital skills, IOT and the so-called soft skills.

The overall results of the survey are intended to describe a dynamic process that begins to rethink even the procedures and tools of organizational action, within which the relationship with employees is increasingly placed at the center of the design.

The increase in the quantity and quality of time due to the lack of home-work journeys puts people in a position to experiment with new daily forms of re-synchronization of work commitments with family and personal needs.

**Keywords** –Smart Working, Covid19; Organization, Healthcare

**Paper type** – Practical Paper

## 1 Purpose of the research

Recent socioeconomic and technological changes in business environments have enabled new ways of working based on flexible ways of working and extensive use of information technologies that support employees to work potentially at any time and space (Lee et al., 2021). Added to this is the global health emergency that is paralyzing most work activities, with dramatic impacts on work and employment (Lee et al, 2020; Diab-Bahaman & Al-Enzia, 2020) globally. Such approaches are generally referred to as "smart working" practices (Andy et al, 2020; Eberhard et al, 2017).

The SW model emerged in Italy during 2014-2015 and finds new vigor , shaping a new philosophy of work. SW has been defined as an agile and dynamic way of working that leads to high performance, higher productivity and better job satisfaction (Nicholls et al 2020; Ingusci et al. 2020). Job satisfaction is one of the most commonly reported outcomes of the SW, but doubts remain regarding the benefits and disadvantages of working remotely versus working in a collocated environment (Fedorova et al, 2020).

Our argument aligns with the existing literature on the consequences of SW, which identifies several mechanisms by which SW affects individual outcomes, including job satisfaction. In particular, it is possible to conceptualize the mechanisms / variables discussed in the literature on SW according to three conceptual blocks:

- the individual and psychological aspects associated with the adoption of the SW;

- the work environment created;
- used for the SW (Li et al , 2021).

We rely on this framework to define the SW on the basis of a series of variables that have as their background the relationship SW-job satisfaction to define a "relatively" new construct: smart working satisfaction (SWS).

Organizations have the opportunity to leverage SW to build true working ecosystems (Rasheed et al, 2021). The word ecosystem describes an open, interconnected and dynamic context, the opposite of most office work environments, traditionally characterized by closure, separation and stillness (Tonis et al, 2021). It is a question of breaking down the barriers that exist today on several levels and crossing borders to acquire freedom of movement and action, that is, being called to conquer a new working space that evokes the characteristics of openness, interconnection and dynamism typical of an ecosystem. Agile work changes the entire organizational system by taking inspiration from these very aspects, and without organizations committed to transparency, trust-oriented leaders and fully accountable employees, this change cannot even begin. For this reason, working in an agile way presupposes a very mature approach to work, eliminating the habits and comfort zones linked to the static nature of work (Tonis et al, 2021).

This contribution proposes is to analyze how this new approach to work can also be applied to Health Organization (HO). The SW can represent an opportunity for the HO in terms of rationalization of public resources, it can promote the use of the most innovative digital technologies representing a level for digital transformation and the development of digital knowledge, it can also reduce forms of "physiological absenteeism. "(Tripi & Mattei, 2020). It also represents a lever for change for organizations and their workers because it allows them to go beyond compliance, favoring collaboration, planning, management and results (Xiao et al, 2021).

Health emergencies and the need to manage territorial routines have led to the indiscriminate use of digital technology, generating new and increasingly smart forms of communication (Cheng et al., 2020). By applying our framework to public sector organizations in general, our research questions can be further specified:

*(RQ1) Can implementing SW in complex systems such as Ho create innovation ecosystems?*

*(RQ2) Do the workers in these sectors identify SW as a new organizational approach or just an alternative way to manage the emergency of the COVID period?*

*(RQ3) Does the SW experience in pandemic conditions open horizons for future applicability?*

From these considerations it emerges that the objective of the research becomes to investigate the variables that underlie the SW as an organizational approach and how to measure worker satisfaction.

## **2 Theoretical framework**

Several models have been structured during the years to better approach SW application, implementing adequate standards to gain benefits from this non-traditional working-model (Kaback, 2021). The concept of SW finds its origin in the literature stream studying the application of non-traditional and flexible work practices and locations for carrying out work (Fedorova et al, 2020). Authors assert that organizations strive to provide flexible work arrangements and more cost efficient and creative office environments in order to support competitiveness and employee productivity without decreasing job satisfaction (Devotto et al, 2019).

Academically, it is recognized that through the application of SW it would be possible to optimize engagement, motivation, satisfaction, and even perceived well-being at work (Angelici & Profeta, 2020). These effects would be possible if satisfaction levels matched professional and private aspects. In particular, job satisfaction is one of the most outcomes of smart working (Fedorova et al, 2020). The implementation of SW provides a number of benefits for the worker and for the organization to which it belongs ranging from productive enhancement, to the achievement of a high level of well- being (Health), to a more sustainable vision of their work (Green) finally, to an enhancement of social aspects(social) (Nicholls, 2020). For these reasons, SW is defined as an organizational approach (Spicer, 2020).

This might also be perceived by employees as reflecting or allowing a greater fit between themselves and their job, which is an aspect of positive work role adjustment (Seepana, 2021; Weintraub et al., 2021). Altogether, these benefits of SW lead us to assume that Smart –Working Satisfaction (SWS) could be shaped as the ability to feel positive emotions in regard the job performed under the SW

application (Lee et al. 2021): a combination of psychological, physiological and environmental circumstances referred to the attitude and feelings people have to be satisfied of the SW adoption. Our framework – according to some previous studies (Fedorova et al, 2021; Lee et al, 2021) investigated the consequences of SW – tries to identifies the factors through which SW affects individual outcomes, especially job satisfaction. These factors in our conceptual model represent three conceptual themes/blocks within the SW literature:

1. the individual and the psychological aspects (micro level)
2. the social/relational dimensions (meso level)
3. the resources and the tools available for SW (organization/context) (see Table 1).

Tests on several models conducted in previous research (Nicholls et al, 2021; Rainero & Modarelli, 2021.) indicated that the factors influencing the SWS largely represent benefits rather than disadvantages of smart working. We build upon this literature (Lee et al. 2021; Rainero & Modarelli, 2021) by proposing factors and dimensions for each level of analysis to better explain the construct of SWS.

Table 1 – Variable of the three level

<b>Level</b>	<b>Definition of the level</b>	<b>Variables</b>
	It is referred to the individual and psychological aspects associated with the SW adoption	Job autonomy Work-life balance Work <b>motivation</b>
<b>Meso</b>	It is referred to the relationship and the social dynamics involved in SW adoption	Relationship with colleagues Communication Emotions Stress
<b>Macro</b>	It is referred to the resources, the tools and more in general the work environment created and used for SW	Work hour flexibility ICT Performance/productivity Career opportunities

These variables arising from the 3 levels through a structural analysis will be combined to understand how they interact but also what impact they have on the worker in SW.

### **3 Research methods**

The objective of the research becomes to investigate the satisfaction that an innovative model of SW can generate, analyzing what may be its predictors and - in particular - if it is possible to define a model in relation to the weight of these aspects in determining a successful experience of SW in HO. In order to answer the question of search with a level of detail and sufficient reliability it has been necessary to involve a greater number of respondents, in order to verify if the model can express one its stability also with particular target like the healthcare sector.

The sample, therefore, is of 1252 people belonging to the health sector. Of these, they have been held valid for the successive analyses only the subjects that have answered to have carried out activity of SW. Ninety cases were excluded.

As a result, there were 1162 participants, of whom 41.8% were men and the remaining 58.2% were women. The age of respondents ranged from 22 to 65 years, with a mean age of 43 years and 5 months.

Data were collected through a CAWI survey conducted in 2020-2021. With specific reference to the educational qualifications of the participants, 0.6% have a junior high school diploma, 1.6% a vocational school diploma, 22.2% a high school diploma, 48.0% a bachelor's degree and 27.6% a post-graduate master's degree or doctorate.

The geographic distribution is represented: 26.96% from the Northwest regions, 3.62% from the Northeast, 51.59% from the Center, and 17.83% from the South and Islands. 75% of the sample performs a clerical role and, in particular, 45.4% define themselves as conceptual employees, 29.6% as executive, official or managerial employees, 8.5% as freelance professionals, 8.1% as executives and 3.8% as entrepreneurs.

The remaining 4.7% of respondents indicated something else.

With respect to company size, 7.1% of respondents work in companies as less than 5 employees, 4.1% between 5 and 10, 14.6% between 10 and 50 employees, 11.7%

between 50 and 150 employees, 22.8% between 150 and 1,000, 17.0% between 1,000 and

10,000, and 22.7% in companies with over 10,000 employees.

3.5% of respondents indicated that they performed less than 20% of their time in SW, 10.6% between 20% and 50%, 18.1% between 50% and 80%, and 67.8% over 80%.

The survey returned significant data in terms of job satisfaction, as information was provided by participants expressing their perceptions, attitudes and levels of both physical and mental health in using smart working as a new organizational approach in the company.

The questionnaire design included an introductory section with data useful for reclassification.

The study represents a pilot survey to be replicated later in an absolute fashion in the health care sector.

To measure the items, we used the five-point multi-item Likert scale (Krosnick et al 1997). Specifically, the items identify latent variables. A latent variable is a hypothetical or unobservable concept that we measure using a set of observable variables.

The selected measurement items were validated by the literature and previous empirical studies, and slightly adapted to make them more applicable to the context of our study.

Subsequently, the exploratory data analysis was extended by introducing more sophisticated techniques, such as structural equation modeling, to gain a more detailed understanding of the issue being analyzed.

Structural equation modeling (SEM) is a technique that combines factor analysis and regression. In this context, we use partial least squares structural equation modeling (PLS-SEM; Hair et al. 2019), which is variance-based, to test the conceptual model. This decision is supported because PLS has been shown to be effective when research is primarily exploratory and predictive (Nelson et al., 2016; Ringle, Wende, & Becker, 2014; Hair et al., 2019).

Finally, they were asked to indicate whether - prior to this experience - SW experiences existed at their company and whether they had participated in them.

24.0% indicated that they had done so, but in an incidental and non-formal way, 35.8% in a formalized way, and 40.2% had not participated in SW experiences.

The subsequent application of linear regression formalises and solves the problem of functional relationships between variables measured on the basis of extracted sample data

Table 2 Presence of formalized or non-formalized SW actions prior to Covid-19

	N	%
Before Covid-19, had you already had experience with smart working?	279	24,0%
Yes, but incidental and not formalized	416	35,8%
Yes, formalized	467	40,2%
No		

The model that was developed aims to investigate the links and their relative strength between latent constructs that determine Smart Working Satisfaction (henceforth SWS for short) and SWS for the worker. The structural model allows a target latent variable (SWS) to be determined by defining the impact of other major constructs (the determinants of SWS).

The determinants constructed by the literature review are as follows: 1. Job autonomy;

2. WLB;
3. Work motivation;
4. Relationship with colleagues;
5. Communication;
6. Productivity/Performance
7. Emotions;
- 8.. ICT;
9. Career opportunities;
10. Work hour flexibility

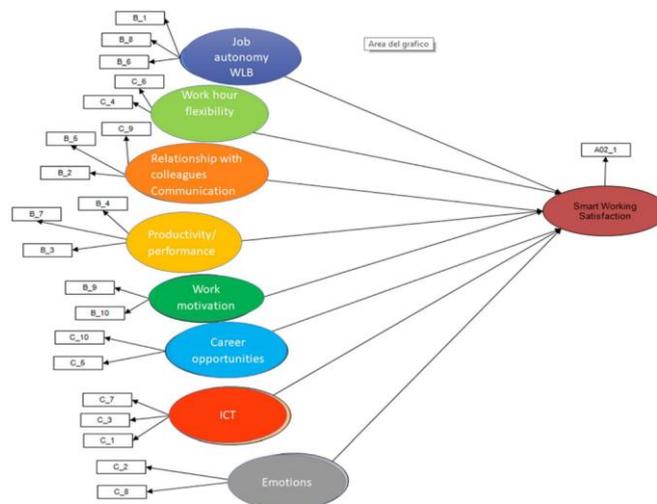

Figure 1 The hypothesized Model for the SWS

In the hypothesized model, the SWS is the variable objective while, the other variables are considered the determinants of the SWS

Based on this model, the following assumptions can be made:

*H0 = No relationship between the latent dimensions and the SWS;*

*H1= Presence of one meaningful relation between the dimensions of the model and the SWS*

In operational terms, the two hypotheses can be considered verified if an R2 greater than 0.40 is achieved, the hypothesis will be rejected with an R2 less than or equal to 0.40.

#### 4 Results

Therefore to assess the degree of influence of the variables on the SWS, a linear regression analysis was performed. The SWS was used as the dependent variable and the questionnaire items as the independent variables. The high level of collinearity between variables was analyzed using SEM to assess causal relationships between latent concepts (VL) from a set of real indicators defined as Manifest Variables (VM). After the analysis of the determinant indicators of SWS, the 8 determinants of SWS were identified i.e. 8 latent variables that the literature has validated, each reflected in a number of indicators between 2 and 3 (derived from the questionnaire questions and detected through the field survey).

Table 3 Association between manifest and latent variables

<b>Variabili latenti</b>	<b>Variabili manifeste</b>
Personal freedom and balancing with private life	Smart working makes me live more freely
	Thanks to smart working I can manage my work commitments with more freedom
	Smart working has improved my work-life balance
Managing emergencies and schedules	With smart working, urgent requests from my bosses and colleagues have not increased
	During smart working I am not often contacted outside working hours
Relations and communication with colleagues and the company	Smart working allows me to have a better relationship with my colleagues
	With smart working I have perceived greater trust in me on the part of my colleagues and the company
	Smart working does not make communication with colleagues very difficult

Goals and job performance	Smart working enables me to better achieve my professional goals
	My work efficiency is increased thanks to smart working
	My work performance has improved thanks to smart working
Motivation and job satisfaction	Smart working has increased my work motivation
	My job satisfaction has increased thanks to smart working
IT tools and spaces for managing smart working	I have adequate tools to be able to work in smart working mode (e.g. computer, software, adequate screen, headset, microphone, adequate Internet connection)
	I have adequate space in my home to be able to work in smart-working mode
	I am able to use digital tools for smart-working (e.g. video call and document sharing)
Emotional consequences of smart working	Smart working does not increase my sense of loneliness much
	Smart working, for various reasons, does not increase my stress
Influence on career and leader evaluation in the company	My bosses and superiors have a positive opinion of people who want to work in smart working
	Smart working cannot penalise the career of those who choose it as a way of working

Responses were recoded, classifying them by response type.

Table 4 Synthesis and classification of the answers to the open question

	<b>N</b>	<b>%</b>
<i>Communication/Relationships/Colleagues</i>	96	37,9%
<i>Working hours/Right of disconnection</i>	38	15,0%
<i>Loneliness/Allienation/Exclusion</i>	35	13,8%
<i>Inadequate setting/home</i>	35	13,8%
<i>Increased workload and working hours</i>	34	13,4%
<i>Productivity/organisation/modality</i>	33	13,0%
<i>Work-life balance</i>	28	11,1%
<i>Inadequate work tools</i>	27	10,7%
<i>Presence of children at home to look after</i>	22	8,7%
<i>Quality of connection</i>	15	5,9%

37.9% indicated the category related to Communication and/or Relationship with colleagues. 15.0% identified issues related to missed work hours and lack of right to disconnect.

13.8% identified the issue of loneliness, alienation and marginalization. Similarly, 13.8% complain about the inadequacy of their SW setting at home. 13.4% link their dissatisfaction to their increased workload and extended work

hours. 13.0% report having reduced productivity, or organizational or mode-related problems.

For 11.1%, dissatisfaction is related to a lack of work-life balance. For 10.7% the work tools are inadequate (and for 5.9% the problem is linked to the quality of the connection), while for 8.7% of respondents dissatisfaction is linked to having to look after young children at home.

#### 4.1 Linear regression analysis

The items of the questionnaire present strong internal correlations, which explains the contribution of each dimension in analyzing the variability of scores related to the level of satisfaction with SW. For this reason, a multiple regression was performed. The regression was found to be significant ( $F(20,1127)= 72.97$ ;  $p<0.01$ ), with an adjusted R2 value of .557.

Table 5 R values of the regression model

Modello	R	R-quadrato	Adapted R-square	Estimation std. error
1	,751 <sup>a</sup>	,564	,557	,594

From the analysis, 10 items emerge as predictors of satisfaction. Of which 8 are positive and 2 are negative.

These are positive predictors of satisfactory SW (the Standardized Beta coefficient):

Smart working makes me feel more free/ WLB (0.138), Smart working has improved my work-life balance (0.104) o WLB, I have adequate space in my home to be able to work in smart working (0.084) o Work hour flexibility.

My work effectiveness increases due to smart working (0.123) o Productivity/performance, I have the appropriate tools to be able to work in smart working mode (0.075) o ICT, My work performance is improved due to smart working (0.113) o o Productivity/performance, Smart working allows me to better achieve my professional goals (0.082) e I am able to use digital tools for smart-working (0.042) o ICT.

These are negative predictors: During smart working, for various reasons, my stress increases (-0.069) o Emotions and Smart working makes it very difficult to

communicate with colleagues (-0.135) o Relationship with colleagues Communication.

Table 6 Correlation matrix between manifest variables and latent variables

The table shows the highest correlations between each manifest variable and the different latent variables, echoing the structure of the model represented in Figure 1. The clear block structure highlights the monofactorial nature of each manifest variable that is more strongly correlated with the concept it is intended to measure than the others however present in the model.

To answer the research question we found it useful to preliminarily investigate the dimensions that influence satisfaction with the Smart Worker.

The value of the linear determination index R2 can be interpreted as the percentage of variability of the respective latent variable explained by the model, i.e. the goodness of the model in predicting the scores of the latent variable. An R2 value greater than

0.40 confirms the first hypothesis tested through the model i.e., the ability of the determinant latent variables to explain satisfaction from a SW experience.

The R2 relative to the model is 0.54, a satisfactory value and above the threshold limit (see Hair, et al 2019).

With reference to the specific objective of the research, related to the possibility of empirically verifying the goodness of a model that linked the items found in the literature to satisfaction with SW, the analysis of the data confirms hypothesis H1, that is, the presence of a significant relationship between the dimensions of the hypothesized model and SWS.

We can therefore reject hypothesis H0, i.e., no relationship between the latent dimensions and SWS.

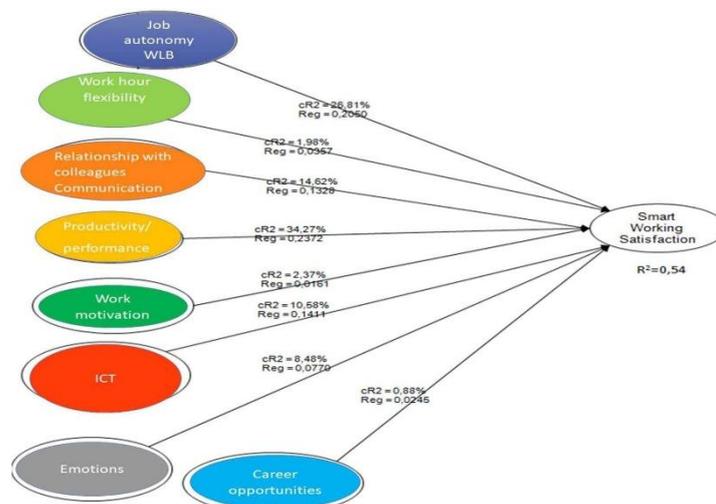

Figure 2. Model of overall SWS

As highlighted in Figure 2 all variables in the model contribute to determining SWS. The two most important factors that emerge are the achievement

Productivity/Performance (reg=0,2372), in the second place Work autonomy, WLB (reg=0,2050), in the third place ICT to manage the SW (reg=0,1411) and finally among those significant the Relationship with colleagues Communication (reg=0,1328). The other variables, while having a positive value, express a less significant contribution in the constitution of the SWS score. As is evident from the calculation of the scores, an increase of 5 points in the total value of the "Productivity/performance" scale produces an increase of 1.18 points in the SWS and an increase of 5 points on Personal freedom and balance with private life of 1.02 points. The other dimensions, with the same increase, produce an increase in SWS of less than unity.

From the analysis of the average scores and the variability of the latent variables reported in Table 6, it can be seen that overall the SWS reaches a fairly high score of 76.4 expressed on the 0-100 scale and that therefore the smart worker considers himself satisfied and the choice of continuing to work from home even in a non- emergency situation particularly attracts him, as long as other determinants such as mental well-being (health dimension) and the sense of community involvement (social dimension) are satisfied in addition to family balance.

Table 7. Mean scores and variability of latent variables in the SWS model

<b>Items</b>	<b>Average</b>	<b>Deviazion std.</b>
Job Autonomy - WLB	73,5527	25,9854
Work hour flexibility	46,8108	29,0580
Relationship with colleagues Communication	52,8494	22,9556
Productivity/performance	62,7659	26,9994
Emotions	58,5649	28,8958
ICT	74,0576	22,9553
Work motivation	59,0561	28,0912
Career opportunities	56,7439	28,1696
Smart Working Satisfaction	76,4415	22,3551

As far as the latent variables determining the SWS are concerned, the highest scores expressed by the SW workers interviewed concerned the availability of ICT to manage the SW (74.05), WLB thanks to the SW (73.55) and Productivity/Performance (62.7).

Less positive was the evaluation of Work Hour Flexibility, with workers complaining of an increase in urgent tasks and calls outside normal working hours, together with Relationships with colleagues Communication in SW, which do not completely satisfy the SW workers interviewed and therefore do not represent attractive factors.

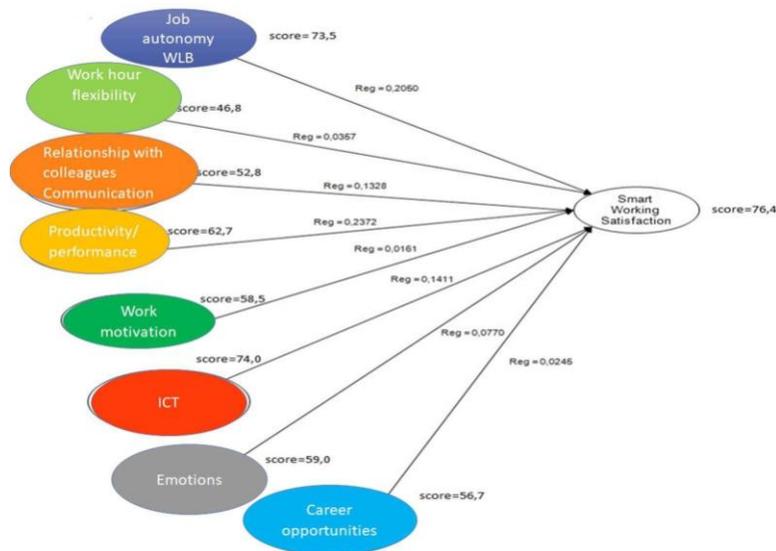

Figure 3 Latent variable scores in the SWS model.

The Smart Working Satisfaction score can be calculated as a weighted sum of the scores of the latent variables that determine it. The PLS algorithm calculates these values, which correspond to the impact coefficients.

Smart working Satisfaction =  $0.94 + 0.20 \cdot \text{Job autonomy, WLB} + 0.03 \cdot \text{Work time flexibility} + 0.13 \cdot \text{Relationship with colleagues communication} + 0.23 \cdot \text{Productivity/Performance} + 0.01 \cdot \text{Work motivation} + 0.14 \cdot \text{ICT} + 0.07 \cdot \text{Emotions} + 0.02 \cdot \text{Career possibility}$ .

An increase in a latent variable that determines SWS corresponds to a total increase in SWS. Figure 3 calculates all potential increases in SWS as the other determining variable changes by 5 points.

It is important not to underestimate that in addition to checking which latent variables have the greatest impact on SWS and which indicators weigh most heavily in the construction of these concepts, it is also necessary to take into

account the average scores calculated for the latent variables and the average scores observed for the items.

Only the joint reading of these two pieces of information (impacts and performance) makes it possible to identify the so-called levers for improvement, since they suggest on which critical areas to intervene, with what urgency and by means of which actions. Basically, if companies or public decision-makers wanted to implement worker satisfaction in SW, they could make use of an intervention matrix (figure 3) that represents the synthesis of this information as well as, a simple and valid tool to support the diagnosis and identification of corrective and improvement actions.

## **5 Discussion and conclusion**

The recent health emergency together with the information that emerged from this research, certainly represent a valid opportunity to question the criticalities that for years have slowed the adoption of SW in various work environments both public and private (Rainero & Modarelli, 2020).

Starting from the research questions (see Par.1) and in line with the objective (see Par.1), this research, despite its incompleteness, highlights a new operational logic of smart working, to be considered not as a strategic tool that organizations put in place with a few simple technological devices, but as a real organizational revolution (Xiao, et al., 2021).

The analysis presented contributes to extending the literature on SW in several ways: first, with the help of the structural equation model that allowed us to test the validity of the research hypotheses. It emerges that the H0 hypothesis is not confirmed, as it has been shown that there is a strong correlation between the identified latent variables and SW satisfaction. This result attributes meaning and value to the work performed and their ability to experiment with new ways of performing tasks and duties through determination and flexibility (Xiao, et al., 2021).

When a worker feels engaged and attaches value to their task, they will be more likely to create a satisfying and challenging environment (Hodder, 2020; Diab-Bahaman & Al-Enzia, 2020). This proactive behavior acts as a protective factor from the onset of burnout and emotional exhaustion (Brooks, Webstar, Smith, et al. 2020).

The research, therefore, highlighting the existence of positive relationships between the 8 variables that the literature has given us, also confirms the H1 hypothesis and enriches the value of the SW by extending its scope to economic and social scenarios of crisis and emergency management.

The survey, if on the one hand confirms the robustness of the epistemological choice made and the fundamental role of SWS, on the other hand adds a piece to the literature on the subject, since it underlines how worker satisfaction represents a positive catalyst for productivity (Seepana, Huq, and Paulraj, 2021). W becomes a true organizational approach characterized by a combination of different dimensions, useful to meet the needs of workers, allowing them to more easily reconcile work time with personal needs and flexibility, achieving benefits in terms of individual and organizational performance as well as well-being and health (Spicer, 2020).

Taking up the classification that the literature review has allowed to formalize emerges from the empirical analysis, an enrichment or rather a reinterpretation of the same variables by adding the dimension of reference.

The pandemic has generated many psychosocial consequences, hitherto underestimated, to which aspects related to isolation and bad relationships have been added, highlighting the importance of the social and health dimension of the SW (Tripi & Mattei, 2020). These dimensions cross all levels of the organization (micro, meso, macro) and, by latching on to latent variables, impact SWS (AlQershia, 2021).

The least satisfied are the workers who have had a previous experience but occasional and little formalized.

In the scenario of isolation and agile work imposed by the health emergency, the SWS can take on the role of a catalyst for the creation of a new model of work and protection from work sickness, considering both its impact on decreasing emotional exhaustion and its role as a mediator between the meaning of work and motivation to work (Seepana, Huq, and Paulraj, 2021).

In fact, it is noteworthy that the direct relationships between the individual variables are insignificant, while with the mediation of the SWS, they assume significance. This result is beyond interesting as the mediating function of the SWS has only recently been explored and highlights its role in enhancing the relationship between job meaning and motivation (Devotto, Wechsler, 2019). Furthermore, the finding is in line with studies suggesting the role of SWS as a

key element in decoding resources into elements of well-being (Seepana, Huq, and Paulraj, 2021).

Reduced social relationships (including those established in the workplace) are known to be risk factors for the onset of conditions such as depression and burnout (Kasbuntoro, Maemunah, Mahfud, 2020).

Smart Working radically changes the organizational structure of the company, corporate culture, leadership systems, employee relations, the use of digital technologies, communication and the corporate workplace (Passmore, Hemming, McIntosh, Hellman, 2020). This innovative ecosystem has the potential to generate a variety of benefits for workers, the company, the environment, and society.

Smart workers are more satisfied with their work than traditional workers not only that, also supported by research data, agile workers are more satisfied with their relationships with colleagues and superiors, and want to stay in the company longer (Fedorova, Koropets, Menshikova, 2020).

Through the practice of Agile Work it is therefore possible to generate benefits that significantly improve the psycho-physical balance of the worker with important repercussions in both private and working life (Dousin, Collins, Bartram, Stanton, 2020).

The survey has returned an important aspect of Smart Working: a high level of worker satisfaction.

The research presented here, in addition to relevant theoretical developments, can provide important operational implications for organizations. The support to the worker through improvement actions to ensure levels of well-being and contain work-related stress, is an important contribution to the testing of positive experiences and improvement in terms of quality of working life.

## **6 Limitations and implementation**

The study, while original, has some limitations. Limitations include the use of an online, self-report instrument, which exposes the risk of social desirability in responses. In addition, the assessment of some items, such as emotionality, reflects an individual's own perception and is not subject to objective evaluation.

The measurements described through latent variables, and specifically emotional exhaustion and meaning of work, although reflecting extremely broad and complex concepts, were captured with few items. Further studies could use

more comprehensive tools, methods, and methods suitable for capturing more specificity of these latent constructs. Another aspect to be taken into account concerns the heterogeneity of the sample involved especially in those characteristics for which there does not appear to be a balance so future studies could try to balance any disaggregation variables. Measuring satisfaction with the SW exclusively with one item and not with a multidimensional measurement scale, for example based on the basic components of attitude would have allowed a more precise measurement of the phenomenon and - certainly - helped to explain a greater share of the variance.

The main limitation of the research is the lack of a representative sample. Participants however numerous, were identified through convenience sampling, which does not guarantee solid representativeness and generalizability of the data. The measurement of satisfaction with SW exclusively with an item and not with a multidimensional measurement scale, for example based on the basic components of attitude (emotion, cognition ...) would have allowed a more accurate measurement of the phenomenon and - certainly - helped to explain a greater share of the variance.

The research was carried out in a particular historical period, characterized by exceptional conditions. In particular, this aspect could have influenced the respondents who judged the experience in "exceptional" terms and not in stable and structural terms; this poses a major limitation on the possibility of generalizing the results even over different historical periods.

From the point of view of application, the research raises many points of interest that will be the subject of further study in subsequent research.

First of all, in relation to the values of some dimensions, such as the right to disconnect, it would seem to emerge strongly a focus of people on other dimensions of growth and development of the tool.

In addition, the time horizon of the research concerns the first period of total Italian lockdown, an interval in which the exceptionality of the situation forced many workers to confront new circumstances. A different time frame might lead to different conclusions. Finally, although the Structural Equation Model considers the presence of numerous psycho-social factors that can influence the expression of personal resources, work resources and work demands, the specific objective of the study in question is to explore, taking as a theoretical frame of reference and as a reading of the professional contexts, the SEM model (MES, Structural Equation Model) to investigate the relationship between the 8 variables and the

relative strength of the latter among latent constructs that determine the Satisfaction from Smart Working and the SWS for the worker.

A first aspect concerns the possibility of implementing a longitudinal research design in the continuation of the study, so as to consider individual and organizational variables and their sustainability over time, with a focus on workers' adaptive capacities in relation to economic-social changes (Ingusci et al, 2019; Van Wingerden J, Poell RF. 2019). It would be useful to replicate the study, overcoming the limitations outlined above, on a larger sample characterized by a random extraction of respondents and also including segments of the population at risk of exclusion (due to the methodology adopted).

In addition, the research could be developed through the realization of qualitative interviews with the central or prototypical subjects of the clusters identified in order to analyze - through more exquisitely qualitative methods - any additional variables not sufficiently analyzed by the current research model and structure.

Also among future developments, a perspective of regard could be referred to the testing of interventions for the promotion of SWS in organizations, not only as activities to support well-being in ordinary times, but as actions of stress prevention and management of risks and emergencies (Fedorova, Koropets, Menshikova, 2020).

### **Abstract**

This paper proposes a method for recognising the elements of cultural interest located in inland areas and disseminating the information by a tool based on the data collection and organisation methods. This is done through the use of GIS (Geographic Information System), which makes it possible to map, manage and analyse a whole series of information, guaranteeing better knowledge and communication, as well as better management of decision-making processes. The application to the case study concerned the Province of Avellino as a pilot area, but it should be noted that the validity of the proposed methodology lies in the possibility of replication to any other context. The versatility of this tool can provide useful guidelines to those who wish to know,

communicate or intervene on the surveyed buildings/assets, which from time to time will become available through the databases implementation.

**Keywords** – G.I.S, S.D.S.S., inland areas, valorisation of cultural heritage, small towns

**Paper type** – Academic Research Paper

## **1 Introduction**

The depopulation of small towns in inland areas has reached significant dimensions, especially in recent decades, with a strong impact on demographic, social and economic balances and, consequently, on the preservation and protection of a vast cultural, natural and landscape heritage of the territories. The interest in the wide-ranging cultural heritage, both tangible and intangible, is countered by the logic of globalization, homogenization and, above all, the drive of economic interests, which increasingly endanger factors related to memory and identity. Therefore, it is essential that the enhancement strategies take on the purposes of "knowing, preserving and valuing" the existing cultural heritage, according to what has been defined-along with "social," "environmental," and "economic" value-the fourth principle of sustainability, namely the "cultural" one (as highlighted by Rio+20 and by the United Nations Habitat World Urban Forum in Naples in 2012 and in Medellin in 2014).

The proposal of this paper is aimed at the re(knowledge) of such artifacts and the easy dissemination of information, through a tool based on the rational ways of collecting and organizing a large amount of data, made possible through the use of GIS.

The Geographic Information System makes it possible to map, manage and analyze a whole range of data, integrating them with all kinds of descriptive information. The advantage is certainly better knowledge and communication, as well as better management of decision-making processes.

Experimentation on a case study was useful in identifying the effectiveness of the proposed tool and offered a starting point for possible linkage with other projects already in place in order to create a shared system of quick reference information.

## **2 Materials and Methods**

### **2.1 Spatial Decision Support System**

The The concept of Decision Support System embraces a plurality of meanings (Sharda et al., 2015). A DSS involves three basic components (Andrew, 1991).

The *Database Management Subsystem* - which includes a database that contains relevant data for the class of problems for which the DSS was designed - and the Database Management System (DBMS), which is the software that manages the database.

The DBMS separates users from the physical aspects of database structure and processing. It should also be able to inform the user about the types of data available and how to access them.

The *Model Management Subsystem* - This subsystem includes a library of models (Model Base) related to science, statistics, management, and other models that provide the DSS with analytical capabilities.

The *User Interface Subsystem* - This subsystem covers all aspects of communication between the user and the different components of the DSS. Since such users are often managers who have no computer training, DSS must have intuitive and easy-to-use interfaces.

These interfaces help in building the model and interacting with the model, obtaining detailed information and recommendations from it. The purpose of a user interface is to improve the system user's ability to use and benefit from the DSS.

### **2.2 Methodology**

The methodology is divided into two macro-phases.

The first macro-phase involves the following steps:

- a) Choosing the survey area;
- b) Subdivision into travel axes within the chosen area;
- c) Choice of the model axis;
- d) Identification of municipalities along the chosen axis;
- e) Focus on one of the historic towns along the axis, as an example.

The second macro-phase is structured as follows:

- f) Identification of buildings of historical-architectural interest (palaces, churches, convents, etc.), rural architecture (farms, mills, votive shrines, etc.) and cultural areas (archaeological areas, historic gardens, parks, etc.) present within the reference municipality;
- g) Inclusion of the surveyed data, by means of Q-GIS software, within routes differentiated by thematic areas;
- h) Exposure of a package of information useful for place knowledge (the actual data base of geo-referenced information).

The implementation of these steps involves the use of data integration techniques based on I datacubes (or data cubes). The latter are a type of structure, in which data are stored in multidimensional arrays (nD arrays); the data contain one or more spatial or temporal dimensions. Datacubes provide an effective way to apply analysis on spatiotemporal data, where the data incorporate both raster and vector data along with potentially other information.

### **3 Application**

The work was approached by taking the province of Avellino as the reference hub, but it is worth pointing out that the validity of the proposed method lies in the possibility of application to any other context, supplementing the amount of data gradually.

The experimentation covered a test area in the Province of Avellino. More specifically, axes of interest were chosen in light of the ancient main arteries connecting the city of Avellino and the surrounding area, and thus referring mainly to provincial and state roads.

These in fact, although partly replaced by the construction of road infrastructure that can guarantee a certainly faster and more efficient mobility, represent the connecting routes that allow a wider and deeper knowledge of the crossed territory.

With the help of the Google Earth Pro program, a complete overview of all identified axes was made:

- Axis A1) Avellino-Salerno
- Axis A2) Avellino-Teora
- Axis A3) Avellino-Rocchetta Sant'Antonio
- Axis A4) Avellino-Venticano
- Axle A5) Avellino-Benevento

- Axle A6) Avellino-Nola

Each axis was symbolically represented with a line joining the starting point and the end point, as shown in Figure 1.

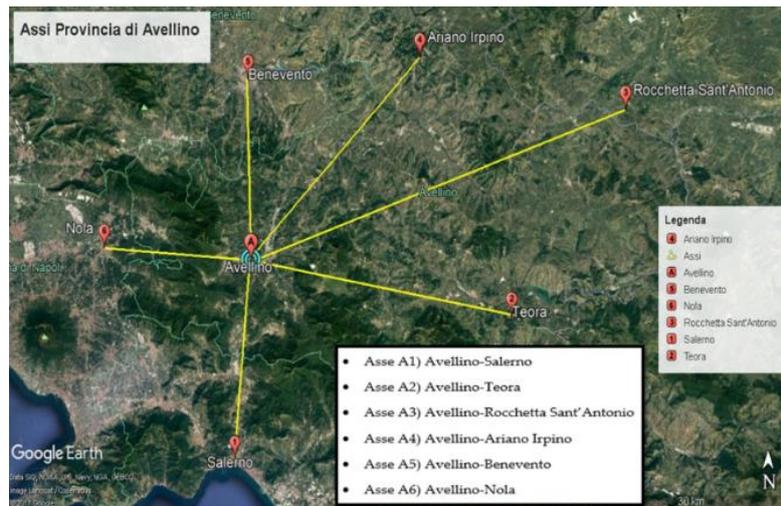

Fig. 1 - Selected travel axes in the analyzed area (Avellino province)

### 3.1 Description of the selected axes

#### Avellino - Salerno axis

By the Avellino-Salerno axis, we refer to the road that connected the Principato Citra, or Principato citeriore, (today's province of Salerno) and the Principato ultra or Principato ulteriore (today's province of Avellino), known as State Road 88 of the Two Principalities.

The SR 88 was established, on the route of the Via dei Due Principati, in 1928 with the following itinerary: Salerno - Mercato San Severino - Avellino - Benevento - junction with the No 87 at Ponte Landolfo with a length of 97.375 km.

The original route ran through the Irno river valley and the hills of Irpinia and Sannio, passing various localities including Baronissi, Mercato San Severino, Montoro Inferiore, Bellizzi Irpino, Avellino and finally Benevento and Morcone. Subsequently, the route was divided into several sections, each within the competence of its province:

- The section that crosses the Province of Salerno has been renamed Regional Road 88 and is divided into two sections: the first section, called SR 88/a, starts from the border with the Province of Avellino and ends at the junction with Provincial Road SP 222, i.e. in the hamlet of Monticelli of Mercato San Severino; the second section runs from the junction with Provincial Road SP 222 to the junction with Provincial Road SP 26, i.e. in the municipality of Pellezzano;
- The section in the Province of Avellino is called SP ex SR 88 and includes the municipalities of Atripalda, Cesinali, Aiello del Sabato, Bellizzi Irpino, Contrada, Forino and Montoro.

#### *Avellino - Teora axis*

By Axis Avellino-Potenza we refer to a section of the historic State Road 7 Via Appia, a highway that - following the route of the Roman consular road with the same name - connects Rome to Brindisi.

The section of interest for the research, chosen as the reference axis, originates from the Pianodardine junction passing through the municipal territories of Manocalzati, San Potito Ultra and Parolise. This section is very congested due to commuting from neighbouring municipalities to the provincial capital, in addition to regional and national traffic. At Parolise there is the junction between the old and the new route on a variant and with State Road 400 at Castelvete.

The original section between Parolise and Lioni passed Salza Irpina, overcame the difference in altitude with the hairpin bends of the 'Malopasso' to reach Montemarano, crossed the Calore River at Ponteromito, and continued towards the suburbs of Sant'Angelo dei Lombardi and Lioni. The disused section from Castelfranci to Lioni was included in the itinerary of the State Route 400 of Castelvete in 1990.

The variant built after the earthquake of 23 November 1980 (called Ofantina Bis) brushes farther south against the Montagnone of Nusco and the territories of Cassano Irpino, Montella and Nusco itself, with a less winding route and over viaducts and through tunnels.

The old route takes different local names for short sections (Via Nazionale, Via Appia, district names). The new route is entirely numbered as SS7, as can be seen from the kilometre progressions.

Once past the town of Lioni, the road separates from the motorway and returns to the old route towards Teora and Sant'Andrea di Conza. The state road enters

Basilicata in the municipality of Pescopagano, continuing with a winding route towards Castelgrande, Muro Lucano, Ruoti until the Appia reaches Potenza.

#### *Avellino - Rocchetta Sant'Antonio axis*

By Avellino-Rocchetta Sant'Antonio Axis we are referring to the historic railway line that connects the city of Avellino with most of the towns in the upper Irpinia region until reaching the province of Foggia, precisely Rocchetta Sant'Antonio. The first section of the line is mainly located in Lucania territory, with some encroachment into the province of Avellino as far as Conza. This section includes the stations of Piscuolo, Monteverde, Aquilonia, Monticchio, Rapone - Ruvo - San Fele and Calitri - Pescopagano.

All, unfortunately, distant from their respective towns. Passenger traffic is non-existent with the exception of Calitri. Near the Andretta - Conza station there is a beautiful, wide panorama of the artificial lake built at the end of the 1970s. Just beyond the lake and after passing through the Morra de Santis - Teora station, it is possible to reach Lioni, which is the major intermediate hub of the line and whose station is slightly different from the others, despite being the result of post-earthquake reconstruction.

The section from Lioni to Avellino is the most popular, also because the attraction of the Irpinian capital is felt more strongly. The population density of the crossed territory is certainly higher than that of the Rocchetta - Lioni section. Near Nusco, the Adriatic-Tyrrhenian watershed is crossed: in fact, the Ofanto valley is left behind before entering the Calore valley. The route of the line between Nusco and Avellino is 55 km compared to 24 km as the crow flies: in fact, the line makes a very wide loop to cross the Picentini mountains.

In this section there is the Bagnoli Irpino station, which is not far from the mountain resort of Laceno and the lake with the same name. It continues on, passing through the towns of Montella, Cassano Irpino, Montemarano, Castelfranci and Luogosano before arriving in the Irpinian capital, where the line enters next to the one coming from Salerno.

#### *Avellino - Ariano Irpino axis*

By Avellino-Ariano axis we refer to two fundamental connection roads in the Province of Avellino that see Venticano as their respective terminus of departure and arrival. The first is a section of the historic State Road 7 Via Appia that leads from Venticano to the gates of Avellino.

The first municipality reached on Irpinian land is Venticano, where the Appia is the main road in the hamlet of Castel del Lago.

This is also the location of the Benevento junction on the A16 motorway and the start of the Benevento motorway junction 9. Just after Castel del Lago, the road reaches the village of Calore di Venticano, where the State Road 90 of Puglia begins. From here the road changes direction and heads south-west, passing through the towns of Montemiletto and Pratola Serra. Near this last centre, the former State Road 371 of the Valle del Sabato branches off.

After crossing the industrial zone of Pratola Serra, the Appia enters the territory of the Manocalzati municipality. Here is the Avellino Est junction of the A16 motorway and the junction with State Road 7 bis of Terra di Lavoro (which in the Atripalda section is more commonly known as the 'eastern variant'), which leads to Naples and then Capua. The Appia does not enter the municipality of Avellino for a few hundred metres, although it is directly connected to the Pianodardine Industrial Area.

Continuing instead from Venticano, the second section of this axis begins, represented by the State Road 90 of Puglia. This passes through the municipalities of Mirabella Eclano and Grottaminarda before reaching Ariano Irpino. It then continues towards Foggia, passing through the municipalities of Savignano Irpino, Greci and Montaguto, the last municipality in Campania before entering Puglia in the municipality of Panni.

#### *Avellino - Benevento axis*

By Avellino-Benevento axis we again refer to the historic State Road 88 of the Two Principalities, this time considering the section from Avellino to Benevento.

To date, this has been subdivided into various sections of different jurisdiction. Starting from Avellino, it passes through the municipalities of Capriglia Irpina, Grottolella, Altavilla Irpina before arriving in the province of Benevento in the municipality of Ceppaloni.

#### *Avellino - Nola axis*

By the Avellino-Nola axis, we still refer to the historic State Road 7 Via Appia, and in particular to a part of the route that was abandoned in 1935 to become what was later called State Road 7 bis of Terra di Lavoro. In the post-earthquake years, much of the old route was revised, and a long, high-speed variant was built, divided into two sections, Villa Literno-Acerra and Acerra-Nola. The total rejoining

of the two sections gave rise to the Nola-Villa Literno Support Axis, a 45 km long, high-speed main road, which not only connects the municipalities but also makes the connection to the various industrial areas along the axis more usable.

The section of motorway ends shortly after the Nola Interporto, where the State Road SS 7 bis continues on the old route parallel to the A16 motorway, passing through many towns in the Nola area and then joining the lower Irpinia area. This part of the old route is the one we are interested in, which starts from Nola, the last municipality in the Province of Naples, and enters Irpinia in the municipality of Avella, continuing on to Sperone, Baiano, Quadrelle and Mugnano del Cardinale, from where, skirting the Partenio Regional Park, it reaches Monteforte Irpino.

ASSE A1	ASSE A2	ASSE A3	ASSE A4	ASSE A5	ASSE A6
Atripalda	Manocalzati	Salza Irpina	Atripalda	Capriaglia Irpina	Mercogliano
Cesinali	San Potito Ultra	Chiusano	Manocalzati	Grottolella	Monteforte Irpino

			Montaguto		

Fig. 2 - Table-list of municipalities along the selected axes (in yellow the Salerno-Avellino reference axis)

### 3.2 Reference axis, pilot municipality and fractional focus

Once the analysis of the main axes was completed, we moved on to study the reference axis: the Avellino - Salerno axis.

The choice was made on the basis of the territorial location that sees this axis as the link between the inland areas and the sea (Salerno) and also for the greater availability of data and information. However, it must be said that the validity of the proposed method lies in its replicability and extension to any other area.

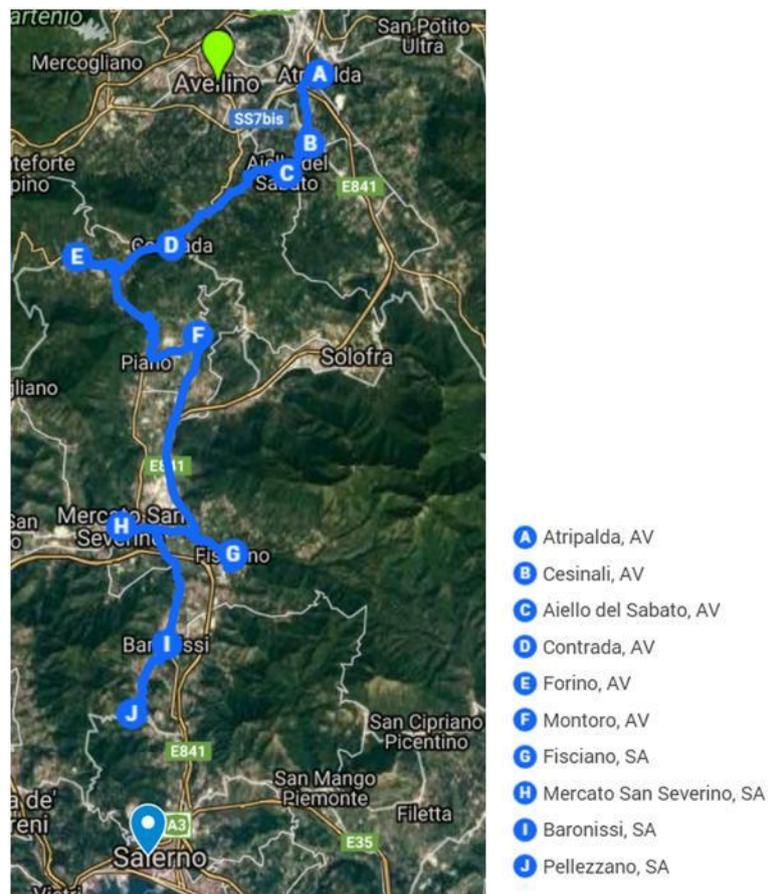

Fig. 3 - Identification of municipalities along the Avellino-Salerno axis

Once the first phase was over, we moved on to the census that involves the identification of all those assets of cultural interest and their subsequent inclusion in the DSS.

This phase, like the previous one, was carried out as an example for only one of the municipalities along the reference axis.

As enhancement in the broadest sense is the primary goal to be pursued, it is therefore first necessary to have a clear overview of the cultural assets available at the chosen site, distinguishing them into the following categories to be searched for in the area of interest, and then to include them in the spatial database:

- Castle, civil buildings of historical interest
- Villa or palace
- Church, abbey, sanctuary and places of worship
- Archaeological area
- Museum
- Rural building
- Historic garden
- Nature park

Various types of itineraries were then defined for up to four different topics, divided into the following routes:

- Historical-cultural route
- Environmental route
- Religious route
- Food and wine route

so as to rationally channel tourist interest towards the individual's subjective preferences.

In doing so, all areas of interest were involved, identifying and enhancing the attraction factors of each individual municipality. The term "attraction factor" is used to identify the reason for movement and thus an element of strategic importance in the analysis of the tourism phenomenon. This strategy must be based on the creation of specialised and distinctive tourism-territorial skills and on the ability to persuasively propose new, sustainable tourism ideas consistent with territorial identity, based on local interest elements.

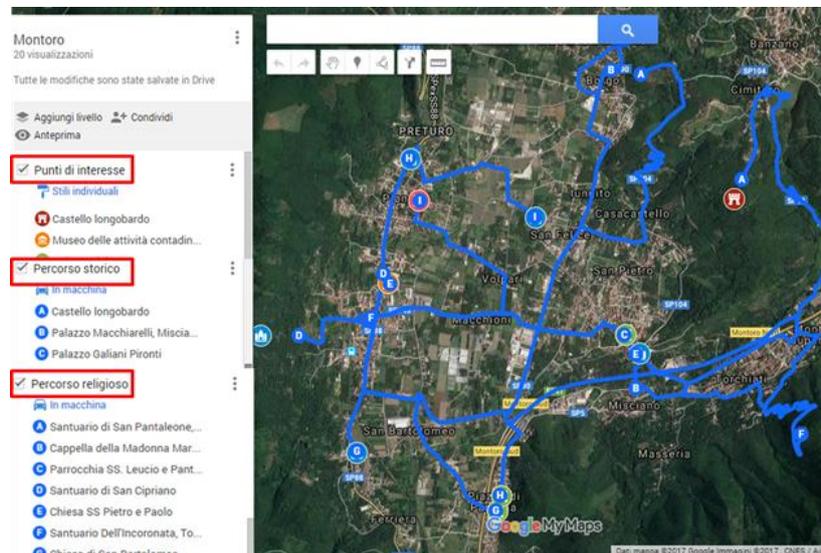

Fig. 4 - Municipality of Montoro. Punctual mapping of thematic routes

The integration of the surveyed information and routes within the tool defines a knowledge vector for those who want to know, communicate or intervene on the surveyed buildings, with the different promotional tools that will be available from time to time.

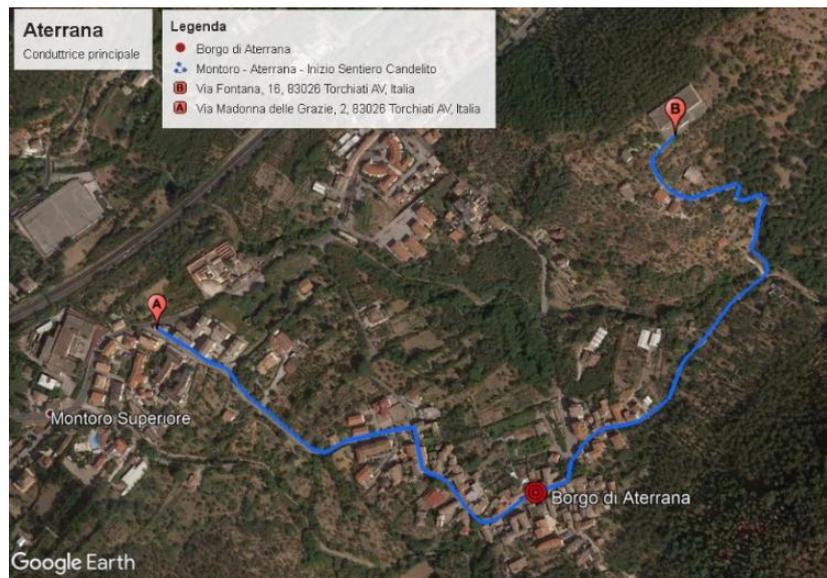

Lastly, the investigation of one of Montoro's villages, called Aterrana - whose typological and positional characteristics make it a real attraction for the entire municipality, as well as for the entire reference axis - was further deepened.

It is an old farming village, with simple architecture, crossed by alleys and narrow stone streets typical of the Middle Ages, ancient portals, courtyards with wells, a few churches such as the one devoted to San Martino with its beautiful baptistery and chapels, and the Angevin-style Montevegine church with a beautiful carved portal and an artistic pronaos.

The almost total immutability over time, made possible by the very few human interventions and the surprising resistance shown during the different telluric phenomena, makes the village of Aterrana a more than significant prototype of a small historic centre to be preserved and enhanced. The first step to proceed in this direction is the territorial framing of the area to be analysed.

The urban conformation of the Aterrana village is defined by the layout of Via Madonna delle Grazie and Via Fontana; in fact, starting from the Chapel of the Madonna delle Grazie, and continuing along the street of the same name, it is

possible to reach the centre of the village. The second, Via Fontana, makes it possible to arrive at the greenest and most wooded part of Aterrana, which leads, via the Candelito path, to the Sanctuary of San Michele on the peak of the mountain with the same name, at 1567 metres above sea level.

*Fig. 5 - The Aterrana village*

A careful bibliographical research at the University of Salerno Libraries, the Provincial Library of Avellino and the State Archives of Avellino, supplemented and expanded by as many web searches, made it possible to acquire a good information repertory to use as a starting point.

We then proceeded with the identification of the village's boundaries and its positional analysis in relation to the geographical area to which it belongs, in order to contextualise the intervention according to the potential of the village site.

We then moved on to the precise identification of all the assets of historical-cultural, religious and environmental interest, in line with the pre-established thematic routes.

Once the research phase was completed, we proceeded with the implementation of the database relating to the assets in all identified categories, in order to create a 'geo-referenced cultural map' of Aterrana.

The structure of the georeferenced system required the database to be organised in different topological tables, whereby each table contains only those assets that will then be identified on the map with the same topological element (point, areal or linear element).

In the case study, point and linear elements were used. The first were used to identify all the buildings and general points of interest; the linear elements, on the other hand, were used to identify the route that includes the aforementioned elements, and the nature trails.

The following tables were thus achieved:

Tab. 1 - Table of historical-architectural assets in the Aterrana hamlet

<b>MUNICIPALITY</b>	<b>HAMLET</b>	<b>ID</b>	<b>Use destination/Name</b>	<b>Year or Period</b>
MONTORO	Aterrana	1	St. Martin's Complex	1300
MONTORO	Aterrana	2	Church of Montevergine	1534
MONTORO	Aterrana	3	De Leo Palace	XVIII sec.
MONTORO	Aterrana	4	Masucci - De Giovanni Palace	XVII sec.
MONTORO	Aterrana	5	Rocco Family Palace	XVI-XVII sec.
MONTORO	Aterrana	6	Curcio Palace	XVI-XVII sec.
MONTORO	Aterrana	7	Abignano Saracino Palace	XVI-XVII sec.
MONTORO	Aterrana	8	Vietri - Giaquinto Palace	XVI-XVII sec.
MONTORO	Aterrana	9	De Leo Garden	XVIII sec.
MONTORO	Aterrana	10	Masucci - De Giovanni Garden	XVII sec.
MONTORO	Aterrana	11	Rocco Family Garden	XVI-XVII sec.
MONTORO	Aterrana	12	Curcio Garden	XVI-XVII sec.
MONTORO	Aterrana	13	Abignano Saracino Garden	XVI-XVII sec.
MONTORO	Aterrana	14	Terlizzi Courtyard	XVI-XVII sec.
MONTORO	Aterrana	15	Ferrazzano Courtyard	XVI-XVII sec.
MONTORO	Aterrana	16	Vietri-Giaquinto Courtyard	XVI-XVII sec.
MONTORO	Aterrana	17	Ventara Cave	Mesolithic
MONTORO	Aterrana	18	Balzi del Guacci Cave	Mesolithic

Comparing this last table with the one drawn up for the entire Municipality of Montoro, it is evident that in this case no reference routes have been defined for each identified asset. This choice is essentially motivated by the modest extension of the hamlet and the homogeneity of the characteristics of the assets located in it. In support of this choice there is also a key consideration, namely that most of the existing assets are encountered by travelling along the main road (via Madonna delle Grazie).

The many nature trails that branch off from the village through the surrounding mountains deserve a separate remark. The 'Wikiloc' portal itself, the largest online database of nature trails in the world, promotes no less than five of them starting right from Aterrana. A second table has therefore been drawn up for their identification, since a different topological sign (linear) is required for their representation in QGIS.

Tab. 2 - Trails identified and included in the Georeferenced Information System

<b>MUNICIPALITY</b>	<b>HAMLET</b>	<b>ID</b>	<b>PATHS AND TRAILS</b>	<b>LENGTH</b>
MONTORO	Aterrana	1	Candelito Path	6 km
MONTORO	Aterrana	2	Madonna dell'Incoronata Trail	2 km
MONTORO	Aterrana	3	Picentini Mountains Trail	16 km

Once this further phase was completed, we proceeded to the punctual identification on a satellite map of each element described in the table, using the programme Google Earth Pro. A different symbology was used depending on the use destination of the identified asset to simplify the reading of the data, and a legend was then prepared.

Fig. 6 - Map of cultural attractions identified in the Aterrana village

The file thus created was exported in .kml format and subsequently uploaded to the QGIS platform, which, using the same reference system as Google Earth Pro, allowed immediate re-localisation of all the identified elements.

This led to the last phase where the geographical information of each asset (georeferencing) was associated with the alphanumeric information previously processed through tables. An instantaneous interrelation between the processed data was thus obtained, thus achieving what was the initially set goal.

#### 4 Discussion and Conclusions

This paper summarises the outcomes of a research project that addresses, from a theoretical point of view, the problem of designing a decision support system with explicit consideration of the geo-spatial dimension (Spatial Decision Support System - SDSS) in order to support the knowledge and valorisation of cultural heritage in small towns.

The proposed conceptual framework has been applied to a case study, but it should be emphasised that the validity of the method lies in the possibility of applying it to any other context, gradually integrating the amount of data. This integration is guaranteed by the proposed Planning Framework, which represents the conceptual and operational basis for the SDSS.

Future developments lie in the identification of the components of the SDSS in terms of basic data, indicators and models and the extension of the webgis component.

This component makes it possible to visualise and query georeferenced information and their associated maps, proving to be a valuable tool for the knowledge and dissemination of cultural heritage.

It also allows the establishment of 'collective identity' places, and can become a starting point for the development of cultural routes in the sustainable tourism field.

This is because supporting the knowledge of cultural heritage can be the trigger of a virtuous mechanism and an economic, tourist and social driver as a prerequisite for a desirable reversal of the phenomenon of depopulation, abandonment and degradation, especially in inland areas.
