# ***ABSTRACTS***

**15<sup>th</sup> International Pragmatics Conference**

**BELFAST, NORTHERN IRELAND**

*16-21 July 2017*

# 15th INTERNATIONAL PRAGMATICS CONFERENCE

## SPECIAL THEME: *Pragmatics in the real world*

CONFERENCE CHAIR: *Catrin RHYS* (University of Ulster at Jordanstown)

LOCAL SITE COMMITTEE: The other members of the Local Site Committee (all at the University of Ulster at Jordanstown) are: *Anthea IRWIN, Karyn STAPLETON, John WILSON*

INTERNATIONAL CONFERENCE COMMITTEE: In addition to the members of the Local Site Committee, the International Conference Committee includes: *Charles ANTAKI* (Loughborough, UK), *Rukmini BHAYA NAIR* (New Delhi, India), *Diana BOXER* (Gainesville, USA), *Winnie CHENG* (Hong Kong, China), *Jenny COOK-GUMPERZ* (Santa Barbara, USA), *Anita FETZER* (Augsburg, Germany), *Helmut GRUBER* (Vienna, Austria), *Janet HOLMES* (Wellington, New Zealand), *Sachiko IDE* (Tokyo, Japan), *Cornelia ILIE* (Malmö, Sweden), *Shoichi IWASAKI* (Los Angeles, USA), *Dennis KURZON* (Haifa, Israel), *Sophia MARMARIDOU* (Athens, Greece), *Rosina MARQUEZ REITER* (Surrey, UK), *Luisa MARTÍN ROJO* (Madrid, Spain), *Jacob MEY* (Odense, Denmark), *Melissa MOYER* (Barcelona, Spain), *Neal NORRICK* (Saarbrücken, Germany), *Jan-Ola ÖSTMAN* (Helsinki, Finland), *Marina SBISÀ* (Trieste, Italy), *Jef VERSCHUEREN* (Antwerp, Belgium), *Tuija VIRTANEN* (Abo, Finland)

---

## INTERNATIONAL PRAGMATICS ASSOCIATION (IPrA)

<https://ipra.uantwerpen.be>

IPrA President: 2012-2017: *Jan-Ola Östman* (Linguistics, Helsinki)

IPrA Secretary General: *Jef Verschueren* (Linguistics, Antwerp)

IPrA Executive Secretary: *Ann Verhaert* (IPrA Secretariat, Antwerp)

### Members of the IPrA Consultation Board (2012-2017):

Keiko Abe (Tokyo, Japan), Charles Antaki (Loughborough, UK), Josie Bernicot (Poitiers, France), Rukmini Bhaya Nair (New Delhi, India), Barbara Bokus (Warsaw, Poland), Diana Boxer (Gainesville, USA), Charles Briggs (Berkeley, USA), Frank Brisard (Antwerp, Belgium), Winnie Cheng (Hong Kong, China), Jenny Cook Gumperz (Santa Barbara, USA), Anita Fetzer (Würzburg, Germany), Helmut Gruber (Vienna, Austria), Yueguo Gu (Beijing, China), Susanne Günthner (Münster, Germany), Janet Holmes (Wellington, New Zealand), Sachiko Ide (Tokyo, Japan), Cornelia Ilie (Malmö, Sweden), Shoichi Iwasaki (Los Angeles, USA), Ferenc Kiefer (Budapest, Hungary), Helga Kotthoff (Freiburg, Germany), Dennis Kurzon (Haifa, Israel), Stephen Levinson (Nijmegen, The Netherlands), Sophia Marmaridou (Athens, Greece), Rosina Marquez Reiter (Surrey, UK), Luisa Martín Rojo (Madrid, Spain), Yoshiko Matsumoto (Stanford, USA), Bonnie McElhinny (Toronto, Canada), Michael Meeuwis (Ghent, Belgium), Jacob Mey (Odense, Denmark), Maj-Britt Mosegaard Hansen (Manchester, UK), Melissa Moyer (Barcelona, Spain), Neal Norrick (Saarbrücken, Germany), Jan-Ola Östman (Helsinki, Finland), Marina Sbisà (Trieste, Italy), John Searle (Berkeley, USA), Gunter Senft (Nijmegen, The Netherlands), Tuija Virtanen (Abo, Finland), John Wilson (Belfast, Northern Ireland, UK)

### Editors of *Pragmatics* (2017 onwards):

*Editor-in-chief:* **Helmut Gruber** (University of Vienna)

*Associate Editors:* **Frank Brisard** (University of Antwerp), **Yoko Fujii** (Japan Women's University, Tokyo), **Inmaculada García Sánchez** (Temple University, Philadelphia), **Sophia Marmaridou** (University of Athens), **Rosina Márquez Reiter** (University of Surrey), **Catrin S. Rhys** (University of Ulster at Jordanstown), **Daniel Silva** (Federal University of Santa Catarina - UFSC), **Elda Weizman** (Bar-Ilan University)

<b>Plenary lectures</b>	1
<b>Panels</b>	3
Panels are listed alphabetically, based on the family name of the first panel organizer.	
<b>Panel contributions</b>	94
Listed alphabetically in accordance with the name of the first author. Titles are followed by an identification of the panel the contribution belongs to.	
<b>Lectures &amp; Posters</b>	706
Listed alphabetically in accordance with the name of the first author.	

*The abstracts contained in this booklet are in principle in the form in which they were submitted; because text was sometimes corrupted by the transfer from text processing files to the online platform, editing was often necessary for consistency and intelligibility. In the course of April 2017, authors were given the opportunity to edit their abstracts themselves. Yet, the end result may still not be fully satisfactory in all cases.*

*This collection of abstracts represents the state of affairs on 21 June 2017. Later cancellations may be responsible for the presence of abstracts that do not correspond to anything in the program which went into print on 28 June.*

## PLENARY LECTURES

**Peter Auer**

***Turn allocation, addressee selection, and gaze***

The recent rise of interest in research on turn-taking from a number of disciplinary perspectives (cf. Holler et al., eds., 2016; Rossano 2012) shows that the last word has not been said on this topic, despite Sacks, Schegloff's and Jefferson's seminal 1974 paper which was foundational for conversation analysis. One of the obvious shortcomings of these authors' model is its lacking consideration of multimodal turn allocation and turn taking practices, above all in the visual domain of interaction. My talk will address one of these components, i.e. gaze, arguably the most central one for turn-taking. On the basis of eye-tracking data of naturally occurring multi-party interaction, my main focus will be on current speaker's gaze and its functions for addressee selection and next speaker selection. Gaze is a ubiquitous resource in face-to-face interaction, not restricted to, e.g., first parts of adjacency pairs. Around the end of a current speaker's TCU it is a powerful and pervasive practice to select a preferred next speaker, as I will show. One of the consequences of this finding is that (non-competitive) self-selection as a hierarchically subordinated option which only applies when the current speaker has not used his or her rights to select a next speaker, becomes considerably less frequent. Its preferred context seems to be after sequence/topic closure. On the other hand, the status of competitive turn-transitions also changes, since a participant may self-select although the current speaker has suggested another participant as next speaker by gaze. The ensuing competitions for the turn are multimodal phenomena which do not become manifest on the verbal level. In sum, I will argue for a reconsideration of the relative status of next-speaker selection by current speaker ("Rule (1)(a)" in Sacks' et al. model), and of self-selection by a next speaker ("Rule (1)(b)").

***The taming of the shrill: Gender, power and political speech***

'It was and still is true', wrote the anthropologist Susan Phillips in 2003, 'that men dominate public talk, and not just in village-level politics, and not just in non-Western societies'. Drawing on the research Sylvia Shaw and I did for our book *Gender Power and Political Speech* (2016), a case study of the 2015 UK General Election campaign, as well as material relating to the 2016 US presidential election, this plenary talk explores the conflicting linguistic norms and ideologies which female political actors in western democracies are obliged to negotiate. I will suggest that one key problem these women face is the existence of a gap or disconnect between the observable facts of their linguistic behaviour and the reception/representation of that behaviour by others: gender difference, whether positively or negatively evaluated, is largely constructed through acts of interpretation. I argue that this real-world pragmatic problem deserves more attention than it has sometimes received in recent research on language and gender.

***News as we know it: Exploring the fake news dynamic***

News, like language, indexes a range of meanings about the larger world and our connection to it. In this paper, I look at the dynamic between "alternative facts" in news discourse and the "echo chamber," or the context by which beliefs are reinforced, often through repetition more than verified fact. The measure to which "fake news" and its ilk succeeds and persuades occurs on two fronts: we believe it or are compelled to doubt its provenance, both of which have real-world impacts. What is it about language and how it is used that effects particular actions or reinforces certain ideologies? How do diverse media domains and channels of transmission and

consumption encourage “fake” news? Over the past several years, Western society has changed how it consumes public information, and I argue that as we are no longer comparably socialized into what news “means” more broadly, this can work against a larger shared social understanding and critical response. Similarly, the extent to which we can rely on our own knowledge and our “reliable sources” – neighbors, family members, trained journalists, experts, or our own research – is called into question, as social commentators have made clear. These are the contexts in which “fake news” proliferates. Thus, awareness of discourse conventions, reporting practices, story-types, sources, and familiarity with social media patterns and search-engine algorithms have the benefit of instilling media literacy, an important corrective that can allow social action and argument over inertia and disengagement. At its root, how language is used and controlled is key to understanding the fake news dynamic.

## **John Heritage**

### ***The expression of authority in primary care medicine***

According to the sociologist Paul Starr (1982), when patients agree to recommendations for medical treatment, they engage in the ‘surrender of private judgment.’ The medical authority to which they acquiesce comes in two flavors: epistemic and deontic. Epistemic authority is perhaps most evident in the diagnostic stage of medical consultations, while its deontic counterpart is more evident in the context of treatment recommendations.

This paper asks whether and how this authority finds verbal expression in these two moments in primary care. It does so by (i) describing the design of turns at talk in which primary care physicians render diagnoses and make treatment recommendations, and (ii) describing the frequency and extent to which patients respond to these two forms of medical action. The paper is based on a study of c.300 American primary care consultations, with brief comparisons of other secondary consultations.

## **Wei Li**

### ***Translating karate: A translanguaging perspective on learning***

Translation is ‘a way of thinking about how languages, people, and cultures are transformed as they move between different places’ (Young, 2003, p.29). In this talk, I will discuss how culture is translated in a multilingual karate club in an ethnically diverse area in East London. I will outline a theoretical perspective on researching this transformative, multilingual process, namely, Translanguaging and discuss the idea of learning as resemiotization. The karate club is led by a 6th dan Polish Roma coach who speaks primarily Polish and Romani and started learning Karate in Poland in his teens and moved to London as an adult. The participants are local school children who speak a range of named languages including Polish, Russian, Lithuanian, and a variety of English. Using data collected through a 3-month linguistic ethnography, we found that there is an intersectional layer of cultures which are referenced, reiterated, ritualised or revered in coaching and learning practices. These include karate culture, culture of learning, and culture of practice and their associated values such as respect, hierarchical social order, competitiveness, learning through modelling, repetition and whole-body pragmatics, and self-discipline. In the meanwhile, there is a certain level of subjectivity in the perceived ownership and origins of these cultures. The connection with Japaneseness (the origins to which karate is often attributed) may be lost in translation. Multiple languages and embodied pragmatic cues are used in coaching but for different purposes: although certain Japanese language competence is required, the use of Japanese is limited to performativity and rituals, as a technical code, as command, and occasionally as an indicator of one’s professional expertise. In contrast, Polish, English and other linguistic, semiotic and physical acts are performed collaboratively as languages of instruction, elaboration, disciplines or information. We argue that such dynamic Translanguaging practices contribute to the transformation of karate from a national martial arts to a global one, which, paradoxically, capitalises on the myth of karate as a Japanese martial arts.

## **Elizabeth Stokoe**

### ***When conversation starts***

In this paper, I will focus on a topic that is of longstanding interest to conversation analysts: the start of an encounter. My aim is to compare openings across many different settings, from friends talking on the phone to police negotiators talking to persons threatening suicide. I want to show how, across medical, commercial and other settings, a focus on openings can work to engage non-academic professionals in the value, integrity and rigour of conversation analysis. I will also give examples of how the analysis of openings can overturn widespread understandings of what a ‘good’ opening looks like, and how research can build the foundations of an alternative method for communication training using the Conversation Analytic Role-play Method.

## PANELS

**Note:** some panel organizers may not have updated their panel descriptions recently; though we have tried to eliminate discrepancies between panel descriptions and the actual content of the panels, some inevitably remain. To check the full content of panels, use the program booklet in combination with the set of panel contribution abstracts following the set of panel abstracts.

### Angeliki Alvanoudi

#### *Language, gender and cognition*

The role of language in the construction of gender identities has been the topic of long-standing research in sociolinguistics, linguistic anthropology, and conversation analysis. A number of studies within the ‘discourse’ or ‘performance’ turn in the study of language and gender (Eckert and McConnell-Ginet 2003) examines the role of referential indexing of gender (Ochs 1992) in producing and maintaining a bipolar asymmetrical gender order (e.g. Hall and O’Donovan 1996; Hellinger and Bussmann 2001-2003; Hellinger and Motschenbacher 2015; Kitinger 2005; McConnell-Ginet 2003; Speer and Stokoe 2011). In claiming that gender is constructed through linguistic practices and that language maintains gender inequality, these studies presuppose or imply that language has a cognitive role, namely, that language mediates the way in which speakers interpret experience. However, studies on language and gender do not address explicitly the relation between language and speakers’ cognition (see Alvanoudi 2014 for an attempt to explore the interface between grammar, gender and speakers’ cognition in Greek). The panel aims at filling this gap, by exploring the relation between indexing of gender and cognition across different languages and cultures. In line with non-formalist approaches within linguistics, cognition is understood as a broad notion that encompasses conceptual categorization, common ground, presuppositions, stereotypes, and inferences, among others, and is interrelated with language and culture. Questions to be addressed in the panel include the following: (i) Does the use of items that are lexically or grammatically marked as female or male contribute to the construction of social gender? (ii) Do referential indexes of gender generate inferences about the social gender order? (iii) Can we explore conceptualizations of gender at the micro-level of interaction through speakers’ public behavior? (iv) What is the cognitive effect of generic masculines? (v) Does gender-fair language orient speakers toward non-biased conceptualizations of gender?

### Charles Antaki

#### *Entry and re-entry into interaction*

The study of the exact process of opening a face-to-face interaction is surprisingly under-researched in Conversation Analysis (which left this rather Goffmanian problem behind after early success in working with *telephone* interactions). Starting an interaction presents multiple obstacles - obviously the sensory ones (you have to be in some kind of sharable sensory space, or plausibly claim to be so) but also the more interestingly subtle ones of entitlement, opportunity, timing, bodily movement and design of opening move.

This proposed Panel would gather together some of the most exciting work in the newer, more multi-modal CA tradition, making full use of the video record and incorporating the physical scene into the analysis. The presentations cover entry into institutional (Svinhufvud, Tuncer, Nilsson) and non-institutional interactions (Antaki, Pillet-Shore), and among the latter, includes a consideration of how interaction is re-established after a lapse (Hoey, Keevallik). The participants come from the UK, Sweden, Finland, France, The Netherlands, and the USA - a fair (if Western) spread of presenters and sources of data.

The question every paper will address is: how to begin? (or in Hoey's and Keevallik's case: how to begin again?) The ubiquity of the phenomenon - we all recognise the barrier that needs to be overcome to establish the grounds for starting (or restarting) a conversation - ought to make the Panel attractive to more than the Conversation Analysis audience (though that does tend in itself to be a considerable one at IPrA conferences). The close adherence to the specific pivot of "openings" should also make the Panel presentations cluster tightly, and help generate an internal sense of coherence and clarity of focus.

## **Anne Barron**

### ***Student mobility and pragmatic competence***

Steady increases in student mobility in recent years (cf., e.g. European Commission 2015) mean that language learners are increasingly experiencing language learning that "remains instructed, despite incorporating elements of naturalistic L2 acquisition" (Coleman 1997:4 on study abroad). In line with these developments, there has been a growing interest in L2 pragmatic development during study abroad (cf., e.g., monographs by Barron 2003, Schauer 2009, Devlin 2014, Ren 2015 and overview articles by Barron forthcoming and Taguchi 2015). By contrast, L2 pragmatic development during student workplace sojourns abroad represents a research desideratum.

Increased input and output opportunities in the context of student mobility offer students the opportunity to develop their pragmalinguistic and sociopragmatic competencies. Hence, it is maybe not surprising that previous research shows a link between study abroad and second language (L2) pragmatic acquisition, with developments recorded on a number of pragmatic features and levels, such as in the use of conventional expressions, pronouns of address, speech act strategies and modification, and on the level of interactional competence (e.g. listener responses, sequences) (e.g., Bardovi-Harlig & Bastos, 2011, Barron 2003, 2006, 2007, Schauer 2009, Shively 2015, Taguchi 2011, cf. also Taguchi 2015 for an overview). On the other hand, however, this same scholarship also shows the limitations of L2 pragmatic acquisition in the stay abroad context, highlighting struggles with a lack of saliency of input and with the related difficulties of negative pragmatic transfer and overgeneralisation. In addition, a range of factors, such as interactional opportunities and proficiency differences have also been shown to influence pragmatic development (cf., e.g. Bardovi-Harlig & Bastos 2011).

The present panel is designed to further explore changes in L2 pragmatic competence during a sojourn in the target community. We envisage papers focusing on the development of L2 pragmatics during student mobility (including both study abroad and work placement settings) for a range of first languages, and target languages, as well as for a variety of pragmatic features. Papers focusing on the following are particularly welcome:

- Effects of the following on the development of L2 pragmatic competence during student mobility:
  - o Length of stay, context of stay (e.g. lingua franca setting vs. target language setting; study abroad vs. work placement), nature of and intensity of interaction during stay
  - o Proficiency levels
  - o Individual differences (e.g. age, gender, aptitude, motivation, attitudes, beliefs)
- Identity, L1 and L2 pragmatic competence during student mobility
- Pragmatic instruction prior to and during student mobility
- Methodological issues and innovations in pragmatic research on student mobility

#### ***Address forms across cultures: A cross-cultural comparison of address terms in Indo-European, Uralic and Altaic languages***

Throughout the past few decades, the central issue in the study of human communication in various languages and cultures has been the examination of the ways in which interlocutors express their understanding of their relationship to one another in various social domains (e.g., academia, entertainment, family, politics, religion, workplace) (Afful 2007; Bayyurt 1996; Bayyurt & Bayraktaro ğlu 2001; Hatipoğlu 2008; Little & Gelles 1975; Mills 1988; Musumeci 1991; Ostermann 2003; Sole 1978). That is, “who the speaker believes he is, who he believes the addressee is, what he thinks their relationship is, and what he thinks he is doing by saying what he is saying” (Parkinson 1985:5) has been tried to be uncovered by examining and describing the use of various address forms (e.g., second person pronouns, honorifics, alternative verb inflections, greetings, kinship terms etc.) in various social contexts. Since the choice of address terms or lack of them in a particular contexts in a particular society can reveal how speakers in different cultures interpret the dimensions of status/power (P) and solidarity/distance (D) (Bayyurt 1992; Brown & Gilman 1960; Brown & Ford 1964) and how they ensure that their daily relationships continue in harmony/disharmony, when and how participants in an ongoing conversation adapt/deviate from local dynamics, what the motives for initiating/terminating a conversation are, how speakers’ and listeners’ show their (un)willingness to communicate, this panel will be focusing on when, why and how native speakers and foreign language learners of various Indo-European, Uralic and Altaic languages choose to use/not use various categories of address terms in their interactions. In this panel, the papers will also examine whether or not, and if ‘YES’ how and when cultural and societal changes as well as micro-contextual factors (e.g., spoken vs. written mode of communication) affect/determine the choice of address terms among interlocutors.

The papers in this panel exemplify two trends of research on address forms. The studies in the first group, scrutinize the semantic sub-systems of address forms in specific languages (Italian, Polish, Turkish) and try to show how different societies exhibit their norms, practices and values by employing ‘assorted’ address forms in contrasting social domains while using specific modes of communication (e.g., spoken vs. written vs. electronic). The papers in the latter sub-group focus on the use of address forms across languages and cultures and reveal why and how employing them in cross-cultural interactions or learning them in foreign languages could be defined as a “crossing of linguistic minefields” (Dewaele 2004:383). These studies also demonstrate how those seemingly unassuming short words form the backbone of the social interactions in different cultures and how with their enduring complexity allow the coexistence of various orders of indexical relations (i.e., contextual dimensions defined and perceived differently in different languages and cultures, and patterns of address form usage).

During the third session of the panel, the papers included in this panel will be summarized and critically evaluated by a discussant who will also moderate the Q/A and discussion sessions of the panel.

### *The new normal: (Im)politeness, conflict and identity in digital communication*

As digital communication continues to expand and increase through ever-changing and newly-emerging modalities, a greater understanding of the ways we formulate relationships and communities in the interwoven digital world is critical. Since new modalities and communicative platforms are emerging daily, communicative practice must constantly change and shift to ensure that subtleties of meaning are not lost and complexly interwoven messages conveyed through increasingly multimodal interactions are comprehended. Recent years have seen a dramatic increase in research examining the ways that various media platforms have been used to promote negative behaviours and agendas (see among others Hardaker & McGlashan, 2016). In many cases, it is argued, the unique features of digital platforms allow (and perhaps even promote) new manifestations of (im)politeness and conflict. This panel focuses on bringing together the ways that 1) (im)politeness is manifested in a variety of digital platforms and 2) how individuals use the capabilities (and limitations) of digital media to construct and negotiate identities through digitally-produced (im)politeness. Panelists will explore whether impoliteness can be linked to online context, digital data type, and/or communicative goal, and examine whether linguistic evidence of aggression and impoliteness behaviour can be understood as effecting a recalibration of what constitutes the norm or standard for language usage in new media. Building on early linguistic research on CMC that began in the 1980s, researchers have continued to examine

the complex ways that people have formed communities and identities in online contexts even as media have continued to morph and change, exploring questions such as how people form insider & outsider groups (Graham, 2015; Klein & Bös, 2015), what types of identities they claim (Gallagher & Savage, 2015; Haugh, et al., 2015), to what extent anonymity affects communicative practice (boyd & Hargittai, 2010; Herring, S.C. & Stoerger, 2014; Marwick & boyd, 2014), and even whether CMC is fundamentally different from face-to-face communication at all (Benwell & Stokoe, 2006; Locher, Bolander & Höhn, 2015). This panel takes a post-modernist approach to (im)politeness research, building on theories developed since Brown & Levinson's (1978/1987) work in examining the intersection between digital platforms and manifestations of (im)politeness (broadly conceived, including conflict), such as the "online disinhibition effect" (Suler, 2004), including toxic and benign disinhibition, which is central to current online aggression research (e.g., Binns, 2012; Herring et al., 2002; Jane, 2004; Demjen & Hardaker, 2016). The panel approaches new media as established sites of aggression and impoliteness behavior, and further proposes to explore how impoliteness behavior is in fact not a marginal activity, but rather seems ever increasingly to constitute a communicative norm.

### Nancy Bell & Michael Haugh

#### *Trickery, cheating, and deceit in language play*

Lying and other forms of deception have been focus of a number of studies in pragmatics (Dynel, 2011, forthcoming a, b; Saul, 2013; Parrett, 1994; Vincent and Castelfranchi, 1981; Vincent Marrelli, 2004 ). Much of this work has focused on the function of deception and pretence in communication, that is, cases where the speaker expresses something he or she believes to be false in ways that are designed to be readily obvious to the recipient (overt pretence) or less so (covert pretence/deception) (Dynel, forthcoming a, b). However, despite the potential to explore the intersection of overt and covert forms of pretence with humour (Bell, 2015; Dynel, forthcoming a, b), there have only been a limited number of studies exploring the role of various forms of deception and pretence in playful discourse (e.g. Dynel, 2009; Haddington, 2011; Haugh, 2016). The aim of this panel is thus to bring together an international group of scholars to explore the ways in which trickery, cheating, and various other forms of deception and pretence arise and function in and around playful discourse. At the most basic level, we aim to examine the forms and functions of such practices: How are jocular forms of cheating and trickery constructed in interaction? What interpersonal and instrumental goals might they achieve?

How do interlocutors respond to such practices? We also recognize that what counts as play, as well as what counts as deception, may vary cross-culturally or situationally, thus the panel will include contributions that illuminate sociocultural norms around playful deceptive practices. Similarly, we ask what linguistic resources are drawn on across a variety of participants and contexts in order to construct and cue that these practices are underway? How are these practices negotiated in multilingual contexts? Furthermore, although we focus on deceptions that are playful, it is well-recognized that non-serious language also works to achieve serious, instrumental goals, and so the functions of ostensibly non-serious forms of deceptive pretence will also be considered. As there as yet no established research group working in this area we anticipate this panel will attract a diverse range of researchers. Alongside inviting those who have already established lines of published research in or related to this area, such as Neal Norrick (Saarland University), Derek Bousfield (Manchester Metropolitan University), Marta Dynel (University of Lodz), Kathy Hall (California State University), Anne Pomerantz (University of Pennsylvania), and Salvatore Attardo (Texas A&M University), we anticipate contributions from additional participants in order to represent a range of theoretical and methodological perspectives, including (im)politeness theory, language socialization, interactional sociolinguistics, and conversation analysis.

#### *Position and stance in politics: The Individual, the party, and the party line*

Within the political sphere, a political actor is often judged by what he says, with language perceived as representative of the individual actor. Indeed, they are individuals with a lifetime of experiences and actions which inform, but may also undermine, their aspirations in gaining political capital (Bourdieu, 1986). However, these actors do not exist in isolation; they are members and, at times, potential candidates of a particular political party with its own ideology and agenda which may cause them to modify their personal speech to align with espoused policies of the party. The aim of this panel is to examine the discourse of political actors through a pragmatic lens, enabling the unraveling of multiple layers of language use and pragmatic representation within political discourse. Panel participants may explore the pragmatic acts within the discourse from a variety of ways, including (but not limited to) the approach and the social practice (e.g., speech, debate, blog). For instance, from a theoretical and categorical perspective, panel participants may integrate Positionality Theory (Harré & van Langenhove, 1991, 1999; Harré & Moghaddam, 2003) as it presents a manner of identifying how individuals enact their roles through language, or pragmatically. Through their utterances, political actors provide an image of who they are; through first order, second order, and third order positioning, the language use delimits who the speaker is (or who he wants the voters to believe he is), who he believes the interlocutor is, and who he believes others outside the immediate communication are. Positionality Theory is quintessentially pragmatic in that the focus remains on the speaker and his use of language to frame a picture of the parties referred to, even more so because it doesn't need to rely on absolute truth, but can present a case of language manipulation *par excellence* (Berlin, 2015; Mey, 2001). This panel and its speakers will explore various forms of political discourse and the multiple stances politicians take therein, utilizing a clearly defined theoretical

perspective and a specified social practice in order to shed light on the ways political actors can position themselves, their party, and/or their opponents toward the ostensive voters. In so doing, we hope to generate hypotheses surrounding how espoused perspectives relate to or reflect on the nature of the individual and his truth, the party he represents and its ideology, and/or the pandering to popular public opinion in order to curry favor.

## **Rukmini Bhaya Nair & Michael Toolan**

### ***Some are more equal: Constitutive and regulative rules in pragmatics revisited***

According to Asa Kasher (1977) “the ultimate goal of any pragmatic theory is to specify and explain the constitutive rules of human competence to use linguistic means for effecting basic purposes... Thus, a girl scout has not grasped the notion of a postage stamp, if she knows all about perforated edges and can even tell the side that sticks from the side that speaks but knows nothing whatsoever about letters and postage. And a scoutmaster does not have a thorough knowledge about his organization if he knows the ropes and can tell a jamboree from a merry rally but is unaware of the constitutive purposes of his movement.” Ideas of constitutive and regulative rules are philosophically foundational and date back to Kant (see French, 1967). However, when they were reframed in the 20th century by Searle (1964, 1969), taking his cue from Austin (1962), they related more explicitly to language and intentionality, as well as to institutional and individual frames for the felicitous performance of speech acts. Today, another update may be urgently needed, having to do with the potential new methodologies available to study rules of discourse via an examination of large-scale data, both longitudinal and cross-sectional, in which quantitative results converge with qualitative studies of discourse patterns and macro- and micro- analytic approaches to communication meet. On this panel, we re-examine the core notions of constitutive and regulative rules in pragmatics, systematized by J.L Austin and J.R Searle as 'felicity conditions' on types of speech act, by looking at an area of the "real world" where the relationship between 'basic purposes' and 'linguistic means' is particularly challenging. This is the vast arena of inequality across the world's regions and countries – inequality in wealth distribution, in educational and digital access, in gender assignments, in the exercise of democratic rights, and in other major ways. How might we systematically understand the constitution and regulation of the discourses underpinning equality/inequality in a "real world" where overwhelming amounts of big data are now being generated in all the fields listed above, yet the interpretation of those data is both limited and problematic? Given this burgeoning virtual space, it is apparent that pragmatics research cannot continue to rely solely on earlier 'face-to-face' models of rule-following, where the initial examples were so often Eurocentric, upper-class and small-scale, e.g. playing cricket, naming ships, or being scouts. Cricket is a good example. This game may still have eleven players and a captain per side and its main constitutive purpose might remain bowling the other side out before they've managed to score more runs than you. Yet the regulative, cultural rules surrounding cricket have changed so dramatically that JL Austin would barely recognize 'T-20 cricket' as it is today, played under evening arc-lights where multinational, many-hued cricketers bursting out of fluorescent T-shirts bristling with advertising slogans perform for a maximum of forty overs. Cricket has also become very big business, breeding various kinds of wealth and fame inequalities between cricket and other sports in formerly colonized countries like India. In other words, the relationship between the 'regulative' and the 'constitutive' aspects of rule-following have changed in fascinating, socially impactful ways in a 24/7 media dominated, big-data-generating environment. How can pragmatics research both learn from and contribute to current fast-moving changes in contexts for rule formation? What happens when people 'violate' virtual rules or 'opt out'? Does rule-following necessarily promote equality because everyone obeys the rules or can it reinforce inequality because different sets of rules obtain for various sets of social agents? The panel includes presentations from Brazil, China, Germany, India, Poland, Spain, and the UK which will address some of these questions. The cross-cultural studies presented on this panel will illustrate the ways in which different societies verbally regulate and control social inequality. Papers on the panel will also aim to show how wealth, health, racial, literacy and/or other inequalities can be understood in these countries via an examination of corpora, for example, of large-scale, longitudinal data-bases such as newspapers which cover several decades of reportage. Overall, the panel seeks to adopt an interdisciplinary approach to examining 'real world' problems of inequality, ranging from stylistic and statistical analysis of corpora to multimodal studies of media and political discourse to anthropologically and cognitively oriented field-studies, in order to illuminate that still very crucial distinction between constitutive and regulative rules in pragmatics.

#### ***Teaching formulaic language to L2 learners***

In recent years L2 teaching and learning materials have increasingly paid more attention to formulaic forms, including collocations, discourse markers, and indirect speech formulae (e.g. Can you help me?). This growing interest in formulaic language suggests that materials developers and publishers, teachers, and students, are becoming more aware of the importance of mastering L2 formulaic forms so as to 'speak' and 'sound' like a native speaker (see Ellis 2012, Meunier 2012). To some extent, this interest in formulaic language in the area of L2 teaching and learning is due to the growing research in formulaic language from a variety of theoretical backgrounds, including, e.g., *Corpora Linguistics and Construction Grammar*. Recent publications (see Corrigan et al. 2009, Wood 2010a, 2010b) show that formulaic language is no longer regarded as a marginal or even an anecdotal area of study, but a relevant—and interdisciplinary—research field which can greatly contribute to our understanding of language structure and use. However, the pedagogical approach to formulaic language poses interesting, and challenging, questions to the research in the field. Two simple questions such as "What do we need to teach?" and "How can we teach it?" are not, by any means, easy to answer. As Meunier (2012) indicates, teachers need, first, to identify formulaic forms, and, second, to know whether a particular formulaic form is worth being taught or not. In addition, teachers need to know how to teach formulaic language in an effective way. On a more theoretical level, these two questions also challenge any definition of formulaic language and any attempt to formalise a diverse, yet similar, wide range of forms. This panel wishes to promote the debate on formulaic language paying special attention to the theoretical and pedagogical challenges posed by L2 learning and teaching in this particular area of study. Any scholar currently working on the area of formulaic language and/or L2 language learning and teaching (of any language) is welcome to submit a presentation to the panel and participate in the panel discussion.

### **Lucien Brown & Pilar Prieto**

#### ***Multimodal (im)politeness***

The negotiation of (im)politeness that accompanies communicative events is mediated through various modalities, including not only verbal language, but nonverbal aspects such as the sound of the speaker's voice, and the use of polite bodily and facial gestures. Despite this, detailed analysis of prosody, gesture, and other nonverbal modalities rarely featured in the (im)politeness literature, which was instead dominated by the analysis of verbal (im)politeness. Indeed, Culpeper (2011) observed that "remarkably, the bulk of research on politeness or impoliteness pays woefully little attention to the role of prosody" (p. 146), and also notes that "non-verbal cues ... [receive] relatively little attention in communication and pragmatic studies."

However, recent years have seen the emergence of a vibrant interest in multimodal components of politeness (see Brown and Prieto, forthcoming). Research has shown that various acoustic and prosodic features correlate with politeness and impoliteness-related meanings including, pitch (e.g., Winter and Grawunder 2012 for Korean), speech rate (e.g. Lin et al. 2006 for Taiwanese), breathiness (e.g., Ito 2004 for Japanese), and pitch contour (e.g., Orozco 2008 for Mexican Spanish). Nonverbal speech sounds such as oral and nasal fillers (e.g.,

Winter and Grawunder 2012 for Korean), hisses (e.g., Fredsted 2005 for Danish), “kiss teeth” (Figuroa 2005 for Caribbean Creoles), and sounds denoting gustatory pleasure (Wiggins 2013) are also tied up with (im)politeness, as is the use or avoidance of manual gestures (e.g., Ola 2009 for Yoruba), head nods (Kita and Ide 2007 for Japanese) and other nonverbal behaviors. Gestures interact closely with acoustic and prosodic features to modulate the politeness levels of utterances (Nadeu and Prieto 2011) and to distinguish between mock impoliteness and genuine impoliteness (McKinnon and Prieto 2014), and are also crucial in the development of politeness sensitivity in children (Hübscher, Wagner and Prieto 2016). In sign language, interlocutors use mouth gestures, movements of the head and other non-manual features to communicate politeness (George 2011; Mapson 2014). Finally, in Computer Mediated Communication (CMC), interactants make use of cues such as emoticons, nonstandard/multiple punctuation and lexical surrogates to mitigate potential face threat (e.g., Vandergriff 2013; Haugh et al 2015).

The goal of this panel is to bring together politeness researchers whose work focusses on nonverbal elements of communication, or whose work features in depth analysis of these features. Nonverbal elements may include (but are not limited to) the following: (1) Acoustics and prosody (2) Non-verbal speech sounds (3) Gestures, nonverbal behavior, body language (4) Non-manual features of sign language (5) CMC (Computer Mediated Communication) cues

The panel will discuss the relevance of these nonverbal elements in the production and perception of (im)politeness across languages and cultures, and investigate the way that these different nonverbal aspects interact with verbal aspects, and with each other. We will also discuss methodological issues related to the study of multimodal impoliteness, as experienced by different researchers and different research labs. The organizers of the panel both have leading roles in ongoing research projects into the use of prosody and gesture in (im)politeness in Korean (Lucien Brown) and Catalan (Pilar Prieto), and recently collaborated for the first time by co-authoring a chapter on “(Im)politeness: Prosody and Gesture” for the *Palgrave Handbook of Linguistic (Im)Politeness*.

## **Matthew Burdelski**

### ***Storytelling in adult-child and children’s peer interactions***

In languages across the globe, storytelling is a ubiquitous mode of interaction that functions in giving coherence to life experiences, conveying affect, constructing identities, and managing human relationships. Over the last couple of decades, there has been a great deal of scholarship examining storytelling from various perspectives including conversation analysis, narrative analysis, and sociolinguistics. In contrast to much of the work from a sociolinguistic perspective that examines the structure of stories, studies from conversation analytic and related perspectives focus primarily on the telling, including how a story gets launched and managed by tellers and recipients, how a sequence of events are ordered, and what kinds of social actions are performed through the story (e.g., Jefferson, 1978; Mandelbaum, 2012; Sacks, 1972, 1974; Stivers, 2008; Stokoe & Edwards, 2006). While most of the research examines interaction among adults, there are a growing number of studies that analyze storytelling in adult-child (Bateman & Carr, forthcoming; Filipi, forthcoming;) and children’s peer interactions (e.g., Karlsson & Evaldsson, 2011; Goodwin, 1982; 1990a, 1990b; Kyratzis, 1999; Puroila, 2013; Theobald, 2016; Theobald & Danby, forthcoming; Theobald & Reynolds, 2015). These studies have provided needed insights into how children view and construct their social worlds in sequentially relevant ways.

This panel brings together researchers investigating children’s storytelling, including various kinds of tellings and narratives—i.e., personally experienced events typically removed from the “here and now”—within various languages (English, Swedish and Japanese). In focusing on children from the ages of two to ten-years old interacting with teachers, peers, and family members, the papers demonstrate ways that children communicate their own and others’ experiences through the re-playing of events. This includes how children: 1) create an interactional space for launching a telling and positioning themselves as tellers, 2) design their talk for particular kinds of recipients, 3) build upon others’ previous utterances in relating a sequence of tellable actions/events, 4) produce assessments and other affective actions, and 5) produce social actions in the “here and now” by telling about events removed from the “here and now”. The papers will investigate storytelling as a multimodal activity that emerges within various kinds of activities (e.g. play, mealtime, storybook reading) and that draws upon a range of semiotic modalities such as gestures, gaze, and facial expressions. By directing the analytical lens towards children’s contributions to storytelling, this panel highlights children as agents in constructing their social worlds with other interlocutors. In offering a cross-linguistic and cross-cultural perspective on children’s storytelling, the panel aims to contribute to research on children’s interaction and storytelling.

## Monica Cantero-Exojo & Eduardo Urios-Aparisi

### *Going viral: The socio-pragmatics of iconic communication in a shared world*

This panel examines the links between social experiences and emotions and their representation and positioning as shared identities in visual or multimodal discourse. The papers in this panel are meant to explore how knowledge is perceived, shared and understood via iconic communication (see Barker and Yazdani 2000) by different individuals and/or social groups with diverse cultural backgrounds across separated geographies. Thus, the sharing of experiences embedded in the verbal-visual structured discourse becomes universally understood realities. The panel aims to include a variety of approaches to the study of multimodal communication from cinema to contemporary social media. To this end, it intends to contrast different approaches including Systemic Functional Perspectives (O'Halloran 2004), Semiotic Approaches (Kress and Van Leeuwen 2001) and Conceptual Metaphor theory. In particular, we study metaphors and other conceptual processes following studies on metaphor and conceptualization in cinema (e.g. Fahlenbrach 2016) or in other contexts of interaction such as social media, telecinematic discourse, comics and other visual arts (see Forceville and Urios-Aparisi 2009).

## Marta Carretero, Björn Wiemer & Juana I. Marín Arrese

### *Evidentiality: Discourse-pragmatic perspectives*

This panel presents studies on evidentiality in discourse, focusing on the role of evidential expressions as mechanisms by which speakers and writers indicate the source of information which lies at the basis of the communicated content. Evidentiality concerns the kind or source of the evidence that speakers / writers (claim to) have for or against a communicated proposition (Chafe & Nichols 1986; Willett 1988; Aikhenvald 2004; Wiemer and Stathi 2010; Boye 2012; Marín-Arrese 2013; *inter alia*). Evidential expressions may express direct access to the evidence by means of visual and other sensory sources, and also indirect access through inference or through some form of mediated communication (Wiemer and Stathi 2010; Marín-Arrese 2013 *inter alia*). Evidentiality is strongly related to epistemic modality, which concerns degrees of probability and certainty. While the former justifies a proposition, the latter marks degree of commitment, and both make up the general domain of 'epistemicity' (Boye 2012). Evidentiality is also akin to a number of other categories, such as: reported speech, which consists in the attribution of information to another speaker or writer (Chojnicka 2012); manner, in the sense that the way in which a state or event occurs may be a source of evidence for qualifying the communicated content (Simon-Vandenberg and Aijmer 2007; Carretero and Zamorano-Mansilla 2013); mirativity, which qualifies the proposition in terms of (lack of) previous expectations (DeLancey 1997, Hill 2012, Aikhenvald 2012); and stance, in the sense of convergent or divergent alignment with respect to other interactional positions (Biber et al. 1999; Englebretson 2007; Marín-Arrese 2013).

In recent years, evidentiality has often been approached in terms of its pragmatic effects, on its own or in conjunction with epistemic modality or other categories such as those mentioned above. Some references approach concrete expressions or types of expressions in a single language (Celle 2009; Dendale 2012; Korta & Zubeldia 2014); others are contrastive or crosslinguistic studies (Simon-Vandenberg & Aijmer 2007; Usonienė & Šinkūnienė 2013; Marín-Arrese 2015; Wiemer & Socka forthcoming), and others concern different genres or text types (Müller 2008; Marín-Arrese 2011; Ruskan 2012; Carretero 2014).

Along these lines, the seven contributions included in this panel present advances in research on evidentiality from a discourse-pragmatic perspective. Four of the papers are corpus-based studies on concrete evidentials, namely adjectives, adverbs and verbs of communication in different languages (English, Spanish, Polish and Lithuanian). The remaining three papers approach the distribution and effects of evidentials and related expressions of stance in different types of discourse: two of the papers concern the ways terrorism is addressed in two different discourse types (journalistic discourse and United Nations Security Council resolutions), and the other is a study on a police interview.

#### ***Touch in social interaction: Integrating haptics into embodied interaction research (1 of 2)***

In addition to talk, our own bodies and the bodies of our interlocutors, the culturally patterned environment,

including the objects that surround us, provide semiotic and physical resources that we use in assembling various forms of human action. Such multimodal character of human action, built through the mutual elaboration of diverse semiotic resources, merits attention as to how different sensory modalities contribute to the organization of social interaction (Goodwin, C. 2000). A growing number of studies have explored auditory and visual modalities (gaze, gestures, speech) and the ways in which they are deployed to bring about ordered sequences of interaction, thus contributing to our understanding of embodied interaction as reliant on orientations to participants' bodies as visually available fields for coordinating social actions. The panel directs attention to the interactional uses and meanings of touch (haptics) as a significant, but largely overlooked communicative modality (but see the emerging field in studies by Burdelski, 2015; Cekaite, 2010, 2015; Goodwin, M. 2006; Goodwin, M. & Cekaite, 2013; Nishizaka & Sunaga, 2015). Based on recent work on embodiment in social interaction (Goodwin, 2000; Mondada, 2007; Streeck, Goodwin, and LeBaron 2011) the papers in this panel advance the study of haptics in several ways: i) they provide detailed analyses that investigate the contributions of touch to coordinated human action; ii) they examine the multimodal, sequential, and simultaneous relationships of touch with other semiotic systems, including talk, and the material artefacts); iii) they explicate how various practices of touch are combined with contextual factors to produce meaning in interaction. The presentations in the panel take into account the specificities of touch, i.e., the relevance of the materiality of this modality, including the affordances of touch to be perceived, its sensory and social features. Panelists outline specific bodily techniques (Mauss, 1935) relevant for inculcating social, bodily accountable ways to act in everyday interactions and provide analytical insights into the corporeality and sensory aspects of human interaction. In all, the panel underscores the analytic importance of studying the multiple sensory modalities in which talk is embedded. These dimensions of embodiment are examined in the context of culturally defined and recognizable events: adult-child socializing interactions in various cultural contexts (Sweden, USA, Japan), teasing interactions between adolescents (Tainio & Routarine, Finland), mediatized and non-mediatized co-body touch in the course of practical activities (Meyer, Germany), the use of touch in handling objects in service encounters (Mondada), and health service encounters (Nishizaka, Japan). Charles Goodwin (UCLA) is discussant.

#### *Pragmatic approaches to literary analysis*

This panel brings together researchers working with various frameworks of pragmatic theory, in order to consider what pragmatics can offer to our analysis, interpretation and evaluation of literary texts. The panel is inclusive in relation to pragmatic approaches, and frameworks for discussion include: Gricean and neo-Gricean Theory (Grice, 1975; Horn, 2007), Relevance Theory (Sperber and Wilson, 1995; Carston, 2002), Im/politeness

Theory (Brown and Levinson, 1987; Leech, 2014). The notion of ‘literariness’ is also interpreted broadly, and individual papers focus on a wide range of genres: novels, short stories, poetry and drama, including TV drama. Within this broad structure, the panel contributors make specific suggestions about how pragmatic theory can be applied to the analysis of a particular literary text or texts, to understanding the more general processes of literary criticism and interpretation, or to a consideration of the ways in which individual readers respond to literary texts. Specific focuses of analysis include speech and thought presentation, irony, satire and metaphor.

The aim of the panel is to consider a range of work that is currently being undertaken in relation to pragmatic approaches to literary analysis, and through discussion to consider possible future directions in the field. It will contribute to more general debates about pragmatic theory, too, since it will explore the analytic and explanatory potential of different theoretical approaches. The panel will necessarily highlight distinctions and contrasts between pragmatic theories. But it will also bring out complementarities, shared aims and assumptions, and ways in which different pragmatic theories might make different contributions to our understanding of literary texts.

### Jan Chovanec & Villy Tsakona

#### *Laughing at the ‘other’: Critical pragmatic insights into the humorous construction of opposing groups*

Having enjoyed an increasing popularity among scholars over the past couple of decades, the issue of humour has developed an extensive body of research in linguistic pragmatics. This panel aims to develop that tradition by focusing on humour explicitly involving the ‘other’. However, while the ‘us’ vs. ‘them’ dichotomy is a recurrent theme in humour pragmatics, the issue has a broader significance: the analysis of humour involving the ‘other’ can reveal broader social practices, i.e. the ideologies, stereotypes and social beliefs that underlie the relationship between such mutually opposed groups (cf. Duszak 2002; Archakis and Tsakona 2005). To this end, the present panel calls for a multidisciplinary approach enriching pragmatics with insights from critical discourse studies in order to explore how the mutual contrast of ‘us’ vs. ‘them’ operates, what forms the relevant humorous acts take, and what ends the targeting of ‘others’ ultimately serves.

Being central to much humour, the notion of the ‘other’ features in various forms in some of the theories of humour. It plays a role, for instance, in the superiority theory, as well as in incongruity-based humour theories (Raskin 1985; Raskin and Attardo 1991), where the mutually opposed semantic scripts often discursively construct differences between mutually opposed groups. Most attention to the ‘other’ has probably been paid in sociological accounts of jokes and short narratives (Davies 1997, 2011) since such short texts systematically draw on stereotypical representations of diverse ethnic and social groups, reminding us that such representations of the outgroup are imagined rather than real (cf. Anderson 1991). Within the burgeoning field of the pragmatics of humour (Norrick and Chiaro 2009; Dynel 2011; 2013), the focus of the discipline has traditionally been on communicative micro-situations, affiliative/disaffiliative functions of humour, and politeness and face (e.g. Boxer and Cortés-Conde 1997; Hay 2001; Haugh 2010) that typically involve individuals rather than groups.

The papers in this panel address the issue of the ‘other’ as a target of humour, discussing the diverse discursive realizations, effects, and functions of othering via humour. We are particularly interested in exploring how personal/public texts (the micro-level) and discursive practices (‘the meso-level’) connect with the broader social practices (the ‘macro-level’; Fairclough 1992); or how humor mediates between the macro-level involving dominant values and views, and the micro-level involving the discursive strategies and texts produced by individuals (van Dijk 2008). This implies, for instance, tracing what stereotypes are associated with the various out-groups and how they are discursively handled by members of the in-group, particularly with view to delegitimising the outgroup or pursuing some other overt and covert aims in local communicative contexts. The papers in this panel apply the relevant methodologies of various sub-disciplines of pragmatics, complementing them with a perspective informed by critical discourse studies (cf. Wodak et al. 2009; Hart 2010; 2010; Hart and Cap 2014). The data for analysis come from various domains including media discourse (cf. Chovanec and

Ermida 2012), political communication (cf. Tsakona and Popa 2011), conversational interactions (Norrick and Chiaro 2009), and social media (Dynel and Chovanec 2015).

#### ***The pragmatics-conversation analysis interface***

The aim of this panel is to bring together presentations exploring the interface between Conversation Analysis (CA) and Pragmatics. This capitalises on the growing interest in the relationship between the two, as evidenced by, for example, the popular panel on the interfaces of pragmatics at the last IPrA. Pragmatics introduced us to the concept of language as action in the form of Speech Act Theory, and the theory of politeness, anchored in empirical, anthropological research, furthered our understanding of collaborative behaviour. CA shares many of its assumptions with these streams of work; in addition, its attention to naturally-occurring data has enhanced our understanding of how actions are implemented across sequences. In so doing, CA has thrown new light on a number of pragmatic concerns. These include the relationship between an utterance's form and its function, the nature of inference, and sequential positioning as a resource for meaning. For example, conversation-analytic work on the actions implemented by particular turn formats has contributed to pragmatic work on indirectness; work on laughter and humour is addressing pragmatic concerns regarding figurative language and the serious/non-serious distinction; and work on variation in grammatical structure can, in its attention to concerns such as morality and accountability, give us access to pragmatic domains such as politeness. Participants are encouraged to present empirical research demonstrating how rigorous, sequential analysis of naturally occurring interaction contributes important insights into these and other topics of Pragmatic interest.

### **Eva Codó**

#### ***The neoliberalization of educational systems: Englishization policies and the creation of flexible workers***

This panel seeks to gain a critical understanding of the process of intensification of English-medium instruction (EMI) in different parts of the world. The objective of the panel is two-fold. First, it aims to tie Englishization policies and practices to the marketizing and neoliberalizing agenda of contemporary school systems whose objective is the creation of productive workers who can enhance the global competitiveness of national economies. Lo Bianco (2014) has argued that the status of English in the school curricula is changing in that it has entered the set of basic skills all kids should acquire and is disappearing as a separate discipline. This is part and parcel of the training of students for the service economy, which requires soft and relational skills, and of the technicist drive in education (Hill & Kumar, 2009), which favours professional, transversal and transferrable skills (Hirt, 2009). Secondly, the panel aims to explore the effects of the whole-heartedly embracing of EMI on the flexibilization (and precarization) of the teaching profession, following the work of scholars like Urcioui (2008), who has investigated the skillification of contemporary labour. This political economic perspective is largely absent from EMI studies, and follows pleas by Block, Gray and Holborrow (2012) and Ricento (2015), among others, to adopt a more interdisciplinary and materialist approach to applied linguistics.

The panel is innovative in two ways. First, it aims to compare ethnographic data from distinct state contexts and educational levels. Scholars working on Catalonia (Spain), the Philippines and Sweden and who are doing research on secondary and tertiary education have been invited. Secondly, the panel tries to dissect the intertwining of English policies and labour issues from different angles. One set of papers will focus on deciphering what types of ideal students these policies aim to produce and with what consequences for whom. One of the papers will investigate the ideological underpinnings and consequences of an ongoing educational reform in the Philippines aimed to introduce vocational training early in secondary education in order to produce employable workers. It is expected that this reform will further intensify EMI. Another of the papers will discuss how EMI in Sweden became more prevalent after a reform in the early 1990s that gave schools more freedom to introduce different forms of instruction, as well as the possibility to marketize educational options. It will also deconstruct stakeholders' views of English as a way to ensure students' successful professional careers imagined in a competitive global context. A third paper will investigate the entrepreneurial ethos and self-skilling practices of EMI teachers working in the public educational sector in Barcelona, Spain, who decide to "volunteer" to teach their courses in English as a way of trying to secure a permanent job. Finally, the fourth paper will present an auto-ethnography of an instructor in an English-medium teacher training program who challenged her students' naturalized discourses about English as the ultimate commodity.

### ***Functions of pragmatic markers: Why should we care?***

Interactive communication – whether spoken, signed or gestural – is characterized by very frequent and multifunctional devices called “pragmatic markers” (henceforth PMs, e.g. Brinton 1996, Aijmer 2013) which have only scarcely been studied in (multimodal) applied linguistics. PMs in speech (e.g. *well, you know*), gestures (e.g. nodding, shrugging) and signed language (e.g. buoys, palm-up gestures) are increasingly the focus of empirical research, whether corpus-based or experimental, investigating their many functions and variation across speakers, situations and languages. The bulk of these studies provide in-depth analyses of the role and meaning-in-context of these discursive devices, either focusing on particular expressions (e.g. Aijmer 1997 on English *I think*, Seyfeddinipur 2004 on the “pistol hand” gesture in Iran), contrastive pairs (e.g. Bazzanella et al. 2007 on Italian *allora* and French *alors*, Bolly et al. 2015 on “palm-ups” in spoken French and French Belgian Sign Language, Romero-Trillo 2007 on *involvement discourse markers* in English and Spanish), a subclass of markers (e.g. Haselow 2012 on final particles in English, Kendon 2004 and Müller 2004 on the “palm-up” gesture family) or, less frequently, the whole category (e.g. Allwood et al. 2007, Bavelas et al. 1995, Cuenca 2013). Most authors converge in identifying three major functions, taking up Halliday’s (1970, 1974) seminal categories of ideational, textual and interpersonal meanings, which can then be subdivided in a variety of more specific uses such as markers of coherence relations, topic structure, interaction management, common ground or emotion. These functions are often associated with internal features such as syntactic position in speech or hand orientation in gesture, as well as differing effects in cognitive processing (e.g. Rohde & Horton 2014). The existence of PMs with similar functions across the spoken, gestural and signed modalities is in itself a cue to the relevance of this category for the study of natural language and its applications “in the real world”. While the functions of written PMs are well established and heavily documented in many theoretical and applied frameworks (e.g. Taboada & Mann 2006 for an overview of the applications of Rhetorical Structure Theory), their counterparts in speech, gestures and signed language are rarely tackled by applied linguists, as opposed to the bulk of descriptive or case studies. Combining a functional and applied approach to PMs brings new light onto the online mechanisms of interpretation and opens up the perspectives of purely descriptive works, however great their theoretical and/or methodological contribution. Applied linguistics has been investigating the functions of PMs primarily in learner language and acquisition studies (e.g. Fung & Carter

2007, Goldin-Meadow et al. 2007, Müller 2005), along with other perspectives inspired by the cognitive and computer sciences.

This panel will gather applied linguists working on the functions of PMs – be they spoken, gestural, or multimodal – in a variety of fields of study such as language acquisition, speech pathology, aging studies and fluency analysis. The aims are to i) raise awareness of existing work and point to promising areas, ii) further our knowledge by triangulating multidisciplinary evidence, and iii) create new synergies and foster collaboration between research fields.

### ***Complimenting behaviour in social media***

Complimenting is a commonplace activity that can fulfil a range of discursal, instrumental, relational and other functions (cf. Golato, 2011; Jaworski, 1995; Kerbrat-Orecchioni, 1994; Sifianou, 2001; Wolfson & Manes, 1980). There is a wealth of research on the realization of compliments and compliment responses in different languages and sociocultural contexts in relation to face-to-face interactions (see Chen, 2010, for an overview). However, not much attention has been given to online environments, and social media, in particular, where

complimenting is a conversational resource of widespread use; indeed, in recent years, its (mis)use in some situations has been the object of heated debate in the press, blogs and social media (cf. Quinn, 8 Sep 2015). Interesting findings are emerging from recent work on compliments and compliment responses on SNSs sites such as Orkut (Das, 2010) and Facebook (cf. Das, work-in-progress; Eslami, Jabbari, & Kuo, 2015; Maíz Arévalo & García Gómez, 2013; Placencia & Lower, 2013; Placencia, Lower, & Powell, in press). Nonetheless, there is still a great deal to be explored in relation to Facebook and other sites such as LinkedIn, Twitter, MySpace, Tumblr and Instagram: for example, how complimenting behaviour is shaped by technology and whether SNSs and globalization processes are resulting in homogenized behaviour (Sifianou, 2013); the objects of compliments and the form that compliments take in these new environments, including the use of multimodality; the functions compliments fulfil, who compliments who, how compliments are perceived by different groups and how compliments are responded to (or not). There is also a need for discussion on methodological issues and challenges in the study of complimenting behaviour in social media.

## Daria Dayte, Els Tobback & Tom Van Hout

### *Self-presentation and self-praise: The neglected speech acts*

Self-praise (or boasting, bragging, self-elevation, positive disclosure...) is a speech act that aims to invoke a desired positive image of the speaker, and can thus be seen as a face-enhancing act directed at the speaker and non-supportive to the hearer (Dayter 2016). The assumption in literature has been mostly that self-praise is interactionally risky in bona fide discourse. However, there is very little research on self-praise from a linguistic perspective and the few empirical studies that exist seem to contradict the intuitions about the 'social ban' on self-praise (Underwood 2011, Wu 2011). For example, in certain genres such as job applications or interviews positive self-presentation is appropriate and expected (Holtgraves 1990, Jones et al. 1961). This panel will involve a series of presenters whose work addresses linguistic self-disclosure and positive self-presentation in the widest variety of communicative contexts. The focus will be on evidence-based investigations devoted to the linguistic practices, strategies and interactional functions of self-presentation in autobiographical reporting on- and offline. With the participation of the contributors to this panel, we intend to investigate the ways in which

people market themselves as a “personal brand” ( cf. Manning 2010, Page 2012, Gershon 2014) and present themselves as successful, enthusiastic, enterprising without losing credibility. An inalienable part of this research question is the influence of gender and cultural background on strategies used to maintain the balance between professional competence and personality, between credibility and persuasive strength in self-praising contexts. We would like to invite contributions which investigate self-enhancement in everyday conversation along with the genres that are traditionally judged to be more appropriate for bragging (social media profiles, professional biographies on social networks such as LinkedIn, selfie captions, award acceptance speeches). The aim of this panel is to open up the discussion of these hitherto neglected communicative activity and to demonstrate that self-praise is an integral and frequent element of interaction. Ideally, the panel will reach beyond the politeness-theory based approaches to self-enhancement and provide an update on the developments of self-praise research from the vantage point of different theoretical models and disciplines, including linguistics, discursive psychology, sociology, and media studies. The attendants of the panel will hopefully contribute to paving the way to the comprehensive description of self-praise, its place and role in interaction and the possible social censure associated with it.

## Arnulf Deppermann

### *Early responses*

Actions in social interaction are not only sequentially ordered (Schegloff 2007), but they are also sensitive to simultaneous events (Goodwin 1981), not only overlaps (Jefferson, 1983) but sometimes even synchronized simultaneous trajectories (Lerner 2002).

This panel focus on an exemplary kind of simultaneity in joint action: early responses. These are responses to a first pair part action (FPP) which start already in overlap with the initiating action, i.e. before the FPP is completed and a transition relevance place is reached. Cases in point are granting a request, following an instruction, and answering a question. Responses may be verbal, multimodal (verbal and embodied) or (merely) visible bodily actions.

Contributions to the panel will inquire into the precise temporal organization of the deployment of early responses with respect to the trajectory of the emerging FPP. Two leading questions will be pursued:

(a) Which features of context and activity do participants orient to when producing early responses?

Responsive actions can build on the recognition point (Jefferson 1983) of the FPP, but they may also use earlier segments of it that provide for early projections of the action the FPP is to perform and/or the expected kind of response (cf. Levinson 2013). Gestures and other multimodal conduct that precede or accompany the verbal turn may also establish early projections, e.g. index (probable) referents or anticipate trajectories of actions. The larger sequential context can establish expectations for next actions (which allow for early disambiguation). Larger shared interactional histories and interactional as well as praxeological routines can make certain responses strongly expectable and sometimes even normatively required given a certain contextual configuration and activity type. As a boundary case, early responses may even be produced independently from the FPP by virtue of shared routines. The contributions in the panel will be interested in the properties of FPPs (e.g. turn-initial particles, syntax of turn-beginnings; cf. Deppermann 2013; Pekarek Doehler et al. 2015) and their producers' bodily activities (e.g. pointing gestures, gaze direction; cf. Mondada 2015) and other contextual sources which provide for early projections which are observably used for the production of early responses. This investigation includes identifying the precise aspects of the expected response which are projected early (e.g. who is addressed, the type of responsive action, the object which the addressee should turn to, etc.).

(b) How are the time courses of FPP and SPP synchronized?

In order to see how the emerging understanding of an FPP and its projective potentials informs responses, it is necessary to attend to the fine temporal details of the unfolding FPP (e.g. the coordination of multimodal resources, Schegloff 1984, its emerging syntax, Auer 2009) and of the responsive action (e.g. its onset vis->0-vis the FPP, the way it makes use of features of the still ongoing FPP produced so far, the emergence of the SPP and its praxeological properties).

Thanks to this focus on early responses, the panel wishes to contribute to two major theoretical issues of research on social interaction:

- a) the nature, sources, temporal trajectories and orders of *projection* in interaction and
- b) the relationship between *sequentiality, anticipation and simultaneity* in multimodal interaction.

### Jennifer A. Dickinson

#### *Between graphic and grapheme: Representation in writing*

Recent work in the study of writing systems has highlighted less formalized practices that fall outside negotiation of written standards. These include mixing writing systems (e.g. Androutsopoulos 2014; Dickinson 2015; Miller 2011), codeswitching in writing (e.g. Sebba 2013), and the use of symbols or graphics in combination with graphemes (e.g. Miller 2011). This panel pushes study of the graphic/grapheme interface further, focusing specifically on the pragmatic effects of manipulating paragraphemic features of scripts (Smith and Schmidt 1996) as well as the use of non-linguistic graphics (pictures, symbols) as part of meaning creation in linguistic contexts. Papers on this panel ask questions such as “How do readers interpret graphics incorporated as elements of written texts?” “What underlying ideologies of graphic representation of linguistic meaning structure graphic elements of writing?” and “How do specific uses and interpretations of writing using graphics and graphemes define or challenge community boundaries?” These questions focus inquiry on graphic representation (of linguistic meaning, of emotional and attitudinal stance, of community membership, of shared beliefs) as part of how writers and readers create meaning in written and hybrid texts. Participants in this panel explore pragmatics at the overlap between graphemes and graphics, where the combination produces culturally situated linguistic meanings. Topics explored on this panel include the pragmatics of emojis, pictures and other graphics in social media posts; representation of paralinguistic elements in textual communication; alternative and hybrid systems for graphic representation of language; the linguistic effects of ellipsis, acronymization and deliberate erasure of textual elements, and creation of complex cultural meaning through the interlacing of visual and linguistic cues. In the first session, papers focus on patterns of use and interpretation of graphic elements in a range of writing contexts; in the second session, papers focus on script choices and the relation between scripts and graphics in cultural and linguistic ideological context.

#### ***The Interrelation between evidentiality, mitigation and appraisal across genres (1 of 3)***

This panel presents contributions to the relations, limits, and interactions between three interconnected discursive dimensions: evidentiality, mitigation and appraisal. Evidentiality, the expression of the source of the information that sustains the speaker's claims (Anderson 1986; Boye 2012), has been researched both from a more formal-linguistic perspective (Aikhenvald 2004; De Haan 1999, 2001, 2005) and from a more discursive-pragmatic approach (Fox 2001; Hill & Irvine 1993; Mushin 2000, 2001). Since evidentiality has a direct connection with the construction and transmission of knowledge in discourse, evidential markers have also been examined in relation to the notion of stance (du Bois, 2007; Clift, 2006; Kärkkäinen 2003; Mushin 2001).

Mitigation, on the other hand, constitutes a communicative strategy used by the speaker to convey distance in relation to the message (Briz 2003, 2006; Briz & Albelda 2013; Caffi 1999, 2007). With mitigation, the illocutive force of the speech acts and the role of the participants are minimized, whether to reach an intended agreement or to reduce conflict (Briz 2006). In this regard, mitigation is dependent upon the management of interlocutors' faces during social encounters. Mitigation and evidentiality can interact in discourse, for instance, when the speaker construes his/her epistemic stance towards certain information. Thus, *shields* (Caffi 1999), a linguistic mechanism to depersonalize the statements made, can also be used as evidential markers to express that the speaker is not the source of the information and that he/she is avoiding any personal responsibility for the content (Albelda in press).

Evidentiality and mitigation also intersect with the linguistic expression of emotion and evaluation, a research topic that has been approached from different perspectives: studies of affect (Batson et al. 1992), subjectivity and point of view (Banfield 1982; Langacker 1990; Traugott 1995, 2010), modality (Palmer 1986; Bybee & Fleischman 1995; Portner 2009), and appraisal (Martin & White 2005), among others. Appraisal has been well described in English across different genres, ranging from political discourse/news stories (White 1998; Coffin & O'Halloran 2006) to casual conversation (Eggins & Slade 1997). Few studies, however, have been dedicated to examining appraisal in Spanish (e.g., Kaplan 2007; Achugar 2008).

Against this background, this panel includes studies dedicated to quantitative and/or qualitative corpus-driven analysis of evidentiality, mitigation and appraisal in different discursive genres, with the aim to reveal genre-type patterns of interaction between these three categories. The research questions of the present panel are:

What are the interrelations between the pragmatic strategies of evidentiality, mitigation and appraisal?

What are the limits and combinations of the semantics and pragmatics of these three dimensions in discourse?

What are the relations between these three dimensions and the macrodimension of stance?

The contributions brought together are concerned with topics related to the interdependences between evidentiality, mitigation and appraisal in contexts such as

- Online communication: social networks, forums and blogs.
- Political discourse in newspaper articles or essays
- Journalistic language
- Academic discourse
- Customer reviews of products (e.g. on Amazon or TripAdvisor)
- Colloquial conversation
- Translation, especially of evaluative texts
- Personal narratives

## **Rita Finkbeiner**

### ***Pragmatics and constructions***

Constructionist approaches to grammar usually do not draw a clear distinction between semantics and pragmatics. This is in line with standard definitions of Construction Grammar as a non-modular theory (Goldberg 2013; cf. also Langacker 1987). Thus, a constructionist analysis represents both truth-functional aspects and aspects such as information structure and speech act force as part of the meaning side of a construction (Lakoff 1987, Lambrecht 1994). Furthermore, constructionist approaches usually do not provide a theoretical explication of the role of general pragmatic principles, e.g., Gricean maxims, in the theory. However, it is clear that (instantiations of) constructions - be it morphological constructions, phraseological constructions,

or more abstract syntactic patterns - are uttered by speakers in discourse, and are interpreted by hearers in discourse. Within recent approaches to the semantics/pragmatics interface, it is unanimously believed that utterances are semantically underdetermined (e.g., Carston 2016, Ariel 2016). That is, the interpretation of utterances is only in part determined by their encoded meaning, while a great deal is achieved inferentially by hearers in context. This should be true not only for utterances of sentences, but also for utterances of all kinds of constructions. For instance, while some constructions may be conventionally associated with a specific speech act force, e.g., *Him be a doctor?* (Kay 2004; cf. also Morgan 1978), others may have a broad illocutionary potential and realize different illocutions in different contexts, governed by regular syntax-pragmatics interaction (Bach/Harnish 1979, Kissine 2012, Meibauer 2013). Therefore, a comprehensive theory of constructions should not only cover aspects of discourse that are conventionally attached to constructions (Östman 2005, Nikiforidou 2009), but should also incorporate a systematic interface with pragmatics, e.g., a systematic component of speech act assignment. Also, constructions often allow for a wide array of slightly different usages/interpretations (e.g., Ariel 2013; cf. also Finkbeiner 2014). A theory that specifies every meaning aspect as part of the construction seems to be forced to assume different constructions for every usage. By contrast, a theory that can account for different interpretations via additional contextual processes such as explicature or implicature arguably is more parsimonious (Borg 2012).

This panel brings together researchers interested in constructions and construction grammar, theoretical pragmatics, and the semantics/pragmatics interface, addressing

- competing theoretical approaches to constructional meaning
- the role of pragmatics in Construction Grammar
- the role of constructions in theoretical pragmatics
- the relationship between conventional and inferential meaning in constructions
- the nature of the meaning of different types of constructions, e.g., morphological constructions, phrasal constructions, sentence types
- the meanings of constructions in different languages, language variation and language change

*Sincerity and epistolarity*

This panel explores the role of sincerity in the epistolary construction and inference of speaker subjectivity and intersubjectivity. Regardless of the specific period of composition, the letter genre holds enduring interest for linguists, literary critics, historians and pragmatists alike as a medium that has the capacity to convey the attitude of the inscribed ego towards the self and the addressee, as well as events, objects and external agents, for example.

One way to investigate the impact of the letter as self-expression or subjectivity is to examine the role that the notion of sincerity plays in persuading readers that the letter serves as a direct and trustworthy representation of the speaker (or writer). Contributors define, operationalize and problematize the notion of sincerity and discuss its salience in reading letters in a range of different languages, written in different periods. The presentations examine metalinguistic, discursive and pragmatic levels in their analysis and interrogate the ways in which the context of production may condition the reading of sincerity.

In English letters, the writer's attitude has been ostensibly inscribed and, over time, conventionalized in the salutations that open and close letters. In particular, the signatory encodes the relationship that the writer shares with the addressee with terms such as *sincerely*, *faithfully*, etc. Contributors working on letters in languages other than English, from all historical periods, explore ways to measure the distance between the epistolary act and its ascription as 'sincere'. We thus examine 'sincerity' from a semasiological as well as an onomasiological perspective. In so doing, we explore the relationship between the linguistic instantiation of 'sincerity' and the range of possible interpretations over time, from the 'avowal of feeling', 'honesty', to 'genuineness of feeling'.

The overarching question for panelists is thus: what is the role of sincerity in the construction of epistolarity in different languages over time? The panel will consist of three sessions over the day in which contributors will present and discuss their papers.

### **Maria Marta Garcia Negroni & Silvia Ramírez Gelbes** *About subjectivity and otherness in language and discourse*

Philosophical in its origins, the category of *subject* has aroused and continues to arouse interest in the field of study of various disciplines: linguistics, psychoanalysis, anthropology, sociology, literary theory. Heir of the Cartesian cogito, the traditional notion of subject is set as a guarantee of absolute truths and has contributed to the representation of a world that can be expressed in stable, universal and true laws. In recent decades, these conceptions which were sustained in a binary logic have been replaced by perspectives that contemplate the unstable nature of the subject and its modes of representation of the world. Along these lines, Pragmatics has incorporated the subjective component as a founding constituent of signification. However, the relevance given in this regard to the question of the intention of the speaker and the concept of literal sense reveals the persistence not only of an almighty subject who says just what she means and nothing more but also of purely informational (i.e., supposedly objective) elements in meaning. In this panel, with polyphonic and non-veridical approaches, i.e., dialogism, enunciation polyphony, enunciation heterogeneities, discourse analysis (Amossy, 1999; Authier, 1995; Bajtin, 1982; Bres et al., 2005; Ducrot, 1984, 2004; Maingueneau, 1999) as its framework, issues related to different types of formulations that account for the presence and the manifestations of subjectivity and otherness in language and discourse will be analyzed: autonimic modalization; evidential, allusive, and ironic points of view; echoes; doxal statements; various forms of presence of discursive memory; different types of ethos, etcetera. The presentations will be delivered in Spanish, Portuguese, French and English.

The first slot will be dedicated to "Subjectivity, otherness and conflict"; the second one will be about "Subjectivity, otherness and dialogism"; the third one will deal with the topic "Subjectivity, otherness and discourses for special purposes"; the fourth and last one will be about "Subjectivity, otherness and new discourses".

### *Activities in interaction*

This panel conceptualizes the notion “activity” as a perspective on the thick descriptions that challenge researchers when analyzing video-recordings of mundane and institutional interaction. Despite the relevance of activities to the social organization of mundane and institutional interaction (Levinson 1992, 2003), Robinson (2013) notes a “relative lack of clarity and precision regarding the conceptualization and definition of *activity* as a unit of interaction” (Robinson 2013: 260). This panel intends to shed more light on how activities may be conceptualized and defined, taking a specific interest in the embodied organization of activities across linguistic and socio-cultural communities.

Activities are regarded as “topically coherent and/or goal-coherent course[s] of action” (Heritage and Sorjonen 1994: 4), which may consist of a minimal sequence, i.e. a single adjacency pair, e.g. a greeting (Sacks 1972, Schegloff 2007), or may come in ‘big packages’ (Sacks 1992 vol. II: 354), i.e. longer, more extended sequences, such as troubles talk (Jefferson 1988). Participants can engage in “multi-activity”, i.e. in more than one activity at the same time, e.g. dinner table conversation (Ch. Goodwin 1984) or telephone calls (Mondada 2008).

The panels brings together contributions that explore the embodied accomplishment of activities in social interaction, at multiple levels and in various settings, drawing on video recordings of naturalistic interaction from these complementary perspectives:

- 1) The use of specific vocal, verbal, visuo-spatial resources and/or object to shape, orchestrate and constitute an emerging embodied activity, in being functional e.g. in turn-taking and sequence organization; in displaying, managing and negotiating the epistemic access, rights and authority as well as speaker’s source of information; in displaying and making relevant stance. The panel welcomes studies that examine the formal and functional range of such resources.
- 2) The embodied coordination and organization of (multi-)activities by participants: in accomplishing the beginning and/or end and/or the transition from one activity to another; in managing the internal organization of the ongoing activity (e.g. Ch. Goodwin 1984, M. Goodwin 1980a,b, Heath 1982, 1984); in orienting to the (changing) participation framework or supra-sequential structures as meaningful steps in the activity at hand (Robinson 2013).
- 3) A theoretical-methodological discussion about which unit of analysis provides the best grasp on the data, i.e. the bodily conduct or talk (or both?) that provides for the progression and coordination of the activity; how extra technological equipment, e.g. eyetrackers, can help us further our understanding of the forms and functions of gaze across activities and cultures; how we can grasp that both a minimal sequence of adjacency pairs (e.g. assessments) as well as extended tellings where turn-taking is suspended are conceptualized as activities theoretically and methodologically.

#### ***Mediatizing emotion in reactions to global events and crises***

Twitter has turned into a key reporting tool for sharing stories and stances on global events, such as national elections, sports events and crises, including natural disasters, celebrity death, political imbroglios, or major attack incidents (Weller, Bruns, Burgess et al. 2014, p.xvi). On Twitter - and other social media platforms - breaking news of global events and crises unfold moment-by-moment in tandem with networked users' commentary and reactions to these. This multifaceted news stream creates an experience of ambient news (Hermida 2010) characterized by 'deeply subjective accounts and interpretations of events as they unfold' (Papacharissi 2015, p. 56). For example, the terrorist shooting at the editorial office of the satirical magazine Charlie Hebdo was followed by a global Twitter discussion that received several millions of tweets. The reactions were divided: the magazine received expressions of solidarity and sympathy, but also ironic and parodic comments (Johansson & al. 2015). The hashtag #JeSuisCharlie quickly trended alongside #CharlieHebdo as a meta-story resource creating dividing lines of identification and bringing about new modes of digital witnessing of global events (Giaxoglou 2016).

The starting point for this panel is that emotion - viewed as inter-subjective, culture-bound, mediated "meaning/feeling experiences" (Leavitt 1996, p.530) - occupies a central place in digital cultures of participation and sharing (Benski and Fischer 2014). Our panel argues for the relevance of discourse-pragmatic approaches to developing our understanding of (i) the impact of social media on the representation, presentation and sharing of emotion in reaction to global events and crises, (ii) the variation of practices of mediatizing emotion across different languages and contexts and (iii) the implications of particular digital practices of stancetaking for the emergence of different modes of public engagement with global events and crises.

Papers in this panel examine a range of contexts and languages, including English, French, Finnish and Greek using a combination of quantitative and qualitative methodologies as appropriate to each study. Individual papers examine how emotion is encoded in world leaders' reactions to terrorist attacks as well as how Twitter users reacted to the Charlie Hebdo attack bonding and dividing around the hashtag #JeSuisCharlie. The ambiguities surrounding the meaning of the hashtag are explored in the context of debates on Wikipedia while the issues related to its circulation and (re)appropriation are discussed in the case of the emergence of hashtag slogans such as #JeSuisAnkara, where place is co-articulated with affect. Papers in this panel also examine the different kinds of resources afforded by different social media platforms, e.g. Twitter, Instagram and Flickr for expressing and sharing emotion in relation to different types of events, including reactions to celebrity death and political or economic crises. Taken together, the papers in this panel shed light into the varied ways in which emotion is drawn upon as a resource for the ecstatic sharing of stories, meta-stories and commentary about global news, events, and crises.

### **Cynthia Gordon**

#### ***Food for thought and social action: Constructing ideologies in food-related communication across digital and cultural contexts***

This panel illuminates the relationship between discourse, action, and ideology by examining the intersection of two areas of growing interest in pragmatics and related fields—interaction about food, and digital communication. Each has been studied separately; for example, recent edited volumes explore *Language and Food* (Szatrowski, 2014) and *Culinary Linguistics* (Gerhardt, Frobenius, & Ley, 2013) on the one hand, and *Discourse 2.0* (Tannen & Trester, 2013) and *Digital Discourse* (Thurlow & Mroczek, 2011) on the other. Increasingly, however, these areas intersect on platforms such as Twitter, Instagram, and YouTube. This panel, by exploring food-related interaction in various digital and cultural contexts, demonstrates how users mobilize language, images, and videos—and food as a discursive resource—to accomplish actions of social, cultural, and political consequence, thereby constructing ideologies that encompass, and transcend, food.

The papers that make up this panel contribute to the relatively small body of existing studies that consider food-related digital communication (e.g., Brandt & Jenks, 2011; Snejder & te Molder, 2005; Vásquez & Chik, 2015; Zappavigna, 2014), while also extending research on conversational discourse that shows how communicating about food (and drink) not only creates tastes and preferences, but also accomplishes social and ideological work (e.g., Dominguez-Whitehead & Whitehead, 2014; Gonçalves, 2013; Karrebæk, 2014; Ochs, Pontecorvo, & Fasulo, 1996; Wiggins, 2013). Panel contributors draw upon various discourse-based approaches to digital communication (e.g., Androutsopoulos, 2008; Herring, 2004) to illuminate food-related interaction across a range of cultural and digital contexts, including the multimodal discourse of an Korean livestreaming online eating show; discussion thread posts by self-proclaimed “picky eaters” on an English-language weight-loss and health website; food blogs that address veganism; *The New York Times* Instagram posts regarding Brooklyn-based restaurants; comments posted in response to YouTube videos addressing Russia’s ban on imported Western food; Twitter communication about an imported food scandal in the Middle Eastern country of Oman; and Facebook posts and tweets that draw on material from a Belgian Dutch-language infotainment TV program on food and nutrition. Collectively, the papers illuminate how, in digital contexts, language and multimodal resources serve to not only communicate about food, but also as a means of accomplishing sociability, circulating health-related information, creating identities, drawing social and cultural boundaries, and conveying political stances.

#### ***The pragmatics of change in therapy and related formats***

Numerous studies have identified recurrent interactional practices in psychotherapy (Peräkylä et al. 2008; Pawelczyk 2011; Scarvaglieri 2013) and related formats like coaching (Graf 2015) or counseling (Muntigl 2004; Hutchby 2007). The primary focus was on reconstructing specific “trajectories” of interaction (Vehviläinen 2003; Peräkylä 2004) and on understanding potential difficulties that emerge in these interaction formats (Streeck 2004; MacMartin 2008). More recently, research focus has turned towards relating interactional processes of psychotherapy to their institutional purpose, i.e. clients’ need for change (Pawelczyk/Graf forthc.). Since change “is the motivation for all psychotherapies” (Peräkylä 2013: ch. 6), this shift has the potential to draw attention to discursive aspects that are of vital importance for process and outcome of psychotherapy (Voutilainen et al. 2011). Concurrently, such findings contribute to discussions in clinical psychology on factors that support change, on ways in which change manifests itself, and on conceptual aspects of change (e.g. Streeck 2008; Lambert 2013). Yet, change is not only a motivating factor for psychotherapy, but also for related discourse formats, especially coaching and physician-patient interaction. Discourse-based process-research in these formats has however only started to address issues of change (e.g. Graf/Pawelczyk 2014; Busch/Spranz-Fogasy 2015). Investigating the pragmatics of change within and across various helping formats addresses crucial interactional processes and allows for deeper insights into differences and commonalities of helping professions (Graf et al. 2014). To do so, the panel aims to address conceptual and empirical questions particularly, but not exclusively, in the context of *dimension of change*, *object of change* and *interactional format of change*:

- Regarding the various *dimensions of change*, change is understood as transformed ways of talking (Voutilainen et al. 2011) from a purely language based perspective, as differences in the way clients act and deal from an action-theoretical perspective (Scarvaglieri 2013) and as differences in the way clients think and react from a mental(istic) perspective.
- Regarding the *object of change*, most work restricts change to the client. Yet there are studies (Buchholz 2003) that locate it in the *relationship between client and the professional*, which undergoes change in successful helping professional interaction. As such, the idea of change in *therapist, coach, doctor etc.*, i.e. in the way these professionals deal with clients, understand and react towards them, needs to be examined as well (cf. Crichton 2015).
- Regarding the *interactional formats that contribute to change* (Ribeiro et al. 2013), questions center on: Where in the interaction does change start (Scarvaglieri 2015)? How can interactional formats that serve as *starting*

*points* for change be identified and characterized? Which actions and interaction formats pursue processes of change and how are they co-constructed by professional and client? And more generally: How is change manifested in interaction? How can change be traced linguistically?

The papers in this panel discuss how these (and possibly others) dimensions of change can be investigated from an interaction based standpoint in psychotherapy, counseling, coaching and physician-patient interaction.

## **Luca Greco**

### ***Touching-the-body in interaction***

A sense like touch, and most specifically the activity of touching-the-body, is a powerful vehicle in interaction with objects, material environment and between social actors. It is maybe one of the most powerful semiotic resources that participants may mobilize in order to perceive and respond to the physical world, accomplish intersubjectivity, construct and maintain intimacy and, more generally, experience the world, as testified by some influential works in psychology (Gibson 1962), philosophy (Merleau-Ponty 1964), neurosciences (Abraira & Ginty 2013), robotics (Culberston, Unwin, Kuchenbecker 2014) and gender studies (Irigaray 1977).

Despite its relevance, physically touching-the-body (i.e. without the mediation of objects) has been little investigated in interactional studies, compared to other modalities such as gaze (Goodwin 1981, Rossano 2012), pointing (Kita 2003, Kendon 2004), nods (Stivers 2008), etc. Notable exceptions are the pioneering work of Streek (2009), Cekaite (2010), Nishizaka (2011), and M. H. Goodwin (2013, 2015).

This panel sets out to explore:

- i) the analysis of different types of touching-the-body (palpation, massage, stamp, brush...), of their temporal and sequential organization in interaction ;
- ii) the role of touching-the-body in the accomplishment of both ordinary and professional practices and in indexing members' identities and organizing participation frameworks;
- iii) the multiple ways through which touching-the-body contributes to the local and shared construction of the body itself as the result of intersubjectivity.

All contributors use conversation analysis and multimodal interaction analysis as methods of investigation. They explore these issues across a set of different languages (English, French, Italian) and settings : ordinary settings (Ticca, Traverso and Ursi ICAR Lab Lyon 2), drag king workshops (Greco, Sorbonne Nouvelle), hairdressing service encounters (Horlacher Basel University), medical encounters (Galatolo, University of Bologna), police encounters with citizens (Mells, UCLA).

Greco will present a critical state of the art concerning the study of touching practices in social sciences within a praxeological approach as an introduction to the panel.

Greco will focus on situations in which a drag king expert mobilizes touching on his own face as a way to show and to project to the drag king novice a possible and a relevant make up for the incomer.

Ticca, Traverso and Ursi will show that touching in everyday greetings is not only used in the more or less conventional forms of shake hand, kissing, etc., but it can also accompan the transition towards the next activity.

Horlacher will show that clients access their head manually a) when giving instructions to the hairdresser during the initial phase of the encounter b) when requesting for a revision at the end of the encounter.

Galatolo's analysis aims at showing how the physical examination, and particularly the touching of the patient's injured limb(s), is introduced, and how touch and visual inspection are intertwined

Mells explores touching from the establishment of rights to physically apprehend a suspect to the more subtle forms of care and compassion that police officers may implement by touching the persons they have stopped.

## **Marie-Noelle Guillot, Louisa Desilla & Maria Pavesi**

### ***Films in translation – all is not lost: Pragmatics and audiovisual translation as cross-cultural mediation***

This panel on Audiovisual Translation (AVT) as Cross-cultural Mediation is intended to promote collaboration and the coordination of research in this new domain from a cross-cultural pragmatics perspective. The circulation of foreign-language films and media products relying on subtitling or dubbing to reach their public has increased considerably with digitization and global dissemination, and audio-visual media, film and television have acquired unprecedented currency as a medium of cross-cultural exchange. Our understanding of

what is at stake in processes of interlingual mediation through AVT from a pragmatics and cross-cultural pragmatics perspective has lagged behind. While AVT has been peripheral in pragmatics research, with barely any publications in main pragmatics journals to date, within AVT studies research with an overt or covert pragmatics outlook has been gathering momentum. There are broad questions to be addressed, at the interface of description and reception. What picture is given by foreign-language films via subtitling or dubbing of how people talk and negotiate interpersonal meaning and interaction in other languages? How do foreign-language film audiences understand foreign films and respond to the linguistic and cultural representations conveyed through AVT? Work has been building up for description, with a growing pool of studies from an acknowledged pragmatics or cross-cultural pragmatics perspective, from early milestone work on politeness, the sequential structure of interactions or interactional naturalness in screen translation (Hatim and Mason 1997, Remael 2003, Pérez-González 2007) to more recent case or corpus studies on a range of other aspects (e.g. speech acts and conversational routines like greetings/leave taking, compliments, swearing, discourse markers, orality, deixis, interpersonal address, implicature; Bonsignori et al. 2011, Bruti 2009, Chaume 2004, Desilla 2012, Greenall 2011, Guillot 2008, 2010, 2012, 2016a, Pavesi 2009 a,b,c, 2013, Pavesi et al. 2014, Pinto 2010 among others). We are at a point where a more concerted effort is called for to systematize description, per se and as a platform for reception studies of responses to AVT-mediated linguistic and cultural representation, so far very few (Desilla 2014, De Pablos 2015). There are general and AVT-specific methodological issues to be mindful of: un(der)-specified theoretical context/methodology/research questions; conclusions from limited evidence or decontextualized micro-level text analysis; neglect of recipient design and other narrative or medium specificities (multimodal interdependence of the meaning-making resources involved; textual stylization; cultural a-synchrony pitching target language-triggered pragmatic expectations and on-screen source context, for example); pragmatic indexing and situatedness of linguistic/pragmatic choices, increasingly seen to mark out subtitling and dubbing as language varieties or registers in their own right, explicitly (Guillot 2016b, Pavesi et al. 2014) or implicitly (e.g. Casarini 2012, De Meo 2012, Longo 2009, Matamala 2009, Romero Fresco 2009, Ranzato 2010)). The panel brings together contributions that are collaborating in this effort, to bring critical mass to this new domain of enquiry and put it more firmly on the pragmatics research agenda<sup>1</sup>.  
 Organised in conjunction with the AHRC-Funded research network Tapping the Power of Foreign Language Films: AVT as Cross-cultural Mediation (AH/N007026/1; Guillot, UEA, Co-I Desilla, UCL, with Mingant, Pavesi, Zabalbeascoa; 05/16-10/17).

### **Miki Hanazaki**

#### ***Linguistic expressions and devices that yield the implicature of cause and effect***

Implicature has been a big issue in pragmatics since Grice (1975), and a considerable amount of research has been conducted to reveal ways in which the interlocutors yield many implications, one of which is the implication of cause and effect. Obviously, one device of inviting the interpretation of cause and effect is to use lexical terms which shows such relation, such as because as in the sentence I was in bed because of a cold. However, the same situation can be expressed by conveying the simultaneity of two events as in I was in bed as I had a cold or I was in bed with a cold or Being sick, I was in bed. Also, showing that the two events occur in a temporal sequence also provokes the construal of such relation as in He died after the stroke. Another linguistic device to invite the interpretation of cause and effect relation is a simple juxtaposing of two events, as in I was in bed. I had a cold. And of course, the cohesion within the discourse plays a great role in the production of the implicature.

The purpose of this panel is to examine 1) what kind of expressions and devices are available cross-linguistically to yield the implicature of cause and effect, 2) to explore which devices are universal / culture-specific in making the interlocutors interpret the expressions as having such implications, and 3) what kind of mechanisms are involved in the construal of such interpretation.

In order to achieve this purpose, this panel will analyze data in English, Japanese, German, Spanish, Babanki, Ewe, Korean, Russian, Sidaama, Yucatec Maya, and Chinese. Some papers in the panel will deal with the lexical items that involve the fabrication of the implicature, some will deal with when and how the causal relation is explicitly uttered / left implicit, some will deal with sports broadcasting or newspaper and also political discourse that let the receivers interpret the discourse as cause and effect, and some will deal with the METAPHOR that is involved in the construal.

### **Maj-Britt Mosegaard Hansen**

#### ***Cyclicity in semantic-pragmatic change***

It has been known at least since Jespersen (1917) that certain types of linguistic items or constructions tend to evolve in a cyclic fashion across languages. Thus, van Gelderen (2011) identifies a total of seven well-documented diachronic cycles pertaining to (morpho-)syntactic items and constructions across a wide variety of languages. Similar cyclic developments have been discovered in the domain of phonology (e.g. Bermudez-Otero & Trousdale 2012). This panel will investigate the nature and cross-linguistic importance of cyclicity at a third level of linguistic description, i.e. that of semantics and pragmatics, aiming to contribute potentially very significantly to current theoretical debates about the nature of language change more generally. The idea that there might be cyclic movements at the level of semantics and pragmatics was first adumbrated and subsequently explicitly proposed by Hansen (2013, 2014), as well as (independently) by Ghezzi/Molinelli (2014). In subsequent work, Hansen (2015, fc) adduces a range of examples of semantic/pragmatic cyclicity from across various Romance languages. Although the phenomenon appears manifest, its existence thus constitutes a very recent discovery, which promises to be of descriptive and theoretical significance, but whose scope and cross-linguistic importance need to be more systematically investigated. Such investigation necessitates a concerted team effort involving semantics/pragmatics specialists with expertise across a range of languages. This panel is therefore exploratory in nature and aims to further the research agenda set out above by presenting a series of pilot studies on semantic/pragmatic cyclicity. Contributions will identify and analyze examples of semantic/pragmatic cycles across a number of languages (principally Latin and Romance), focusing on the evolution of pragmatic markers from propositional source items and constructions. In addition, and with a view to identifying suitable empirical domains of focus for further investigation, the contributions and the concluding roundtable will address issues such as (i) the relative importance of semasiological (form-focused, e.g. Lat IAM > OldFr ja > ModFr déjà) vs onomasiological (function-focused, e.g. Lat NUNC > OF or > ModF maintenant) cyclicity; (ii) whether some semantic/pragmatic fields (e.g. temporality) are more prone to exhibit cyclicity than others; and (iii) whether semantic/pragmatic cyclicity typically involves push chains or drag chains.

#### ***How to construct “memory”: Stories of the nuclear events from Hiroshima to Fukushima***

In resonance with Belfast, the city where IPrA 2017 will be held, this panel aims to reveal how we human beings re/construct “memories” of the past historical events in Hiroshima and Fukushima. A “memory” is constructed with the collective and selected elements in the flow of the time. Therefore, it necessarily forces us to insert subjective, political, personal, governmental, or media’s viewpoints in the manner of selecting elements for the reconstruction.

Especially, we will analyse the cases of nuclear power related to memorable events in Japan over a century, Hiroshima and Fukushima, former was the bomb and the latter was an accident. In May 2016, Hiroshima, a place where the first nuclear bomb was fallen in 1945, was visited by the current American President Obama. This memorable event was worldwide broadcasted immediately, followed by many interviews to the victims/survivors, and discussion of supporting and opposing groups in the mass media, Internet media and

inter-personal media. Analysing these materials by the methods of critical discourse analysis, multimodal analysis, conversation analysis, and narrative analysis, from the viewpoints of sociology, anthropology, and discursive psychology, we will illustrate how the personal experiences, current culture, society, political intention, and international power relationships are reflected on the reconstruction of “memories.”

Bakhtin ([1975] 1981) says that the meaning of reported speech can be transformed by the reporting context. Following him, Fairclough (1992) insists that texts may or may not be “reaccentuated,” according to key or tone of the context. In terms of the level of the word, “referring term” is also one of the key issues (in this case, victims / survivors / *hibakusha*, killed / died / dead, nuclear weapon / killing machine / terrible force) in collective memory (Schffrin 2001). Referring term may or may not come from the context including complex aspects. In the discourse level, mention of the details is effective to involve people to be emotional (Tannen 1989).

From these points of view, four contributions with data analysis will be presented on this panel. As a starter, from CDA perspective, Akira Satoh investigates how media construct ‘realities,’ comparing and contrasting Western and Japanese media coverage of the nuclear events in Japan, i.e., the atomic bombing and the nuclear power plant accident. Second, from narrative and multimodal analysis, Kaori Hata explores the process of reconstruction of collective memory in the historical nuclear event in Hiroshima and recontextualisation of memory about newly nuclear event in Fukushima in mass media. Third, from discursive psychological approach, Toshiaki Furukawa analyses how participants constructed memory in hearings held by the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission. Last, Noriko Okamoto analyses multimodal aspects of media coverage about Obama’s visit to Fukushima to explore the process of recontextualisation of memories. In this panel, we will discuss these points above with actual data.

## **Stefan Hauser & Wolfgang Kesselheim**

### ***Empractical speaking and knowledge construction***

Whenever non-linguistic activities in a joint action setting dominate the attention of the participants and speech is oriented to these activities, we may speak of „empractical speech“. Throughout the last two decades empractical speaking has gained increasing interest in various disciplinary fields. Empractical communication comes in all kinds of shapes and colours, and it challenges traditional language-centred concepts of interaction. The multifaceted nature and its multimodal foundation might be the main reasons why empractical speaking still is, as several scholars have pointed out, a rather fuzzy concept: „Empractical speaking may be elliptical, but need not be; it may involve turn-taking, but need not; it may also contain extended phases of silence, occasionally interrupted by “islands” of terse speech, floating on the sea of action, as Karl Bühler used to say“ (o’Connell/Kowal 2012, viii). The booming field of research in multimodal interaction (Goodwin 2000; Mondada 2013) has prepared the ground for new research in empractical communication, highlighting the role of the spatial environment with its objects and with the participants’ bodies (Neville et al. 2014). This has often led to an interest in situations where language is subservient to non-linguistic activities such as video gaming, surgery operations, sessions in physiotherapy, teaching in dancing classes, etc. In our panel we want to push forward the methodological and theoretical reflection on empractical communication. We will focus especially on empractical settings where participants jointly construct shared knowledge (cf. Svensson Sanchez et al 2009; Arminen et al 2014), since it is often in situations like these that the role of objects, bodies or space in and for interaction gets readily observable. The goal of the panel is to gain a deeper understanding of empractical speaking in contexts of interactive knowledge construction inside and outside institutional frameworks and formalized teaching-and-learning-settings . We invite papers that focus on: - Analytical aspects: How is empractical communication realized in terms of semiotic resources? How is knowledge shared and interactively constructed? - Methodological aspects: What types of empractical interaction are best suited to analyze the complementary effects of the different semiotic resources involved? What kinds of observations are needed to get hold of the spatial boundedness of empractical communication? – Theoretical aspects: What kinds of concepts of interaction and joint activity need to be considered in order to gain a deeper insight into empractical speaking?

#### ***Children's explaining and arguing in different conversational contexts***

Explaining and arguing are frequent activities in children's and adolescent's everyday life. They form an inherent part of peer interaction (Goodwin & Goodwin 1987, Corsaro & Rizzo 1990; Aukrust 2004; Church 2009; Blum-Kulka, Hamo et al. 2010; Hester & Hester 2010; Cekaite 2012; Morek 2014; Zadunaisky Ehrlich & Blum-Kulka 2014; Arendt 2015), family interaction (Aukrust & Snow 1998; Heller 2012, 2014; Morek 2012; Arcidiacono & Bova 2014) and classroom discourse (Heller 2012; Morek 2012; Spreckels 2009; Koole 2012; Vogt 2009). Both the social organization as well as the functions of explaining and arguing differ greatly across contexts. While in peer interaction arguing has been found to fulfill purposes of negotiating identities and constituting social order, in classroom discourse it is mainly used for constructing knowledge by substantiating validity claims. Children thus need to understand the different contextual requirements and functions of explaining and arguing in the real world; and teachers need to know how they can support and evaluate explaining and arguing skills. Contextual differences make it difficult though to conceptualize explanatory and argumentative competence. Researchers agree, however, that producing explanations and arguments requires children to organize longer and more complex sequences of talk, to display and recognize epistemic stances such as knowing/not knowing, claiming, justifying, conceding, and to establish global relations (e.g. such as causal, conditional, functional, means-end relations). The panel investigates the facets that constitute explanatory and argumentative competences in conversations and discusses empirical evidence of explanatory and argumentative practices in children of different age and varying socio-cognitive resources. From a methodological perspective, the panel also deals with the question how acquisitional processes can be empirically investigated. The papers of the panel analyze explaining and arguing as sequentially organized interactive processes. They are based on audiovisual recordings of naturally occurring interactions and reconstruct patterns and functions of explaining and arguing in different contexts as well as resources and mechanisms of acquisition. The questions we aim to address include:

- Which functions does children's explaining and arguing serve in peer interaction, family interaction and classroom discourse?
- Which multimodal resources including prosody, gestures, facial expressions as well as lexical and syntactical resources are used for explaining and arguing?
- How can explanatory and argumentative competences be conceptualized?
- What data constellations are appropriate for investigating the acquisition of explanatory and argumentative discourse competence?
- What are the social, interactive and epistemic resources that support the acquisition of argumentative and explanatory discourse competence?

### **Yuko Higashiizumi, Noriko O. Onodera & Reijirou Shibasaki**

#### ***Sequentiality and constructionalization of discourse-pragmatic markers***

This panel aims to explore the relation between the sequence of linguistic items in discourse and the development of their form–meaning pairings, i.e. constructions (Goldberg 2006). Among these, we will particularly focus on constructions which typically serve discourse-pragmatic functions, such as discourse markers, pragmatic markers, modal particles, and comment clauses. Such constructions are frequently created and develop in the initial and final positions of a discourse unit (turn, utterance or clause), e.g. utterance-initial and utterance-final use of connectives in Japanese (Onodera 2014; Izutsu & Izutsu 2014), utterance-final use of *then*, *though*, and *anyway* in English (Haselow 2014).

The initial and final positions of a discourse unit, referred to as left and right periphery (LP and RP) respectively, is another focus of this panel. Discourse-pragmatic expressions used at LP and RP have recently drawn growing interest (Onodera (ed.) 2017; Higashiizumi et al. (eds.) 2016; Traugott 2016, 2015; Hancil et al. (eds.) 2015; Haselow 2016, 2015; Higashiizumi 2015; Beeching and Detges (eds.) 2014; Shibasaki to appear,

2011) and have been examined in previous IPrA panels (Higashiizumi & Sawada's and Sohn's at IPrA 2015, Higashiizumi & Onodera's and Traugott & Degand's at IPrA 2013, Beeching's at IPrA 2011). Developing from prior work on constructions at LP and RP, and mainly using a constructionalization approach (Traugott & Trousdale 2013; Traugott 2014), we will discuss how sequentiality in discourse affects the diachronic rise of new constructions. We take the constructionalization approach because relatively less work has been done on the diachronic aspects of the constructions which mainly serve discourse-pragmatic functions. By taking the constructionalization approach, we will explore a wide range of expressions that serve similar discourse-pragmatic functions at LP and RP cross-linguistically, as in Table 1. We bring together contributions from a diachronic perspective, related (but not exclusively limited) to constructions at one or more of the syntactic level(s) in the table. Notice that we will interpret both LP and RP in a broader sense, e.g. 'left peripheral' and 'right peripheral' (see Traugott 2015). Among others, one question to be asked in this panel is: should we posit macro-schemas differentiated by preference for position (LP or RP)? If there are distinctive distributional patterns in the use of discourse-pragmatic expressions in a particular language, it would be appropriate to do so. Discourse-pragmatic expressions' preference for LP/RP may differ among different languages.

We use empirical data such as examples taken from a diachronic corpus, conversations in novels and play scripts and present-day conversational data for analysis.

**Table 1:** Examples of LP and RP constructions ( X = utterance or clause )

LP	
Syntactic level	
Morpheme/lexeme	English: <i>Surely</i> + X (Traugott 2014b)
Phrase	Japanese: <i>Tte-yuu-ka</i> + X 'quotative-say-question + X' as an initiator for a (sub-)topic shift (Laury & Okamoto 2011)
Clause	English: <i>The question is</i> + X (= Interrogative) (Shibasaki 2015)
Sentence	German: <i>Weißt du was?</i> + X 'know you what? + X' as an initiator for a (sub-)topic shift
RP	
Syntactic level	
Morpheme/lexeme	Japanese: X + <i>koto</i> 'X + event = Do X (order, request)' (Onodera 2014)
Phrase	English: X + <i>and everything</i>
Clause	English: X + <i>is what I mean/is all.</i>
Sentence	English: X + <i>That's the bottom line.</i>

### **Christiane Hohenstein, Magdalène Levy-Tödter, Bernd Meyer & Kristin Bührig** ***Increasing mobility in health care and challenges to multilingual health care communication***

Ageing populations in the well-developed countries of both Europe and Asia, increasing mobility of both health care workers and patients from different linguistic and cultural backgrounds, and the arrival of unprecedented amounts of refugees in Europe are recent phenomena which lead to an increased complexity in public health care and within health-care organizations. Our panel aims to bring together researchers in these areas in order to examine the intersection of institutional discourse, healthcare communication, intercultural pragmatics and medical interpreting. Many studies have focused on the practice of multilingualism in health care (cf. Rehbein

1994; Angelelli 2004; Gotti/Salager-Meyer eds. 2006; Roberts 2008; Meyer/Apfelbaum eds. 2010; Meyer 2011), considerable attention has been paid to the relationship between doctors and patients, and more recently to the interaction between nurses, pharmacists and patients in intercultural and multilingual settings (Major/Holmes 2008; Watermeyer/Penn 2009; Meyer et al. 2010; Heritage/Maynard 2011; Schön 2012; Staples 2015). The crucial role played by interpreters has been highlighted specifically (Meyer 2004; Pöhhacker/Schlesinger eds. 2007; Garzone 2011; Albl-Mikasa et al. 2015; Hohenstein/Albl-Mikasa forthc.), and linguistic issues as well as the cultural background of patients form recurring focal points of research (Frank 2000; Schouten/Meeuwiesen 2006; Zhang 2010; Zayts/Schnurr 2011; McGrath et al. 2013; Bührig/Meyer 2015; Gotti et al. eds. 2015). Specific interest has been taken in pragmatic competences of doctors (Erickson/Rittenberg 1987; Nguyen 2012; Fioramonte 2014); and research on training concepts and international medical education also takes into account L2 and ESP contexts (Cordella/Musgrave 2009; Dorgan et al. 2009; Van de Poel/Brunfaut 2010; Hoekje 2011; Jain/Krieger 2011; Lu/Corbett 2012). Findings of a study on linguistic competence and professional identity in English medium instruction suggest that in the face of linguistic lacunae macro-contextual social factors play an important role for constructing a professional identity (House/Lévy-Tödter 2010), which may have an impact as well on doctors using a foreign language or lingua franca with patients. Based on these subjects and findings, the panel aims to discuss the need for new communicative and methodological agendas which may address the complexity of multilingual health care communication. In order to explore this, we invite presentations that focus on and address questions such as:

- Which are the specific communicative challenges of multilingualism and intercultural communication in relevant discourse types (i.e. medical interviews, briefings for informed consent, bad news delivery, counseling)?
- How do multicultural and multilingual constellations relate to current models of the doctor-patient relationship (especially shared decision making)?
- How do multilingual language policies look like that take into account specific communicative needs of patients and health professionals?
- How do practitioners actually make use of their linguistic competencies in communication with allophone patients?
- To what extent can linguistic competence have an influence on professional identity within a multilingual environment? The aim of this panel is to gain a deeper understanding of the methodological and theoretical challenges in this research field and also to discuss ways of contrastive analysis. (Text: 478 words)

### ***The pragmatics of “bonding” in cross-cultural encounters: East Asian perspectives***

The purpose of this panel is to discuss and describe how cross-cultural encounters are managed pragmatically, using multimodal resources from phonetic resonance to social affiliation. Building on the panel “*Bonded through Context*” held at the 13<sup>th</sup> International Pragmatics conference, the panel brings together scholars who look into cross-cultural encounters as situated discourse with an East Asian perspective of focusing the analysis on the emergent context of interaction. The term “bonding” is used here as a metaphoric framework, as we examine how the processes of interaction themselves pull participants into the act and art of creating and recreating discursive alignments and dis-alignments. Here, the notion “to bond” does not point to an idealized state of solidarity-making or shared affiliation/identity category. Rather, the idea is used to highlight how multiple layers of discursive alignments and dis-alignments enact the sense of co-occupancy of the diachronic real-time present. Issues in “cross-cultural encounters” have been a real world concern and a leading research theme in pragmatics, yielding universal theories as accommodation (Giles, Coupland and Coupland 1991),

speech acts (Wierzbicka 2003), rapport management (Spencer-Oatey 2000), and politeness/impoliteness (Brown and Levinson 1987, Culpeper 2011) to which humans work out to maintain interpersonal relationships. While many of these classic theories identified cross-cultural as cross-linguistic, this panel takes a broader and more refined definition to the notion of “cross-culture,” incorporating differences in linguistic and stylistic backgrounds as well as shared and non-shared common grounds (including physical space) and imbalanced participational frameworks. The papers in this panel focus on the fine-tuned mutual engagement between the interlocutors on multiple levels, such as phonetic resonance, prosody, laughter, mutual gesturing and body positions, in order to demonstrate how cross-cultural encounters are managed in a self-organizational matter beyond the volitional strategies of the individuals. Taking the linguistic anthropology view of “discourse-centered approach to culture” (Sherzer 1987, Hill 2005, Yamaguchi 2006) as well as incorporating the concept of “Ba” from the recent developments in Emancipatory Pragmatics (Fujii 2012, Saft 2014, Ide 2016), the panel aims to rigorously describe the dynamic nature of emergent discursive processes, taking “interactional processes” rather than the “speaker(s)” as the center of meaning-making. We bring together papers by researchers who take an ethnographic approach to the study of cross-cultural encounters, looking at interaction as a corporal practice emerging within the situated contexts of the here-and-now. Presentation topics include cross-cultural discussions, interaction between interviewers and interviewees, residents of a community talking with new-comers and the like. Through this panel, we hope to illuminate the dynamic processes of moment to moment interactional alignments/dis-alignments, which play a central role in “bonding” the participants in the local of cross-cultural encounters.

## **Cornelia Ilie**

### ***Questioning-answering practices across contexts and cultures***

From the early stages in the development of the field of pragmatics, questioning and answering practices have been a constantly expanding area of research, since they are the building blocks of co-constructed communication dynamics, encompassing a multiplicity of linguistic, extralinguistic and paralinguistic paradigms. Both empirical evidence and scholarly findings indicate that most of our private and professional activities are being carried out partially or wholly by means of question-answer sequences (Meyer, 1988; Ilie 2015). Research on questioning and answering has been conducted in a wide variety of settings, such as casual conversations (Weber 1993; Freed 1994; Yoon, 2010), media interviews (Harris, 1991; Elliott & Bull, 1996; Heritage, 2002; Ilie, 2011), press conferences (Clayman and Heritage, 2002; Clayman et al., 2007; Sun 2010; Clayman et al., 2012), parliamentary debates (Pérez de Ayala, 2001; Sánchez de Dios and Wiberg, 2012; Ilie, 2015), talk shows (Ilie, 1999, 2001; Tanaka, 2015), criminal trials (Atkinson and Drew, 1979; Pascual 2006; Aldridge and Luchjenbroers, 2007; Monsefi, 2012), police interviews (Williamson, 1993; Heydon, 2005; Haworth 2006; Newbury and Johnson, 2006), doctor-patient encounters (Frankel, 1990; Ainsworth-Vaughn, 1994; Boyd & Heritage, 2006). While considerable research has been devoted to varying aspects related to the asking of questions in specific contexts and settings, less attention has been devoted to cross-linguistic examination of commonalities and differences regarding the presuppositions, implicatures and expectations triggered by the uses of language- and culture-specific questioning-answering practices in comparable communication situations. A major purpose of this panel is to bridge this gap by acknowledging that although the forms, functions and frequency of questions may differ widely across languages, cultures and societies, their contextualized uses reveal certain basic mechanisms of interpersonal understanding and interactive meaning co-construction that also display commonalities.

In this panel we adopt a variety of analytical approaches pertaining to pragmatics, and/or interfacing with pragmatics, in order to ensure systematic examination and comparison of different types of empirical data in an inter-disciplinary, trans-contextual and cross-cultural perspective. On the one hand, we wish to explore the pragmatic dimensions of the interplay between questions and answers in various situations and communities of practice. On the other hand, we want to further develop existing methodological frameworks for the analysis of questions and answers, by adopting interdisciplinary approaches that can more appropriately provide new insights into the diversities and commonalities of questioning-answering practices and highlight shifting interpersonal relationships (social, professional, individual role interplay; identity issues; affiliation/disaffiliation; in-group/out-group), institutional and non-institutional goal orientation (public-private communication interface; cooperation/competition), culture- and language-specific norms and rituals (cross-cultural politeness behaviour, context-specific face saving/threatening acts), to name but a few.

The panel brings together scholars who are using various pragmatic and interdisciplinary approaches to explore the context-based correlations between questions and answers, and the ways in which questioning and answering strategies shape and are shaped by the socio-cultural contexts and the communities of practice in which they are used.

### **Wolfgang Imo & Jens Philipp Lanwer** *Stance-taking in interaction*

Stance-taking is inextricably interwoven with everyday interaction: Whenever we talk about something, we also express our stance (e.g. DuBois 2007). Objects of stance (such as self and other, propositions etc.) are as diverse as the linguistic displays used for stance-taking. In everyday usage contexts we can typically observe co-occurrences of different semiotic resources, for instance a combination of a specific pitch-tone with specific lexical material in a specific syntactic slot in a specific sequential position. An example in case would be lengthened, whispered instances of German *nein* (*no*), with which speakers can express incredulity and an alignment concerning the assessment of a given situation (Imo in prep.). In face-to-face interaction those co-occurrence-patterns are regularly accompanied by specific gestural displays. At the same time gestural displays can also function as stance-taking devices on their own. For instance, loosely dropping the eye-lids can be used as a visual display for signaling accordance (Kendon 1967:57). Accordingly, the questions that are to be addressed in this panel are how the expression of stance is managed by exploiting various semiotic resources, i.e. which prosodic, lexical, syntactical or even gestural patterns are used resp. combined in which kind of usage context to express which kind of stance (e.g. epistemic vs. emotive stance) and which of these patterns can be treated as more or less specialized and conventionalized stance-taking devices. A special focus will be on the empirical (Conversation Analysis or Interactional Linguistics informed) analysis of stance-taking in institutional contexts, i.e. on what the forms, functions and processes of the interactional management on stance-taking in communicative situations such as service encounters, medical communication, teaching contexts etc. are.

### **Shoichi Iwasaki, Yoshiko Matsumoto & Toshi Nakayama** *Multiplicity in grammar: Modes, genres and speaker's knowledge*

Research based on naturally-occurring data from various contexts has illustrated that speakers' grammatical knowledge is not monolithic, thereby challenging a unitary view of grammar. This panel will further examine the multiplicity of grammatical knowledge represented in different modes, genres and contexts, and delve into the question of how systematically such grammatical multiplicity can be described. In pursuing this goal, the panel will consider different approaches to the question, examining phenomena presented in different languages. One of the approaches that has advanced the multiplicity view is the tradition of research on spoken vs. written languages, recently formulated as the multiple grammar (MG) model (Iwasaki 2015). Spoken and written languages differ not only in the media that they use (sound vs. graph), but also in a host of other features. Spoken language most typically realized in conversation, and used mainly for social interaction, is temporally and spatially immediate, and is acquired in a naturalistic setting, while written language, detached from the temporal and spatial immediacy is suited for expressing complex thoughts, and is acquired through explicit learning. As a consequence, it is possible that different grammatical systems develop, and individuals who both speak and write may have multiple grammars (e.g., Pawley and Syder 1983a,b, Miller and Weinert 1998). Another approach represented in some recent work in construction grammar (CxG) has focused on the relationship between grammatical constructions and contextual patterns /genre (e.g. conversation, religious ceremony, advertisements, emphatic narration, newspaper headlines, invocatory discourse, among others). In exploring the possibility of extending the core concept of the form-meaning pairing of construction grammar to the arena of discourse and contextual patterns (i.e. genres), it addresses the possibility of pairing the features of the form with function/situations (e.g. Fried and Östman 2005, Nikiforidou 2015, Fischer 2015, Matsumoto 2015). It also facilitates inclusion of constructional patterns that otherwise may be seen as being in the periphery of normative grammar. Our panel aims to further our understanding of variability in grammar within one speaker and across genres, drawing examples from several languages. We invite researchers working in various frameworks to jointly engage in this inquiry. Some topics of our inquiry include the following. What phenomena prompt us to consider multiplicity? Does grammatical variability necessarily entail multiple grammars or can we model it in a different way? How do the actual usage data fare with the traditional bounded,

unitary view of grammar, and top-down approaches? How multiplicity manifest at the structural, discourse, and societal levels? Is multiplicity observed systemwide, or is it localized in a limited range of domains? Can grammar be internally diverse ('multiple') and integrated at the same time? In what ways do we need to change the way we look at and study language/grammar? Do we need to change our methodology? Does it affect goals of our studies?

#### *Postcolonial linguistic landscapes: Reading globalisation in the margins*

The ethnographic analysis of contemporary linguistic and semiotic landscapes is proving to be a sensitive tool for exploring the sociolinguistic effects of globalisation on communities in an increasingly connected yet unequal world (cf. Stroud & Mpendukana, 2009; Blommaert, 2013). Czaika and de Haas (2014) and many others have argued that globalisation is not a uniform process but rather experienced in deeply asymmetrical ways. For some, globalisation may be experienced as increased mobility, greater social contact, opportunities for education or employment, access to material goods and technological resources, and resulting in increasingly complex language and identity practices as work on sociolinguistic superdiversity has shown. For others, globalisation is experienced altogether differently, often in the form of social rejection and loss of status, autonomy or linguistic capital, and resulting in increased marginalisation, exclusion or exploitation (Ferguson, 2006). It therefore matters for our theories of language and globalisation whether we take a metropolitan perspective or a perspective from the margins (Wang et al., 2014).

The contributions to this panel therefore seek to engage with postcolonial linguistic landscapes and read in what forms current globalisation appears, how globalisation is experienced, and what globalisation means from the peripheral/semi-peripheral vantage point. The study of linguistic landscapes as a visual and material approach to language in the real world can serve to explore centre-periphery relationships as well as to identify the global asymmetries and material inequalities involved. The asymmetrical interconnections between centre and periphery, post-colony and post-empire, homeland and diaspora or urban and rural present an opportunity to explore these dual dimensions of linguistic landscapes in settings where translocal and transnational flows and relationships are very much in evidence. Responding to recent calls to use Southern theory in the humanities (e.g., Connell, 2014), the papers in this panel consider the globalising and localising meaning-making and place-making processes of visible language in material and symbolic spaces in postcolonial and post-communist settings and their diasporas, in order to engage with alternative readings of globalisation from the margins and so to decentre the sociolinguistics of globalisation.

#### ***Ritual and ritualisation in interpersonal pragmatics***

**Background:** Ritual practices play a key role in daily interpersonal interactions, due to the liminal nature of ritual: as ritual practices embody and reinforce the moral order of communities (Kádár, 2013; 2016), they serve as a tool for communities to maintain their interaction norms. Ritual can manifest itself in many forms, spanning demarcated ceremonies, through short and informal exchanges, to seemingly freely co-constructed interaction. Yet, all these interactional manifestations of ritual behaviour have a number of joint characteristics, including a) recurrence (ritual is a practice, with recurrent formal and sequential properties), b) liminality (ritual brings the participants into an altered state of mind), c) emotivity (ritual is a highly emotive practice), and d) embodiment of the moral order. Ritual has a broad interface with (im)politeness (Kádár & Haugh, 2013), due to the fact that the maintenance of moral order triggers (im)polite inferences. Thus, ritual deserves in-depth research from the perspective of the pragmatician, due to the central role that politeness plays in the field. In addition, ritual is a salient phenomenon in intercultural contact (Kádár & Ran 2015), and so the study of this phenomenon can contribute to intercultural politeness research, which is a somewhat neglected area. The aim of this panel is to bring together leading researchers of the ritual field, hence promoting collaborative research in this area. We intend to publish a collection of papers of the panel with a leading academic publisher (we will approach Cambridge University Press).

#### ***Producing 'foreigners' in TV entertainment shows: Sequence, categorization, and multisemiotic practices***

In research on media discourse, the category of 'foreigner' has predominantly been investigated in expressly political genres, including political speeches, legislative initiatives, and discussions of such initiatives in the news media. Less attention has been given to the representation of 'foreigners' in entertainment genres such as television talk shows and variety shows. Yet as demonstrated in prior research (Fukuda 2017; Furukawa 2015, 2016), such representations trade on and reinforce public knowledge and opinion. An important feature of these shows is their enhancement for the TV audience through 'telop' (Television Opaque Projector). These texts or graphics are superimposed in post-production and communicate to the viewer how to understand and what to feel about the indexed character or scene (O'Hagan 2010; Sasamoto 2014). Telop are also strongly present in TV entertainment programs in Korea and becoming more widespread across East Asia and South East Asia. It therefore bears investigation how telop as semiotic resources shape viewers' experience at particular moments and in conjunction with the unfolding interaction.

This panel examines how the category of 'foreigner' is produced in different genres of highly popular TV entertainment shows in several sociocultural contexts. To this end, we adopt the combined perspectives of multimodal conversation analysis (e.g., Mondada 2014), membership categorization analysis (Fitzgerald & Housley 2015; Hester & Eglin 1997; Sacks 1972, 1992), and multisemiotic analysis (Ventola & Guijarro 2009) to answer three overarching questions. 1. How is the category of foreigner mobilized to advance participants' agenda in the local context of the TV program? 2. How are participants in a TV show interactionally and semiotically constructed as 'foreigners'? 3. What are the visible consequences of such categorizations in the ongoing interaction in the show and what might their inferable audience impact be?

### **Istvan Kecskes**

#### ***Current issues in intercultural pragmatics***

Intercultural Pragmatics is a relatively new field of inquiry. Its theoretical frame has been shaped by scholars for more than a decade (e.g. Haugh 2008, House 2008, Kecskes 2004, 2013; Moeschler 2004; Romero-Trillo 2011). The discipline is concerned with the way the language system is put to use in social encounters between human beings who have different first languages, communicate in a common language, and, usually, represent different cultures (cf. Kecskes 2004; Kecskes 2013). The communicative process in these encounters is synergistic in the sense that in them existing pragmatic norms representing the L1 of interlocutors and emerging, co-constructed features are blended in a variety of different ways. This approach represents a socio-cognitive perspective in which individual prior experience and actual social situational experience are intertwined in meaning construction and comprehension.

The development of a relatively coherent theoretical frame in intercultural pragmatics has resulted in a great number of different applications that has brought the new field together with other disciplines such as Gricean pragmatics, politeness research, corpus linguistics, discourse and dialogue studies, second language acquisition and others. This panel pulling together scholars from several different countries aims to give a representative sample of research endeavors in the field addressing issues such as deliberate creativity in intercultural interactions, vagueness in English as a Lingua Franca, corpus studies, implication of intercultural pragmatics for language teaching, service encounters, impoliteness in intercultural interaction, etc.

Even though the contributions of the panel deal with diverse issues, the ‘glue’ that holds them together derives from the nature and main tenets of research in intercultural pragmatics. The papers address issues concerning intercultural interactions, present data collected in a variety of intercultural settings and treat interlocutor both as social beings and individuals giving equal importance to cognition and socio-cultural factors. All papers present data and analyses that are bound to inform future research in intercultural communication.

### **Leelo Keevallik & Yael Maschler**

#### ***The emergent grammar of complex clausal structures in interaction***

Over the past two decades or so, linguistic research paradigms have arisen that no longer see grammar as an autonomous system of abstract rules, but rather as a locally sensitive, temporally unfolding resource for social interaction (Hopper 1987, 2011, Auer 2009). As a consequence of this new conceptualization, within interactional linguistics (Selting and Couper-Kuhlen 2001) grammar is studied in its natural ecology, i.e., talk-in-interaction, and in relation to embodied semiotic resources, such as gaze, gesture, and the moving body (Hayashi 2005, Keevallik 2013, Mondada 2014). Owing to thriving research in the field, we are beginning to have a robust understanding of how specific linguistic constructions function as interactional resources for accomplishing specific social actions in a growing number of languages. These studies show that interactional use shapes grammar, which thus is understood as a continually evolving set of constructional patterns emerging from recurrent social actions. In this panel we set out to explore social actions that develop a routinized grammar characterizable as complex clausal structures. Clauses are regarded as the basic units of grammar, and as the building blocks of discourse (Thompson and Couper-Kuhlen 2005). From a formal point of view, complex clausal structures are considered bi-clausal constructions in which one of the clauses (‘the dependent clause’) is embedded as one of the arguments of the main verb, or modifies one of the nominal constituents. However, once investigated in actual spoken language use, this traditional description of subordination is oftentimes found lacking. It has been shown that a ‘dependent’ clause may actually be profiled in interaction, while the ‘main clause’ functions as a formulaic stance device or simply a projector phrase (Thompson 2002, Kärkkäinen 2003, Hopper 2004, Maschler and Fishman 2015). The ‘dependent’ clause may be syntactically unintegrated into any other clause (Wide 2014, Günthner 2015, Lindström et al. in press). Subordinating conjunctions may instead function as discourse markers that structure turn-taking and participation (Keevallik 2008, Koivisto et al. 2011). The real-time production of language furthermore regularly results in incrementally emerging grammar (Couper-Kuhlen and Ono 2007). In this panel we will therefore be exploring how so-called embedded linguistic structures emerge linearly, as continuous adjustments to interactional contingencies and recipients’ actions. While the interactional syntactic studies so far target mostly language (but see Stoenica and Pekarek Doehler 2015), in the current panel we also start to explore the role of recipient gaze, bodily orientation and gesture. The panel is designed to enrich our empirically based understanding of the complex interrelatedness of grammar, the interacting body, and social action. Based on audio and video recordings of interaction, the talks set out to establish routinized formats of social action involving complex clausal structures across several languages, including, English, Estonian, Hebrew, Finnish, and Swedish. Our ultimate aim is to understand the role of grammar within a larger ecology of interactional resources, and how participants deploy them in real time to organize their turns-in-progress.

## **Kobin Kendrick & Paul Drew**

### ***The recruitment of assistance in interaction***

The recruitment of individuals into social and other activities lies at the heart of cooperation and collaboration in our social lives. In several recent publications we have proposed that recruitment provides a more holistic way of conceptualizing and studying how assistance may be provided, sometimes sought (e.g. by requesting, but by many other means) and volunteered (e.g. by offering, but again by many other means) (Kendrick & Drew, 2014, 2016). Recruitment is not itself an action, and implies no necessary intention or other such cognitive state; rather it is the result of a cluster of actions and practices, and encompasses both the vocal (linguistic) as well as the variety of embodied, semiotic resources through which Others are recruited to help resolve difficulties. It also encompasses anticipating another's need of assistance, and offering or simply giving that assistance - Other is thereby recruited to assist, without their assistance having been sought. 'Need' is not a psychological disposition, but refers rather to the difficulty or impedance that can arise during a course of action. That need or difficulty is resolved through the provision of assistance - that is to say, through a recruitment having occurred. Whilst it may be more conventional to refer to seeking and volunteering assistance as requesting and offering, these are better considered to be two sides of the recruitment coin - recruitment conjoins overtly seeking help, with perceiving another's need for, and offering, help (without being asked). But recruitment is achieved through so many other forms of conduct. This broader, more holistic view of the management of assistance is gaining widespread attention and support; other scholars are now beginning to explore the linguistic and other

semiotic resources and practices through which recruitments of assistance may be managed. The aims of this panel are i) to bring together scholars working on recruitment, internationally and in a variety of types of interactions (settings), to explore different forms of (and practices for) recruitment, ii) to promote this vision that treats requesting and offering as not analytically separate actions, but often as conjoined in embodied interactions, and iii) to explore in what ways recruitment is associated with co-operation, altruism and social cohesion in interaction.

#### *Orientations to low entitlements and/or high contingencies during request sequences*

When making or responding to requests, speakers routinely index more (or less) entitlement to have their request granted and less (or more) contingency around possible barriers to its granting (Craven & Potter, 2010; Curl & Drew, 2008; Heinemann, 2006). However, there has been less systematic exploration of different entitlements or contingencies that speakers might mobilise during request sequences. For example, Robinson (2016) notes that when refusing requests (e.g. for his daughter to wash the car), the account for the refusal can reveal radically different orientations to the grounds for the request: e.g., “*You haven’t driven your car since I washed it last week*” is grounded in her lack of need [to wash the car]; “*I just cut my finger*” is grounded in her inability to comply; “*It’s my sister’s turn*” is grounded in her lack of obligation to comply; “*I’m not in the mood*” is grounded in her unwillingness to comply; “*You can’t tell me to wash the car*” is grounded in my lack of right ... to make the request” (p31). This panel will explore different entitlements and contingencies that speakers orient to during request sequences, how such orientations get manifested and negotiated within the interaction (both in turn design and sequence organisation), and what they tell us about the social organisation of getting others to do things for us.

We are restricting our attention to requesting actions and sequences that index low entitlements (LE) or high contingencies (HC). In LE/HC environments we might expect to see orientations to multiple contingencies, tightly constrained displays of entitlement, or reciprocal orientations from recipients (both congruent and incongruent with those initially claimed by requestors).

Our panel consists of six papers, which encompass a wide range of everyday and institutional interactional environments. The first two papers explore healthcare interactions. O’Brien, Pilnick, Beeke, Goldberg & Harwood explore the interactional consequences of overt patient refusals of LE/HC requests in hospital ward-based interactions between people with dementia and the healthcare professionals caring for them. Then Bolen, Angell & Hepburn explore how clients with severe mental illnesses (schizophrenia, bipolar disorders, etc.) advocate for their treatment preferences using LE/HC requests.

Our next three papers each address telephone interactions. Huma, Stokoe & Sikveland examine business-to-business sales calls in which LE/HC requests were recurrently used to occasion a self-invitation to a potential client’s place of work in order to discuss the potential sale further. Bolaños-Carpio explores the range of LE/HC formulations used by callers to emergency services (911) in Costa-Rica when requesting assistance. Kent & Hepburn also explore service request calls, this time in a UK context. They explore the use of “wondering” and “hoping” formulations during callers opening requests for help to a Child Protection Helpline (NSPCC) and to the police (both emergency and non-emergency lines).

Our final paper by Potter, Bolden & Hepburn extends our focus on the use of “wondering” and moves us out of specific institutional contexts to consider the use of “I wonder” formats in everyday conversation. Taken together, these six papers offer an exciting development within the study of entitlement and contingency in interaction. Our aim for the panel is that it will help to illuminate nuances within the framework of entitlement and contingency and thus contribute to the recent resurgence of interest in requesting within Conversation Analysis (cf., Drew & Couper-Kuhlen, 2014).

### Monika Kopytowska & Piotr Cap

#### *Conflict, public sphere and mediated experience: Perspectives on proximization*

**Description and objectives** The goal of the panel is to shed new light on the discursive construction of (mediated) social reality, a process during which certain phenomena, events, groups or individuals acquire their

axiologically and emotionally imbued representations, often with real life implications within the sphere of collective consciousness. It is specifically, to determine how conflict and crisis representations are construed through "proximization", a symbolic shift whereby the THEM elements of the social discourse space are construed as the central US elements (Chilton 2004, 2005; Cap 2006, 2013, 2016). The explanatory power of proximization has been utilized within a number of different theoretical frameworks and thematic domains. Chilton (2005, 2010, 2014) draws upon it in the cognitive-grammatical Deictic Space Theory, Cap (2006, 2008, 2010, 2013) makes it part of his pragma-cognitive model of legitimization, and Hart (2010) incorporates it in his multidisciplinary approach to (metaphoric) construals of the speaker-external threat. While Cap's (2013) model of proximization involves the dimensions of space, time and value and their different construals in state political discourse, the follow-up proximization model developed by Kopytowska (2013, 2014, 2015a, 2015b, 2015c) is essentially media-oriented, positing that mediated social reality is contingent on journalistic/media manipulation of distance in its various dimensions. More specifically, Kopytowska's model explains how in various forms of mediated communication real-world entities (events, groups, individuals, phenomena, both abstract and material) are selected and brought closer to the media users (who have no direct access to these entities), thus influencing their cognitive-affective involvement and, as a result, perceptions, judgements and actions. Models of proximization serve to account for a variety of discourses and genres in public discourse space. They are used in the analysis of crisis construction and war rhetoric (Chovanec 2010; Okulska and Cap 2010; Kopytowska 2015a), (anti-)immigration discourse (Hart 2010), political party representation (Cienki, Kaal and Maks 2010; Kaal 2015), construction of national memory (Filardo Llamas 2010), and mediating religious experience (Kopytowska forth.). Such a variety of approaches and empirical territories calls for a panel which will discuss, (i) the most promising and/or newly evolving thematic areas for the application of proximization as a descriptive tool (e.g. conflict and terrorism studies, crisis communication, new media in political communication), (ii) common methodological procedures to be used within this approach (meant to address both verbal and visual dimensions of proximization), (iii) the methodological status of proximization as a component or a controlling concept in theoretical models.

#### ***Creating worlds from the inside: Turn-initial positions as creators of discourses and worlds***

**Description/Content/Goals** The Panel wants to analyze the conversational and illocutionary functions and forces of the turn-initial positions verbal elements in different settings of spoken discourse and registers (political discourse, patient-doctor-communication and forensic communication). We assume that turn-initial positions create the most decisive parts of discourse because they not only prepare for theme/topic introduction but they introduce and predetermine the discourse role of the speaker and his/her intentions towards world and reality. We try to descend from very little elements of turn-initiators (as we call them “starters” such as Czech *je*) much in the way they were introduced by John Heritage (2013) “Turn-initial position and some of its occupants” (such as *oh* which can appear in different positions and functions as discourse initiators, responders and closing parts). We analyze turn-initial elements in turn-proper contexts (not including non-verbal means of multimodality such as gesture, hands, or tone, visibility) which are in one way or another already a part of the build up syntactic structure, even though they seem to be outside of it, not yet fully integrated. In contrast to non-verbal aspects of turn beginnings (such as breath, hesitation markers etc.), the turn-initial elements described here are very much a part of the ‘turn proper,’ though they are still, for the most part, not yet immediately “syntactically” integrated with the rest of the turn constructional unit. Most of them comprise single lexemes and very little parts of cognitive lexicon, varying greatly in their semantic and functional import from apparently straightforward items like address terms (vocatives), through expressions like Czech *je* (engl. ‘oh’ and ‘ah’) (cf. Heritage, 1984; Aston, 1987) to more opaque discourse markers like Czech *tak teddy, no tak*; Russian *nu čtož*. (engl. ‘well,’) on the semantics and pragmatic functions of which it has been more difficult to find consensus (Jucker, 1993; Pomerantz, 1984; Schiffrin, 1987:102--127; Schegloff and Lerner, 2009; Schourup, 2001, Heritage 2013). Some, but by no means all, of these objects can occupy an entire turn by themselves, cf.: Cz. *Ježíšmarjá* (Geez etc.). These turn-initial objects share some common characteristics that contribute to the difficulties associated with their analysis, and that will bear enumeration. The panel wants to discover the social aspects of these elements w.r.t the establishment of macrostructures, (registers and social contexts) and microstructures. Thus, it will be important to demonstrate, which turn-initial elements can and which must be avoided and which are preferred in different styles and registers of casual (every day urban styles) and non-casual conversational settings (political discourse, patient-doctor-communication and forensic communication).

**Data:** The Corpus Data of any language of the IPRA are welcome. In our analysis, we choose English, German and Slavonic Languages (Russian, Ukrainian, Czech and Polish)

### **Dennis Kurzon**

#### ***Pragmatics in literary texts and other arts***

The interest among linguists in literary texts has a long history, probably spurred on by the pioneering work of Roman Jakobson over a large part of the 20th century (see, e.g., the 1980 volume of *Poetics Today* on ‘Roman Jakobson: Language and Poetry’), from the Russian Formalists to his writings as part of the Prague School, where we may include other scholars such as Jan Mukařovský. The 1960s saw a substantial increase in linguistic studies of literature. Work by Nils Enkvist, Geoffrey Leech, Roger Fowler and Thomas Sebeok firmly established the field within the rather vague but almost all-embracing domain of applied linguistics. Crystal and Davy’s *Investigating English Style* (1969), since it did not include an analysis on literary texts, expanded the term ‘style’ to non-literary style. The pragmatic turn in studies of literary texts, emerging in the latter half of the 1970s, may be partly due to John Austin’s remark concerning language uttered by the actor on stage or by the

poet as “parasitic upon its normal use” (1962: 22). Apart from Jacques Derrida’s far-reaching reaction to Austin’s position, papers began to be written on pragmatic and semiotic features of literary texts. This research has developed in two directions. Firstly, literary works have provided data for pragmatic analysis such as speech act theory, Gricean pragmatics, relevance theory, and politeness. Secondly, the literary work is studied as an act of communication whose basic structure is a message (the work itself), an addresser (the author) and addressees (the readers or audience). Of the many papers and books devoted to aspects of literary pragmatics, we may mention Teun van Dijk’s paper in 1977, Leech’s collaboration with Michael Short on the pragmatics as well as the stylistics of fiction (1981), Brown and Gilman’s study of politeness in Shakespearean tragedies (1989), Hickey on stylistics and pragmatics (1993), the collection of articles in Sell’s edited book (1991), the convener of this panel’s article on speech acts in the novels of Thomas Hardy (Kurzon 1993), and Jacob Mey’s *When Voices Clash* in 1999. More recently, we have Chapman and Clark’s *Pragmatic Literary Stylistics* (2014), two of whose authors are presenting papers on this panel. Moreover, pragmatics may be applied to other artistic fields such as music and the fine arts. There has been some work published on the pragmatics of music (e.g. Coventry and Blackwell 1994, Cram 2009, Kurzon 2011), but very little on the pragmatics of the visual arts (recently, Gompertz 2012).

The panel presentations will tackle both areas of pragmatic research of literary texts - both as data and as an act of communication: artistic texts as a source for data for further pragmatic or literary analysis in topics such as politeness, discourse markers, use of tense in narration, and as part of an analysis of artistic texts as communicative acts, often in terms of Goffman’s approach, such as the role of the director vis-à-vis the audience, the single actor in a dramatic monologue: vis-à-vis the audience, the audience of operatic trios, quartets, quintets, etc., and readers in book groups.

### Cynthia Lee & Angela Chan

#### *The interfaces between pragmatics and language education*

Researchers of pragmatics have explored a variety of topics, ranging from speech acts, speaker meaning to interpretation and negotiation of meaning in natural talk in social contexts, taking into account linguistic and non-linguistic features, sociocultural norms, contexts, and social and power relationships (LoCastro, 2012).

Different approaches have been adopted to reveal the production and comprehension of talk in a variety of social and institutional settings (Bardovi-Harlig & Hartford, 2005; Nguyen & Kasper, 2009), identity construction and role negotiation (Freed & Ehrlich, 2010), politeness in cross-cultural communication (Bargiela-Chiappini & Kádár, 2011) and interlanguage speech act development (Achiba, 2003; Rose, 2009). In addition to these major areas, there is a growing concern on the role of pragmatic competence in language education, particularly for second/foreign language learners (Ishihara & Cohen, 2010; LoCastro, 2012; Rose & Kasper, 2001; Tatsuki & Houck, 2010). Pragmatic competence is an essential component of second language (L2) learners' communicative competence (Bachman, 1990). Many L2 learners with good grammatical competence, however, may fail in intercultural communication because they lack pragmatic competence. One way to develop L2 pragmatic competence is to provide appropriate input for learners or help them to notice the similarities or differences in first language (L1) and L2 social norms and use of language to negotiate meaning in interactions. Classroom instructions (Seedhouse, 2004), printed and Internet resources (Ishihara & Cohen, 2010; Taguchi & Sykes, 2013) and natural exposure to target language and culture (Taguchi, 2015) are some possible ways to achieve the pedagogical goal. However, as shown in many second language acquisition studies, effectiveness of instructed input and natural exposure can be or will be mediated by L2 learners and teachers who bring their own learning beliefs, expectations and sociocultural values when they learn and teach the social norms of the target culture and behaviors of the target language users. Purpose: This panel aims to provide a platform for researchers and practitioners of pragmatics to explore the interfaces between pragmatics and language education, enhance our knowledge about pragmatics in the educational setting through authentic discourse data and discuss pedagogical implications for developing L2 pragmatic competence in the Asian context. Organization of the Panel: This panel will consist of seven to eight contributors. We will share research findings on a variety of topics related to teacher-learner or learner-learner interactions, talk and behaviors, negotiation of role and identity, as well as relationships among input (printed vs technology), instruction (explicit vs implicit) and L2 pragmatic development inside and outside the classroom. A discussant will give some comments at the end of the panel. Panel organizer: Cynthia Lee, Centre for Applied English Studies, the University of Hong Kong. Co-organizer: Angela Chan, Department of English, City University of Hong Kong.

**Carsten Levisen & Eeva Sippola**

*The pragmatics of place: Colonial and postcolonial perspective*

Panel organizers: Carsten Levisen, (Roskilde), Eeva Sippola, (Bremen) In this panel, we explore the diversity of

ways in which “place” is construed and enacted in colonial and postcolonial discourse. Universalist pragmatics has had little to say about place, let alone the pragmatics of place across cultures and historical epochs. Within newer post-universalist approaches to pragmatics, we can begin to study the historicity and variability of “place discourses” constituted by words, metaphors, grammars, narratives, memories, cosmologies, and linguistic worldviews. The aim of this panel is to shed light on the cultural models and knowledges that are at play in discourse and inscribed in people and produced by them through socialization and recurrent discursive enactments. We encourage contributions from a broad range of diversity-oriented approaches to pragmatics, such as Postcolonial Pragmatics (Anchimbe & Janney 2011; Schubert & Volkmann in press), Ethnopr pragmatics (Goddard 2006, Goddard & Ye 2015), Discourse Analysis (Carbaugh 2007, Warnke & Busse 2014), Historical Pragmatics (Taavitsainen & Jucker 2015), Ritual Communication (Basso & Senft 2009), and similar approaches and fields. Contributions may address (but are not restricted to) the following topics:

- Cultural scripts for thinking and talking about place
- Keywords of place enacted in cultural discourse
- Place-based grammatical features enacted in discourse
- Songs, rituals, and other discursive practices or genres associated with place
- Political discourses of place (e.g., in land rights movements)
- Place name research and onomastic pragmatics

We give priority to *empirically* and *emically* grounded contributions that can help explore speech practices across cultures and epochs. The panel understands *pragmatics* in broad terms as the study of meaning-making in cultural, historical, and situational contexts. We seek papers that can help explore place-specific knowledges, conceptualizations of place, or codes associated with people in specific places. A *place*, in this context, can be highly localized (busses, beaches), ethnogeographical (cities, nations), virtual (internet forums), or symbolic/mythical (terra australis, paradise). Our focus on *(post)colonial* means that we are interested in papers that can shed new light on (1) conceptions of place as associated with colonial-era discourse and contemporary postcolonial discourse across the globe, and/or (2) papers that can help deconstruct the Anglocentrism (and Eurocentrism) of universalist pragmatics through comparative studies.

#### ***Personal and collective identities in populist discourse***

A major challenge in the study of political discourse consists in taking into account the extra-linguistic context and its constant evolution. Recent phenomena such as the blurring of the distinctions between left- and right-wing ideology, the fragmentation and diversification of the electorate or the tensions arising between national and supranational structures signal the need for re-defining the actors and reconsidering the role of discourse in worldwide politics. While political candidates and politicians in office tend to employ mediatization and ‘personalization’ strategies (Enli and Skogerb?8 2013; Moffitt and Tourney 2013; Wodak 2011), emphasizing their identity as individuals, the collective identity of the represented appears to be more abstract and vaguely defined. So far, research on collective identity in political discourse has tended to focus on ethnic and national identities, especially from the perspective of political and historical studies (e.g. Kevin and Dunn 2004; Benhabib 1996; Anderson 1991; Smith 1991; Gellner 1987). The construction of national identities has been explored by (critical) discourse analytical studies (e.g. Wodak et al. 2009; Galasińska and Krzyżanowski 2009), which have also provided valuable contributions to the investigation of the relations between identity and otherness in discourse (e.g. Coupland 2010; van Leeuwen 2008; Blommaert and Verschueren 1998; van Dijk 1991). Still, the employment of ‘the people’ as a collective force and the construction of political leaders’ and parties’ identity in contemporary political discourse, either moderate or extremist, have been understudied. This panel aims to shed light on such issues by analyzing the case of populist discourse. The panel will investigate

the discursive characteristics of contemporary populism, aiming to identify similarities and/or differences with democratic and extremist political discourse. It will debate whether features previously considered representative of populist discourse (Laclau 2005; Finchelstein 2014), such as the marked antagonism between the 'people' and the élites or governing parties, the role of the leadership or the topos of crisis maintain their applicability to today's politics. Further research questions to be addressed regard: the discursive strategies of identity construction and legitimation of political actors; the relation between self-claimed and ascribed discursive identities; the cultural factors influencing identity construction in political discourse; the role of traditional and new media in shaping the political actors' identities and their mobilization of the electorate. The perspective adopted is that of discursive pragmatics, which allows the integration of the linguistic and the extra-linguistic dimension in the analysis (Zienkowski 2011).

#### ***Multimodality and diversity in Chinese interaction***

Fuelled by the advent of the video technology in research, issues of multimodality and embodied interaction have found recent attention in linguistic research informed by conversation analysis and interactional linguistics. Interaction-oriented approaches have enriched linguistics not only with regard to data and methods, but also in view of concepts and theoretical understandings. However, most of the research on multimodality in interaction has been based on Indo-European languages such as English (Stivers & Sidnell, 2005), French (Mondada, 2006, 2007, 2009), German (Schmitt, 2005, 2007; Deppermann, 2013), Italian (Rossano, 2006) etc. Research on multimodality in Chinese interaction is still relatively scarce (see Li, 2014). Previous work on Chinese spoken discourse has mainly focused on lexico-syntactic constructions and their function in Chinese conversation (e.g., Zhang & Fang, 1998; Wu, 2004, 2005; Luke, 2000, 2005, 2012). Li (2013, 2014) explores the role of lexico-syntax, prosody, bodily movements and their interaction in turn organization in Chinese face-to-face conversation, and shows that resources of different modalities are relevant to the construction of Chinese interaction. Further, Chinese is a language with great internal diversity. It is commonly accepted that Chinese has seven mutually unintelligible varieties including Mandarin, Cantonese, Min, Wu, Xiang, Gan, and Hakka. The linguistic structure of each variety may provide affordances for different methods of constructing interaction. Within the study of Chinese interaction, the research has been predominantly on the standard variety, Mandarin. We know next to nothing about how speakers of other Chinese dialects use multimodal resources to construct social action in interaction. This panel brings together research from conversation analysis, interactional linguistics, gesture studies, and multimodal analysis to explore the function of multimodal resources in forming situated activities in interaction conducted in Mandarin and other Chinese dialects. Papers

in the panel aim to analyze how interactants use linguistic resources (lexico-syntax, prosody, etc.) situated in a larger semiotic context in interdependence with visual signals, such as e.g. gaze, gestures, and body posture in constructing talk and action in the diverse Chinese (dialects) interaction. Specifically, this panel intends to discuss the following questions: - What are the multimodal resources that are related to the construction of interaction in Mandarin and other Chinese dialects? - What is the role of each type of multimodal resource (lexico-syntax, phonetics/prosody, gaze, gesture, posture, action, etc.) in interaction in Mandarin and other Chinese dialects? - How do the resources of different modalities interact (i.e., mutually elaborate or play off each other) in constructing turns, actions, and activities in Mandarin and other Chinese dialects?

***On ‘interpretation’ in the context of language acquisition and in clinical settings: Under the effects of speech errors and symptoms***

Being language use and interaction ‘the object’ of Pragmatics, specific speech/discourse contexts as well as the particular contour of interaction formats are logically at issue. Needless to say that the speaker’s linguistic activity and the process of utterance interpretation are both at stake. This panel session aims at discussing interaction and interpretation in two well-defined contexts which impose communicative difficulties to the interpreter because they imply radical dialogue asymmetry, i.e., children’s erratic and unstable utterances, in the one hand, and anomalous pathological productions, on the other hand. In the first case, it is widely admitted that the mother’s interpretation introduces and guides the child throughout the language acquisition process - the child is thus recognized as subject-speaker. It is worth mentioning that the structural articulation linking *speaker-language-other*, proposed by De Lemos (1992), is implied in the notion of interaction and therefore in the very concept of interpretation. In the case of symptomatic speech, the notion of interpretation calls upon clinical practice and intervention. That is to say that it must be sharply different from the interpretation in everyday communicative situation. It is argued that speech therapists have to face language disorders which cannot be identified either with ambiguous or casual odd utterances. Several pragmatic studies argue that rehabilitation procedures should promote the appropriate convergence between *context* and the patient’s speech production in order to facilitate meaning (re)construction and a more easy-going interpretation by the listener. Therefore, it seems to be out of the scope of Pragmatics to account for the functioning of language itself, which is here taken to be at basis of any speaker’s production and comprehension. Such a view on language as an instrument of thought is supported not only in Pragmatics but also in most language acquisition theoretical proposals and clinical fields. That is the reason why those areas privilege the focus on *language external reference power*. The studies to be presented in this panel session assume that language is governed by *internal reference operations*, which affect both *speech production* and *interpretation* in interaction situations. The papers presented in this panel is also motivated by the challenging questions related to the intrinsic relationship between *listening* and *interpretation* in the above mentioned contexts. Two distinct theoretical domains underlie the approaches concerning those themes: European Structuralism (Saussure, Benveniste and Jakobson) and Psychoanalysis (Freud and Lacan).

***Talk in/with the environment and other life forms***

This panel emboldens pragmatics to engage with two profound and interconnected themes – the *posthuman* and *mobility* – in relation to human language use in social interaction and activity. First, there is a complex relationship between, on the one hand, the ‘social’ world in which human language use and embodied action are embedded and, on the other hand, the so-called ‘natural’ world, namely animals and other living things in the environment. Second, rather than being primarily sedentary, gazing on animals and nature from a fixed and privileged observer’s position, humans are like other animals in being profoundly shaped by the capacity to move in coordination with or in relation to others. In the case of humans, these aspects of mobility are historically endogenous to, and constitutive of, how important dimensions of language use in social interaction relate to the world: movement shapes our embodied participation, our opportunities to cooperate, and the language used to guide our senses.

Using video recordings of natural settings, contributions to the panel explore empirically how human sociality encounters animality, how animals feature in, or become participants in, our social interactions. Furthermore, contributions explore how we may accommodate to, or are transformed by, contact with the sometimes radically different semiotic systems and interactional life worlds of other creatures, both domesticated and wild. The practices of professional and amateur animal handlers, for instance, have to reconcile the socio-logics of human

interaction (eg. pragmatics, semioticity, intentionality, sequential actions ordered by normative expectations) with the natural logics of the behaviour of the animals or life forms (eg. instinctive and conditioned behaviour, sensory modes). Such practices range from anthropomorphic reframings of the behaviour of the animals to coordinative activities involving the integration of the trajectories and requirements of the two logics, and additionally extensive preparation of the (mobile) environment and repeated instruction sequences to enable successful interaction or performances with the animals. Moreover, if we are to be faithful to a more symmetrical view of humans/animals, we find also the entrainment of human embodied action to the rhythms, traits and senses of animals.

Contributions also investigate how humans talk together as they move through the natural or wild environment and navigate its terrain with or without other animals. People display their orientation to different features of the terrain, flora and fauna, for example, as possible obstacles or hindrances to their movement. As a result, they may guide, instruct and assist each other in wayfinding. Also, animals can provide a reason for coordinated movement over terrain as a group (eg. hunters) and they can aid the speedy or successful traversal of the terrain, which requires a heightened awareness and shared understanding of the environment by independent human 'movers' as well as cooperation with the animals that guide or move them.

#### ***The micro-analysis of online data (MOOD): Using discourse and conversation analytic methods to analyse online interactions***

The study of online interaction using micro-analytic methods, such as conversation analysis (CA) and discursive psychology (DP) has developed in recent years (Giles, Stommel, Paulus Lester, & Reed, 2014). Research using these methods aims to focus on the language which is used in online settings, but also aims to address the interactional norms, dynamics and practices which have arisen online (Giles et al., 2014). Research which has used such methods has often focused on issues around maintaining coherence, managing trouble in talk and how participants accomplish social actions in asynchronous environments (Paulus, Warren & Lester, 2016). These studies all attempt to systematically describe and analyse the organization of online interaction. There has also been a wide range of types of online data studied, including online forums, chat rooms, instant messaging chat, and e-mail (Paulus et al., 2016). There are, though, a range of methodological challenges which relate to carrying out micro-analyses of online discourse and interaction in textual and, increasingly, multi-modal environments. Methods such as conversation analysis were developed using, and for, spoken interaction, and this can raise challenges for how to use these methods in an online setting (Meredith, 2016). This panel draws together a number of empirical papers which apply discourse and conversation analytic methods to a range of online data, in order to address and discuss these challenges.

#### ***Exploring roles of ideology in Japanese workplace discourse***

This panel explores ways in which interlocutors utilize hegemonic ideology as a resource in workplace or institutional discourse in Japan. In the world of globalized economy, where workers with multicultural and multilingual backgrounds communicate with one another based on different cultural assumptions, it is crucial to investigate roles that cultural ideology plays in workplace discourse in order to avoid misunderstanding and enhance effective business transaction. The panel focuses specifically on Japanese workplace discourse since, compared to Western hegemonic ideology, Japanese cultural ideology is not wellknown despite the fact that the number of non-Japanese employees is rapidly growing in Japan. The increasing awareness of the intersubjective nature of linguistic interaction puts emphasis on the importance of cultural ideology, including stereotypes, social categories, beliefs, norms, conventions, language ideologies (Schieffelin, Woolard and Kroskrity 1998) and gendered discourses (Sunderland 2004). To make inherently co-constructive interactional work intelligible to recipients, interlocutors need to depend, among many other things, on cultural ideology widely accepted in the speech community (Eckert 2002; Queen 2014). Ideologies play a crucial role in sense-making, for ideologies

mediate linguistic forms and their indexical meanings (Silverstein 2003). In the workplace, cultural ideologies permeate in all aspects of corporate or institutional activities, including creating positive corporate images, making decisions, and gate keeping activities among others. Research on workplace discourse in the West has investigated topics related to ideologies including identity construction (e.g., Baxter 2008; Holmes 2006; Mullany 2007) and correlations among power, gender, and politeness (e.g., Holmes and Stubbe 2003; Rees and Monrouxe 2010; Vine 2004). In particular, studies that investigate how immigrant workers are socialized into the workplace in the West highlight the role of ideologies in the workplace. They show, for example, that language ideology can be utilized as a gate keeper of the professional membership (e.g., Sarangi and Roberts 2002), and how a discrepancy between the institutional rhetoric and language ideology is created (e.g., Heller 2002; Roy 2003). Recent study of Japanese workplace discourse based on naturally occurring data have demonstrated that actual practice in the workplace does not always reflect the language ideology of honorifics and gender widely accepted in Japanese society (e.g., Cook 2011; Saito 2011; Takano 2005). This body of research raises a question of what role ideology (including cultural ideology) plays in the workplace. To date, the role of cultural ideology in Japanese workplace discourse has not been extensively investigated. We still do not know what types of stereotype, social category, and belief are emphasized, how they are utilized to make sense of workplace discourse, and how they contribute to perpetuate or change social reality. Thus, the goal of the panel is to closely examine Japanese workplace and institutional discourse in order to find how cultural ideology serves as a resource for maintaining or changing jointly-constructed social realities. In sum, the panel intends to make a contribution to the study of complex and dynamic roles that ideology plays in the success of workplace communication by analyzing the case of Japanese society.

#### ***The Trump factor: Analyzing the communicative practices of Donald Trump across broadcast settings***

This panel focuses on the communicative practices of one politician, namely, the recently elected U.S. President Donald Trump, when he was the presumptive Republican nominee during the 2015-2016 U.S. Presidential

primary election season. The panel's first three papers provide a series of analytical observations concerning Trump's communicative style across three interactional formats (the accountability interview, hybrid political interview, and political campaign debate), drawing on the methodological framework of conversation analysis to explore how Trump negotiates and manages his identity and role as interviewee and political 'outsider' during the primary campaign. The fourth paper uses the lens of critical discourse analysis to explore Trump's use of person deixis and verbs in his political speeches to construct himself in opposition to his opponents and persuade his audience.

The first paper - by McLean - discusses how Trump ignores interviewer questions in NBC's Meet the Press with Chuck Todd. In these instances, Trump either makes no acknowledgement of the interviewer's questions or makes only nonverbal acknowledgment of the interviewer's questions. McLean observes how Trump uses the practice of ignoring questions as a means of negotiating coverage of topics. The second paper - by Sheese - investigates the ways in which Trump occupies the role of interviewer in MSNBC's Town Hall with Chris Matthews, giving him license to alter the interviewer's agenda. Sheese discusses how this role reversal was accomplished in a range of ways and to different ends. The third paper - by Montiegel - describes the ways in which Trump challenges journalistic neutralism in responding to adversarial questioning during the first Republican primary debate programmed by Fox News. Montiegel observes how Trump attacks the interactional conduct of the moderators as a way to negotiate his role and expectations as interviewee. The fourth paper, by Flores-Ferran, discusses how Trump issued deictic expressions to persuade and polarize his audiences. The paper shows how proximal *I* was attested in utterances related to a positive aspect of Trump's own performance such as being '*on top*', '*winning*', etc. The paper also shows how Trump characterized his opponents with expressions such as *that guy*, immigrants or terrorists with *those people*, and his opponents with *these people*.

Taken together, this panel sheds lights on the communicative style of Trump, and how he interactionally 'does' politics. It also illustrates some of the ways Trump manages his role as interviewee across a range of broadcast contexts, effectively performing an atypical, and thus, "non-traditional" political identity that was consistently put forth by the media.

### **Melissa Moyer & Gema Rubio**

#### ***Multilingualism, mobility, and work***

The theme of this panel is multilingual language practices in connection to the new work order that is being shaped by the mobility of persons to different locations across the globe. Mobility for purposes of *work* (including *non-work* related mobility, such as for reasons of life experience, leisure or study) is taken as a central element for understanding social processes involving structuration and exclusion, where multilingualism and other language practices --both oral and written-- have become key in the realization of work tasks, but also in the production and marketing of a product or service (Agha 2011). Nowadays, emphasis is placed on language and talk in this new economic order that Heller (2003) has coined as the new word-force. Language, both the manner in which it is used in work interactions (Sarangi and Roberts 1999), as well as the knowledge of a bounded system of communication used by a given community of speakers, is a skill required of workers by employers but also, more importantly, a personal trait of the individual (Urciouli 2008). The added value --for an individual or a business-- provided by knowing a particular language, or being able to speak in a particular way (Duchêne and Heller 2012), or the manner in which the language of workers gets regimented (Cameron 2000) for certain types of work are not strictly new developments in the field, but they do represent alternative perspectives to earlier approaches (where language in the workplace was considered a static variety associated with specific work domains or professional roles). The purpose of this panel is to contribute to current understanding of mobility and work from a social, linguistic, and pragmatic perspective. This multidisciplinary perspective takes into account social processes and realities that have developed more recently as the outcome of an increasingly globalized and diverse world, shaped by a dominant neo-liberal economic order. The focus on language and multilingual practices is essential for understanding the ways relevant social actors construct relations of power and exclusion through their multilingual language practices.

#### ***Gender, regional and generational varieties in Japan: Re-exploring negotiation of identities***

Aside from dialect specialists, most linguistic studies have traditionally focused on standard Japanese or *hyōjungo* based on a variety of Japanese spoken in the middle upper class neighbourhood of Tokyo. The speech

of these speakers was used to validate a number of generalizations such as the differentiation between male and female language, or the use of honorifics and politeness strategies. In recent years, however, many researchers have contested those studies arguing that they are *not* representative of Japanese and they have started to look at the speech of non-urban and non-standard variety speakers from a variety of social and professional backgrounds (see e.g., Okamoto & Shibamoto-Smith, 2004). Studies on dialect distribution, phonology, semantics, syntax, honorifics, modern dialects and specific dialects have produced many interesting results. While these have contributed enormously to the understanding of the diversity of Japanese, there is a paucity of research from the viewpoint of discourse, including language usage in one's lifespan (e.g., Kobayashi & Shinozaki, 2003), and dialect speakers' development of different variants as well as *hyōjungo* (Standard Japanese). Assumptions about dialects, politeness, and 'genderlects' in Japanese needs to be critically explored with more empirical discourse studies. A number of researchers have explored how particular linguistic variables from standard Japanese are incorporated in younger generation of 'dialect' speakers (e.g., Takagi, 2005), how shifts from Standard Japanese to dialect in the same conversation occur (e.g., Didi-Ogren, 2011; Okamoto, 2008), or the lack of 'genderlects' in some northern dialects; however, much more research is needed in order to know, for example, when speakers adopt features of new variations and what factors may be associated with these changes. This panel will explore an intersection of age, gender and regional varieties in Japanese, presenting the latest research that looks at the usage of dialects and Standard Japanese in relation to gender and shifting generational identities. Scholars who engage in empirical studies of gender, age and regional identities in Japanese with innovative discourse pragmatic approaches will be contributing to this panel presentation.

### *Tensions within the repertoire of prescribed, prestige, and non-prestige forms*

The deficit approach that characterizes non-standard language as manifesting a mental or developmental deficit was powerfully rejected half a century ago by Labov (1969) and others who followed suit (e.g. Trudgill, 1975; Godley et al., 2007; Pearson et al., 2013). However, language ideologies preserving traces of the deficit approach persist to this day among educators, policy makers, and the public in general.

The rejection of deficit views need not imply that standard language should be rejected altogether. Indeed, standard language – as defined by language academies, dictionaries, grammar books, and other language authorities – constitutes a unifying cultural resource and as such is a valuable element of culture and education (Deutscher, 2011).

Myhill (2004) has proposed a framework that differentiates between languages, such as English and most European languages, in which the prescribed standard form is also the "prestige-based" form, spoken by people of highest social status, and other languages, such as Hebrew and Arabic, in which the prescribed standard form and the prestige-based form are not necessarily the same. It has also been argued that in those languages in which the high status forms do not match the prescribed standard, there are actually two types of non-standard forms: those accepted by the elite and educated people and those that are not (Rosén, 1955; Shatil, 2014).

Still others have argued that rather than a "difference" framework, in which standard and non-standard forms are presumed to be discrete, it would be more accurate to talk about a "repertoire" framework (e.g. Snell, 2013), placing standard and non-standard forms as poles on a continuum. The repertoire view is based on the recognition that speakers of a language are not speakers of either one or another form, but rather have at their disposal a repertoire of language forms, which they choose from in accordance with the specific discursive context and their specific discursive motivations.

The tensions between prescribed, prestige, and non-prestige forms, as well as the repertoire of standard and non-standard forms available to speakers, give rise to questions about what gets corrected vs. what passes as acceptable, under what circumstances, why so, and to what effect. Panel contributors will present studies

addressing these and related questions in different languages (English, Arabic, and Hebrew) and in different contexts (everyday interaction, classroom discourse, and radio language).

#### *Knowing me and knowing you – reference and identity markers in public discourse (1 of 2)*

This panel studies the use of labelling in texts intended to be public, as reflected in their accessibility or distribution in the public domain. It approaches the importance of reference and identity markers in both synchronic and diachronic data and investigates their contribution to the construction of a potentially evaluative stance. The data studied will draw on a variety of text types and contexts, including newspapers, online media, political communication, business or legal texts, and therefore allow for a range of 'real world' settings to be considered, aligning the focus of this workshop with the conference's overall theme. The public nature of the data allows for self and other reference to be studied in contexts, where the exact composition of the audience may not be fully known. Nevertheless, considerations of ratified and unratified participants (cf. Goffman 1976; Lugo-Ocando 2015) will have affected the (potentially strategic) use of terms of address and reference and led to the creation of specific stylistic and pragmatic effects in diverse discourse situations. By studying these effects, it is the aim of this workshop to uncover new insights into discourse specific labelling patterns, both from a historical and present-day perspective, and to discuss their impact on self and other representation in the construction of identity in public texts. Social identities and intergroup relations are usually manifested in the so-called in-group and out-group discourse. Impoliteness, and negative labelling in particular, entails creating and maintaining negative impressions, which can be aided or achieved through the use of 'labels of primary potency' (Allport 1986). This means that certain characteristics, like male/female or criminal/law-abiding, carry more perceptual potency than others, and signal difference from what is considered mainstream (e.g. moral distinctiveness). While the diachronic dimension of this panel will allow for trends to be observed in the development of certain reference markers, the synchronic approach will facilitate the immediate application of findings to enhance our understanding and use of reference practices in more or less institutionalised contexts.

#### *Language regulation in professional contexts*

In recent decades, the practices of language regulation have become a salient feature of various professional contexts. This is seen as being related to the emergence of a new globalised economy and the transformation of work, most notably a shift from material production to service industries and information processing activities which are specifically carried out in and through language use (e.g. Williams 2010). In these new contexts of work, language has come to be viewed as an asset that can promote opportunities and achievements, and is therefore often treated as an object to be managed and regulated.

Language regulation can be defined as the various practices through which language users monitor, intervene in and manage their own and others' language use (Hynninen & Solin forthcoming). Language regulation has been

examined particularly in the field of language planning and policy research. Recent studies have focused on language policing as a multi-layered and non-linear discursive process where not only language norms but also the identity and social relations of discourse participants are constructed and negotiated (e.g. Johnson & Ricento 2013; McCarty 2011).

In discourse studies and sociolinguistics, language regulation has been approached from the point of view of the technologisation of discourse (Fairclough 1996) and the commodification of language (Heller 2010). Studies have looked at, for instance, the standardisation of professional language practices and the training of personnel in these practices (e.g. Cameron 2000a, 2000b; see also Heller & Duchêne 2012). Conversation and interaction analysts have explored the interactional ideologies connected to professional settings by analysing, for instance, training materials and simulated interaction (e.g. Peräkylä & Vehviläinen 2003; Stokoe 2013). Finally, language regulation has been studied as the situated negotiation of acceptability in multi-party interaction (e.g. Nissi 2015; Hynninen 2016).

Elaborating on these themes, the panel explores different practices and forms of language regulation in professional contexts. In particular, it focuses on the following questions:

- What kinds of forms does language regulation take in different professional contexts? Are mechanisms of regulation relatively permanent or temporary? What kind of scope do forms of regulation have?
- How is language regulation intertwined with the aims of the institution and/or profession in question? What broader goals are accomplished with local practices of regulation?
- How do practices of language regulation position the participants involved? What kind of agency do different actors have?

The contributions of the panel adopt and develop the above-mentioned themes and investigate language regulation as part of professional practices by focusing on the regulation of language choice (which languages can and should be used in which settings) and/or the regulation of language quality (what kind of language is ratified as acceptable or functional in a given setting). Moreover, the contributions focus on top-down regulation and regulation practices between peers, study explicit or implicit mechanisms and draw on both written and interactional data.

#### ***Interactional routines in caregiver-child and peer interactions***

Language, intended as the whole range of semiotic modalities constituting oral communication, is always in tension between repetition and change, between convention and innovation. Research on children's talk, either in interaction with caregivers or peers, reveals both the pleasure of familiarity – for example with nursery rhymes or bed time stories (Trehub & Trainor, 1998; Ninio & Bruner, 1978) and the thrill of rule-breaking (Ratner & Bruner, 1978 ; Stern, 1977). Routines – intended as a recurrent interactional format – begin with the initial care activities around the infant hygiene, nutrition and sleep; the inevitable repetition makes these activities predictable, but the dyads also develop idiosyncratic habits or ancillary activities that make such

moments interactionally dense, the repetitive format not only creating a locus for developing coordination and cooperation but also for playful variation around the routine itself. Children also encounter as they grow culturally provided routines – lullabies, social games in which physical and vocal actions are performed, and as they grow nursery rhymes, songs, jokes and so on. Families and peer-groups develop their own as well (Corsaro, 1997; Fasulo et al. 2002). Interactionally, routines provide a flexible structure that supports all participants in maintaining reciprocal engagement. The regular succession of similar steps makes them predictable, enabling even very young children to anticipate the sequence and take part in it. Yet they not only entail a particular temporal order of individual actions ('what to do next') and specific junctures ('when is my turn'), but also a particular social organization: participants assume certain interactive roles and take responsibility for role-related tasks ('who does what'). Also, within routines not any action, but very specific actions are expected. As such, they are the "vehicle" towards language (Bruner, 1985, p.39). What starts off as an embodied experience of language as acting with each-other (Ochs, 2012 ; Raczaszek-Leonardi et al., 2013) becomes increasingly conventionalized, as routines become less idiosyncratic and more recognizable to a broader cultural community. Thus, routines are the context for the acquisition of conventionalized means of communication. This panel will focus on interactional routines - culturally conventional or idiosyncratic ones - between children and caregivers, or in the peer group, guided by the following questions:

- How are social routines established and how do they develop over time?
- How do children come to take up their role in routines and what makes acting within a routine different from other interactional frameworks?
- In which ways is children's participation scaffolded by caregivers and/or peers?
- Do routines facilitate communication with children with learning or speech impairments?
- What is the role of social routines at different ages?

### Aisling O'Boyle

#### *Stance-taking in educational contexts*

This panel will explore the dialogic act of stance-taking in educational contexts. It aims to offer a forum for researchers interested in dialogue as it relates in and to educational contexts. Drawing on Du Bois (2007), stance can be defined as:

"a public act by a social actor, achieved dialogically through overt communicative means, of simultaneously evaluating objects, positioning subjects (self and others), and aligning with other subjects, with respect to any salient dimensions of the sociocultural field" (Du Bois, 2007, p.163)

The study of stance is important for the field of Education as stance-taking is a public act of self-presentation, knowledge and social judgement. It is how people make perceivable to others their epistemic and attitudinal positions. Educational contexts and educational activity are not necessarily bound by a formal classroom. The papers in this panel report on research from a variety of formal and informal learning environments, classroom and non-classroom contexts but share a common ground in the investigation of dialogic acts of stance-taking in an educational context. The panel includes both empirically and theoretically oriented papers and contributor and participant discussion will be a prominent feature of this panel.

### ***Economics & language use: The pragmatics of economics experts' engagement with non-specialists***

The relationship between studies of language use and economics has been troubled and troublesome. This is partly due to the vastness of the topics that such a relationship might encompass, partly due to the usual tensions, confusions and competition that are characteristic of work across disciplinary boundaries. In addition to these, not insignificant difficulties, the power-infused nature of economics and the discourses that surround it increase the trouble, but also the importance of researching economics and language use. Indeed, the pervasiveness of the language of economics in public discourse, policy debates and organizational life has led to much scholarly work on the language use in economics and economic expert discourse. Within economics itself there has been an increased awareness, admittedly from a very low base, of language (McCloskey, 1998; Samuels and Perry, 2011), including the analysis of specialist uses and non specialist audiences interpretations (Perrin et al. 2015). More recently there has been studies of the economists' influence on the public sphere (Fourcade, 2009; Mirowski and Plehwe, 2009) yet there has been relatively little work on the language of interaction between economists with non-specialists in contexts such as the media, policy debates or organizations, although there has been a recent blossoming of interest (Fairclough, 2016; Maesse, 2015; O'Rourke, 2014; Pühlinger and Hirte, 2015). This panel seeks to add to this recent work.

Francois Claveau examines economics generalizations, frequently used in economists' communications with the public and explores how ideology plays a role in these uses of generics. Forecasts are an important in economists-public communications and Angela Schrott uses a corpus based approach to examine the linguistic techniques of such economics discourse. Some economists contribute to public discourse more often as 'public intellectuals' and using a conceptual metaphor approach Stephan Pühlinger explores the discourses of one such economist. The discourses of economists in news interviews is examined by Joseph K. FitzGerald and Brendan K. O'Rourke to reveal how such communications are legitimated. Kate Alexander Shaw analyses how narratives of the economy, initially developed to enable policy action, can later in their life cycle, constraint policy. Looking at another sort of constraint - the linguistic framing of government debt in the press- Sebastian Giacobelli looks at how this can be used in a government's negotiation with the IMF. Public finance coverage in newspapers is also examined by Tanweer Ali and Eva Lebdušková, who look at the use of expert and institutional sources and the relationship of such sources to the prominence of various interests and ideological positions. Jens Maesse explores austerity discourses to examine how a particular sort of European discourse is emerging and is connecting to an emerging institutional order of Europe. It is envisaged that these contributions will provide stimulation for a deeper understanding and discourse on the interactions between economists and non-economists.

## Jan-Ola Östman

### *Responsibility, migration, and integration*

Because of the massive increase in the number of refugees that have been fleeing to Europe from locations to the south and to the southeast, Europeans have over the last couple of years become more than fully aware of the dynamic force of migration that constantly takes place all over the world. Migration no doubt poses social, cultural, economic, juridical and political challenges, and despite the realization that we live in a linguistically globalized and superdiversified era, linguistic challenges are still constantly taking their toll in people's quest to live together. Pragmatic analyses, applied linguistic analyses, and sociologically attuned discourse analyses of (the linguistic effects of) intercultural contacts have been fruitfully carried out, unraveling ideological differences and challenges. But further pragmatic ways of approaching the multifarious diversity need to be discussed and developed.

With this as a backdrop, the panel seeks to do three things.

- (a) Theoretically, it wants to further develop the notion of “responsibility” in sociolinguistic analyses, in discourse analyses and in pragmatic analyses. The studies in Östman & Solin (2016) show that in order to be able to discuss (linguistic) agency and role-relationships in discourse, we need to develop more dynamic notions in addition to those discussed under ideology (cf. Verschueren 2012). One such pertinent notion is “responsibility”, and the panel will further develop the implications of taking this perspective on language use, including issues of identity construction, appropriation, and intervention.
- (b) Empirically, the task is to collect data from migration in various parts of the world and from contacts in different kinds of speech communities in order to get a deeper understanding of the challenges that integration (or rather, “contegration”) faces linguistically and pragmatically. For instance, how do processes differ in rural areas vs. in urban areas; what parts do the (local and global) media play; how does naming (use of unofficial place names and choice of personal names) affect integration; what pragmatic features (markers, particles, prosody) are (typically) picked up by newcomers and how does integration affect the (language of the) receiving communities; and, in particular, how can a refined tool like “responsibility” help us better understand what we see as (socio)linguistic realizations.
- (c) Practically, new avenues are sought for how to approach newly established contact communities in practice. How can we as linguists take responsibility for developing new and better methods to give advice to contact communities where language challenges are topmost on the agenda. This includes developing or discussing pragmatically attuned language teaching methods – immersion, CLIL, parallel language use – that take as their point of departure responsibility, and fostering discussions of how to best cope with integration into a state's minority or dialect communities.

The panel contains presentations by scholars from different parts of the world who address one or several of the issues in (a-c), where an understanding of the concept of “responsibility” can be shown to play a role. Although empirical data is at the center of the panel, theoretical (sociological/philosophical/semantic) discussions of responsibility and its relation to ideology, identity, ethics, morality, and accountability are also addressed. Diversity in the language communities dealt with is given special attention, and comments, understandings, experiences and responses from the audience are warmly welcomed.

### *Interactional competence: CA perspectives on second language development*

The human competence for social interaction is unmatched in the animal world. Levinson (2006) speaks in this regard of the “human interactional engine”. It has been argued that the uniquely human modes of social interaction represent the foundation from which language evolves (Tomasello 2000, 2008; Levinson 2006; Schegloff 2006), and the ‘methods’ (i.e. systematic procedures) that make up human interactional competence have been documented in much detail throughout decades of conversation analytic (CA) research. Yet, important questions have remained largely unexplored: What happens when people move into a second language (L2)? Is interactional competence simply transferred from the L1 to the L2? Or is it re-calibrated in the course of L2 learning? If so, what are the basic features of such re-calibration? While the development of communicative competence has been a core issue for Second Language Acquisition research from the 1970s on, the fine-grained techniques which are needed to successfully engage in L2 *interaction* have only recently become an object of systematic empirical research (see e.g. Cekaite 2007 on turn-taking; Hellermann 2008 on task-openings and closings; 2009 on repairs; Pekarek Doehler & Berger, forthcoming, on story-openings; for

overviews see Hall, Hellermann & Pekarek Doehler 2011; Kasper and Wagner 2011; Pekarek Doehler & Pochon-Berger 2015). In this panel we pursue this line of research by extending the body of empirical evidence provided by CA research and by discussing implications for longitudinal CA studies. The panel addresses the following questions: - What are the documentable changes in L2 speakers' interactional practices over time? - What do the documented changes tell us about the nature of L2 interactional competence, its development, and how it relates to L1 interactional competence? - What are the methodological challenges of comparing situated practices across-time and/or across individuals? The panel brings together contributions that investigate the development of L2 interactional competence within naturally-occurring data from either the classroom or the 'wild' and within a variety of languages.

#### ***Poetics, the "wild" side of CA: Twenty years after Jefferson***

In her 1996 article "On the Poetics of Ordinary Talk," Gail Jefferson described a second-order set of practices that influence turn construction, especially concerning word selection by sound-triggering and category-triggering. Although her published article was a revision of a 1977 conference paper, she still considered "poetics" as "the wild side of Conversation Analysis" and as something that probably should not be taken as seriously as other CA observations, because it was "stuff which we'd pretty much kept to ourselves and played with as a hobby" (1996: 2).

Probably because of this description, there have been few CA studies focused on "poetics" (for an exception, see Woffitt and Holt 2011). Nevertheless, Jefferson's insights are widely accepted in the secondary literature. Arguably, however, the importance of "poetics" in CA should be reevaluated because of the growing sophistication in the study of prosody in talk-in-interaction as well as increasing interest in the role of epistemics (Heritage 2012a, 2012b). Furthermore, some recent studies of "poetics" and "conversation" have not engaged in a sufficient discussion of Jefferson's work (for example, Norrick 2002; Bowles 2011; Kataoka 2012). Therefore, a reassessment of "poetics" may be timely twenty years after the publication of Jefferson's article.

The proposed panel will critically assess "poetics" as described by Jefferson by soliciting papers that contribute to the discussion of at least one of the following: (1) bringing new data from naturally occurring talk to bear on "poetics," including from languages other than English, (2) applying CA to literature (including folklore and oral traditions) as a form of institutional talk adapted from the "poetics" of "ordinary talk" (for example, Person 2016) and (3) exploring the implications of CA "poetics" on cognition. The proposed panel seeks to bring together scholars of conversation analysis, literature, and cognitive studies to discuss the importance of Jefferson's work on the poetics of ordinary talk-in-interaction in their respective fields.

### **Marco Pino Ruth Parry**

#### ***Talking about dying***

This panel brings together studies that take an interactional approach to death as a topic in conversation. How do people talk about dying? What norms and constraints inform their practices for initiating, managing, and closing off conversations about dying? Our panel specifically focuses on occasions where people are demonstrably orienting to the death of one of the parties to the interaction (or someone close to them) as a relevant matter or concern within the interaction; at the same time, it takes a broad approach in terms of how death can become relevant for the participants—as a topic for the conversation or as a relevant concern within specific action sequences and activities (e.g., making plans for future care).

This line of inquiry is timely given increasing cultural and political trends—or even pressures—that encourage individuals to discuss, think about, and make preparations for their own dying. These trends are underpinned by assumptions that death is not discussed enough—due to cultural taboo—and that this has negative repercussions in terms of missed opportunities to prepare for one’s end. Health professionals have been called upon to encourage patients to discuss dying and communicate their wishes about the care and support they want for their end of life. There is evidence that both healthcare professionals and patients regard talk about death as important, but at the same time difficult to initiate. Conversation analytic studies showed that death is a special topic insofar as people orient to distinctive interactional norms for initiating, managing, and terminating discussions about death. Holt’s (1993) study on how people announce the death of a mutual acquaintance in informal telephone conversations shows that people recurrently follow talk about death with more positive commentaries within “bright side sequences”. Studies on healthcare interactions—in HIV counselling, oncology, and palliative medicine—show that professionals regularly hold off introducing death as a topic and instead subtly cue patients to death in ways that give them opportunities to be the first to introduce death as a focus for the conversation (Peräkylä, 1995; Lutfey and Maynard, 1998; Pino, Parry et al., 2016).

This panel extends these lines of inquiry by bringing together studies on recorded episodes of interaction where participants demonstrably treat the death of one of the parties to the interaction—or someone close to them—as a relevant topic or concern within the conversation. The studies focus on how death is managed as a conversational topic—how people initiate, progress and terminate it, or sometimes only allude to, or even avoid it—as well as the various action sequences and interactional activities within which, or related to which, death is a demonstrably relevant concern (e.g., investigating and assessing the patient’s emotional wellbeing relative to the prospect of dying; making plans for end of life care).

### **Maria E. Placencia & César Félix-Brasdefer**

#### ***Service encounters in the Spanish-speaking world from a variational pragmatics perspective***

Service encounters (SE) are everyday interactions in which some kind of commodity, be it goods, information, or both, is exchanged between a service provider (e.g. clerk, vendor) and a service seeker (e.g. customer, visitor). SE include commonplace activities that we all engage in face-to-face, over the phone, and increasingly through the Internet, in order to purchase products and obtain services and information. Further, numerous companies, for example, at present offer a chat facility through which we can ‘chat’ with service providers to complain about a product or service or to get information. Likewise, the platforms some online marketplaces provide, allow sellers to interact directly with vendors in order to obtain information about the products advertised (cf. Placencia, 2015). The genre of SE encompasses both the transactional (buying and selling) and the relational dimension (interpersonal talk, small talk) (cf. Félix-Brasdefer 2012; Placencia 2005). Service encounters have been studied relatively extensively in the Spanish-speaking world from different research traditions (see Félix-Brasdefer, 2015 for a recent overview); however, studies from a variational pragmatics perspective (Barron & Schneider, 2009; Schneider, 2010; Schneider & Barron, 2008) are still scarce. And yet variational pragmatics studies in Spanish, focusing on other types of activities, have shown the interest of the area (see Placencia 2016 for a recent overview). Variational Pragmatics examines intra-lingual pragmatic variation and the impact of macro-social factors such as region, age, gender, ethnicity, and socioeconomic level on language use in interaction (Schneider & Barron 2008; Barron & Schneider 2009; Schneider 2010). This panel will be looking at pragmatic variation across varieties of Spanish in the co-construction and formulation of service encounters in relation to macrosocial factors such as gender (Félix-Brasdefer, 2012), regional affiliation (cf. Bataller, 2015; Placencia, 2005, 2008), age, socioeconomic background and ethnicity (Placencia, 2001). Presenters are encouraged to use different theoretical and methodological approaches to the analysis of service . Aspects of analysis of interest include the structure of service encounters; how they are opened and closed; how the transaction is realized; participants’ orientation to different interactional goals and lesser/greater attention to interpersonal concerns; perceptions of appropriateness in service encounters; the format of key speech activities like requesting, complaining; the interplay between macro and microsocial factors, etc. The presentations of this panel advance our understanding of the transactional and relational dimension of SE interactions across regions of the Spanish-speaking world in both face-to-face and online settings.

#### ***From models of discourse units to interactional construction grammar***

In this panel we explore the use of models of discourse segmentation for the development of an interactional construction grammar. Models of discourse segmentation (e.g. Pons Bordería, ed. 2014) allow us to classify and organize the flow of talk into well-defined discourse units at both monological and dialogical levels. These discourse units may serve to identify interactionally relevant grammatical constructions and furthermore provide a way to formalize interactional units beyond the grammatical clause and clarify their grammatical status by integrating them into a wider framework. We invite scholars of construction grammar who are interested in expanding construction grammar to interactional phenomena, as well as scholars working on discourse segmentation who are interested in grammatical approaches. Furthermore, we invite scholars who combine issues of defining discourse units and grammatical description. We suppose that combining the two approaches will shed new light on a wide range of hot issues in Pragmatics; correspondingly, possible topics include, but are not limited to: - the relationship between discourse segmentation and left- and right peripheries; - the relationship between discourse segmentation and the combination of discourse markers; - the relationship between discourse segmentation and the multifunctionality of DMs and of modal particles; - the grammatical description of the structure of conversations.

#### ***Discourse, interaction, new families and contemporary kinship processes***

This panel explores the contributions that sociocultural linguistic approaches can make to current socio-anthropological research on emergent family forms and contemporary kinship processes. Various social disciplines (Anthropology, Sociology, Psychology, Family Studies, Human Development, etc.) have witnessed a resurging interest in definitional issues around kinship and the social construction of family life (e.g. Golombok, 2015; Rivas, 2009). New family forms facilitated by changes in legislation, new reproductive technologies or transnational flows in industrialized contexts entail new linguistic practices in the family sphere. Additionally, family members (i.e. participants) and researchers, in describing key issues in relation to emergent family forms, recurrently appeal to problems such as "naming" new families, "communicating" or "narrating" family origins, "communicating" and "sharing" with other families, "interacting" with children; thus foregrounding processes in

which discursive and/or linguistic dynamics play a central role (Fogle, 2012; Poveda, Jociles & Rivas, 2014). With the scenario of changing kinships in post-industrialized society as a backdrop, this panel addresses two main gaps in the research literature. On one hand, discursive/linguistic/interactional research -- defined very broadly and including traditions such as interactional sociolinguistics, conversation analysis, linguistic ethnography, linguistic anthropology, etc. -- does not seem to have incorporated into its current research agenda new and emergent family dynamics (Fogle & King, forthcoming; Frekko, Leinaweaver & Marre, 2015). On the other hand, social research focused on these emergent family dynamics, often conducted using research procedures such as participant observation, interviews, document analysis, etc; does not seem to have incorporated the potentialities found in the analytical apparatus of the above discursive approaches to answer key research problems (cf. Ochs & Kremer-Sadlik, 2015). Consequently, this panel will explore and realize the interconnections between discourse-oriented research and the study of new families and kinship processes. Papers in the panel will showcase either/both: (a) linguistic/discursive research focused on new family dynamics (i.e. language socialization studies conducted in new family settings, the analysis of "naturally occurring interaction" -oral and digital- within new families or institutional/professional/peer settings central to new families, among other possibilities) or (b) the affordances in the linguistic/discursive analytical apparatus to unpack data drawn from interviews, documentary sources, digital media, etc. In short, the goal of the panel is to open an important and relevant dialogue in the study of contemporary kinship processes and underscore the particular and necessary contribution linguistic/discursive research can make to these debates.

## **Matthew Prior & Jack Bilmes**

### ***Upgrading/downgrading in interaction***

Up/downgrading (hereafter “regrading”) has been for some time dealt with in the linguistic (e.g., Sapir 1944; Lyons 1977), sociopragmatic (e.g., Faerch and Kasper 1983; Barron 2007), and conversation analytic (e.g., Pomerantz 1984; Edwards 2000) literatures. In very rough terms, we might say that the linguistic approach deals with how expressions are gradable; the sociopragmatic with how certain expressions can be viewed as regradings of ‘normal’, unmarked forms, especially in relation to speech acts; and the conversation analytic with how some actually occurring expression is regraded by the same or another speaker in the course of interaction. The current panel adopts the conversation analytic, interactional perspective.

Although regrading is frequently mentioned in CA studies—for example, those dealing with prosody (Couper-Kuhlen 2014; Ogden 2006; Plug 2014), extreme case formulation (Edwards 2000; Pomerantz 1986; Sidnell 2004), and second assessments (Ogden 2006; Pomerantz 1984)—rarely is it the primary subject matter. Consequently, regrading remains conceptually and empirically underdeveloped. A number of open questions surrounding regrading in interaction include: how it is formulated on the spot, what sequential and other implications it has, what its formal properties are, how it operates within and across various institutional and conversational settings and activities, and how it intersects with interactants’ other communicative resources. To advance scholarly research and discussion, this panel will take up regrading and related scaling practices as its central focus. Contributors will present papers on their original analyses of regrading based on interactional data to examine the forms, functions, causes, consequences, and verbal and nonverbal resources for accomplishing regrading in situ. A discussant, Elizabeth Couper-Kuhlen, will provide remarks on the papers and issues raised.

***Critical perspectives on language socialization processes and trajectories in (bi-)multilingual contexts***

One of the most productive trends in language socialization research during the last two decades has focused on multilingual contexts with contested sociopolitical histories, such as postcolonial nations and populations (e.g. Garrett 2005; Meek 2011; Minks 2013; Reynolds 2008; Riley 2007), as well as communities characterized by transnational mobility and large-scale language and culture contact, including both historical diaspora populations (Fader 2009) and more contemporary immigrant communities (e.g. Baquedano-López 2004; Lo 2009; Relaño-Pastor 2008; Zentella 2005). This body of work has documented and theorized a number of crucial processes of multilingual language socialization, particularly in relation to children's management of multiple languages and participation in diverse communities and institutions. This research, for example, has elaborated upon how children come to learn the political economic indexicality of different linguistic codes (Paugh 2012); how they manage conflicts in religious and secular social identities (Ek, 2005; Klein 2009); how they negotiate differential forms of citizenship and belonging across immigrant generations (Mangual Figueroa 2011); or how they deploy linguistic practices to produce radicalized exclusion in interaction (García-Sánchez 2014). Building on this wealth of research, the proposed panel attempts to open up the scope of language socialization research in multilingual communities by addressing phenomena that impinge upon people's (bi-)multilingual trajectories going beyond primary language socialization sites, i.e. home and school, to examine other different social sites and institutions, as well as by incorporating the much less explored experience of adult (bi-)multilingual speakers who increasingly find themselves having to manage languages and identities in deterritorialized, transnational spaces. The panel capitalizes on the affordances of the language socialization paradigm to understand how the experiences of individual and communities shape specific (bi-)multilingual local contexts, and how, in turn, these contexts are impacted by global sociopolitical and economic trends. Yet, in order to amplify these affordances, the panel also incorporates the "new im/mobility" paradigm (Sheller and Urry, 2006), as well as more overtly critical perspectives that place a stronger emphasis on how local practices are (re-)produced in structurally unequal social fields, often with varying degrees of possibility for resistance against them (e.g. Heller 2007). Some issues that the panel will consider more specifically are: What are the multiple linguistic and interactional resources (bi-) multilingual individuals and communities (particularly non-dominant ones) use and/or create in order to negotiate participation within local multilingual social encounters, but also to lever up spaces of belonging within larger social collectivities, whether national or institutional? What kinds of multilingual linguistic repertoires are allowed (or discouraged) in multilingual spaces? How can the development of multilingual competence be understood as embedded in local and macro relations of power and ideologies? Collectively, the presentations in this panel aspire to lay the groundwork for analyzing and theorizing context-specific and global trends in the language socialization processes and trajectories in (bi-)multilingual communities increasingly characterized by language hierarchies and sociolinguistic inequalities.

### ***Emotion as an action oriented resource in interaction***

According to Goffman (1978:813), in spoken interaction, perceivable affect or a seeable lack thereof, is a necessary part of *any* spoken utterance. Pragmatics has thereby had a longstanding relationship with research into displays of emotion in language (e.g. Jakobson, 1960; Wierzbicka, 1986) and interaction (Kendon, 1975). An enduring contribution of Discursive Psychology (DP) to the field of pragmatics had been a respecification of studies of emotion from emotion as an *ends* to emotion as a *means* to an end. That is, DP and related interactional research has programmatically advanced a research agenda demonstrating the ways in which emotion, constituted in interaction, is a *resource for action*. Research on emotion has traditionally taken a cognitive, individualistic approach (Hepburn & Jackson, 2009). Even rigorous and empirical research from interactional approaches has increasingly over-emphasised description of emotion as an interactional object to the detriment of the analysis of the routine practices of action accomplished with displays of emotion (e.g. Benitez-Quiroz, Wilbur, & Martinez, 2016; Chovil, 1991; Clift, 2014; Kendon, 2004; Samra-Fredericks, 2004). Presented analytically as an *ends*, emotion loses traction as interactional *means*. Instead in this panel we aim to contribute to a contrasting body of empirical work that interrogated what social actions and social structures are constituted in and through displays of emotion (Perakyla & Sorjonen, 2012) Taking a sociologically grounded perspective from DP, conversation analysis (CA) and ethnomethodology (EM) we aim to highlight work that both describes the ways in which emotion is constituted interactionally and just what it is interactionally constituted for. We aim to extend the program of Edwards (1999) and Perakyla & Ruusuvuori, (2006) presenting novel empirical research in the description of *emotion as action-oriented resource*. This panel encourages contributions from scholars taking an action-oriented approach to some dimension of feelings, emotions, and affect in interaction.

This panel considers

- The social structures enacted with and in embodied displays of emotion
- How embodiment, space, comportment are managed in doing emotion
- Use of emotive language or feelings talk; me-talk about feelings and emotions
- How affect and emotion are produced to accomplish social actions

**Catrin S. Rhys, B. Benwell, A. Irwin & K. Stapleton**  
***Complaints in institutional settings: Accountability, affect and identity***

Studies of complaints and complaining have frequently identified complaints as a response to some kind of deviation from 'normative' or expected social practice. Complaining has been theorized (particularly in informal settings) as an accountable, even stigmatised, activity which "holds powerful negative connotations at the social level" (Dewar 2011: viii). It has been noted by many complaints researchers that moral and accounting work frequently accompanies the activity of complaining (e.g. Drew and Holt 1988; Edwards 2005; Stokoe 2009). Indeed, making a complaint carries social risks for the complainer and may involve emotional investment and vulnerability.

Institutional settings make official provision for complaining as a legitimate social activity, often with explicitly identified procedures and roles involved. Evidence suggests that complaining in these settings is nonetheless interpersonally sensitive and potentially socially consequential. Complainers thus have been shown to engage in a variety of practices oriented to these issues. These include:

- distancing from the activity of complaining (e.g. 'we're not really complaining people')
- announcing explicit membership of particular kinds of 'reasonable' identity categories (e.g. 'I'm not an ignorant man'; 'I'm the kind of person I say I'll not bother anybody');
- using attributes or activities tied to the category 'reasonable person' (e.g. 'don't want anybody getting into trouble'). (Benwell & McCreddie, in press)

Similarly, complaints reciprocity raises issues for the institutional and social identity of the complaints handlers who may have "a delicate balance to maintain – to be friendly and helpful showing understanding and appreciation of the complaint without endorsing the caller's stance" (Weatherall 2015: 155).

The papers on this panel examine complaints in a variety of institutional setting (health service complaints calls; consumer complaints calls about utility providers; performance appraisal interviews) and focus on aspects of complaining interaction including the negotiation of epistemic rights; the role of affiliation; the relationship between complaining and other concurrent activities; temporal formulations in complaint sequences; negotiating complainer identity.

#### ***High hopes for mobilities? Researchers' and researchees' discursive co-constructions of expectations for mobility experiences***

The internationalization of tertiary education institutions worldwide has propelled the emergence and popularization of a relatively new type of global mobility: that of a heterogeneous cosmopolitan middling class of university students who engage in multifaceted lifestyle mobility practices at the crossroads of tourism and local/international student experiences (see, e.g., Cots et al. 2013, 2014; Vila 2015). Much has been written about these young social players' experiences concerning (a) personal educational attainment, (b) post-national, modern identity practices and (c) individual language gains prospects. This has contributed to a better understanding of multilingual European youth in Study Abroad (SA) contexts (see, e.g., Garrett & Gallego-Balsà 2014; Llurda et al. 2015) – particularly in/to/from non-English speaking areas of the south, which have traditionally remained unchartered (Huldren et al. 2015). Within the disciplines of sociolinguistics, critical discourse analysis, narrative inquiry and interrelated fields, these experiences tend to be generally conceived of as discursive constructions with which students apprehend, make sense of, present, negotiate and shape and re-shape their positionings in situated communicative events, for example when narrating the Erasmus expectations to peers face-to-face or via Facebook. One of such communicative events is the informal (peer-to-peer) or formal (student-researcher/university staff/instructor) written/oral narrative interview, which has been undermined as a site of discursive mediation – as an interactional act (see, e.g., De Fina & Perrino 2011; Wortham 2001). From a socially-engaged, informant-oriented, critical reflexive perspective, this panel seeks to contribute to a more comprehensive understanding of the SA experience by delving into its dialogical, transformative and mutually constitutive nature between students and instructors/researchers, particularly in research contexts aimed at exploring individual and collective representations of myriad SA-related phenomena. More specifically, we ask: 1) To what extent, and how, are the students' expectations and outcomes revolving around concepts such as "Europeanization", "intercultural citizenship" or "multilingual competence" mediated and shaped by our research instruments and reports and by the discursive constructions that we as researchers bring into the field? 2) What are the consequences of understanding these students' expectations as emanating from the research project designs and from negotiations among the social agents involved in it? 3) Can this interplay shed light on circulating global discourses on what to expect from an SA experience? What do these global discourses consist of; who buys into them, who does not, for what purposes, and why? With these questions we wish to understand and problematize what all this can tell us about the sedimentation of prevalent discourses that get into, and influence, the SA mobility policies, programs, curriculums and designs from which key Higher Education European institutions draw, trying to ultimately provide a realistic picture which may help all actors involved to make the most of the SA experience. The panelists, who draw on mix-methods which include long-term ethnographic observations, narratives, interviews and questionnaires concerning SA students' expectations in bilingual regions of Europe, welcome contributions which may depart from (but do not stop at) similar research motivations at the crossroads of research practice and research action, within the SA domain.

### **Toshiyuki Sadanobu & Andrej Bekeš**

#### ***Japanese-born "characters" meet European and American insights***

This panel offers a unique opportunity to become familiar with the developments in "character" research, which evolved in Japan mainly around and after the turn of the millennium, by gathering papers discussing the potential contributions of "characters" research to general research in linguistics and communication, beyond the Japanese-speaking community. Since the beginning of this millennium, there has been active discussion of "characters" in Japan, with a steady stream of publications on the topic in various fields including manga studies (e.g. Ito 2005, Iwashita 2013), contemporary philosophy (e.g. Azuma 2003, Uno 2008, Okamoto 2010), psychoanalysis (e.g. Saito 2011), sociology (e.g. Senuma 2007; 2009, Doi, 2009), socio-cultural theory (e.g. Aihara 2007, Kuresawa 2010, media studies (e.g. Ogiue 2008), linguistics, and communication theory (e.g. Sadanobu 2006; 2011). But the content of the "characters" being studied is not uniform, and includes a uniquely Japanese concept of "character" that cannot be translated by the English word "character." Sometimes a word

"Kyara" is even coined in distinction with "character". In this panel, we address the Japanese-born "characters" issues that are directly related to language and communication. Naturally, there are differences in terms of subtle nuance among the authors, but there are no large discrepancies in their use of the everyday word "character," which has been built up in the course of daily life by general Japanese speakers, especially young people. This everyday word "character" signifies an image of humanity that is not incompatible with the traditional view that "barring some extraordinary circumstance, such as the disintegration of personality, people do not change depending on the situation. What changes is style; people change their style in response to the situation." In other words this type of "character" pushes the limits of the traditional view of humanity and the speech-act view, which assume intention (e.g. Grice 1957, Sperber and Wilson 1986). It is a taboo to overtly violate this traditional view of humanity, so nobody will openly admit to "changing depending on the situation." However, on anonymous electronic bulletin boards, young people are secretly coming out about the fact that they have "different characters for school and for their part-time jobs." These are the main kind of "characters" discussed here. This conception of "character" is, depending on the focus, intriguingly reminiscent of insights from European and American literary criticism, social science and history, namely, from the Bakhtin circle, Bourdieu, Goffman and Braudel among others. For example, "character" as a dynamic phenomenon seems to be closely related with the notion of habitus, elaborated by Bourdieu (1982). Habitus is physical, psychological and linguistic demeanor, unconsciously acquired throughout individual's dialectical interaction with his social environment through one's whole life. Perceived stereotypes regarding collective habitus of an ethnic group or social class play an important role in present treatments of both "role language" and of "character".

**Scott Saft, Yoko Fujii & Sachiko Ide**

***Emancipatory pragmatics: Approaching language and interaction from the perspective of Ba (1 of 5)***

Emancipatory Pragmatics (EP) is an area of research that pushes the field of Pragmatics to incorporate the voices and perspectives of languages that heretofore have rarely been considered within mainstream western academia. Through panels at IPrA conferences in 2007, 2009, 2011, 2013, and 2015, as well as in three special issues in the Journal of Pragmatics (Hanks, Ide, and Katagiri 2009, 2012, 2014), EP has examined languages such as |Gui, Hawaiian, Japanese, Javanese, Korean, Chinese, Laotian, Libyan Arabic, Mayan, Persian, Thai, and Tibetan and has produced studies that sometimes challenge previous assumptions about human social interaction. Sugawara (2012), for example, showed that multiparty interaction in |Gui commonly consists of extending overlapping and thus does not follow the basic turn-taking principle of "one speaker at a time". Similarly, Intachakra (2012) has offered an indigenous Thai concept, abbreviated as KKJ, as a part of questioning the universality of western-derived theories of politeness. Rather than begin with concepts already accepted within Pragmatics, for example, turn-taking, implicature, politeness, and speech acts, and attempt to apply them in non-western contexts, EP looks to illuminate key cultural concepts indigenous to lesser-studied languages, even suggesting that these concepts may aid in understanding interaction in other cultures as well. One such concept that has emerged is *ba*, commonly translated into English as "field". Developed by the Japanese philosopher Kitaro Nishida and the bio-physicist Hiroshi Shimizu, *ba*, unlike much western thought, does not assume a Cartesian division between body and mind nor does it consider the self as inherently separate from the other. Instead, *ba* refers to a dynamic field in which interaction emerges, where the participants as well as the surrounding environment stand as components that may be indistinguishable from one another. Emerging research has not only described linguistic processes in Japanese that leave participants merged in their *ba* (Fujii 2012; Ide 2011) but also suggested that the concept of *ba* may enhance understanding of interaction in other languages such as Hawaiian (Saft 2015) and Korean (Kim 2015) where participants place a high value on connectivity with their surrounding environment. This panel will further elaborate the EP approach by exploring applications of *ba* to linguistic interaction in diverse parts of the world that include but are not limited to Africa, East Asia, Europe, Polynesia, the Middle East, and Southeast Asia. Each panelist will present an analysis of interactional phenomena, ground the analysis in the knowledge and belief systems of the participants, and consider both how *ba* might serve as a model for describing social interaction in those contexts and how the patterns of interaction themselves may inform understanding of *ba*. Does the notion of *ba* make it easier to comprehend the use of Arabic in a hierarchically organized society such as Libya? How would an investigation of deixis in a language such as Mayan enhance our conception of *ba* as a dynamic field that blends selves and others? By speaking to such questions, this panel, for which we are planning to fill at least four sessions, will increase knowledge of sociolinguistic contexts not often included in prior theories and thereby make it possible to attain a deeper appreciation of the human capacity to employ language and organize social interaction.

**Ryoko Sasamoto, Kate Scott & Tim Wharton**  
*(Pragmatics) beyond verbal communication*

In recent years, a wide range of communicative phenomena cross-cutting the verbal and non-verbal distinction has begun to attract the attention of scholars in pragmatics. Some of these – emotional tone of voice, interjections, onomatopoeia – have already been addressed within ‘traditional’ linguistics frameworks, and are considered to be located at the edge of language with their roots in a form of sound symbolism. Others – hashtags, emoji, typography – have only *recently* attracted attention as a result of an increasing interest in the pragmatics of the interaction between verbal and non-verbal modes in a variety of media and communicative genres, including participatory online communication, fandom, and face-to-face communication. In addition, more and more communication is taking place with anonymous, non-singular hearers in mind. As a cognitively-grounded theory of communication, relevance theory does not limit its application to specific communicative phenomena or specific genres of communication. Rather, it provides a framework in which the interaction between verbal and non-verbal stimuli, and the different ways such stimuli are put to use, might be explored. It accounts for how each ‘mode’ plays a role in a particular context without relying on taxonomies and without treating them as special cases. Indeed, the relevance-theoretic notion of the showing-saying continuum has been applied in the analysis of tone of voice, interjections, and onomatopoeia. In addition, it has been shown that uses of other items which would have been considered exceptions (for example online communication and digital media devices such as hashtags), can also be explained in these terms. There are also many works that attempt to unpack the strategies humans employ in online communication from the perspective of politeness or speech act theory. The fact that many of the notions within pragmatics have been developed with verbal communication in mind means that we are yet to establish precisely what the limits of pragmatic research are, and how existing frameworks can be applied to the under-researched non-verbal communicative phenomena and/or societal aspects of communication mentioned above. This panel will presents papers that discuss how insights and concepts from relevance theory and other pragmatic approaches can be applied to the interaction between verbal and non-verbal communicative stimuli.

**Ulrike Schröder, Hans-Georg Wolf & Farzad Sharifian**  
*Intercultural pragmatics and cultural linguistics*

Recently, critique has been leveled against the primary focus of many pragmatic studies on functional aspects such as action patterns, co-orientation and coordination in talk, while cognitive aspects concurrently involved in the process of co-construction of meaning have been largely excluded (Deppermann 2012). Especially when it comes to cross-linguistic, cross-cultural, and intercultural matters, this tendency often goes along with the avoidance of entering the problematic field of tabooed claims about ‘culture,’ since in poststructuralist approaches to intercultural communication, group bearers and sharers of culture have fallen into disrepute due to the suspicion of essentialism (Wolf 2015; Schröder 2015). Cultural Linguistics is a multidisciplinary field of research that explores the entrenchment of language in culture-specific conceptualizations comprising schemata, categories, prototypes and metaphors (Sharifian 2015: 474; Sharifian 2011). As opposed to the traditional view of Cognitive Linguistics, Cultural Linguistics emphasizes the dynamic aspects of such concepts that emerge by ‘distributed cognition’ (Sharifian 2003) in the interaction of the participants of a speech community. This view entails that conceptualizations do not necessarily correspond to the L1 of a speaker but can also represent the result of a particular cultural environment where new cultural conceptualisations emerge as a synthesis of intercultural contacts. English as a lingua franca is just one example of a research field where the emergence of such concepts is actually being studied (Wolf & Polzenhagen 2006). In the field of intercultural pragmatics, especially the work of Kecses (2013, 2015; Kecses & Horn 2007) has called upon the exploration of the sociocultural and cognitive dimensions of intercultural communication, showing how semantics and pragmatics are intertwined by way of language use and context. Finally, we can observe interesting developments pointing to possible interfaces in the work related to metaphor and gesture in real interaction (Cienki 2008; Müller 2008; Müller, Cienki, Fricke et al. 2013), although there is still a need for bringing those studies to the realm of culture. The aim of this panel is to bring together scholars who want to discuss the dialogue between intercultural pragmatics and Cultural Linguistics from a theoretical and empirical perspective. Hence, we welcome papers based on epistemological, theoretical and methodological questions related to this interconnection, as well as those which present results of cross-cultural, as well as intercultural research.

## Lucas Seuren & Traci Walker

### *Linguistic structures and actions: Does function follow form? (1 of 3)*

One of the major issues that participants in talk-in-interaction face is to determine what would be an appropriate response to an utterance by a co-participant; that is, they need to establish what action the co-interactant has implemented in the prior turn (Levinson, 2013; Sidnell & Enfield, 2014). The resulting question for analysts of talk-in-interaction is the action formation problem: “how are the resources of the language, the body, the environment of the interaction, and position in the interaction fashioned into conformations designed to be, and to be recognizable by participants as, particular actions [ ]” (Schegloff 2007: xiv). While a good deal of research has investigated how language is used in action formation (e.g., Couper-Kuhlen, 2012; Raymond, 2010; Hayano, 2012; Hedberg, Sosa & Görgülü, in press; Heeren et al., 2015; Steensig & Heinemann, 2013), the mechanism is still not well-understood.

Some recent work has argued that the contribution to action formation of linguistic characteristics of turn-design, such as morphosyntax and intonation, is smaller than has often been assumed. Heritage (2012, 2013a, 2013b) and Stevanovic & Peräkylä (2014) have argued that participants primarily orient to the social orders of knowledge, power, and emotion for interpreting utterances as specific actions. At the same time, research on preference organization (e.g., Pomerantz, 1984), epistemics (e.g. Heritage & Raymond 2012), and on the different designs of requests (e.g., Curl & Drew 2008; Rossi, 2014) has shown that participants do indeed orient to the linguistic design features of utterances in their response. Therefore, the questions that drive this panel are: how does the linguistic design of an utterance contribute to its interactional characteristics, such as action, stance and preference? And why is it that a single language can have multiple linguistic forms that are co-opted to perform what participants treat as “the same” action?

### ***Foreground and background: The conversational tailoring of content and context***

The idea that conversational participants distinguish between what is in the foreground and what is in the background appears in a variety of forms across a variety of subfields of linguistic research. For example, research in the philosophy of language has long relied on a distinction between what is asserted and what is presupposed, a distinction that has played an important role in formal semantics and pragmatics (e.g. Strawson 1950, Stalnaker 1974, Heim 1992). More recently, work in formal pragmatics has appealed to a specific distinction between content that is “at issue” and content that is “not at issue” in order to explain a variety of constructions, including evidentials, clefts, and appositives (e.g. Roberts 2012, Anderbois, Brasoveanu, and Henderson 2015, Murray 2014). Along a similar vein, work in sociolinguistics and linguistic anthropology has explored how explicitly realized content may invoke implicit sets of cultural assumptions, or contextualizing ideologies (e.g., Mitchell-Kernan 1972, Hill 2008).

While these distinctions (assertions/presuppositions, at-issue/not-at-issue meanings, explicit content/implicit ideologies) are ostensibly related, it is not obvious how they line up with one another. For example, it is unclear whether they perform similar theoretical work, given possible differences in how they regard foreground and background to be connected, how they address shifts of foreground and background over the course of conversation, how they account for (or do not account for) either truth-conditional or non-truth-conditional kinds of meaning, what evidence they use to determine background meaning, and what they consider to be the scope of relevant background, or context.

The goal of this panel is to bring together related work in different subfields—work by linguists, philosophers, and anthropologists who think about conversational foreground and background—to examine conceptual convergences and divergences as well as to explore the interface between foreground and background in each subfield. This interdisciplinary panel will seek to illuminate conceptual limits and possibilities as well as new cross-disciplinary tools for analyzing the tailoring of conversational context. We will invite submissions from philosophers of language and sociolinguists; we also welcome submissions from members of the general IPrA community. Papers should address any of the following questions:

(1) What is the relation between various conceptualizations of background meaning, including context, ideology, presupposition, and not-at-issue content? Do these concepts perform the same theoretical work? (2) What are the

diagnostics for determining whether meaning is foregrounded or backgrounded and what counts as evidence for relevant background meaning? Do the diagnostics apply equally well for different constructions and different concepts of foreground and background? (3) How are foreground and background related? How does background, such as cultural assumptions, shape what becomes foreground, when does background become foreground, and when does foregrounded content become an accepted part of the background? (4) Are non-truth-conditional meanings, such as sociocultural assumptions about honorifics, registers, and styles, necessarily part of the conversational background? (5) How do participants challenge presuppositions or other parts of the conversational background?

#### ***Exploring effective ways of group discussions for constructing a democratic society***

In order to construct sustainable society, it is generally agreed that a democratic process plays an important role and citizens' participation into the process is necessary for the development of democracy. It is widely agreed that increased citizens' participation into a decision-making process produces many important benefits, and there have been increasing opportunities for citizens to be involved in social-decision making such as forensic settings and policy making processes. This panel focuses on the form of group interaction, which is a crucial communicative activity for democratic participation and deliberation. Group interaction is a dynamic practice whose processes and outcomes are affected by many factors, including participants' roles and identities. Especially in group discussions in (real) social settings, there are four issues that participants need to face: (1) various stakeholders, (2) conflict of interests among participants, (3) potential or real power differences among participants, (4) involving participants with asymmetric levels of knowledge or expertise. (e.g., Morimoto 2015, Murata 2016). Given these challenges, the panel aims to explore both how to make group discussions more meaningful and productive and how to overcome barriers in order to achieve the goals of the group interactions. It also aims to contribute to developing "discussion designs" or the ways of designing the process of group discussions in social decision-making. The panel specifically poses the following questions: (1) what problems are found in discussions in real world (especially in social settings such as town meetings or (mock) jurors' discussions), (2) how we can evaluate the quality of group discussions, and (3) what is 'a good discussion' in the real world, i.e., from a viewpoint of citizens who actually participate and deliberate in the process. This panel brings together empirical studies on various types of group discussions such as town meetings involving people from various stakeholders, deliberations in judicial settings between professional judges and lay judges, science communication between professional scientists and non-expert citizens, etc. We also welcome studies of online discussions on social subjects which have been widespread in recent years through Social Networking Services (SNS) as well as face-to-face discussions. In addition, the panel will invite research on educational programs to foster discussion abilities.

#### ***On language users and their relations with others: Debating notions of the subject and intentions in pragmatics***

As the pioneer definition of Morris goes, pragmatics studies the relation of signs to interpreters. Currently a highly heterogeneous field, pragmatics finds its distinguishing feature in the activity of the language user among

her peers, something visible both in its continuous boundary-making as in delineations of problems. Obviously, users act together with others, a fact that requires pragmatics to not only explain individual constraints to speech acting (e.g. cognition, memory, psyche) but also to devise theories about rules stemming from social aggregates. Often pragmatics offer theories about the very nature of the individual and her relation to others. For instance, Grice's inferential model of communication cannot be disentangled from his assuming that (1) language users are rational and cooperative subjects, whose intentions are made transparent in speech action; and that (2) societies are composed of transactional exchanges grounded on cooperative precipitates.

Although idealized notions of the subject and the transparency (or opacity) of her intentions are helpful to linguistic analysis, these notions prove to be problematic in many scenarios. For example, current language practices such as transnational asylum seeking or hate speech litigation usually exceed the analytic model of the rational individual. In asylum hearings, refugees may find their language resources subjected to ideologies of referential accuracy that may not match with cultural norms of kinship and naming or with their mastery of the national language of exile. Coming from traumatic experiences and sometimes bearing no documents, these individuals may not fit in into the bounded model of the self that rationally seeks maximum benefit at least cost in communication. In the adjudication of hate speech, conflicts between the attribution of intentions and the effect of historically sedimented injurious tokens may affect the temporality and location of intentions: When responding in court about original intentions, subjects accused of discrimination may relocate their intentions from individual minds to convention, or deny their intentions altogether. What these cases show is that ideologies of the human person and of the mental and affective binding of individuals to themselves and to others should not be taken as givens; instead, evidence from linguistic practice is necessary if one wants realistic explanations about language in the globalized world.

This panel invites scholars to engage in a critique of idealized models of the individual and/or her intentions in pragmatics. Of particular interest is the scholar's use of empirical or textual evidence to engage in a critical explanation of particular ideologies of the subject and/or intentionality. Participants are invited to bridge their textual analysis or empirical perspective and particular pragmatic understandings of individuals (as salient in specific models of individuals' intentions, in/conscience or aspirations). Opting for an understanding of ideologies not as false conscience but as shared beliefs that bind peoples into groups, this panel therefore invites a critical stance on particular ideologies of individuals and intentions in any (including the scholar's own) approach of pragmatics.

## **Valeria Sinkeviciute**

### ***From self to culture: Identity construction in humour-related discourses***

The question of identity has become one of the most frequently raised not only in the areas of social psychology and variationist sociolinguistics, but also in conversation and discourse analyses and, consequently, in the field of interpersonal pragmatics (Benwell & Stokoe 2012; Fitzgerald & Housley 2015; Spencer-Oatey 2005; Mullany 2010). Even though some types of identity, especially those related to gender or ethnic background, can be referred to as more fixed, it is in different social contexts and in interaction that most identities are constructed and negotiated (e.g. Mullany 2008; De Fina 2010; Clift 2013). Taking into consideration that one of the main functions of humour refers to interpersonal relationships, it is easy to conceive that humorous interactions can contribute to the construction of identity in various ways (e.g. Schnurr 2010). For instance, humour can help to establish one's membership in a group (Boxer & Cortés-Conde 1997; Fine & de Soucey 2005; Haugh forthcoming) or maintain one's individual or social identity at workplace (Schnurr 2009; Schnurr and Holmes 2009; Holmes and Marra 2002). On the other hand, humour is a powerful tool for social exclusion, when one can be easily positioned (or position him/herself) as an outsider (Moody 2014).

The aim of this panel is to look at how identity is constructed in different humour-related discourses, e.g. in conversations, story-telling or interviews, and to observe to what extent the concept of *self* (whether individual, collective or culture-related) and the *other* are portrayed and negotiated by the interlocutors. The papers in this panel are pragmatically-oriented analyses that look at the question of identity from different methodological perspectives in various humour-related interactional practices as well as qualitative interviews. They primarily include such topics as

- Humour and group membership;
- Humour and social, cultural, ethnic, professional identity;
- Humour, identity and gender;
- Humour, identity and (im)politeness;
- Humour and minority groups.

### ***Mobile eye-tracking in interaction***

Linguistic research within the framework of Conversation Analysis (Schegloff 2007; Sidnell/Stivers 2013), Interactional Linguistics (Selting/Couper-Kuhlen 2001) and Multimodality (Goodwin 2000, 2003; Streeck/Goodwin/LeBaron 2011; Pitsch 2006; Stukenbrock 2015), conceptualizes verbal interaction as an embodied phenomenon in which speech is coordinated with other modalities such as gaze, gesture, body movements etc. Among those resources, gesture has received by far the most attention with the participants’ gaze conduct increasingly coming into focus as well (Kendon 1967; Goodwin 1980; Rossano 2012; Streeck 2014). As the early reflections of Kendon (1967) already show, a key methodological problem concerns the reliability and precision of recording the participants’ gaze behavior. While most analyses are undertaken on the basis of video data recorded by external video cameras, only very few studies so far have captured the participants’ (visual) focus of attention more precisely when interacting with other co-participants. First attempts have been made using Augmented Reality technology based on head mounted displays capturing the participants’ field of view (Schnier et al. 2011, Pitsch et al. 2013). Most recently, studies on gaze-and-talk-in-interaction have commenced to use mobile eye-tracking technology to record the participants’ gaze conduct in natural settings (Holler/Kendrick 2015; Gehle et al. 2015; Stukenbrock forthc. a, b). This panel brings together researchers who use mobile eye tracking technology in order to closely examine the participants’ gaze conduct in concert with other resources (talk, gesture, body orientation etc.) in various fields of social practice (everyday conversation, visiting a museum, shopping on a market, way finding, human-computer interaction). Since the use of mobile eye-tracking (MET) is highly innovative, it bears a range of risks (Clark/Gergle 2011), even more so when recordings are undertaken in truly mobile settings “in the wild” (Stukenbrock forthc. a; Gehle et al. 2015). The panel therefore also addresses the chances and challenges of *in situ* recordings as well as methodological and theoretical issues of applying MET to research on social interaction.

### *Nationalism, courtship, elitism, and enemy language: Linguistic ideologies in the Japanese TV show "Massan"*

The panel will investigate language ideologies that frame issues of courtship, race, gender, and nationalism by analyzing the morning serial drama (*asadora*), "Massan," broadcast by Japan's public television network, NHK. "Massan" is a fictional account inspired by a true story of the Japanese whisky pioneer, Masataka Taketsuru, and his Scottish wife, Rita Taketsuru (Masaharu and Ellie Kameyama in the drama, respectively). Analyses of "Massan" would shed light on the position of non-Japanese people within the Japanese nation; in particular, they illuminate the ways in which such individuals are positioned behaviorally and linguistically. They add to the literature on non-Japanese in the media such as Miller (1985), Iwabuchi (2005), Yano (2010), and Doerr and Kumagai (2014).

In Japan, race, language, and culture are considered inseparable (Gottlieb 2005:4) and only ethnically Japanese people understand Japanese culture and speak the language. "Massan" challenges these folk beliefs by casting a non-Japanese actor as the heroine, who is described as "more Japanese than the Japanese," but it also elicits questions such as the following:

Through the story of a Scottish wife and a Japanese husband, does NHK attempt to reflect Japan's transition into a more multicultural society? The characters speak Standard Japanese, regional dialects, and English. For example, Masaharu speaks the Hiroshima dialect while Ellie, who supposedly learned Japanese from him, does not. Katherine, an Osaka native and Ellie's best friend, speaks "so-called" broken English. Do these portrayals reveal and/or promote certain ideologies about these language varieties? Language ideologies are indexical of particular sociohistorical contexts. What can the depiction of English ("the enemy language") and the family who uses it during WWII period scenes tell us about how contemporary Japan frames this historical period? Romantic relationships, one of the most common themes of *asadora*, occur in "Massan" as well. Ellie's use of the English word "love" in her attempt to support a budding romance between the subordinate characters Toshio

and Hana almost derails the courtship. What does her role in this romance mean?

Harvey (1998: 139) notes, “*asadora* have a definite educational content with regard to Japan and Japanese culture. Education is [...] part of NHK’s mandate as a national broadcasting corporation.” Yano (2010: 220) also writes, “The *asadora* genre [...] is particular to NHK and distinctively frames the way Japanese viewers interpret what they see. [...] This is not reality as much as an NHK fiction that gives viewers a prescriptive dose of programming for what is considered to be personal and national good.” Through an analysis of “Massan,” the panel would provide a glimpse into the nation’s cultural and ideological landscape.

### **Polly Szatrowski**

#### ***Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German***

In this panel, we analyze how people describe and assess/evaluate a variety of foods in individual sensory evaluation, spontaneous face-to-face and SKYPE conversations, and focus groups in English, ELF, Japanese, and German. Themes relate to multimodality (the use of verbal and nonverbal resources), food evaluation/assessment, knowledge, identity, and storytelling in talk-in-interaction. Results contribute to research on contextualized social and cognitive activity, and the growing body of research on language and food (Lakoff 2006, Gerhardt, Frobenius, & Ley 2013, Szatrowski 2014).

The first paper “The management of infants’ food preferences by parents during everyday weaning interactions” investigates how parents orient to their infants’ food assessments and food preferences during weaning interaction. Food preferences, interactionally managed through facial expressions, vocalizations, and body movements, are consequential for social actions.

The second paper “Laughing about food in CASE” found a significantly higher use of laughter in discussions of food in SKYPE conversations between students in Europe/US speaking in English Lingua Franca (ELF). Laughter used in explanations of culture-specific dishes, culinary stereotypes, etc. relieved potentially delicate situations related to subjective views of food/culture and linguistic uncertainty.

The third paper “Comparative study of Japanese expressions used for individual versus group sensory evaluation of dairy foods and drinks” found more texture expressions used to describe/evaluate milk, yogurt and ice cream in individual sensory evaluations than in spontaneous Dairy Taster Brunch conversations, and shows how expressions of taste, smell, texture and appearance correlate with positive versus negative evaluation.

The fourth paper “Japanese descriptions and evaluations of multiple types of specific dairy products at Dairy Taster Brunches” shows how participants formulated their descriptions of 3 different types each of milk, butter, yoghurt, cheese, whipped cream, creamer based on similarities and differences in features of each type, and made relative rather than absolute evaluations, using deictic gestures, facial expressions and stories of past experiences to support their evaluation.

The fifth paper “Describing the likes and dislikes regarding known and unknown food items in German Taster Lunches” demonstrates how participants expressed their likes and dislikes using lexical and nonverbal resources. Unknown food items led to the construction of experiential reference from known components giving rise to an expert identity, while known food items were positioned in relation to personal and national identities.

The sixth paper “Emergence and co-construction of the identity ‘fresh cream lover’ through stories in Japanese talk-in-interaction” demonstrates how identities can be triggered by food and co-constructed by participants using verbal and nonverbal resources in stories about experiences with and expressions of knowledge of different kinds of sweets and uses of fresh cream.

The seventh paper “Epistemic stance markers in the expression of dislike in focus groups on food” shows how participants’ use of epistemic stance markers of high certainty (e.g., “I know”) when talking about their dislike of food in conditional worlds, and markers with lower certainty (e.g., “I guess”, “I think”) to express their dislike of food in the present, relate to face-saving and politeness.

#### ***The diachronic aspect of politeness: Value and form***

This panel is discussed in terms of historical linguistics or the transmission of politeness. Most of the research and discussions on politeness have focused on the synchronic aspect. The papers of this panel focus on the various forms of expressing politeness spanning different years and generations and tries to illustrate the causes of the transmission of politeness in historical pragmatics and interactional sociolinguistics. The theme is examined in terms of both macro and micro points of view, which are mentioned below.

#### 1. The macro view

The surveys by Tanabe et al. (2015) focus on the dynamic transmission of the characters of the Japanese politeness system. The system of adopting polite and honorific forms for upper status persons who is referred to in conversation has historically been the outstanding feature of Japanese politeness in comparison with other systems where politeness is conventionally shown toward the listener irrespective of his or her social standing. However, according to the investigation by Inoue (1989), the Japanese system is gradually changing to a listener-oriented system. This is a significant pragmatic change. According to Romaine (1997), the Nahuatl language, spoken in Mexico, uses a special form to address persons who are not physically present but are mentioned in a conversation; however, such a language convention is found to be diminishing. Romaine attributes this change to the identity of race and development of egalitarianism. The presenter will illustrate the remarkable socio-economic change that have occurred in the Japanese society over the past two decades and overlap them with the changes that have occurred in Japanese politeness usages over the same period.

#### 2. The micro view

One of the presenters, Takeda focuses on the overlaps in the interactions between participants of different generations (asymmetrical female dyads with different participant groups) by diachronically comparing talk show data recorded recently and that recorded twenty years previously. This paper's contribution to the panel is that it examines how the functions of overlaps differ according to generation, as well as the level of intimacy and hierarchy. In addition, it helps to clarify one aspect of the change in honorifics from referent to addressee by broadening the scope of discussion from honorifics to politeness in an interaction. Tentative results showed that the overlaps by the participants in the newly recorded data reflect a lesser sense of distance and concern for silence in interactions than those in the data recorded twenty years before, clarifying opinions on commonality in the content of overlaps, as well as expressing a sense of intimacy and empathy that helps the conversation to progress.

It is hoped that this panel will offer sufficient opportunities to examine the universality of change in politeness usages among various languages.

### **Sandra Thompson & Tsuyoshi Ono**

#### ***The pragmatics of the 'noun phrase' across languages: An emergent unit in interaction***

From functional grammars to language typology, the 'NP' appears to be one of the least controversial grammatical units that researchers work with. Perhaps the strongest argument for postulating a grammatical unit of 'NP' is the fact that NPs prototypically serve as arguments of predicates (Hopper and Thompson 1984, Dryer 2007, Genetti 2015), and in fact, for any given language and across languages, the range of items that can fill argument slots in constructed sentences appears to be quite broad, but these items are taken by researchers to represent a unit 'NP' based on arguments like the following: - The NP is a crosslinguistically stable unit (compared to 'VP' or even 'clause') in that it can be manipulated in constructed examples similarly across languages of different structural types - The NP is a structurally robust unit within grammar in that, for any given language its internal structure (order and type of modifiers) is comparatively fixed. Surprisingly, however, the empirical basis for 'NP' has not been established; the category has simply been assumed and never questioned. Motivating the research for this panel, then, is the conviction that we need to test this assumed category against the pragmatics of everyday language use. Previous work testing such assumed categories against interactional data has consistently shown that such categories are either unnecessary for an understanding of the grammar of everyday interactions or in need of augmenting with richer and more realistic accounts (Englebretson 2003 ('complements'), Hopper 2004 ('pseudo-clefts'), Miller 1995 ('sentence'), Ono and Thompson 2009 ('adjective'), Pekarek Doehler et al. 2015 ('dislocations' and 'topic constructions')). Perhaps not surprisingly, trying to identify 'NPs' in everyday interactions, in fact, proves quite challenging. First, there are 'fuzzy boundaries', challenging traditional static views of grammar where the NP is defined with a priori fixed set of criteria. Second, though the order of elements may be fixed within an NP, multi-element NPs are in fact quite rare in spontaneous interaction. Third, various kinds of nominalization, though they could be considered NPs, complicate the category membership by being markedly different from other members pragmatically. Fourth, many 'NPs' do not appear to be serving 'argument' functions; languages may exhibit numerous 'free' NPs (Helasvuo 2001a, b), and have NPs which are more or less 'tightly' tied to predicates. Given these problems, a promising avenue for understanding the 'reality' of such a category for interactants (thus also for analysts) is to see it as emergent, where items clearly used as arguments to predicates

serve as ‘attractors’, towards which a dynamical, self-organizing system tends to evolve. We invite presentations which examine what have been taken as ‘NPs’ in interactional data from diverse languages, including minority endangered languages, as well as the better-researched ‘dominant’ languages, and including conversations among adults and children, internet-based spontaneous communication, and conversations with adults using Augmentative and Alternative Communication devices. We explore how varied ‘NP’ is across languages and interaction types, to determine how real such a category might be for participants actually engaged in communicative encounters.

### Larissa Timofeeva-Timofeev & Leonor Ruiz-Gurillo

#### *Exploring identities through humor*

This panel aims to provide an interdisciplinary framework for a fruitful reflection on how linguistic humor is used as an identity-building tool and as a psychosocial strategy. Humor, seen as a perfect combination of subversion and fun, becomes a powerful means towards cultural and personal affirmation, since its format allows speakers to voice opinions and ideas which would probably be inappropriate within a serious mode of communication. Children learn to understand, to define and to state linguistically their different identities as a part of their cognitive, psychosocial and metalinguistic development (Erikson 1968, 1996; Gombert 1992; Eccles 1999; Santaemilla, Gallardo & Sanmartín 2002; Yus 2002; Litosseliti & Suderland 2012). Indeed, some research reveals that as early as age 2 years, girls and boys exhibit incipient gender awareness through their gender labeling (Zosuls et al. 2008, 2009). Different developmental achievements –such as physical independence, an awareness and control over the closest environment, the ability to cope with relatives, social and school demands, or the process of self-esteem building– enable the child to reflect on her or his individual role(s) in society and to make decisions about their relations with peers and adults. The development of so-called humor competence (McGhee 1979, 2002; Martin 2007; Hoicka 2014; Hoicka & Gattis 2008) runs parallel to all of these phases, since humorous procedures are frequently drawn on this understanding of themselves and the environment. Later, as adults, speakers use humor in order to shape their sexual, political, religious, cultural, professional identity/ies (Lennox Terrion & Ashforth 2002; De Fina, Schiffrin & Bamberg 2006; Habib 2008; Schwartz, Luyckx & Vignoles 2011; Jenks, Lou & Bhatia 2015), and a variety of linguistic procedures are put into practice in their discourse with the aim to tackle many crucial social issues under an (apparently) humorous format. Along this line, studies on genderlect-building through humor (Crawford 1995; Yus 2002; Martin 2007; Ruiz Gurillo 2015) arise as one of the most promising research fields.

### ***Linguistic differences, interpreting and institutional re-shaping of non-natives' talk in social encounters***

Presentations in this panel explore situations of interpreted encounters and focuses on how, in addition to the proper activity of translation and linguistic mediation, interpreters as well as other institutional participants perform a re-shaping of the non-native's talk, aiming at increasing its conformity to the institutional format expected in the specific context. This re-shaping work consists in casting what the non-native says into the categories previously set up by the institution. Such categories are often materialized in paper forms that need to be filled up during or after the encounter, or get manifest in terms of the institutional representative's knowledge about what specific conditions might lead the non-native to successfully accomplish her/his request. The re-shaping work can be identified in how the non-native's talk is rephrased, translated, worked upon by the institutional representative and the interpreter; in how the institutional representative formats the questions addressed to the non-native in order to get the “appropriate” information; and in how a given information offered by the non-native is selectively treated and filtered in order to comply with the institutional agenda. A related issue concerns the non-native's participation in these encounters, and whether they attempt to conform to the institutional expectations, or they rather try to get their own talk (a story telling, a problem presentation, a categorization activity, etc.) taken into account by their institutional interlocutors (through repetitions, explanations, negotiations). In this panel we invite papers specifically aiming at understanding how the process

of re-shaping the non-native's talk is achieved in the detail of the actual development of the encounters, in its progressive mode, and in the setting up of evolving participant configurations of the people involved in the interaction. The topic of the panel raises issues related to participant categorization, participation framework construction, epistemics, sequential organization of talk, interpreting. They will be dealt with from different analytical and methodological perspectives, ranging from discourse and conversation analysis to interactional sociolinguistics and linguistic anthropology.

***Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction***

Everyday interactions, a “primordial site for sociality” (Schegloff, 1986, p. 112), are embedded in a material world, laden with objects to which co-participants pervasively orient in a tight articulation of embodied conduct and talk-in-interaction. This has been acknowledged by the growing interest, in EM/CA research, in embodied interaction (Streeck, Goodwin & LeBaron, 2011), and more recently in objects in action (Hazel et al., 2014; Nevile 2015). It includes referring to, pointing to, showing, and manipulating objects in all kinds of way; but also putting to the test the way we might relate to objects, i.e., our attitudes towards the world. This panel aims to bring into a clearer focus this mostly unexplored aspect of social interaction. Some recent studies focus on the ways physical objects can be made present and oriented to in interaction (see Nevile et al., 2014), in particular in situations where they feature mostly as tools or instruments within an overall interactional project. It has been shown, e.g. how an aphasic speaker can be understood as proposing going to the movies understandable by pointing to schedules on a newspaper (Goodwin, 2003); or how auctioneers together with buyers can produce the price of a good around the movements and strike of a hammer (Heath & Luff, 2013). A second strand of emerging research, more relevant for this panel, concerns sequences where an object or objects are central to the ongoing interaction and activity in a different way (Mondada, 2009; Fasulo & Manzoni, 2009; Oshima & Streeck, 2015; Fox & Heinemann, 2015). One crucial characteristic of these sequences is that participants constitute, describe and assess an object(s) in and through interaction, so that the consideration of the object is elaborated and becomes the temporary focus of the ongoing activity. The sequential trajectories of such ‘object-centered sequences’ are relevant to the task at hand but also raise specific issues regarding the joint achievement of intersubjectivity and social relationships in the here and now. Building on this perspective, the panel aims at gaining a better understanding of such object-centered sequences by bringing together a consistent series of recent and innovative empirical studies in multimodal conversation analysis. The contributions are based on video-recordings from various settings and activities, including, in institutional settings, designer workshops, laboratory work and geologists; and in mundane settings, video-mediated interactions, interactions in cars and mushroom picking.

### ***Pragmatics in the real world of signed and spoken languages***

Under a broad conception of pragmatics, whilst different theoretical perspectives arrive at differing accounts of the relationships that pertain between linguistic structures, language in use, social actions and conceptions of context, it is rarely the case that analysts move away altogether from a focus on *speech*. Though this has increasingly been understood to include co-speech *gesture*, the field of pragmatics has to date had little to say about *signed* languages. Conversely, the sign linguistics literature has been conspicuously quiet on the subject of pragmatics. This panel session is therefore designed to consider the particular complexities of interactional pragmatics at the *interface* between signed, spoken and gestural forms – prototypically, these converge in interaction that is professionally interpreted between Deaf signers and hearing interlocutors. These are not only 'real world' contexts, but frequently arise in public service settings (eg medical and legal interaction) in which the consequences are significant and the stakes correspondingly high. The interpreter's presence may be critical in creating this analytical opportunity, but the panel's focus lies equally on each member of the interactional triad: as Liu (2011: 89) notes, "examining how non-interpreter participants react in an interpreter-mediated interaction can offer new perspectives on human communication" and is "a new direction that interpreting research can take". Whilst interpreter-mediated interaction plays an infrequent part of most hearing people's lives, it is a common experience for Deaf people, and one which opens a rare window for interactional linguists: interpreters – unlike partners in monolingual conversations – *explicitly display their understanding of every other turn at talk*. Studying such interaction therefore casts fresh attention on intersubjectivity and the mutuality of participants' actions necessary to maintain experiences of communicative adequacy. We are afforded a uniquely specific opportunity to investigate Hans-Jörg Schmid's key question (Schmid 2012) : what are the cognitive abilities and processes required to be able to arrive at "what can or must be said" in order to get across "what is meant", and to arrive at "what is meant" on the basis of "what is said"?

### ***Political humor as social action: Verbal-visual attitudes towards politicians in late modernity***

At the intersection of discourse and media studies lies media linguistics (from German *Medienlinguistik*), an umbrella term for the study of mediated language in society. Two approaches can be discerned within media linguistics. Work on language of the media examines how (news) media use language to represent social life. Work on language in the media investigates how language standards, ideologies, and change are represented in the media. The popularity of media linguistics is spurred on by two developments: the shifting ecology of media organizations and their fragmented audiences, and the proliferation of mediated communication in society, or mediatization (Van Hout & Burger 2016).

This panel addresses the relationship between political humor and media(ted) language. In keeping with the conference theme of 'Pragmatics in the real world', this panel examines the distinctive nature of the pragmatics of humor as this involves

- news events such as sound bites (Lee 2012), bloopers (Silverstein 2011), or talk scandals (Ekström & Johansson 2008)
- media genres such as cartoons (Swain 2012), fake news (Waisanen 2011), late-night comedic monologues (Santa Ana 2009) or internet memes (Milner 2013)
- types of humor such as irony (Sanina 2014), and political satire (Reilly 2012)

The panel brings together empirically grounded contributions that show what social action is accomplished when political discourse and media discourse are juxtaposed. Panel contributors explore political humor from a variety of analytical approaches such as discourse analysis, rhetorics, multimodality, and linguistic ethnography.

***The interpreter's role in healthcare conversations: A multimodal analysis of a multimodal reality (1 of 2)***

Due to demographic changes, cities all over the world are developing rapidly into multicultural societies. As a consequence, healthcare workers are frequently confronted with patients that do not share their language. Especially in mental healthcare this can be problematic since the diagnosis is mainly based on the patient's narrative. The patient's words are taken into account, but the way these words are expressed and gestures, gaze, facial expressions, head movements, etc. are also part of the diagnostic instruments (Bouhuys 1989). The importance of multimodality in interpreter-mediated discourse is highlighted mainly in the last decade (Mason 2012, Davitti 2013, Pöchhacker 2016). This panel will focus on interpreter mediated conversations in healthcare with special attention to mental healthcare. The focus is in particular on how interpreters, (mental) healthcare professionals and patients manage the multimodal reality on the one hand, and how to analyse this multimodal reality on the other hand. Interpreters are bound by codes of conduct prescribed by national and international organisations. Often these codes are written for public service interpreters in general and not tailored to the requirements of a specific setting, like (mental) healthcare. The traditional view in these codes is that interpreters are neutral, discrete, passive and transparent (Mason & Ren 2012). An illustrative example can be found in the Flemish code of conduct (Kruispunt Migratie-Integratie 2013 - translation): *The interpreter has the duty to interpret completely and faithfully everything that is said [...] without adding, omitting, or changing anything. The interpreter uses the same register and the same intonation as the speaker [...] Moreover, the interpreter does not show personal opinions, preferences, interpretations of feelings, not even non-verbally [and] at any time refrains from taking part in the conversation.* In reality many multimodal resources like positioning, gaze and facial expressions make it almost impossible for the interpreter to be completely neutral and passive. Instead, the interpreter seems to be a co-constructor of the conversation (Mason & Ren 2012: 233) that can exercise power "by adopting various verbal and non-verbal strategies to negotiate, coordinate, check, and balance power relations." According to Pasquandrea (2012: 150) the three main functions of multimodal resources are "monitoring the ongoing interaction, displaying engagement in the activities performed, and reorienting the participant's constellation". The second focus of this panel is on multimodal analysis of the multimodal reality, since this kind of analysis can enrich our understanding of the triadic interaction (Davitti 2015). Verbal and non-verbal resources should be seen as a whole and should be analysed as such if we want to "gain a thorough understanding of the communicative dynamics of interpreter-mediated interaction". (Pasquandrea 2012: 150). The composition of a multimodal corpus implies the availability of video material, which is not easy in the sensitive setting of mental healthcare.

#### ***Research versus practice: Towards a stronger partnership between academia and the real world in the study of institutional discourse***

Research and practice are two innately different, and often separate worlds. The two pillars of this dynamic, i.e. academics and practitioners, often stand apart in terms of dialogue, reciprocity and partnership (Barkho, 2013). There are many reasons behind this academic-real-life disconnect. Research tends to produce briefs, reports, and articles; but practitioners say they need strategies, techniques, and ideas arising from such research that is applicable to their classrooms or programs (Bingham & Smith, 2001). Practitioners tend not to trust or will downright discard scholars' – i.e. 'outsiders' – findings on their daily routines. Researchers, too, have reflected on their cooperation with practitioners, and have highlighted possible tensions and pitfalls. (cf. Amabile et al. (2001: 425) who identify three variables mediating the researcher/practitioner divide, and Visconti (2010) who reflects on increasing researchers' and practitioners' awareness in deploying ethnography for case study research)

Both sides, however, express the growing need to bridge the gap between the growing academia-real world divide.

In the long-standing tradition of institutional discourse studies, there is a clear need for the voice of the practitioner to be heard. This panel intends to explore the opportunities and challenges of collaborative associations between practitioners and researchers, in fields as diverse as healthcare, business, education and the media. The goal of the panel is to foreground and document existing partnerships between practitioners and researchers. We do this by expressly including the practitioner in the research process, not as a mere object of study, but as a full partner.

The questions we ask in this panel's papers include but are not limited to:

- What are (recurring) issues academics on the one hand, and practitioners on the other are faced with before, during, and after research collaboration, and how can we address them?
- Which research methods can we employ to reduce the distance between academic researchers and practitioners?
- What factors can be considered determinants of the potential success of academic-practitioner research collaboration, when it comes to processes, environment characteristics, et cetera?
- In which ways can we strengthen existing partnerships between practitioners and researchers?
- How can we optimize the dissemination of research results so they are passed on in ways that are useful to the field of practice under examination, and that satisfy the needs of practitioners who need to evolve alongside a continuously changing world?
- What are the effects of sharing research experience on reciprocal expectations, and how can we better align these expectations?

In this panel we present eight co-authored papers in which researchers in the field of institutional discourse studies and practitioners from a wide range of settings work together. By presenting pilot-tested research in the field, focusing on the practitioners' need for the influx of practical recommendations from academia (Bruyer, Jacobs & Vandendaele, 2016), or highlighting the need for more practice in research, this panel will help us to come to terms with how communication is operating on a macro-level, and how to enhance it.

By looking at the researcher and the practitioner as equal partners in institutional discourse research, this panel aims to move towards a better understanding of the discourses and their institutions that are active in society.

#### ***CMC pragmatics of L2 discourse***

The enormous growth of multilingual content on the web calls attention to second/foreign language (L2) and multilingual practices in computer-mediated communication (CMC). This panel will examine and discuss pragmatic phenomena in L2 CMC in social media. As an "emerging interdiscipline" (Herring, 2015), CMC pragmatics has applied the methods and approaches from traditional pragmatics, as well as from discourse analysis and sociolinguistics to studying pragmatic phenomena in CMC. In the process, research on CMC data has pushed the boundaries of pragmatics and expanded its scope, e.g., by accounting for medium effects (for an overview, see Zourou [2012].) In addition, CMC pragmatics can promote a more complete understanding of emerging social and linguistic practices. Because Web 2.0 has dramatically increased connections across linguistic boundaries it provides fertile ground for multilingual practice in its many forms, e.g., for sustained L2 use but also for codeswitching between L1 and L2.

This panel brings together papers on "classic" pragmatic phenomena such as stance as instantiated in CMC and on CMC-specific phenomena such as emoticons and hashtags. In their empirically-based investigations, panelists critically reflect (a) on the interplay between form, function, and context and (b) on the theoretical implications the empirical results may have.

#### ***Analyzing Online prosumer discourses: Consumer reviews, customer feedback, and other modes of eWOM***

This panel explores online prosumer discourses, which evolve as users turn from readers to writers and adopt the double role of consumer and producer of content. Although such discourses are increasingly present in our everyday lives, little attention has been paid to the pragmatics of prosumer discourse (but see Vásquez 2014). Electronic word-of-mouth (eWOM) has, however, long been of interest to companies and organizations, and large-scale quantitative studies have focused on ways of mining these data to inform marketing practices. Yet, the meanings arising from eWOM are highly situated and tied to complex contexts, in which prosumers engage in social action by posting written, audio, or video feedback about commercial products or experiences, and in which users search, interpret and make use of myriad texts brought to their screens by sophisticated algorithms and identification tools. This panel examines linguistic and multimodal indices of pragmatic variability, negotiability and adaptability (Verschuere 1999) in consumer reviews and other types of prosumer feedback appearing across various modes of computer-mediated communication (Herring et al. 2013).

As they produce consumer feedback, users grapple with some degree of 'context collapse' (Marwick & boyd 2010) in their efforts related to audience design and the social authentication of reviewer reliability (Vásquez 2014; Virtanen 2015). Analyzing language in context, panel participants will address questions such as: How are implicit or explicit audience conceptions manifest in users' discourse? How do users brand their prosumer personae in view of imagined audiences? In what ways are the automatic self-commodification tools afforded by various retail sites reflected in the discourse of customer reviews, or other forms of customer feedback? Of special interest will be how prosumers construct coherent interactions with one another in a mode not necessarily designed for these purposes; evidence of such interactions has been found in CMC-modes that were not originally designed for reciprocity. Other relevant questions concern users' playful actions in view of emerging conventionalisation of such genres, as well as the online or offline roots of the phenomena identified in prosumer feedback data. Still other matters of interest are user attitudes toward prosumer discourse, as well as users' metapragmatic awareness of the social meanings of the commercial and self-commodifying actions that they are actively engaged in.

The studies in the panel are concerned with micro-pragmatic or macro-pragmatic issues. Methods vary from in-depth, qualitative, textual analyses to corpus-based quantifications of particular linguistic elements or pragmatic phenomena in terms of discourse practices, either within or across CMC-modes. The studies address several

different languages. The panelists will make their theoretical framework explicit so that comparisons across different approaches will offer insights to a wide audience. The concluding discussion will identify cross-cutting themes across studies, and will highlight similarities and differences between the CMC modes and languages under investigation, as concerns the pragmatics of online prosumer discourse. The panel aims to have an impact on pragmatic theory while also adding to the understanding of the emerging linguistic and/or multimodal behaviour of online users engaged in prosumption on commercial sites.

***Construal of person in interaction – a cross-linguistic comparison***

Referring to people can be seen as a universal characteristic of human social organization (Enfield & Stivers 2007), but person systems in languages offer remarkably different strategies for construing person. In terms of grammar, person systems differ, for instance, with respect to number, clusivity and gender marking, as well as the ways in which they express impersonality or distinguish between human vs. non-human participants or speech act vs. non speech act persons (Siewierska 2004). There has been a great number of research on these grammatical properties in Indo-European languages, but a cross-cultural, empirical study of the construal of person in interaction opens up new perspectives into the ways in which, for instance, agency and experience are organized and distributed. For this panel, we invite presentations that focus on the empirical study of the construal of person in interaction. The panel aims at a cross-cultural perspective that sheds light on the interdependencies between culture, social action and language use. We aim to find similarities in the ways in which participants organize joint-action as a constant "fission-fusion" process between the "I", the "you", the "we", and the "they" (Enfield 2013). Simultaneously, we want to explore the different ways in which agency and experience are organized and distributed in the studied languages. The Finnish person system, for instance, is similar to many European languages in that it comprises three persons and the 1st person plural form makes no distinction between inclusive and exclusive reference. However, Finnish organizes person differently compared to many other European languages (Helasvuo & Laitinen 2006). First, it has a personal passive that always implies a human agent performing the action and is typically used for expressing first person plural actions (Helasvuo 2006). Second, it has a zero-person construction with no overt subject where the predicate verb appears in the third person singular form. The reference of a zero-person form can be interpreted as specific or non-specific: it offers an open space for shared experience that anyone can enter (Laitinen 2006). Unlike the passive, whose implied agent is typically collective, the implied agent of a zero is an individual, i.e. it treats its referents distributively (Etelämäki & Herlin forthc.). Third, in standard Finnish, the person is marked on finite verbs; therefore it is possible to leave out an overt pronominal subject. We encourage the view of emancipatory pragmatics (Hanks et al. 2009) in the analyses of person systems. A key assumption in this approach is that pragmatics has been dominated by Euro-American languages and ways of speaking, and that to overcome this bias, there should be more comparative work on a wider range of languages, which would allow the possibility for other ways of describing language. The panel is a continuation of the panel "I, you, we and the others: dynamic construal of intersubjectivities in grammar and in interaction" (IPrA 2015).

***Stage of life categories: Morality and identity work in talk in interaction***

With an expanding older population by mid-century, this demographic shift has a range of implications for society including what age and ageing means. Interactions occur in a range of settings, including health, family, classroom, courtroom and aged care, where age may be more or less relevant to what is being done. The papers

in this symposium investigate precisely how age is invoked and made relevant to participants in the context of routine institutional encounters. In everyday life, parties routinely assemble versions of each other through descriptive categories that implicate particular versions of social identity. These assessments are inferentially laden, as they describe both the person and the describer. Sacks' work on membership categorization analysis, and particularly his lecture on 'Hotrodders as a revolutionary category' (Sacks, 1992, Vol. 1, p. 396-403), shows how invoking categories does identity work and culture work, and requires relevant member knowledge. As with everyday routine assemblages and assessments of others, category-bound activities also employ morality accounts. In this symposium, we explore categorization deployment observed through the invoking of Stage of Life categories. Papers will investigate how stage of life categories are made relevant by the parties involved in the interactions, across a range of contexts, and how they work to show how meanings are invoked through displays of common sense knowledge. A focus on "identity-in-action" involves investigating category work that involves stage of life deployment, and the associated morality work. Through observation of how participants constitute social identity and construct particular social realities, we can examine how they empower and promote the dignity, worth and well being of persons of all ages.

#### *Constructing ordinariness across media genres*

In *on doing "being ordinary"* Sacks (1984) examines the "event's ordinariness, its usualness" (1984: 414) and how "being ordinary" (ibid.) is done. Departing from the interactional-sociolinguistic premises that 'being ordinary' is (1) an interactional achievement and thus constructed, reconstructed and deconstructed in communication, and (2) that ordinariness is brought into the discourse and brought out in the discourse, this panel investigates the (re-/de-)-construction of ordinariness, that is 'being ordinary', in the context of media discourse, paying particular attention to its (re-/de-)-construction across media genres, and to its strategic use in order to achieve particular goals in media discourse by both professional and non-professional participants. Ordinariness may be a constitutive part of the media discourse, as is the case with reality shows, audience-participation TV programmes and participatory journalism online; and it may also be (re-/de-)-constructed locally to achieve particular perlocutionary effects, for instance when public figures such as politicians assign their private lives the status of an object of talk in the context of political discourse, as in Prime Minister's Questions, political interviews and political speeches.

Media discourse has been described as public discourse, institutional discourse and professional discourse, generally produced in accordance with institutional constraints on the macro level, genre-specific constraints on the meso level and genre-specific contextual constraints and requirements on the micro level. Unlike face-to-face interaction, media discourse allows the uncoupling of space and time and thus communication with distant others. This also holds for the (re-/de-)-construction of ordinariness, which is also a public endeavour and which is generally produced and interpreted in accordance with institutional and genre-specific constraints. The (re-/de-)-construction of ordinariness is also frequently followed up in media discourse and may even be assigned the status of an object of talk (Fetzer & al. 2015, Weizman & Fetzer 2015). The self- and other-positioning (Harré & Van Langenhove, 1999) as ordinary is generally done by foregrounding ordinariness and at the same time backgrounding non-ordinariness anchored to professional or expert identities.

This panel examines the strategic construction, reconstruction and deconstruction of ordinariness across media genres done by professional participants (e.g., politicians, journalists, scientists, artists) and by ordinary people participating in media discourse (e.g., viewers, members of the audience, on-line commenters, bloggers etc.). It focuses on contexts in which (1) professional and non-professional participants position themselves as ordinary, (2) addressees and third party are positioned as ordinary, in various genres of public talk. The discursive strategies discussed will include, for instance, small stories, quotations, conversational style, irony, naming and addressing as well as references to the private-public interface.

***Financial literacy – a key to the real world***

Over the last years, the study of communication in finance from a discursive, textual, and quantitative perspective has attracted strong interest not only in economics and finance, but also in the humanities. This panel intends to enhance the understanding of the pragma-linguistic aspects of financial communication in general and financial literacy in particular from innovative perspectives. In line with the overall theme of the IPrA 2017 Conference, “Pragmatics in the real world”, the panel focuses on the key role of financial literacy in society and discusses research in which the various genres of finance (e.g., pension fund information, financial analysts’ recommendations, corporate announcements, bank statements, insurance letters, tax forms, financial advisors’ papers) are examined with inter- and transdisciplinary approaches that reconstruct, scrutinize, or aim at improving the communication between financial experts and society-at-large (Whitehouse & Perrin, 2015). By doing so, this panel addresses theoretical, methodological and practical challenges of investigating the intertextual dynamics and linguistic strategies at the interface of verbal, visual, and numerical languages. Methods combined include text analysis, multimodal genre analysis, writing research, critical discourse analysis, but also quantitative approaches such as correlation and regression analysis. We intend to contribute to an enhanced understanding of what the characteristics of financial communication are, which strategies the stakeholders use, and where there is a mismatch between the actual financial literacy – or even illiteracy – of lay persons and the assumptions or policies of financial experts. By creating the occasion for close interdisciplinary dialogue between complementary disciplines, the panel aims at developing a common agenda of joint research on financial literacy as a key to an economically shaped world.

***Deixis in discourse***

Deixis (or indexicals) has long been one of the key research topics in pragmatics because it links the structure of language and the context in which a deictic expression is used (Levinson, 1983). Apart from its canonical deictic uses, it also has various kinds of extended discourse pragmatic functions. For instance, the second person pronoun can be used impersonally in many languages (e.g. *You see a crime, you report it*); it can also be used metalinguistically to elicit addressee’s attention and display the speaker’s strong stance (Biq 1991). Demonstratives and possessive pronouns can likewise develop beyond their referential uses to convey different shades of speaker emotion and attitude (e.g. Lakoff 1974; Rybarczyk 2015). For example, in addition to developing into grammatical markers such as connectives, complementizers, definite articles, focus markers, nonverbal copulas, etc. (Diessel 1999), demonstratives are often also used as markers of speaker’s subjective and intersubjective stance (see Kratochvil 2011; Nagaya 2011; Schapper & San Roque 2011). In Vietnamese, for instance, medial demonstrative *đây* is also used to signal the speaker’s solidarity with the addressee (‘it’s relevant to you, so I’ll let you know’), while distal demonstrative *kia* (and its phonologically reduced form *co*) is used by the speaker to offer a modified assessment of the addressee’s prior expectation (‘X is better/worse than you expected’) (Adachi 2016). In modern Khalka Mongolian, postnominal possessive pronouns are frequently used to signal familiarity, with the first person possessive pronominal enclitics =*min*’ and =*maan*’ additionally expressing familiarity and solidarity respectively, while the second person honorific possessive pronominal enclitic =*tan*’ additionally encodes deference (see Ayanga, Brosig & Yap 2016). An interesting question is whether languages with *postnominal* indexicals tend to develop as stance markers at the right periphery (RP) of an utterance, while languages with *prenominal* indexicals on the other hand tend to be recruited as stance markers at the left periphery (LP). The pragmatic uses of demonstratives in some languages lend support to such a hypothesis, with rightward scope expansion observed among Vietnamese sentence final particles derived from postnominal demonstratives (Adachi 2016), and leftward scope expansion among Cebuano discourse markers derived from prenominal demonstratives (Tanangkingsing 2016). On the other hand, evidence from postnominal possessive pronouns in some languages indicate that postnominal possessive pronominal enclitics combine with their host constituent to form epistemic, evidential and evaluative stance markers at the left periphery (e.g. colloquial Malay and Indonesian *agaknya* ‘it seems’ (< guess=3SG.GEN), *nampak=nya* ‘it appears’ (< see=3SG.GEN), *sebaiknya* ‘it’s best’ (< as.good=3SG.GEN); see Englebretson 2003, 2007; Yap 2011), though

given the parenthetical status of these stance markers, they can also sometimes occur in utterance-medial and utterance-final positions, the latter a right-periphery (RP) phenomenon often in the form of an utterance tag (sometimes referred to as an after-thought). In the case of in modern Khalka Mongolian, the postnominal possessive pronouns with stance functions remain encliticized to their head nouns, begging the question of how scope expansion is to be construed. Indeed, numerous questions are raised with respect to the relationship between the pre- vs. post-nominal positions of indexicals in their roles as determiners and their left- vs. right- vs. non-periphery realizations. Among these questions are: How robust is the tendency (if any) for prenominal indexicals to be recruited for stance marking functions at the left periphery, and for postnominal indexicals to develop into stance markers at the right periphery? What accounts for such tendency (if any)? If there are deviations from this tendency, what motivates such deviation? Are there differences in the roles between left periphery and right periphery indexical-based stance markers? Are there differences in types of functions and preferred grammaticalization/pragmaticization trajectories among indexicals, say between demonstratives and possessive pronouns? How do the biases for left-periphery vs. right-periphery vs. non-periphery indexical-based stance markers differ from the biases for stance markers derived from non-indexicals (e.g. stance markers derived from complement verbs such as ‘think’, ‘say’, ‘look like’ and ‘feel’; see Thompson & Mulac 1991; Kärkkäinen 2003; Endo 2010; Lim 2011; Yap, Chor & Wang 2012; Yap & Chor 2014). Recent studies have also begun to explore the dynamic embedded properties of deixis in natural conversation. Among the questions of interest in these discourse studies are how deictic expressions interact with bodily conducts such as gaze orientations and gestures (Goodwin 2003; Stukenbrock 2014) and how indexicals such as demonstratives are used to project possible upcoming actions in talk (Hayashi 2004). These dynamic properties of indexicals in interactional talk have yet to be investigated in languages other than English. Using a variety of discourse analytical frameworks, this panel explores the extended uses of versatile indexicals across a wide range of languages to gain a fuller understanding of robust similarities and subtle language-specific variations in the grammaticalization and pragmaticization of indexicals, including but not restricted to the non-deictic and non-referential uses of demonstratives and personal pronouns.

### ***Interpreting and representing non-English language data in discourse studies***

This session will be concerned with representing (and thus making accessible to international audiences) data from languages other than English for the purposes of discourse studies. Scholars in international debates are curious to compare – even if not explicitly – the specific findings about how different languages are used for communication, identity construction, relationship building but also expressing emotions, perpetuating and subverting ideologies, doing politics. Key researchers have emphasised the need to work on the original data, that is data in the language in which they were produced and collected for analysis (e.g. Sarangi 2010). Nikander and Egberts have called for setting up “guidelines on how data are translated, glossed and/or transliterated in an accessible yet precise fashion”, so that the “analytic transparency is secured” (Nikander and Egberts IPrA2015 panel description). Discourse analysts have often questioned the possibility of capturing details of discursive form and function in translation (e.g. Temple 2005; Temple et al. 2006) and transcription (Green et al. 1997, Roberts 1997, Bucholtz 2000). In conversation analysis questions have been asked whether “conversational actions such as “asking questions” or “giving directives” [are] present in every culture, or are these culture-specific categories based on English (...)” (Dingemanse and Floyd 2014: 447). Ethnographic studies suggest that not everything in (conversational) data is cross-culturally comparable (see Moerman 1988; Simon 1996: 137-138) and looking closely at original language data is a necessity. Additionally, the question has been posed about how much background ethnographic knowledge is required of both researchers and audience members to make sense of the data in its original contexts. Many cross-cultural studies (e.g. on migrants) often rely on data from speakers who are not fluent in the dominant language of the community (and of the research context). Dealing with the resulting cross-language material involves the help of translators and researchers familiar with minority languages, and relies on their transmission and/or glossing of the primary data for analysis: Temple et al. (2006) argue that the transmitted data should in fact be treated as secondary rather than primary.

The issues to be addressed by the panel contributors will include:

- transcribing non-English language texts for analysis
- translation and/or glossing of non-English language texts for presentation of analysis
- representing language contact phenomena (code-switching, borrowing) in the data
- representing conversational data
- issues in researching highly culture specific data and idiosyncratic communities (intimacy and/or socially sensitive topics, specialised registers, etc.)
- representing multilingual communication in media contexts
- best practices and conventions in non-English data transcription and translation
- challenges in dealing with non-English interactional data

We hope this session will be relevant to researchers (and their audiences!) – linguists, social scientists, translators, etc. – from an array of language backgrounds, who study narratives, conversations, institutional texts, and their translation and transcription. We intend to debate and work towards a consensus on how original language data should be represented and analysed to extend researchers’ access to diverse types of data and their understanding of specific human communicative practices.

#### ***Beyond the myth of journalistic storytelling. Why a narrative approach to journalism falls short***

"Reports of new events are stories - no more, but no less". This assertion by Gaye Tuchman (1976, 93) opened a window onto a central issue in journalism studies, i.e., the conceptualization of events in the news as stories. Since then, journalism research and education have further developed the concept of narrative journalism, which has resulted in a plethora of approaches to journalism as storytelling. In our panel, we examine this "mantra to think story" (Cotter & Perrin 2016) as relevant, but falling short and partly dysfunctional (Flath 2014). We theorize and empirically investigate why news is much more - and at the same time less - than stories and why this matters for both journalism research and practice (Perrin & Wyss, 2016). This panel offers space for considering issues such as:

- the reasons (e.g., historical, political, pragmatic) behind the conceptualization of journalism as storytelling
- the relationship between storytelling and narration in journalism and other domains, such as literature, organizational communication, and everyday conversation
- the interplay of narration with description, exposition, and in particular argumentation
- the role of this interplay in public discourse and in its constitutive processes, such as gatekeeping and framing
- the theoretical and methodological instruments for investigating this complex interplay in the dynamics of journalism in both mass and social media.

Beyond addressing such questions, we intend to contribute to better understanding and contextualizing the narrative effort of journalists. Given the challenges these practitioners must face in the contemporary news-overloaded world, it is fundamental to explore the limitations of the traditional narrative writing pattern and the opportunities it offers.

#### ***Global transitions in health care***

The proposed panel aims at bringing together an international group of pragmatics scholars working on health communication, and in particular the issues related to global transitions in health care. In a broader area of workplace communication transitions are typically understood as periods of change and discontinuity in professional life space (e.g. Westerman, 2012: 11). Much has been written about transitions in the workplace, particularly in the contexts of career change, novice-expert experiences, inter-organizational job change, and organizational mergers and acquisitions. In this panel we take a more comprehensive view of transitions by

acknowledging that transitions encompass both changes, discontinuities, advancement and development, as well as preservation, continuity, and possibly even stagnation in professional life spaces. The focus of the panel is on transitions brought about by globalization of healthcare, namely spatial and symbolic mobility brought about by various social, historic and economic processes, and the effects of such mobility on healthcare deliveries. The panel participants will investigate transitions that concern various participants of healthcare encounters (i.e. healthcare professionals and patients/ clients), as well as transitions in the modes of provision of healthcare services. A more comprehensive take on transitions will be reflected in the analyses of transitions at three different levels, namely, how the global macro-transitions (e.g. spatial/ geographical mobility of healthcare professionals' and patients' population around the globe; global healthcare services delivery across countries and continents) are interrelated with and impact on (as well as are impacted on) by meso-transitions (within specific institutions and communities) and micro-transitions that are manifest at the level of language use (also see Angrouri et al., in press; Marra et al., in press). To investigate transitions, the participants of the panel will draw on a range of empirical data. While previous research on transitions in healthcare has primarily drawn on participants' accounts of transitions experiences (e.g. in interviews or questionnaires), in this panel participants will explore how transitions are actually experienced and managed in real life through talk and text. Undoubtedly, managing transitions involves acquiring 'new' and adopting 'old' discourses and linguistic resources, skills, and appropriate ways of doing things. The participants of this panel will examine how transitions are represented and manifest in language use and the role of language in mediating transition experiences. Among the issues that the participants will engage with are the effect of lingua franca on healthcare service deliveries, the role of pragmatic competence in intercultural healthcare encounters, and healthcare delivery via remote communication technologies. Importantly, the international group of panel participants will contribute to illuminating perspectives on global transitions in healthcare from the main stream research on English-dominant contexts, as well as the research on non-English dominant contexts that remains largely underrepresented, thus providing an innovative comparative angle to pragmatic studies on transitions in healthcare.

#### ***Multimodal turn-taking***

As early as 1967, Adam Kendon argued for the relevance of gaze for turn-taking in conversation and throughout the 1970's and 1980's occasional studies explored **turn-taking in its natural, multimodal habitat** (Argyle & Cook 1976, Duncan & Fiske 1977, Goodwin 1980, 1981). Nonetheless, the purely verbal outline of the turn-taking machinery (somewhat symptomatically referred to as the speech exchange system) as it was proposed in the foundational paper by Sachs, Schegloff & Jefferson (1974) has remained largely unquestioned until very recently. The growing interest in the multimodal dynamics of the turn-taking process has primarily concerned gaze behavior (Jokinen 2010; Rossano 2012, 2013; Streeck 2014; Holler & Kendrick 2015; Oben 2015; Oben & Brône 2015; Brône et al. 2017; Auer, to appear) but selected studies also demonstrate the need to take gesture and posture into account (Schmitt 2005; Mondada 2007, 2013; Deppermann 2013; Selting 2013). However, many issues remain to be explored to uncover the rules that govern the multimodal turn-taking machinery. This panel brings together researchers working on issues of multimodal turn-taking from different theoretical perspectives (most notably CA and cognitive multimodality research) with different methodologies (video analysis and mobile eye tracking) and different empirical focus (dyadic and multi-party interaction, experimental, private and institutional settings, and different activities such as e.g. storytelling versus discussing or arguing). The panel addresses **topics** as diverse as:

- In which ways is the gaze behavior of dyadic interactions different from how speakers use gaze to claim and allocate turns in multi-party interactions?
- Do the rules that Goodwin (1980) has argued to govern gaze behavior in dyadic interactions also apply to conversations of more than two participants?
- Does the use of unobtrusive eye-tracking technology produce novel insights into the rules & dynamics of eye gaze behavior as part of turn-taking?
- What role do hand and head gestures as well as proxemics play in the process of turn-taking? And how do they

relate to the above-mentioned gaze patterns?

- Is the importance of gesture use affected by the number of participants of a conversation, their spatial arrangement, their level of acquaintance, or the activity they are engaged in?
- Is there a hierarchy of multimodal cues in turn-taking, such as e.g. mutual gaze is obligatory to allocate a turn while deictic hand gesture or deictic head nods are optional?

***Language workout in bilingual parent-toddler interaction: A case study of Russian-Swedish family talk*** (Contribution to *Discourse, interaction, new families and contemporary kinship processes*, organized by Poveda David [et al.]

This paper examines language learning practices that are used to organize minority language training embedded in mundane family activities. The data come from a video-ethnographic study in three Swedish multilingual families with preschool children where mothers speak Russian. An analytical focus is on the organization and accomplishments of so-called home language lessons and *language workout* as their variety in multilingual family talk. This language learning practice resembles common language socialization practices in middle-class families as mobilizes a teacher talk register. However, it is specific in its sequential organization and consistent employment of a parent talk register, which dialectically invokes intimate and educational, task- and language-oriented dimensions. The findings reveal that realization of the parental language policy to support heritage language development rests not only on consistent language choice, but also on parental understanding of the language learning process and who child is as a speaker vis-à-vis parent.

**Mayumi Adachi**

***Stance-marking uses of sentence-final demonstratives in Vietnamese*** (Contribution to *Deixis in Discourse*, organized by Yang Ying [et al.]

Based on conversation data, this paper examines how Vietnamese extends its three-way distance-oriented demonstrative paradigm to other domains, in particular, the speaker's subjective and intersubjective stance. Proximal demonstrative *đây* at the sentence-final position is used as a marker of subjective assessment on the basis of the speaker's direct experience ('as I see it'). Both distal demonstrative *kia* (and its phonologically reduced form *co*) and medial pronominal *đấy* are used by the speaker to present new information to the addressee. The two particles, however, differ from each other in the speaker's attitude toward the addressee. The distal *kia* (or *co*) signals a difference in knowledge between the two interlocutors, with the speaker criticizing that the prior information provided by the addressee is wrong ('X is better/worse/more/less than you expected'), while *đấy* highlights the speaker's attempt to synchronize his or her utterance with the addressee's prior statement with a view to eliminating the current imbalance of knowledge between them (I'll let you know). A medial determiner *ấy* (and its reduced form *y*) are the markers of shared knowledge, which recall an already-known issue to the addressee's mind ('remember?'). The speaker often supplies more precise information with *ấy* or *y* so that the addressee can retrieve it from memory ('to be exact'). These particles also serve as a common grounding device, regarding previously unknown information as if it was familiar with the addressee, to persuade him or her and elicit an agreement ('you know'). Our findings reveal that the speaker's consideration for the addressee's involvement in the conversation, i.e. the speaker's intersubjective stance, expressed by the Vietnamese particles discussed above is gradually increased in this order: proximal, distal and medial.

***Conceptualizing selves in media discourse: Metaphoric conceptualizations of femininity in female-authored articles in Nigerian newspapers*** (Contribution to *Language, Gender and Cognition*, organized by Alvanoudi Angeliki [et al.]

Scholars in linguistic anthropology (e.g. Mele 2010, Ellece 2012) note how gender can be constructed through metaphors. These scholars further argue that metaphors are not just mere rhetorical ornaments or literary devices, but rather a powerful means of constructing, producing and maintaining gender inequality. In this paper I examine the many complex and subtle ways in which Nigerian women use metaphors to not only conceptualize their gender but also, index it. I also discuss presuppositions and inferences associated with indexing of gender and their role in communicating messages about the way Nigerian women perceive their

gender. For example, the metaphor: ‘A woman is the engine room for the birth and upbringing of children’ (*Dailytrust*, 23 March 2012) does not only define ‘womanhood’ in terms of child bearing but also, locates child rearing as the sole responsibility of women. Methods of and insights from feminist critical discourse analysis, conceptual metaphor theory and pragmatic notion of presuppositions are employed to analyze over 500 metaphors used by Nigerian women to describe or make reference to selves. The data are obtained from 200 female-authored articles on gender and related issues published in five Nigerian newspapers that enjoy wide readership in Nigeria: *The Guardian*, *Dailytrust*, *The Punch*, *New Nigerian* and *Vanguard* from 1999 when democratic governance returned to Nigeria after more than two decades of military dictatorship to the year 2014 (a period that has witnessed an unprecedented surge in the wave of gendered discourses in the Nigerian print news media). The analysis demonstrates that Nigerian women still use metaphoric expressions which largely keep in place a gender ideology, which upholds male dominance and female subordination. It also reveals that the underlying cognition of the Nigerian woman seemingly indicates her consent to patriarchal hegemony. The paper concludes that the dominant gender ideology in the society influences or constrains how individuals perceive and index their gender in relation to others.

***Crisis-motivated humour in computer mediated platforms in Nigeria: A pragmatic study***  
(Contribution to *CMC Pragmatics of L2 Discourse*, organized by Vandergriff Ilona [et al.]

Humour, an established means of releasing stress and tension has attracted scholarly attention over the years. In the Nigerian discourse context, studies on Crisis-Motivated Humour (CMH) via CMC platforms are scanty. This paper, therefore, investigates humour composed and shared on the social media during the socio-economic/political crisis in Nigeria with a view to identifying CMH as a genre of humour. Ethnography of Communication and Pragmemic theory serve as the theoretical framework. Ten anonymous humorous compositions were randomly selected from *WhatsApp* and *Facebook*. CMH is a creative composition of jokes which also serves as a reflection of Nigerians’ experiences, perceptions, imaginations and assumptions. They are purposefully composed by Nigerian, most especially, the middle-class, for Nigerians, in order to down-play the effects of the crisis and bring temporary reliefs to the audience. These jokes elicit amusement, high-level wits and satirise the crisis situation(s). CMH are composed mainly in the nation’s official language with a blend of pidgin and a reflection of some Nigerianism, then circulated through the social media. These CMH are replete with verifiable, but exaggerated facts. Use of the first person singular pronoun ‘I’ and second person singular/plural ‘you’ with the use of simple present tense of verb among other grammatical elements, are a norm. All these make some of the jokes believable and also establish CMH as a unique genre of humour with an unlimited audience. CMH are often preservable and re-usable subsequently and thus serve as a relevant medium through which political leaders can assess the plights of the populace and access first-hand information on the ‘real’ impacts of the crisis.

#### Najma Al Zidjaly

***Transforming food from a political action on Twitter to a health action on WhatsApp: An example from Oman*** (Contribution to *Food for thought and social action: Constructing ideologies in food-related communication across digital and cultural contexts*, organized by Gordon Cynthia [et al.]

In this paper, as part of a larger ethnographic project on social media and Arab activism in the Arabian Islamic social monarchy of Oman, I examine how Omani citizens used discourse to transform a failed political campaign on Twitter—the boycott of a major food company—into a successful health campaign on WhatsApp. To document this transformation, and to showcase the agency of the users of social media, I draw upon the theory of mediated discourse (Scollon, 2001). My analysis highlights how health-related practices that emerged in the Twitter campaign were reframed on WhatsApp to create a new health discourse in Oman. This discourse is aimed at creating a new type of consumer, one who is aware not just of his or her rights but also of what kinds of food he or she purchases and why. The practices that constitute this new health discourse and are constructed

in the WhatsApp messages include: examining food labels, learning about various ingredients, and monitoring food expiration dates. They are delivered using the traditional Omani discourse of preaching, where two voices are constructed, an authoritative voice and a naïve voice, even though both voices are the voice of the public. The data consist of posts from a long thread in Arabic on Twitter tagged with #BoycottKimjis and of WhatsApp messages on the same topic. The #BoycottKimjis was created in May, 2016 when a food corruption scandal broke out in Oman: It was revealed that a major Omani/Indian company that had been caught selling expired food to Omanis for ten years was not being held accountable. Because corruption was a major catalyst for the Omani Arab Spring in 2011, when this expired-food scandal came to light, the public took measures into their own hands (instead of just letting the justice system deal with the company). They did so by launching a rigorous Twitter campaign to boycott all Kimjis products, not just food. When the justice system declared that the company was not liable (legal failure), and participation in the boycott was not widespread since Kimjis has market saturation (social failure), instead of admitting defeat, the public turned the food scandal from a failed political campaign against social corruption on Twitter into a major health campaign on WhatsApp. They did so by creating, and sharing nationally, multimodal and verbal texts that voice health and food-related practices aimed at introducing a new discourse that involves Omanis evaluating and thinking critically about food, not just consuming it. The paper contributes to exploring how health food is introduced into a new community; it also documents how social media users are able to discursively construct—through language and images—certain health practices to empower themselves and create agency, instead of accepting a failed political campaign. In addition, it adds to research on social media and Arabs by focusing on a less examined area—activism and food—to demonstrate the transformation of a political action on one social media platform into a health action on another.

### **Marta Albelda Maria Estellés**

***Using evidentials indirectly. Strategy, mitigation and objectivity*** (Contribution to *The Interrelation between Evidentiality, Mitigation and Appraisal across Genres*, organized by Figueras Bates Carolina [et al.]

It is not infrequent in Spanish to find examples in which evidentiality is expressed formally in some way (for instance, it is *presented* as reported discourse), but where the information was really acquired otherwise (for example, it is *actually* obtained through reasoning). The present contribution analyses such examples and attempts to explain them. We assume that evidentials are organised in scales of preference: some evidentials are considered more preferable than others. This fact is not new in the literature, having been suggested, among others, by Oswald 1986, Willett 1988, Frawley 1992, Faller 2002 or McCrady 2015. However, two further steps should be taken, theoretically speaking, since a) The degrees of preference are changeable and are determined contextually, being evidentials not more preferable *per se*, but in a given context. The scale of preference is flexible, it may change in some circumstances, genres, cultures, etc., and b) Speakers take advantage of the above mentioned flexibility, accommodating their discourse to these scales (more or less) strategically, depending on their intentions and goals, as well as on the expectations raised by the context; and they do so by

- (i) Choosing the evidence best ranked in a particular context and, if not available,
- (ii) Concealing the (less preferable) evidence they have available in the guise of evidentials located higher in the ranking. A corpus study has been carried out revealing that such indirect uses of evidentials are mainly used by speakers to achieve two goals: convincing the audience, especially in *objective* genres, and mitigating, especially in interactional genres. Special attention will be paid to the role of discursive genres in the use and values of pragmatic indirectness in evidentiality.

### **Michaela Albl-Mikasa**

***Schemata for conventional interaction forms: The influence of (interpreters’) knowledge***

***of doctor-patient encounter structure on (interpreter-mediated) medical interactions***  
(Contribution to *Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.] )

The proposed paper is based on a larger-scale study funded by the Swiss Commission for Technology and Innovation (KTI) and carried out by an interdisciplinary team comprising medical specialists from the University Hospital of Basel and interpreting studies/applied linguistics researchers from the Zurich University of Applied Sciences (ZHAW) in the German speaking part of Switzerland. On the basis of 19 video-recorded and transcribed authentic doctor-patient interactions with interpretation into and from Turkish and Albanian, interpreter (non-)accuracy and role behavior has been investigated (Sleptsova et al. 2014) as well as (non-)rendition of the mitigating effect or nuance of hedges by the interpreters (Albl-Mikasa et al. 2015). This paper looks at the link between knowledge (representation) of medical conversation structures and its effect on the interpreter-mediated interactions. A cognitive discourse analysis-based examination (van Dijk/Kintsch 1983) of the data suggests that the asymmetry between medical personal with specialist knowledge and patients who lack such knowledge is similarly reflected in the interpreters' lack of knowledge of encounter structures. It can be shown how such lack of knowledge of not only the structure, but, more precisely, the intention and purpose behind the different parts of a doctor-patient interaction (e.g. welcoming section -> rapport-building; treatment discussion -> compliance generation), adversely affects interpreters' renditions leading to detours and partially unsuccessful communication between medical personnel and patients.

At the intersection of pragmatics and cognition, a cognitively based approach to the analysis of medical interactions is proposed as a contribution to tackling the complexity of multilingual health care communication. As such, it is an innovative approach in that community interpreting – contrary to conference interpreting – has so far been looked into only from a sociolinguistic perspective, at the exclusion of the cognitive processing dimension of interpreting (Englund Dimitrova/Tiselius 2016).

***The narrative as prison: A theory of the life-cycle of economic policy narratives***  
(Contribution to *Economics & Language Use: The pragmatics of economics experts' engagement with non-specialists*, organized by O'Rourke Brendan [et al.] )

Economic policymakers routinely operate under conditions of uncertainty, faced with competing and often incompatible readings of the economy, incomplete data and expert disagreement. Politics, however, requires governments to project certitude in order to foster both political and economic confidence. Governments resolve this dilemma by the construction of narratives: causal stories that make sense of the economy and so provide a basis for policy action. Over time, however, a tension emerges between two imperatives: on the one hand, the need to explain changing economic conditions and, on the other hand, the need to preserve the internal coherence of the narrative. This tension between the external and internal validity of the narrative is likely to sharpen over time as events move away from the trajectory initially posited. However, since narratives reflect not just pragmatic framings but ideational commitments, consistency is often prioritised over external fit. Economic narratives therefore go through a life-cycle in which they move from empowering policy action to potentially becoming its major constraint.

The paper situates the notion of a narrative life-cycle in foundational debates in political science. It argues that a fuller understanding of the role of narrative in economic policy lends weight to the case for ideas and discourse, rather than interests or institutions, as primary causal forces in political economy. However, it is argued that ideas, often conceptualised in the theoretical literature as change agents, are in fact highly conservative, being embedded in narrative claims that, because they are designed to master uncertainty, cannot easily admit change. Empirical evidence from the New Labour government of the United Kingdom is presented to illustrate the tenacity of narrative in the face of enormous economic change.

***Primary definers in economic news reporting*** (Contribution to *Economics & Language Use: The pragmatics of economics experts' engagement with non-specialists*, organized by O'Rourke Brendan [et al.]

Media reporting on economic news is not only created by journalists but also by institutions and experts who are quoted as informed sources. These sources were termed primary definers by the sociologist Stuart Hall. We will analyze articles in three UK broadsheet newspapers, The Financial Times, The Guardian and the Daily Telegraph, on public finances in the six months leading up to the 2015 general election. The topics covered will be the government deficit, public expenditure and debt - in summary the debate on austerity. Our aim will be to elucidate which primary definers appear in the creation of news stories in these three publications. We will compare the use of primary definers in each of the newspapers. We will set out to examine which institutions appear most and which sectors are represented with a view to understanding what sets of vested interests and what ideological positions were given the most prominence in the reporting. We will also examine if there are any significant differences in the coverage by the three newspapers selected, and, if so, whether these differences reflect their editorial positions.

***Using a systematic Discourse segmentation model for a construction grammatical description of discourse particle functions*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

In this talk, the Val.Es.Co model of discourse segmentation (e.g. Estellés Arguedas/Pons Bordería 2014) will be used to refine and clarify a construction-grammatical description of discourse particle functions as construction grammatical constructions, using the German word *also* (“so”) as an example. In German of today, *also* is most frequently used as a discourse particle with a general conclusive meaning (“so”). As a discourse particle, *also* can be used in many different functions distributed over many different discourse positions (Fischer 2006b; Alm 2007; Fernández-Villanueva 2007; Fischer/Alm 2013; Alm 2015). The host units of *also* and other discourse particle can be of variable pragmatic and syntactic status. In Alm (2007), they are divided into “host units below TCU-level” (e.g. comprising functions as a hesitation marker, repair marker and reformulation marker) and “host units on TCU- or turn-level” (comprising thematic functions and turn-taking functions). Example (1) illustrates a hesitation function with the expression searched for being interpreted as the host unit of *also* and example (2) illustrates the framing of a whole new discourse activity, marking the transition from a phase of unofficial small talk to the official pursuit of the experimental task:

(1)

Dirk: dass ich glaubte irgendwo (1 Sek) .h (.) **also** den (.) den GRABstein NIETzsches völlig (.) ver- (.) verMODert zu finden (BR001B) Dirk: *that I thought that I would find (1 sec) .h (.) PRT the (.) NIETzsche's GRAVEstone completely (.) de- (.) decayed*

(2)

Instr1: ((Lachen)) katja? ((Lachen)) **also** du musst jetzt aus diesen wunderschönen bauteilen soll zum schluss erstmal (ei)n flugzeug dabei herauskommen (..) so `n propellerflugzeug. (Paar1) Instr1: ((laughter)) katja? ((laughter)) **PRT** now you'll have to out of these ((clears her throat)) wonderful building bricks in the end a there should be an air plane (..) a kind of propeller-driven plane.

In Fischer/Alm (2013), a first attempt is made at defining the relationship between discourse positions and discourse particle functions as form-meaning pairings, i.e. as construction-grammatical constructions. However, we believe that the systematic contribution of the discourse position to the functional interpretation of discourse particles that we claim exist (e.g. Fischer 2000; Fischer 2006a; Alm 2007) could be described even more precisely when basing it a differentiated and systematic model of discourse segmenting. The Val.Es.Co model of discourse segmentation offers a wide choice of identifiable discourse positions by distinguishing between an initial, medial, final and independent discourse positions defined with respect to seven different types of host units. Using this differentiated model, we will try to cast new light on an old problem: When can *also* be used postpositively with respect to its host unit? The final position of *also* is generally accepted when it is used as a repair marker or reformulation marker but there is disagreement on the direction of its scope when used after sentential discourse units (3). Should it be analysed as a final particle with a host utterance or as an initial particle with an optionally realizable host utterance (cf. Mulder et al. 2009)?

(3)

Thomas: /.../ un un deshalb hä- hat mich das mit den mit den waffen nich so sehr überrascht **also**. (BR006A)

Thomas: /.../ and and therefore I wasn't that surprised by the whole thing with the weapons **PRT**.

Since previous attempts at determining the affiliation of utterance-final *also* (for example the prosodic approach in Alm (2015)) have failed to yield a clear result, we will use the Val.Es.Co model of discourse segmentation to re-analyse the spoken language examples from Alm (2015) to shed some light on the situation of *also* in particular and to improve the construction grammatical description of discourse particles in general.

***Using a novel triad for analyzing public relations discourse: Kuwait PR police . A case study*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

This study is an attempt to apply a new model for analysing public relations discourse, the case of Kuwaiti Public Relations police discourse. This new model of analysis is introduced by the first author to effectively analyse public relations discourse. This paper hypothesizes that applying this novel method of analysis will provide a more in-depth insight into the way public relation discourse uses language in the public sphere, carry out messages of superior social agents, and implement the policies stipulated by higher authorities. The study also emphasizes the importance and efficacy of the three elements of this novel triad: Cultural schemata, naturalisation and legitimisation in public relations discourse, and pragmatic selections, situated action-invoking verbs. A key officer in the Kuwaiti Ministry of Interior was interviewed and asked questions about the role he plays in conveying particular political messages to the Kuwaiti public, the efficacy of the Public Relations Administration at the Kuwaiti ministry of Interior, and the methods used to fulfil ordinances of the Kuwaiti higher authorities. The authors found out that public relation discourse of the Kuwaiti Ministry of Interior is stipulated and guided by the Kuwaiti higher authorities to preserve security, and safeguard the country in the midst of one of the most volatile regions of the world.

***Gendered noticing and speakers' cognition in Greek conversation*** (Contribution to *Language, Gender and Cognition*, organized by Alvanoudi Angeliki [et al.]

The present study explores the interface between referential indexing of gender, social action and speakers' cognition at talk-in-interaction. Indexical processes through which identity is discursively produced include - among others - the overt mention of identity categories and labels, and presuppositions regarding interlocutors' identity positions (Bucholtz and Hall 2005). As a number of conversation analytic studies show (e.g. Hopper

and LeBaron 1998; Kitzinger 2005, 2007; Speer and Stokoe 2011; Alvanoudi 2014), the use of gendered terms can make gender interactionally relevant, and sustain tacit presuppositions and norms about the social gender order. The present study builds on this strand of research and analyzes the relation between referential indexing of gender (Ochs 1992) and speakers' cognition in gendered noticing in Greek conversation (Corpus of Spoken Greek). According to Hopper and LeBaron (1998), gender creeps into talk through an action series of three phases: peripheral gendered activity whereby gender is implicitly indexed, gendered noticing whereby gender is explicitly indexed, and extending of gender's relevance. In Greek conversation, gendered noticings occur after actions that invoke specific presuppositions about gender, such as the norm of heterosexuality and stereotypes regarding 'typical' feminine and masculine attributes. Speakers employ items lexically or grammatically marked as female or male to attend to gender as a relevant aspect of context, and position self and others as women or men. The analysis demonstrates that via gendered noticing speakers uncover the 'conceptual baggage' (McConnell-Ginet 2008) associated with referential indexes of gender and bring their covert assumptions about social gender to the 'surface' of the talk.

***The effects of English-medium instruction on the use of interpersonal and textual pragmatic markers.*** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

The effects of English-medium instruction on the use of interpersonal and textual pragmatic markers. This study investigates the pragmatic learning of undergraduate English-medium instruction (EMI) students at a Catalan university, specifically examining the effect of increased contact with English on the use of pragmatic markers (PMs) in student's oral communication. Previous research shows that context of learning significantly impacts pragmatic competence (Taguchi, 2015). However, little research has been conducted investigating language gains in EMI contexts. The study takes a functional-pragmatic approach to the analysis of PMs and identifies two functional categories of PMs textual and interpersonal (Ajimer, 2013; Fraser, 2006; Del Saz Rubio, 2007). Participants are two groups of EMI undergraduates, a full EMI group (N=21), a non-EMI group (N=16) and a native speaker control group (N=10). Data were collected through two oral tasks, a monologue and an interaction. Participants' recordings were transcribed and PMs were coded according to their function. Quantitative analyses reveal that the EMI group employed a higher frequency and variety of PMs when compared to the non-EMI group. The EMI group reached target like levels for the variety of PMs used. Neither group reached target like use for interpersonal markers. Both experimental groups overproduced textual markers when compared to the native speaker group. The authors interpret the quantitative results through qualitative analysis. In an effort to bring to light how learners and natives use PMs differently, which functions learners and natives assign to PMs in the context of the study, and, in turn, how this sheds light on the acquisition of PMs and pragmalinguistics. The authors discuss how the use of PMs reflects the context of learning, and importantly metapragmatic competence in a second language.

***The effect of nature of interaction during stay in France on the use of the tu and vous forms of address*** (Contribution to *Student mobility and pragmatic competence*, organized by Barron Anne [et al.])

The acquisition of *tu* and *vous* forms of address in French L2 is said to be facilitated by the nature and intensity of interactions during a stay abroad (Dewaele, 2002, 2004b, Belz & Kinginger, 2002). These studies concentrate only on student interaction with French natives. However, during study abroad, students do not only interact with French natives. Using a Language Contact Profile, we found out that Ghanaian French Learners engage in four different natures of interactions during study abroad: a) French with native speakers b) French with fellow Ghanaian students (likely to code switch between English and Twi) c) French with other non-native speakers (such as other study abroad students from other countries like China, Spain etc) d) English/Twi with fellow Ghanaian students This study explores the effect of nature of interaction on the appropriate use of two variants of *you* in French during a stay in France by Ghanaian French learners having previously acquired languages that only have a single second person pronoun (example: *wo*: Twi, *you*: English). The study takes into account inter-individual variations in the use of the forms of address as well as individual differences in the volume and nature of contact with the French language. We analysed the use of the forms of address in everyday situational oral exercises that we conducted before and after study abroad. We compared the context of usage with data from a control group of native French speakers. The results show different uses of the forms of address: the use of both forms of address in the same context, and the appropriate use of forms of address in certain contexts. The usage of these two forms of address is sometimes in accordance with and sometimes different from how the native French speakers use them.

***Ambiguities of initiation in adults with a profound intellectual disability*** (Contribution to *Entry and re-entry into interaction*, organized by Antaki Charles [et al.])

How do you initiate and maintain an interaction, when you have no (recognisable) language? Using video records of everyday life in a residential home, I report on the interactional practices used by people with severe and profound intellectual disabilities. There were very few initiations, and all presented difficulties to the interlocutor; most were highly ambiguous as first turns, and one ("blank reciprocity") gave the interlocutor virtually no information at all on which to base a response. Only when the initiation was of a new phase in an interaction already under way (for example, the initiation of an alternative trajectory of a proposed physical move) was it likely to be successfully sustained. Otherwise interlocutors (support staff; the recording researcher) responded to potential initiations with verbal repair-initiators, as if to neurotypical speakers - but inappropriately for people unable to comprehend, or to produce well-fitted next turns. This mis-reliance on ordinary speakers' conversational practices was one factor that contributed to residents abandoning the interaction in almost all cases. On the other hand, having some superordinate activity already in play seemed to help interlocutors both make sense of residents' otherwise ambiguous proto-initiations, and provide a more specified set of second turns with which to respond.

**Lúcia Arantes**

***Interpretation in the speech therapy clinical setting: Focusing diagnostic procedures*** (Contribution to *On 'interpretation' in the context of language acquisition and in clinical settings: under the effects of speech errors and symptoms*, organized by Lier-DeVitto Maria Francisca [et al.])

This presentation aims at discussing some theoretical-methodological issues concerning the way speech data is dealt with in the language diagnostic procedure (interview and language evaluation) in the speech-therapy clinic with children. I share the idea, to be deepened in the panel proposal, that there is *no continuity* between "actual

speech” and “data speech” and also support the argument that the striking difference between them determines either the construction of descriptive tools to be projected on language *corpora* or the analytical treatment given to speech. If we agree with the idea that *an act of speech can fully sustain itself only in real time*, the questions I raise may sound proper: (1) “what – from the actual speech instance – remains accessible to the researcher?” and (2) “what remains from live speech whenever the speech therapist deals with speech data?.” The main aspect focused in this presentation calls attention to a polemic methodological issue concerning language assessment procedures, i.e., the relevance of recording and transcribing clinical dialogues in order to build and carry on language evaluation procedure. As I see it, such a controversy is misleading because it seems to lead to the somewhat naïve idea that since transcriptions produce *corpora* and shade the effects of *live speech* and efface subjectivity. My point is that, on the one hand, the effects of *live speech* remain *live* in the therapist’s ear and do guide the diagnosis. On the other hand, if the clinician’s ear is not a theoretically constrained listening, such an “ear” cannot be properly conceived of as a “clinician’s ear”. That being the case, neither can transcriptions erase the vivid effects of live speech, nor can the clinician’s speech interpretation be held equivalent to the native speaker’s intuitive judgment. In short, *live speech* is a sharp and permanent imprinting in the body of the other and the therapist’s ear is special because it is (or should be) theoretically shaped. Thus, the central issue of this presentation is *interpretation in the specific context of clinical practice*, which involves speech in real time. In the field of Speech Therapy, interpretation is no doubt, inherent to dialogue itself. Though extensively mentioned in the literature, the term “interpretation” is seldom followed by a clear definition of its specific nature. Therefore, the different meanings subsumed under the term “interpretation” in that clinical field will be addressed, focusing, as mentioned in the title, the diagnostic process. Besides discussing the clinicians’ theoretical positions which affect the diagnostic perspectives, segments of clinical sessions will be presented to support my discussion. The theoretical background adopted here gives recognition to the internal laws of *la langue* (Saussure, 1916, 2002) which operate on *la parole* (Jakobson, 1960), i.e. metaphoric and metonymic operations. The notion of the subject-speaker and of that of “speech interpreter”, proceeding from such a viewpoint, is logically incompatible with that of an epistemic subject. For that reason, the discussion to be presented implies the psychoanalytic notion of “the unconscious”, introduced by Freud (1900).

### **Liudmila Arcimaviciene**

***‘Self’ and ‘other’ metaphors as the strategy of persuasion in populism discourse: A case study of Obama and Putin’s speeches*** (Contribution to *Personal and collective identities in populist discourse*, organized by Levonian Raluca Mihaela [et al.]

The role of populism in shaping current political reality cannot be underestimated. Today populism has become an inseparable part of political reality, where politicians are appealing to populism or populist sentiment, whenever it suits them. In linguistic research, it can be referred to as a kind of discourse that popularizes a set of beliefs that are defending one’s stance and attacking the opposite view towards a specific issue, by thus appealing to voters or supporters’ sentiments and making one’s position even more popular and likeable. This study offers a cognitive socio-linguistic approach to evaluating the levels of persuasiveness in political communication through the use of Self and Other metaphors. The specific aims of the study involve (1) the identification of metaphors related to positive self-representation and negative other-representation, (2) how their use contributes to the persuasion strategy in populism discourse, and (3) how the metaphors of SELF and OTHER are embedded in the discursive space involving moral and political identities. To achieve the above aims, political speeches delivered by Obama and Putin in the time span of two years (2014-2015) were collected and analysed by using the analytical framework of Critical Metaphor Analysis and procedurally applying Pragglejaz Group’s Metaphor Identification Procedure (2007) and metaphor power analysis (MP) by applying De Landtsheer’s model (1994, 2009). The analysis of the collected speeches has demonstrated that metaphor use significantly contributes to leaders’ populism strategies, and, more importantly, that the strategies of legitimisation and delegitimation are used in parallel but with different metaphoric intensity (positive metaphor use vs. negative metaphor use). The populist discursive space of President Putin is framed around the Victim scenario, where Russia, Crimea and Ukraine are represented as close family members who are continuously bullied by the US and the EU. The populist strategy of sounding right is contextualised through the intensive use of the Personal Relationship metaphor with the emphatic Us As Good Neighbours/Friends and Russia As the Defender of the Weak, in particular. By contrast, President Obama popularizes his leadership stance through the Moral Argument Is War metaphor, whereby the US and the EU are represented as the Defenders of the moral right, while Russia is positioned as the Other confronting and threatening the moral order, and, more emphatically, as challenging the present with the past. The metaphorical analysis in terms of its evaluative functions has shown that two leaders are creating two different kinds of populism discourse by

thus offering ideologically different worldviews of political hegemony: (1) hegemonic intervention strategy and (2) hegemonic activation strategy. The former is realised through creating an ideological distance between the Self (Russia) and the Other (the US and the EU), by thus confronting the current political order; by contrast, the latter is activated through emphasizing the Self (the US and the EU) and the positive context of the present political order.

### **Birte Arendt**

***Kindergartner's arguing in peer-talk – and its acquisition supporting effects*** (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.]

Peer-talk as a dominant practice of kindergartner's everyday life plays a prominent role in the acquisition of discourse competencies (Zadunaisky Ehrlich/Blum-Kulka 2014, Morek 2014, Arendt 2015). This is due to its specific characteristic: mainly absent adults. But how can the supportive effects of peer talk be explored and described exactly? In the paper, I assume that the children themselves establish interactive contexts that provide specific affordances for practicing discursive skills. Based on naturally occurring peer-talk of German speaking kindergartners the study aims at describing both discursive competencies as well as resources supporting the acquisition. The paper targets at addressing the following questions:

- In which interactional contexts are kindergartners arguing (occasions)?
- Which topical resources are used by the children to support their claims?
- Which interactive resources support the acquisition of argumentative discourse competence (typical beneficial mechanisms)?

Although arguing is known as a relatively complex technique of dealing with opposition, findings indicate that kindergartners already use justification to support their positions. With regard to acquisitional resources it is argued that affordances provided by peer talk play a crucial role: a) stipulating the other's arguments by continuously displaying opposition - mainly in contexts of role play, b) dealing seriously and cooperatively with the other's arguments and offering a model for doing so

utinsoftLocal.ByteClass e.g. in marking and c) interactively co-constructing complex arguments by keeping up a coherent thematic focus.

### **Mira Ariel**

***Constructions, cues and pragmatic inferences*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

Constructions are conventional form-function associations, where at least some of the total meaning is not compositionally computable from their parts (Goldberg, 1995). The functions associated with constructions are not necessarily truth-conditional meanings. Indeed, nontruth-conditional meanings may very well be conventional and hence, semantically encoded (Ariel, 2008, 2010). But as is well known, speakers' messages are rarely exhausted by the semantically encoded meaning of their utterance. This is true for linguistic units on any level, and constructions are no exception. Constructions above the lexical level are rampant in natural language. For example, as many as 459/1053 of the *or* tokens in the Santa Barbara Corpus of Spoken American English (43.6%) participate in some specialized *or* construction or sub(-sub)-construction. This raises a question about the role of pragmatic inferencing. Does the fact that the construction incorporates noncompositional meanings, nontruth-conditional ones included, mean that pragmatic inferences play no role in interpreting constructions? Needless to say, ad hoc Particularized conversational implicatures are (nearly) always involved in interaction. The question I will address concerns the role of so-called Generalized conversational implicatures, namely pragmatic inferences that consistently though not obligatorily accompany specific linguistic forms. I will focus on pragmatic inferences that constitute part of the explicature, namely ones that combine with the linguistic meaning (constructional in this case) to create the propositional content of the

utterance. I will propose that *or* constructions manifest a wide continuum with respect to the ratio of encoded and inferred components. The basic [X *or* Y] construction can receive any one of 22 readings, since the super-*or* construction only imposes an alternativity relation on "X" and "Y". naturally, heavy inferencing is involved. However, the highly idiomatic *more or less* (= "approximately") and *sooner or later* (= "bound to happen at some point) require no pragmatic enrichments (except for ruling out the compositional meaning). In between is the [either X *or* Y] construction, which is heavily skewed towards an Exhaustive reading ("none other than X and Y"). While the 24 tokens of the construction gave rise to 4 different readings (via pragmatic inferencing), almost 80% of them (19) served a single, "Exhaustive" reading. But the picture is even more complicated in that zeroing in on the intended interpretation does not depend only on inferencing and codes. Many of the basic, super *or* constructions show a skewed discourse pattern, introducing linguistic cues which bias towards certain but not other readings. For example, all 88 Choice-immediate readings (where the addressee is invited to make a choice) occur within questions. Now, direct questions cannot be identified with Choice, because there are 259 such questions, distributed over 18 different *or* readings. Still, Choice is the one dominant reading associated with direct questions. Direct questions serve as biasing cue for the Choice interpretation, then. The argument I will make is that for the most part, interpretation is not a matter of only codes and pragmatic inferences. Biasing linguistic cues, which can be seen as partial codes facilitate specific inferred interpretations.

***Religious rituals in Arabic*** (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

Religious rituals are believed to play a salient role in many Arab cultures; however, they have been understudied in ritual theory (see e.g. Kádár 2013). The phenomenon of religious ritual consists, in our view, of interactional actions that animate religious social values; from an etic perspective, they tend to be illogically frequent in the given language and culture. From a pragmatics perspective, a noteworthy characteristic of these rituals is that they tend to be highly standardised in spite of their high frequency of occurrence in both ceremonial and mundane language use. As data we examine naturally occurring spoken interactions in Libyan Arabic, in particular, conversations which take place in secular settings. We aim to demonstrate that even in such settings the Arabs tend to use religious rituals. This raises an interesting typological question from a ritual theoretical point of view, namely, that in some societies the category of religious ritual has a different scope than in others. We attempt to define religious ritual from an etic point of view, hence contributing to ritual theory from a cross-cultural perspective.

***The fabrication of ordinary people in French media discourse: When ordinary people are not only ordinary*** (Contribution to *Constructing Ordinarity across Media Genres*, organized by Weizman Elda [et al.]

The participation of "ordinary people" in the context of media discourse, particularly in political media discourse (Fetzer, Weizman and Berlin, 2015) is a phenomenon which can be analyzed in relation to three stages. The emergence of political talk-shows and TV forums in the 90's brought to the forefront the figure of "ordinary person". Indeed, one of the most significant developments in media genres is to involve the participation of ordinary people over the last 25 years, through the programs based on narratives, self-disclosures and personal accounts (Livingstone & Lunt, 1992) Social TV can be seen as a reinforcement of this phenomenon. "Social TV" refers to the hybridization of TV and digital communication (via social media); it includes several functions that enrich the communicational nature of TV, for instance, systems of vote, the integration of digital social media (Twitter, Facebook, etc.), the possibility for "ordinary viewers" to post comments about the program, and, sometimes, the display of a selection of comments during this program (Atifi & Marcoccia, 2015) Social media and digital video (YouTube, Facebook, Periscope) constitutes a third phase in this media evolution: with the invitation to "broadcast yourself", the distinction between media professionals, experts and "ordinary people" is effectively becoming more and more blurred (Thornborrow, 2014). This paper focuses on these three modalities of ordinary participation: on political talk-shows, on social TV and on

Facebook / Youtube videos. From a pragmatic approach and a media discourse analysis perspective, this paper will ask: how is the role of “ordinary participants” displayed and constructed within the context of French TV programs, social TV and digital videos. Our data is constituted by three cases studies. We analyze the participation of Wiam Berhouma, (defined as “Teacher and Muslim French Citizen”), who shouts at the French Philosopher Alain Finkielkraut in the program “Des Paroles et des Actes” (France 2, 21 January 2016), the participation of “displayed ordinary twitters” in the same program (DPDA) and the video discourse of H  l  ne (posted in her Facebook page), young Teacher who criticizes the French former Minister of economy Macron in 2016. This paper focuses on (1) the way participants position themselves as ordinary: how to “play” the ordinary person (conversational style, self-presentation, politeness strategy, visual and non-verbal markers, emotional discourse, illocutionary values, etc.). This paper focuses also on (2) the way these participants are defined by media and audience. Are these ordinary persons always ratified as ordinary? This paper shows that the ordinariness of these participants is often seen as questionable by media and audiences and that it can trigger public debates and even institutional calls to order. For example, the ordinariness of Berhouma was called into question (it seems that her identity of political activist was hidden). In 2016, following the Berhouma case, the CSA (the French Independent Authority of Audiovisual Communication) ordered France Television to give more precise information in the future about the identities of “ordinary participants”. When ordinariness is challenged by media, audience or institutions, which arguments are used? From which criteria ordinariness is ratified or denied? In conclusion, traditional media and digital media favor the participation of ordinary persons but, at the same time, this ordinariness is more and more problematic. It results from processes of construction and deconstruction, fabrication and denunciation.

***On the constant movement of language: Effects of divergent speech in language acquisition.*** (Contribution to *On ‘interpretation’ in the context of language acquisition and in clinical settings: under the effects of speech errors and symptoms*, organized by Lier-DeVitto Maria Francisca [et al.]

Grammar brings into light the knowledge of an idealized speaker-hearer, belonging to an assumed homogeneous linguistic community. Whenever that idealization happens to be questioned, the admitted homogeneity of language becomes nothing but a fiction (Lyons 1982). If linguistic theory must answer to variation in adult speech, children’s flagrant instable and heterogeneous productions between 2 to 5-6 years should also interest linguistic studies. The interpretation of the so called “errors” leads to the investigation of divergent unexpected occurrences, conceived of as rich empirical evidence which enlighten dynamic aspects involved in each subject-speaker relationship with language. Saussure, in the second lecture given in Gen  ve, states that: “son [de l’enfant] langage est un v  ritable tissu de formations analogiques” (*  crits de Linguistique G  n  rale* 2002: 160). Such an assertion was taken as an invitation to reflect *innovations* in children’s speech under the lens of analogic movements – or what it is retained from it as an activity of *mise en rapport* (Figueira 2015), i.e., the constant movement of language at the touch of relations. *Innovations* as real by-products of language itself indicate the route to a correlated research issue i.e., their vivid effects on the other within the complex interaction scene that call one’s attention to the intrinsic relationship between listening and interpretation. This presentation focuses on 2 to 5 years old Brazilian children’s divergent speeches, including both predictable and unpredictable occurrences. Morphological processes affect both verbs and nouns. A researcher is no doubt confronted with the surprising impression of dissolution of expected boundaries between distinct verbal conjugation classes (1st, 2nd, 3rd verbal conjugation). Such glaring instability can be envisaged as unpredictable “moving pieces” during the building up of a system. When you leave aside the domain of verbs, our analysis take into account original designations for situations in which the child names somebody (by what this person does) or names her/himself (for what s/he is doing). Benveniste (1948) is called upon because he enriches that discussion with his theoretical proposal concerning both action nouns (*noms d’action*) and agent’s nouns (*noms*

*d'agent*), as indicated by Milner (2002: 94). First person sentences (I am NP), comprising a *nom d'action* or a *nom d'agent* in the predicate perform original acts of speech. It seems worth mentioning the fact that the child presents her/himself as the author of an actual act, which is creatively named. From a discursive point-of-view, at the same time that the child performs an act, s/he expresses what s/he is doing at that very moment (a performative act). This empirical segments to be discussed, constituted of self-referential episodes, shall highlight such dimensions of language use in the language acquisition process. In addition to the above data, we also include anecdotal dialogue situations in order to identify particular "creations" borrowed from the so called diarists. What is remarkable about those utterances is the particular children's apprehension of the world and of language as well they show. The effects of those utterances are immediately felt in the other's laughing out loud or showing pleasant smiles.

**"So let's get the doors open and have some fun!": Investigating rapport management in work place briefings from a conversation analytic perspective** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

Within institutional settings, and within the roles that are born from these institutions, conversation analysis is a valuable tool in understanding the sequential organisation (Schegloff, 2007) of the talk at work (Drew & Heritage, 1992). So, too, is an understanding of socio-pragmatic issues such as (*mock*) *im/politeness* (Haugh & Bousfield, 2012) and *rapport management* (Spencer-Oatey, 2000). This paper thus serves to offer insights into exploring how the interface between each of these areas can be of mutual benefit to the other. This paper investigates talk at work using socio-pragmatic and conversation analytic frameworks. The data set we draw upon consists of 18 morning briefing sessions from a U.K. high-street target-oriented electrical retailer. Specifically, we use these data to demonstrate how the assistant manager and duty manager each attempts to manage rapport with their employees. Some of the CA-relevant aspects to be explored in this research include second position silences (Jefferson, 1989) after addressing a collectivity (Lerner, 1993); third position action following the response to *open* questions; third position action following the response to *closed* questions (Pomerantz, 1984; Stenström, 1984); and the ways in which the participants manage speaker selection (Sacks, Schegloff & Jefferson, 1974). Subsequently, this paper provides analyses of how these CA-relevant aspects of manager-employee interactions inter-connect with Face Theory (Goffman, 1967) and, more specifically, with humour (Holmes, Marra & Vine, 2011) and (*mock*) *im/politeness*, as well as common ground (Clark, 1996).

***Positioning in the Blue-card question and answer sequences in the European Parliament***

(Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

The paper focuses on the linguistic and discursive behavior of the Members of the European Parliament (MEPs) in their use of the Blue-card Question and Answer Procedure. Blue-card Q&A sequences constitute the only "naturally occurring" interactional situations in the EP, allowing the MEPs to provide "spontaneous" responses to prior or projected future stance actions. The corpus of the paper comprises a collection of Blue-card Q&A sequences from the plenary debates held in the EP in 2011, when the Sovereign Debt Crisis had just been stabilized but still evoked plenty of controversy. Theoretically the paper builds on Stance Theory (Du Bois, 2007), Positioning Theory (Davies & Harré, 1990) and research on Q&A practices in institutional settings. The pragmatic analysis of Blue-card Q&A sequences in the present paper is informed by, on the one hand, conversation analytic approaches to courtroom interaction (Archer, 2005) and to news interviews (Clayman and Heritage 2002; Haddington, 2005) on the other hand, pragmatic and pragma-rhetorical approaches to parliamentary interaction across cultures (Ilie, 2010a, Ilie, 2010b, 2015a, 2015b). The paper displays that there are certain types of question design that are recurrently deployed in the EP. The MEPs use these schablone-like question formats to package their often-adversarial stances (see also Harris 2001; Heritage 2002; Ilie 2003; 2015c). The primary function of Qs in the EP is, thus, not to "do questioning", but instead to make assertions that are meant to place constraints on the projected answer, to propose candidate positions for the Other vis-a-vis the Self, to force the Other into self (re)positioning, which may eventually damage the Other's public image. The paper argues that the MEPs use the Blue-card Q&A Procedure as a vehicle for stance-taking, thereby for managing interpersonal as well as intergroup positioning. Key words: Question and Answer Sequence, Stance-taking, Intergroup Positioning

***EFL Narratives: Creating agents or interpellating subjects?*** (Contribution to *About*

*subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.]

This article deals with how the texts included in English textbooks shape and construct the English learner's national identity, attitudes towards the Other, and ideological stands regarding the Israel-Palestine conflict. This topic is particularly significant in Israel, as the English curriculum is uniform for all populations, including Palestinian Arabs.

Discourse analysis of English textbooks in Israel has shown how through the recurrence of Western – and specifically American and Jewish – culturally-based issues, the textbooks interpellate English learners as Western-oriented Jewish Zionist subjects, thus contributing to the reproduction and perpetuation of Western and Jewish hegemony (Awayed-Bishara 2015). Concomitantly, these English schoolbooks disregard the identity of the Palestinian Arab minority, its culture and communal traditions.

The present study presents a discourse analysis of interviews with 30 high school students (mainly secular Jews and Christian/Muslim Arabs). Analysis indicates that learners recurrently use re-contextualization, indexical pronouns, and positive-self or negative-other narratives to associate/disassociate themselves from the texts and narratives included in English textbooks. Interviewees' responses also indicate how discourse may contribute to the construction of a hybrid identity (Bhabha 1994). Analysis of responses to an article on a black teenage dropout, for example, reveals a constant shift in the self through differentiating a "positive self" from a "negative other" or going against and hence doubting "negative" representations coming from the text. In other words, the discourse about blacks presented in this text interpellated most respondents into reproducing and perpetuating the idea that blacks, as a minority, are deprived and in need of the West (more specifically whites) to help them manage in this world. Most of the Hebrew speakers' responses generally demonstrate how superior they feel towards the Other, how ignorant they are about who the other is, and how fully they accept the legitimacy of the Jewish-Zionist values promoted in the texts. Conversely, most Arabic speakers demonstrated an understanding of how marginalized they are in the Israeli educational system and other spheres, how cultural and religious narratives may be contradicting national narratives within their Palestinian Arab community, and how they seem to accept their role as victims of discrimination.

To conclude, identity seems to be constructed dialogically and in reference to the Other (Blommaert 2005; Wodak et al. 2009). This work examines the general assumption that EFL discourse in Israel has a constructive role in shaping people's ideologies, attitudes, and identities.

***Losing weight, bodybuilding and compliments in the context of social media*** (Contribution to *Complimenting behaviour in social media*, organized by Das Anupam [et al.]

While still skimpy, compliments expressed online have received some attention in recent studies into the language of social media, focusing primarily on Facebook (see among a few others, Placencia & Lower 2013; Placencia, Lower & Powell, in press). Verbal praise in theme-specific portals, on the other hand, has not been of much interest so far. The purpose of the present study is to analyse the language used on selected websites dedicated to health and fitness-related issues (e.g. healthy diets, sport). Specifically, complimenting behaviour on portals revolving around the problem of (1) dieting and losing weight and (2) those devoted to fitness and bodybuilding will be under inspection with the view to uncover (i) the linguistic structure of compliments (cf. Holmes, 1986; Manes & Wolfson 1980), (ii) the types of compliments most often involved (direct vs indirect), (iii) the most common topics used in both thematic areas, (iv) any similarities or differences in the act of complimenting used in the context of dieting vs. fitness (e.g. objects of complimenting), allowing for gender-specific variations. Thus the methodological framework employed in the analysis combines structural analysis of the compliments used, typological differences (direct vs. indirect compliments) and the topics of compliments. The study is corpus-based and the current corpus size oscillates around 5000 tokens yet it is still growing as part of an ongoing research project devoted to the analysis of compliments used in the social media. The tentative results seem to suggest that there are differences between the topics and the linguistic structures used by men and women in the two thematic groups (fitness vs dieting).

***The speech act of responding to dard-e-del ‘sympathy’ in Persian A cultural Linguistic Perspective*** (Contribution to *Intercultural Pragmatics and Cultural Linguistics*, organized by Schröder Ulrike [et al.]

Using the framework of Cultural Linguistics (Sharifian, 2011), this study unpacks the cultural conceptualizations that underlie the speech act of responding to *dard-e-del* (lit. pain of the heart) in Persian. Cultural Linguistics employs a multi-layered hierarchical framework to analyze the relationship between cultural pragmatic schemas, speech acts, pragmemes, and practs (collectively termed a "pragmatic set") (Sharifian, 2016). This multi-layered framework draws on the three analytical tools of Cultural Linguistics (cultural schemas, cultural categories, and cultural metaphors) and in particular the concept of ‘cultural schema’. Analysis of the data from a number of Persian online forums reveals that native speakers of Persian draw on the cultural pragmatic schema of *hamdardi* (lit. co-suffering) in responding to *dard-e-del*. The instantiation of the cultural pragmatic schema of *hamdardi* includes listening to people who are suffering or experiencing unpleasant circumstances, verbally responding to what they say (responding to their *dard-e-del* ‘sympathy’), and helping them. The speech act of responding to *dard-e-del* is reflected in a number of pragmemes which are informed by the cultural pragmatic schema of *hamdardi* and are expressed via different practs. The table below exemplifies this hierarchical analysis: **Cultural pragmatic schema: [Hamdardi]** Speech act/event: Responding to *Dard-e-del* (e.g. in case of an unwanted break-up or divorce) **Pragmeme 1: Showing willingness to suffer/be sacrificed for what happened to the sufferer** Practs: 1. *Elâhi man bemiram in roozo nemididam* [may I die and not see this day 2. *Kâsh koor mishodam nemididam enghadr azâb mikeshi* [I wish I was blind and would not see you suffer this much] **Pragmeme 2: Praying/wishing for God’s intervention** Practs: 1. *Khodâ khodesh halâle hameye moshkelâte* [God himself is the key to all problems] 2. *Hameh chizo bespor be khodâ* [Let God act on all your problems] **Pragmeme 3: Praying/wishing that the one/ones who caused the pain pay for their unfair deed** Practs: 1. *Omidavâram be haghe Ali nâbood beshe* [I hope, in Ali’s name, he is liquidated] 2. *Omidâvârm har chi saret âvordeh saresh biâd* [I wish whatever he did to you someone else does to him]

***Hate speech and the youth: Intracultural beliefs, attitudes and affects*** (Contribution to *Current issues in intercultural pragmatics*, organized by Kecskes Istvan [et al.]

Drawing on the results of research carried out within an EU Action project on hate speech and hate crime (CONTACT), this presentation focuses on the analysis of data gathered with questionnaires and interviews conducted to qualitatively investigate attitudes towards homophobic and racist speech in Cyprus and Poland. After presenting a general overview of the socio-political and legal context of hate speech in the EU, we present our custom-designed methodology and the linguistic data relevant to the intra-cultural perception of hate speech among a sample of the youth population (aged 18-35) in each culture. The contrastive study of Cypriot and Polish data shows the impact of contextual parameters, such as religion, history, and legal framework, as well as the role of certain structural-functional features of online communication. The data will also be framed within the results of previous research on the mainstream and social media, along with their discourses related to sexual, ethnic and religious identities. The data will also be discussed from the perspective of psychological research examining the influence of anonymity and accountability on the complexity of the thinking process and verbal incivility of Internet users (Bandura et al. 1975, Santana 2013, Tetlock 1983). Intra-cultural beliefs, attitudes and affects, which are salient within the two communities, will be identified and analyzed, using the concepts of salience (Giora 1997, 2003; Kecskes 2013) and common ground (Stalnaker 1999, Kecskes & Zhang 2009).

**“Pf” as stance marker in French interactions** (Contribution to *Stance-Taking in Interaction*, organized by Imo Wolfgang [et al.]

French studies of interjections or French dictionaries mention frequently “pf” as interjection used to express anger (Fraisie & Paroubek 2015), sadness, desperation (Halté 2013), indifference (*Le Grand Robert de la Langue française*), annoyance or disapproval (*Trésor de la Langue française*). Interactional studies of “pf” confirm this variety of functions, but argue at the same time that analysis have to take into account the phonetic realization of the sound (length and articulatory force of the plosive and the fricative), the multimodal environment (mimics, but also changes in body posture or gestures) and its position in turn and sequence (Baldauf-Quilliatre 2016, in press). It seems that turn-initial “pf” is mostly related to disengagement (from a previous action, a previous topic or from the on-going interaction), appears frequently in repair-sequences or downgrading turns and is used to indicate an affective stance (ibid.).

In this presentation I want to show how the sound object (Reber 2012) “pf” in turn-initial position or as stand alone token shows the speaker’s unwillingness or inability to produce the next turn or action. “pf” appears frequently after questions and requests and may be followed by accounts indicating that the speaker is not able to produce the projected turn (e.g. “I don’t know”) or after longer periods of silence to show that the speaker reluctantly selected himself. In mid-turn position “pf” displays the speaker’s difficulty to continue the turn.

According to Du Bois (2007) I consider “pf” in these cases as stance marker. It displays a specific affective-laden position of the speaker, that is, it indicates that the speaker is not being able to continue as one could expect him or that he is not willing to do so and, simultaneously, shows a kind of disengagement: the speaker does not try to produce the turn or the action, which are required, neither he apologize or recognizes a mistake of any kind whatsoever. He rather displays annoyance about what he or she has asked to do or to produce.

The study is based on a linguistic, sequential and multimodal analysis of collections from the French database CLAPI ( [www.clapi.ish-lyon.cnrs.fr](http://www.clapi.ish-lyon.cnrs.fr) ) and focuses on the emerging of the stance in the unfolding interaction (cf. Goodwin 2007, Goodwin / Cekaite / Goodwin 2012).

### **Claudio Baraldi & Laura Gavioli**

**On migrant patient participation opportunities in healthcare interaction: A comparison of data with and without language mediation support** (Contribution to *Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.]

Studies on healthcare interaction with migrant patients have highlighted that language barriers, as well as a lack of competence of healthcare professionals in managing those barriers, increase the hierarchical distribution of authority in talk, which makes the migrant patients’ participation difficult and calls for the necessity of removing linguistic obstacles (e.g. Baraldi & Luppi 2015; Harmsen et al. 2008; Moss & Roberts 2005). While healthcare interpreting has been regarded as a solution to the problem, research in interpreter-mediated interaction has shown that interpreters’ actions too may produce strong discourse asymmetry, in that interpreters may side with the healthcare operators in their exercise of authority (e.g. Bolden 2000; Davidson 2000; Hsieh 2007). More recently, however, a number of papers have shown that while managing the consequences of asymmetries in talk may require professionalism and engagement, there are ways in which language interpreting contributes to re-balance the hierarchy and give migrant patients voice (e.g. Angelelli 2012; Baraldi & Gavioli 2014, 2016). Our hypothesis is thus to see if and how different conditions of language negotiation affect patients’ participation in the interaction and give them actual possibilities of contributing to talk by providing information on their own health conditions.

Our study is based on a collection of audio-recorded and transcribed interactions involving healthcare professionals and migrant patients. The collection is divided into two sets, one with, one without interpreting-service support. We analyse the interactional distribution of the participants' rights and responsibilities in claiming knowledge in talk; examples of such claims may concern medical knowledge of health and illness or knowledge of patients' history, symptoms and worries. Drawing from a concept introduced in research by John Heritage, what he has called "epistemic authority" (Heritage 2012, 2013; Heritage & Raymond 2005), we look at the ways in which participants express or withdraw their claims for knowledge in order to favour or inhibit claims for knowledge by their interlocutors. Our aim is to compare the negotiation of rights and responsibilities for access to knowledge in interpreter-mediated vs. non-mediated interactions.

The presentation deals with two types of interactional structures. First, we look at the positioning of healthcare operators in the interaction and their consequences in giving more or less support to the patients' production of knowledge about their health conditions. Here, we focus on the dynamics which seem to be at the basis of the distribution of epistemic authority between the healthcare operator and the patient, in particular whether the operator's actions do (not) support participation by the patient. Second, we analyse the mediators' contributions distinguishing between those which give more or less support to the production of knowledge by the "main" participants, the operator and the patient. Here, we look at the distribution dynamics of epistemic authority involving the operator, the mediator and the patient. It seems that explicit negotiation based on clear coordination of rights and responsibilities among the participants plays a crucial role as for the management of the hierarchy in talk and consequent participation of the migrant patients.

***Exploring stance-taking beyond the classroom in the university: Student talk in study groups.*** (Contribution to *Stance-taking in educational contexts*, organized by O'Boyle Aisling [et al.]

Previous research on stance-related phenomena in educational contexts has focused primarily on classroom settings, particularly in university settings (Csomay, 2005; Barbieri, 2015). These studies have typically investigated variation in the use of a comprehensive set of lexico-grammatical features (Cosmay, 2005), or of a comprehensive set of lexico-grammatical and discourse-pragmatic features associated with stance and involvement (Barbieri, 2015), across university classrooms representing different disciplinary domains and levels of instruction. Studies of spoken academic talk have also investigated variation across a range of registers,

including study groups, service encounters, office hour consultations (Biber et al., 2002). Overall, however, we know relatively little about the use of stance-related lexico-grammatical features in academic contexts beyond the classroom. Furthermore, because most previous research on the linguistic characteristics of academic talk has not separated the talk of instructors from the talk of students, we know relatively little about how the expression of stance in educational contexts might vary in association with different speaker characteristics. This study aims to begin to address this research gap by investigating the expression of stance in university student study groups. The study is based on the ‘Study Groups’ subcorpus (ca. 130,000 words) of MICASE and employs a range of exploratory corpus linguistics techniques in order to identify stance-related features in students’ talk in this particular academic speech event. Stance-related features by students in study groups are compared with stance-related features in other academic speech events representing lecturers and guest speakers, such as monologic (large) lectures and colloquia. Preliminary findings reveal important differences in the way that university students, and lecturers and guest speakers, express stance in these academic speech events. University students draw to a large extent on the same lexico-grammatical features they use in informal, non academic talk, such as casual conversation, thus displaying limited ‘register sensitivity’.

***How to bridge the chasm between institutional discourse theory and practice in the newsroom?*** (Contribution to *Research versus Practice: Towards a Stronger Partnership between Academia and the Real World in the Study of Institutional Discourse*, organized by Vandendaele Astrid [et al.]

There is an urgent need for institutional discourse research to connect with the organizations it studies. This paper suggests three steps to bridge the chasm. The first is for researchers to agree their topics with the practitioners in the institutions they study. The second calls for scholars to agree to have practitioners helping them in gathering the data, the analysis of data and drawing of implications. In the third step, the sides will agree on which implications are practical, relevant and useful to the organization. The scientists would ensure the rigor of investigation, particularly in terms of distance. Practitioners would help explain the real world of their organizations. The paper designs a method on how to operationalize the three steps by investigating institutional discourse of four major newspapers: two English-speaking and two Arabic speaking. The investigation shows that the dailies rarely consult academic work and are in the dark about the implications institutional discourse studies may have on their practice. The practitioners in the four newspapers acknowledge the credibility and worthiness of academic research, but they find its language difficult to read and its analysis and findings directed at peers rather than subjects of academic investigation. Based on the three steps above, the paper charts a path on how to bridge the gap and provides a roadmap to bring the two separate worlds together through dialogue, reciprocity and partnership. It provides examples and citations from the critical analysis of selected samples of the four newspapers’ discourse to illustrate how scholars and practitioners can cooperate and reciprocate interpretations of organizational world for mutual benefit. Finally, the paper highlights the hurdles preventing the sides from entering into a useful dialogue to bridge existing gaps and proposes new ideas on how to sustain links between the academia and the real world of institutional discourse.

***Gender and identity in TripAdvisor posts*** (Contribution to *Analyzing Online Prosumer Discourses: Consumer Reviews, Customer Feedback, and other modes of eWOM*, organized by Vasquez Camilla [et al.]

In this presentation we examine the differences in the content and style of TripAdvisor hotel reviews with the main focus being gender differences. To carry out the study, the username, location, heading, and comment from over 1500 Tripadvisor postings from a selection of 2-star and 5-star hotels in several US cities were

extracted and saved to a spreadsheet. The entries were filtered to include only those from contributors in America whose gender can be identified with reasonable certainty. The headings and comments sorted by gender were amalgamated to create four sub-corpora based on gender and type of hotel. The sub-corpora are analysed in various ways. For example, a keyword analysis of the headings highlights the most distinctive words and we find that the top-ranked words used by women are *lovely, love, charming, wonderful, comfy, here*. For the men, the top-ranking words are: *inexpensive, new, experience, my, terrific, classic*. We can proceed in a similar way to examine the language of the comment section of the reviews. The keyword analysis provides a useful starting point in understanding the themes and style preferred by men and women in this type of discourse. It is, however, necessary to follow up the results with a further fine-grained examination of individual variation in the way men and women approach the writing of TripAdvisor reviews. Further dimensions to the analysis are added by making use of POS-tags and semantic tags. The aim is to use the techniques of corpus analysis to provide insights into both the differences (and similarities) in the phraseology and discourse of online hotel reviews constructed by men and women. We examine both central tendencies and individual variation to give an account of both the linguistic features of this genre and the ways in which contributors project an online identity.

***Developing pragmatic competence in a study abroad context*** (Contribution to *Student mobility and pragmatic competence*, organized by Barron Anne [et al.]

Within interlanguage pragmatics, research into the effects of study abroad on the development of L2 pragmatic competence remained scant for many years. In recent years, however, study abroad has come into its own, as attested by current overviews of the area (cf. Bardovi-Harlig 2013, Barron forthcoming, Xiao 2015, Taguchi 2015, 2016). The present paper opens the panel on student mobility and pragmatic competence and in this context reports on a systematic meta-analysis of empirical studies of the development of pragmatic competence in a study abroad context. The meta-analysis reports on research design and levels of analysis, on the study abroad informants investigated and on major findings from a variety of perspectives, including those on differing study abroad contexts and learner profiles. It does so with an aim to situating the papers in the panel on student mobility and pragmatic competence within the broader research area and also to highlighting research desiderata and future potential research questions.

***Discourse units in English interaction: A prosodic-phonetic perspective*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

The view that spoken language is produced in chunks, or units, is widely held (e.g., Chafe 1980: 13; Ladd 2008: 288; Szczepek Reed 2010, cf. Deppermann/Proske 2015). However, less scholarly consensus has been reached, at least in the anglophone "unit approach" (Barnwell 2013), with regard to defining what exactly these chunks are, which language-organizational dimensions create them, and how exactly they are indicated. Thus, "chunking" has been observed with regard to various linguistic dimensions, such as syntax, semantics, the accomplishment of actions, and prosody (see, e.g., Chafe 1994, Ladd 2008: 288, Szczepek Reed 2012), and there have also been various attempts to capture more *Gestalt*-like discourse units, such as "turn-constructural units" (e.g., Schegloff 2007: 3-4) and "talk units" (e.g., Halford 1996) (cf. Pons Borderiá ed. 2014). At the same

time, there is still some disagreement on relevant linguistic resources (e.g., Szczepek Reed 2010, 2012), and – more importantly – linguists, in particular interactional linguists, point out that, next to numerous cases of convergence of the various linguistic dimensions forming the more *Gestalt*-like chunks, we also have to deal with a considerable number of instances of divergence, in which the boundaries of turn-constructional units, for instance, are hard to determine without ignoring obvious linguistic facts (cf. Ford et al. 1996, Ford 2004). While some solutions question whether we can exhaustively segment discourse at all (Auer 2010), units do have relevance for the participants, not only for speaker change (e.g. Sacks et al. 1974) but also with regard to a number of cognitive issues (e.g., Bybee 2010). This paper therefore advocates pursuing the issue of chunking, but it proposes to do so in a different way:

- the linguistic dimensions need to be treated separately, to be able to do justice to each dimension and its specificities, so that we can pay attention to all at least potentially relevant details.
- the approach should provide for various degrees of granularity, to allow us to capture both the fine details of talk as well as the "bigger picture".

This paper will lay out such an approach for the prosodic-phonetic dimension. The cesura approach (cf. Barth-Weingarten 2016), which was developed with interactional-linguistic methodology, argues that prosodic-phonetic chunking is best treated in terms of what creates the chunks and promises to be able to deal with neat chunks as well as cut-off units and fuzzy boundaries in everyday talk exhaustively, non-circularly, and truthful to linguistic facts. While it focusses on prosodic-phonetic parameters, this approach will also be shown to prove fertile for the description of grammatical units, viz. the basis of constructions, on the word, phrase, clause, and sentence level as well as beyond.

#### Rebeca Bataller & César Félix-Brasdefer

***Intra-lingual pragmatic variation in Mexico City and Bucaramanga (Colombia): The negotiation of service in small shops*** (Contribution to *Service Encounters in the Spanish-Speaking World from a Variational Pragmatics Perspective*, organized by Placencia Maria E. [et al.]

Research on service encounters (SE) has looked at different aspects of transactional and non-transactional talk in commercial and non-commercial settings (Félix-Brasdefer 2015; Placencia 2008; Placencia & Mancera Rueda 2011). While transactional talk refers to the negotiation of the request for service, non-transactional talk looks at how metalinguistic and small talk enhances the interpersonal relations between the customer and the service provider. In the present talk, we adopt a variational pragmatic approach to examine three levels during the negotiation of service: actional, interactional, and stylistic (Schneider 2010). We examine the negotiation of service in two varieties of Spanish, namely, Mexico City and Bucaramanga, Colombia. The data included 140 face-to-face interactions in corner-stores (70 in each region). Results: At the actional level, most frequent Mexican requests were realized in the form of assertions, ellipticals, and imperatives, while in the Colombian data, requests were mainly made in the form of imperatives and simple interrogatives. At the stylistic level, Mexican requests showed a deferential interactional style by means of formal pronominal form (*usted*), while in the Colombian data a deferential interactional style was shown by means of the formal pronominal form, the use of formal address terms, and the selection of verb lexical downgrading (*regalar* instead of *dar*). Presence or absence of internal modification of the request for service is also analyzed. We also examine the interactional resources used to negotiate the request for service-response. Finally, this presentation looks at relational sequences (non-transactional talk) as a way to express involvement or affiliation between the vendor and the customer.

#### Yasemin Bayyurt

***Forms of address in e-mail communication between university instructors and students at an English medium university in Turkey*** (Contribution to *Address Forms across Cultures: A Cross-Cultural Comparison of Address Terms in Indo-European, Uralic and Altaic Languages*, organized by Bayyurt Yasemin [et al.]

In today's world, online communication has become part of our daily lives through social networking, online/offline learning and similar. Thanks to technological advances and the Internet, we can now access to information faster than we did not more than ten or fifteen year ago. This necessitates us to adapt and learn new ways of communication. In this respect, without any doubt we can say that e-mail communication is one of the earliest and most popular modes of electronic communication (Berghel, 1997; Sevingil & Bayyurt, 2010). We write e-mail messages to people for different purposes almost everyday – e.g., request messages, complaint messages, application messages and similar. While writing an e-mail message, we choose our words carefully in order not to offend the receiver of the message. In other words, we take into consideration how the receiver of the message would feel when s/he reads the message (Derks and Bakker, 2010; Izadi & Zilaie, 2012; Vinagre, 2008). When people come from different cultures their expectations about a polite e-mail exchange might be different (Watts, 2003). Ideally in an intercultural e-mail exchange, the expectation is to make the e-mail message polite according to politeness norms acceptable by both parties (Nistorescu, 2012). In this paper, the e-mail exchanges between undergraduate native/non-native English speaking students and their native/non-native English speaking instructors/tutors at an English medium university in Turkey are analyzed. Fifty-five university students and four university instructors participated in the study. Data were comprised of student/instructor e-mail messages, and a usability and user experience survey. In this paper, the results of the analyses of address forms in e-mail exchanges are presented. In these e-mail exchanges, the choice of which language to use in the e-mail message depends on the nationality of the instructor. The preliminary results of the study showed that the participant students addressed their instructors differently in their English and Turkish e-mail messages. To address both native and non-native instructors, they used deferential address terms, such as, “dear sir/madam”, “dear dr. xxx”, and similar. In some cases, the participants did not use an address form when the topic was a sensitive one like asking “what the grade of an exam was” or “why the instructor was not accepting her/him to her/his class”. In these kinds of cases, in the opening and closing parts of the e-mail

messages, the participants avoided using any address terms. This finding may be partially due to the increasing use of social media networks on smart phones, iPads/tables and so on (Eshghinejad & Moini, 2016; Miller et al., 2010). In conclusion, it can be said that factors like collective references drawn from the past experiences, the language choice of the parties, the relationship between the participants and the background of the participants might influence the way the participants prefer to use an address term in the opening and closings of the e-mail messages and what forms of address they use in their messages.

#### William Beeman

***Creating Ba in discourse through modal pragmemic triggers*** (Contribution to *Emancipatory Pragmatics: Approaching Language and Interaction from the Perspective of Ba*, organized by Saft Scott [et al.]

The term “modality” has been used to describe the attitude of a speaker toward the propositions expressed in an utterance. Lyons elaborates on this, stating that modality is “having to do with possibility or probability, necessity or contingency, rather than merely with truth or falsity.” (Lyons 1970:322). In this paper I would like to extend the concept of modality to include expressions that demonstrate the attitudes of speakers toward other speakers and to their environment. In particular I wish to show how modal expressions can be used to indicate empathy, community and interconnection. This is the essence of what has been explored in *Ba* theory, as articulated in the philosophy of Kitaro Nishida and Hiroshi Shimizu. *Ba* can be thought of as cognitive space for developing relationships—both interpersonal and in relationship to shared environments. However, *ba* does not arise *sui generis*. It arises in social interaction, and for individuals to enter this state there need to be pragmatic signals—something I have termed “pragmemic triggers” in other publications—to initiate creation and sustaining of a *ba* state. I will demonstrate in this paper the role that modal structures play to carry out this function in Japanese, Persian, German and English. The modal pragmemic triggers I will be exploring include not only specific indexical and deictic vocabulary, but also performative dimensions of discourse, including supra-segmental markers such as tone, pitch, emphasis and length as well as kinesics, including facial expression, bodily attitude, proximity and gesture.

#### Kristy Beers Fägersten

***The role of swearing in creating an online persona: The case of YouTuber PewDiePie*** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.]

Social media websites are a relatively new development within the Internet context, and despite the emergence of communication protocol and ‘netiquette’, not all users adhere to prescriptive guidelines for online interaction, nor do they necessarily apply established practices of face-to-face interaction. Instead, the Internet context seems to encourage users to rebuke or challenge linguistic norms. Consequently, face-to-face interaction and

computer-mediated communication can differ substantially with regards to that which constitutes ‘normal’ or ‘standard’ interactional practices. In this paper, I continue previous investigations of new media contexts as e-communities of practice (Graham 2007) where impolite language use constitutes a norm.

Dynel (2012) has suggested that in the YouTube context, “cursing is commonplace” but perhaps only offensive to those not acclimated to the culture of impoliteness that characterizes this e-community of practice. Continuing this line of argument, I propose that impolite language in the form of repeated swearword usage can be considered a new media norm. Furthermore, this “new normal” has been established most prominently by Youtuber, PewDiePie. PewDiePie is the alias of Felix Kjellberg (born 1989 in Gothenburg, Sweden) whose YouTube channel, started in 2010, is the most subscribed channel on the site, currently with over 48 million subscribers. PewDiePie’s videos, now numbering nearly 3000, feature him playing and commenting on video games, using English to do so. Despite an early, noticeable accent and occasional code-switches to Swedish, PewDiePie’s language has instead drawn public attention for the frequent use of swearwords. In this paper, I consider his swear word usage in three example videos, arguing that the use of English allows the Swedish Kjellberg to perform his online persona of PewDiePie, which is characterized most saliently by English-language swearword usage. The use of English in general, and the use of English swearwords specifically are analyzed according to the theories of lingua franca English as *lingua emotiva* (Phillipson 2006), the use of English swear words in Swedish media (Beers Fägersten 2014) and the neuro-psycho-social aspects of swear word usage (Jay 1999). Finally, I use Horton and Wohl’s (1956) theory of para-social interaction to approach YouTube as a new form of mass media that gives “the illusion of face-to-face relationship” with a media performer, arguing that PewDiePie’s excessive use of swearwords ultimately creates a “bond of intimacy” with his viewers.

*Japanese "characters" meet 'habitus'* (Contribution to *Japanese-born "characters" meet European and American insights*, organized by Sadanobu Toshiyuki [et al.]

Linguistics has always profited from insights from the ‘outside’. Work in literary sciences (Bahtin), anthropology (Malinowski), social sciences (Goffman), etc., has in important ways contributed to deeper understanding of how language is related to and how it functions in society. In Japan there is, from about the turn of the new millennium on, an interesting ongoing research on linguistic variation stemming from and inspired by popular genres such as *manga* and *anime* but reaching deeper into discursive reality and its connection with society - namely, the research on *kyarakuta* (character) and its not necessarily only linguistic manifestations, and the related notion of *yakuwarigo* (role language). Toshiyuki Sadanobu plays the central role in the former and Satoshi Kinsui in the latter. Several monographs by these researchers or inspired by them have already been published, more recent ones being Sadanobu (2016) and Kinsui (ed. 2012), but their efforts have been almost unknown outside Japan. The insights of this research should be more widely known and dialogue with the similarly motivated research in Europe and America

Bourdieu’s research, with his stress on empirical and aversion towards apriori abstractions and rationalisations shares a lot with preoccupations of the research on *kyarakuta* (character). Indeed, Bourdieu’s notions of *habitus* and *capital*, focusing on the relationship between the individual and the social, seem to be prime candidates for such a dialogue. The goal of my research is to explore possible relations of the notions of *habitus* and *capital* and their relevance to the aforementioned research on *kyarakuta* (character) and by implication, *yakuwarigo* (role language). I argue that Bourdieu’s notion of *habitus* can shed light on the research on *kyarakuta* and that this research is relevant more widely in language research. With research on *kyarakuta* gaining impetus and scope there is also necessity of more ambitious theoretical considerations, going beyond description. Bourdieu’s work may provide directions in which to continue (structuring of *kyarakuta*, *symbolic capital*, more precise understanding of social space). On the other hand, research on phenomena related to

Japanese popular fiction and other genres may provide a rich new challenge and opportunity also for Bourdieu-inspired social scientists, or those working in cultural anthropology or conversation analysis.

### Nancy Bell, Michael Haugh & Roslyn Rowan

#### *Jocular deception and pretence in interaction* (Contribution to *Trickery, Cheating, and Deceit in Language Play*, organized by Bell Nancy [et al.]

While it is now increasingly recognised that teasing constitutes a heterogeneous category of behaviour (Keltner et al. 2001), there has been little systematic investigation of different teasing practices in pragmatics (Haugh forthcoming), with the primary focus being on the extent to which the teasing is taken to be serious through to joking (Boxer and Cortés-Conde 1997). In this paper, we examine forms of teasing that have received little attention to date, namely, instances where the tease producer engages in some form of jocular deception or pretence that is subsequently revealed to be just that to the recipient.

- G: Quick Laura someone has messed up all your organisation in the pantry and even ripped off all the label.  
 L: ARE YOU SERIOUS?  
 G: Ha-ha nah just stirring you up. Knew I'd get a reaction.  
 L: God you're such a shit-stirrer. (Rowen 2012: 69)

While a limited number of studies have noted instances of playfully deceptive forms of teasing (Dynel forthcoming; Haugh 2016; Hopper and Bell 1984; Rowen 2012; Sherzer 2002), the interactional mechanics of jocular deception and pretence are not yet well understood. In this paper, drawing from interactions amongst American and Australian speakers of English sourced from a range of different corpora (Bell 2015; Haugh 2014, 2016), we examine the pragmatics of teases that are accomplished through jocular deception and pretence, including:

- How are jocular forms of deception and pretence constructed in interaction?
- How do interlocutors respond to such practices?
- What linguistic resources are drawn on in order to construct and cue these practices?
- What (serious) interpersonal and instrumental goals do they achieve?

We suggest in the course of our analysis that jocular pretence involves teases designed to occasion shared laughter, while jocular deception involves teases designed to provoke ostensibly negative affective responses from the target, in the latter case the negative response appears to be all too real in some instances. We also reflect on the interactional and interpersonal effects of these different forms of teasing in different relational settings.

***Causality in discourse: Crosslinguistic patterns*** (Contribution to *Linguistic Expressions and Devices that Yield the Implicature of Cause and Effect*, organized by Hanazaki Miki [et al.]

This study examines crosslinguistic patterns in the encoding of everyday causal chains in narrative discourses, focussing on lexical underspecification and reliance on conversational implicatures for the representation of subevents and causal relations.

Video stimuli (N=43) depicting short causal chains (e.g. a woman tearing a piece of paper; a man being startled when a woman sneezes behind him) were created to test variables including volitionality, control and animacy of event participants, type of resulting event, and the presence of an intermediate participant (Causee). 12-22 speakers per language (English, Japanese, Korean, Russian, Sidaama, Yucatec) viewed each stimulus video, and were asked to describe the events depicted in response to the prompt 'What happened?'. To date, data has been coded and analysed from 5-12 speakers per language for a subset of the stimulus items (N=23).

52% of descriptions did not entail a causal relation between Causer action and resulting event (e.g. the pushing and the ripping events in (1)). In another 15% of cases, *responsibility* for the outcome was explicitly attributed to the Causer (e.g. as the subject of *caused* in (2)), but the description of the Causer's *action* (*pushed the girl* in (2)) was still only implicitly causally linked to it.

- (1) The first girl [CAUSER] **pushed** the second girl [CAUSEE], and the second girl **ripped** her paper [AFFECTEE].
- (2) She [CAUSER] **pushed** the girl [CAUSEE], and **caused** the girl to **rip** the paper [AFFECTEE].

We identified three distinct operations hearers can rely on to recover the causal chain from the descriptions (which correspond to three related types of underspecification in the descriptions). **Underspecified subevent recovery** is required when only a semantically underspecified representation of one of the causal chain subevents is encoded (e.g. the causing event of a causative transitive verb, a morphological causative or a periphrastic causative). **Causal link recovery** is required when two causally related events are encoded without an entailed causal relation. **Subevent unification** is required when the same event is encoded more than once in the description (often one of these is semantically underspecified), and the hearer must infer that these refer to the same subevent in order to recover the causal chain. All three operations were found in every language, although with considerable distributional variation between languages (Table 1).

Language	English	Japanese	Korean	Russian	Sidaama	Yucatec	Total
Underspecified subevent recovery	28.46%	35.48%	20.99%	43.61%	60.16%	60.78%	38.43%
Causal link recovery	37.80%	50.00%	77.77%	52.63%	80.49%	52.94%	56.63%
Subevent unification	19.92%	37.90%	9.26%	18.05%	21.95%	24.51%	19.66%
No operations required	34.96%	13.71%	9.88%	21.80%	1.63%	0.00%	16.85%

Table 1. Percentage of descriptions which require at least one application of the specified operation, by language. Multiple operations may be required per description.

Both **causal link recovery** and **subevent unification** involve a gap in the encoding of the causal chain, in which the representation of causality is implicit. The gap was most frequently located following the first event in the causal chain even in chains involving representations of more than two subevents. Chains involving two human participants were most strongly correlated (compared to the other causal chain variables) with a gap occurring after the first event in the causal chain ( $j=0.36$ ,  $p<0.001$ ).

A model of production strategies utilizing these pragmatic operations will be proposed: speakers leave out information (semantically specific subevent information, explicit encoding of the causal relation) when the hearer can readily recover such information. Our research is informed by the working hypothesis that these patterns may ultimately be reducible to one or more underlying heuristic algorithms speakers apply when

narrating causal chains. Such algorithms would make significant contributions to theories of discourse representation and coherence and the development of human-machine-interaction systems.

### **Diana ben-Aaron**

***Provided or provisional endings? Narrative closure in news*** (Contribution to *Beyond the myth of journalistic storytelling. Why a narrative approach to journalism falls short*, organized by Zampa Marta [et al.]

In dematerializing economies where ever more jobs are constructed in terms of attracting and keeping consumer attention, it is not surprising that journalists should be valorized for their ability to “tell stories.” However, the production of stories that can be formulated in an Aristotelian beginning-middle-end scheme sits uneasily with other models treating the desired role of news media as moderators in a dialogic news sphere, for example “public journalism” as described by Rosen (1999). This paper investigates the notion of closure in news stories as compared to other narratives, with particular attention to models informed by the organization of digital texts. This paper will suggest that news can be viewed as a hypertextual narrative in which “fuzzy coherence” (Tyrkkö 2007) is sufficient for producing satisfactory meanings. This model requires treating individual “stories” as part of a complex intertextual network through which readers form idiosyncratic paths without necessarily reaching closure or consensus, as with literary hypertexts whose aesthetics are based on irresolvable aspects of cognitive experience (Aarseth 1997); in particular, providing local rather than global endings. The narrative view of news has already been counterposed to “chronicle” functions in which the news provides colonistic or encyclopedic information such as crime news in brief, events listings or meeting minutes that may be reassembled into narrative by news producers or by readers (Bird and Dardenne 1988). Chronicle and story are not sharply divided; traditional hard-news stories vary in the degree to which order, completeness, and evaluation are present, sometimes to the discomfort of readers and analysts.

As Bird and Dardenne have pointed out, the telling of one story from the evidence tends to foreclose others; media systems are still asymmetric and whose story is told is critical. Ethnographically informed studies of news such as Cotter (2010), have described the practices by which journalists strive for their conception of balance and the constitution of their position as neutral or at least neutralistic authority. Different spatiotemporalized and specialist news cultures vary in the degree to which journalists are expected to draw conclusions for the reader, as opposed to acting neutralistically or representing difference. In some cases such as economic reporting and sports reporting there are often practices of seeking consensus with other news sources on the reasons for outcomes. Such examples will be examined along with narratives whose early framing was contested and ultimately overturned on new evidence, including the Hillsborough disaster and the Central Park jogger case, as well as the ongoing Brexit referendum coverage, which has so far been in large measure a narrative of indeterminacy on multiple levels. The extent to which genres can apprentice and scaffold news consumers as opposed to catering for their anticipated preferences will also be considered in arguing for a less “storified” treatment of news discourse both within the profession and in studies of it.

***The role of affiliation in responses to complaints to the NHS*** (Contribution to *Complaints in Institutional Settings: Accountability, Affect and Identity*, organized by Rhys Catrin S. [et al.]

In this paper we use Conversation Analysis to examine telephone complaints to the NHS which focus on a variety of issues raised by patients or their families. The Patient Relations department is the first point of contact for patients wishing to register a formal complaint and one of its key functions is to manage and resolve discord between patient and health service. Previous analyses of the activity of complaining have demonstrated how complaining occurs in extended sequences that emerge in a collaborative stepwise fashion in which

complainants may engage in elaborate interactional work oriented to securing recipient affiliation (Drew and Curl 2008). These sequences also display variations in participation frameworks that are closely tied to the restrictions of the recipient's institutional role and influence the trajectory of the sequence as well as the action orientation and stance of the complaint recipient (Heinemann and Traverso 2008). While callers to the NHS complaints helpline are overarchingly oriented to "telling their story", the call handlers are oriented to the institutional requirement to gather information and identify an appropriate outcome. Intricately enmeshed within these orientations is the participants' negotiation of the normative preference for alignment and affiliation (Stivers et al. 2011). Our analysis has focused specifically on the sequential and epistemic environments and forms of talk through which callers pursue affiliation and call handlers display or withhold affiliation. One of our key observations is that the receipt of complaints is not simply a matter of gathering information. The act of complaining in this particular institutional setting is socially and emotionally consequential for callers. Our data shows that a range of often quite subtle interactional resources are employed by complaints handlers to negotiate the interaction between epistemic stance and affiliation but in cases where affiliation is sought but withheld, complaints are often heightened and the grievance escalates.

***A longitudinal study of L2 interactional competence: Practices for self-initiating other-repair in French talk-in-interaction*** (Contribution to *Interactional competence: CA perspectives on second language development*, organized by Pekarek Doehler Simona [et al.]

This paper investigates the development of second language (L2) interactional competence as it is observable in how an adult speaker of L2 French changes her repair practices over time while sojourning as an au-pair in a French-speaking host-family. Repair has been shown to be a pervasive feature of everyday interactions. It is a central vector for the maintenance of intersubjectivity (Schegloff, Jefferson & Sacks 1977) while sometimes putting at risk the progressivity of talk (Schegloff 2007, Heritage 2007). And it is a potential site of L2 learning (Brouwer 2003). Repair practices have been studied in terms of their local accomplishment, mainly in classroom contexts (e.g. Seedhouse 2004; Fasel Lauzon & Pekarek Doehler, 2011). Yet, how practices for accomplishing repair change over time as part of speakers' developing L2 interactional competence, has so far remained unexplored (but see Hellermann 2009, 2011). This paper presents a longitudinal case-study of an au-pair girl's practices for self-initiating other-repair during word-searches. Based on a corpus of 20 dinner table conversations (a total of 7h) between the au-pair (Julie, whose L1 is German) and her host family, the study documents how Julie's 'methods' for self-initiating other-repair change over time. Julie had followed 12 years of French instruction before her sojourn, yet her practices of self-initiating repair undergo a remarkable development within the nine months of her stay: Results show a shift from the use of 'heavy' resources that temporarily suspend the ongoing course of action (such as explicit calls for help), towards the use of more subtle resources (e.g. paraphrase) that maximize the progressivity of talk while still allowing the speaker to overcome lexical problems with the help of others. It is argued that these changes indicate the speaker's developing L2 interactional competence.

#### **Lawrence Berlin**

***The positionality of post-truth politics: Claims and evidence in the 2016 US Presidential Campaigns*** (Contribution to *Position and Stance in Politics: The Individual, the Party, and the Party Line*, organized by Berlin Lawrence [et al.]

The phrase "post-truth politics", widely attributed to a blogger in 2010 (Roberts), derived from the concepts of "post-truth era" (Keyes, 2004), "post-truth political environment" and "post-truth presidency" (Alterman, 2004)—the latter referring to the American presidential administration of George W. Bush whereby misleading statements were made to justify the invasion of Iraq in the post-9/11 era. Essentially, post-truth politics refers to a shift in the discourse within the political domain where assertions appeal to emotion (cf. Berlin, 2012) rather

than logic. Moreover, when assertions are suggested to be *untruths*, counterclaims (i.e., those asking for support for the claim, pointing out a lack of evidence, or even outright denying the veracity of the original claim) are largely ignored and/or simply dismissed. As an ongoing theme in pragmatics, the manipulation of language (e.g., by politicians) occurs as intentional attempts to sway the opinions of hearers. In an article from *The Economist* (September 10-16, 2016), for instance, a claim made by Donald Trump, the Republican candidate for the US Presidency in 2016, is given as an example of post-truth political discourse. Trump uses an emotionally-charged syllogism when he proffers the conclusion that US President Barack Obama is the “founder of Islamic State”, and that Hillary Clinton, his Democratic opponent and former US Secretary of State during Obama’s first term, is the “co-founder” (of ISIS) by association. The fallacy in his logic can be reduced to the deductive argument that Obama ordered the withdrawal of US troops from Iraq which, ostensibly, led to the vacuum that allowed ISIS to emerge. Using Positioning Theory (Harré & van Langenhove, 1991, 1999), statements made by the two candidates who represent the two major American political parties in the run-up to the 2016 Presidential Election are examined as potential exemplars of pragmatic acts in an ostensive post-truth era. Comparisons will be made between the candidates regarding their use of first-, second-, and third-order positioning in political speeches (Berlin, 2012) versus debates (Berlin, 2015). Additionally, their claims will be explored for uses of evidential markers (Berlin & Prieto-Mendoza, 2014; Chafe, 1986) and logical argument forms.

***Corpus-based study of turn-initiators in Czech*** (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

This study aims to scrutinize the use of turn-initiators in spoken Czech. Turn-initiators have many forms and several conversational and pragmatic functions. They can signal an alignment or disalignment with the previous turn by providing the preferred reaction or, on the contrary, by resisting to the present presupposition or by posing some sort of reticence. Moreover, as far as the conversational structure is concerned, turn-initiators occur in a variety of sequence positions (initial, middle, closing) (Heritage 2013). This rather complex situation is only hard to grasp with a purely qualitative pragmatic research. For this reason, this study opts for a corpus-based approach which enables us to assess the frequency (as a factor of observation) and the regularity of occurrences (as a factor of predictability) in Oral 2013 which is a lemmatized and tagged corpus of spoken Czech containing 2,8 Million tokens. After developing a general picture of some selected turn-initiators, a special focus will be dedicated to the many functions of the turn-initiator “no”.

**Anne Bezuidenhout**

***The direct challenge test of “At-Issue” content*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

Previous studies suggest that New Zealand English speakers tend to strongly mitigate or even avoid the direct expression of disagreement (e.g. Holmes, 1995; Holmes & Marra, 2004; Marra, 2012). In other words, they display a strong preference for agreement, implicitness and softening strategies such as tag questions, hedges, gambits and hesitations. Adopting a multimodal perspective, Stadler (2006, p. ii) notes that “New Zealanders’ non-verbal behaviour in disagreements differs little from their behaviour in neutral speech”, which consists, for example, of looking at the recipient less directly than in other cultures (e.g. in Germany). However, Stadler’s analysis is purely quantitative and no attention is paid to the situated coordination of verbal and non-verbal resources.

Drawing on a descriptive and language oriented approach to argumentation (Doury, 1997, 2012; Jacquin, 2014; Jacquin & Micheli, 2012; Plantin, 1996, 2012), this paper explores the multimodal dimension of argumentation in talk-in-interaction by looking at the various resources that are used by the speaker to “disagree without being disagreeable” (Marra, 2012). Data are taken from a video-recorded corpus of management meetings held in 2005 in New Zealand and recorded by the Language in the Workplace Project (e.g. Holmes, Marra, & Vine, 2011).

Linguistic, sequential, and multimodal analysis of various extracts shows the crucial importance – for the expression and accountability of the disagreement – of polyphonic negations combined with shifts in gaze direction and/or pointing gestures. While verbal negative formulations allow the speakers to uncover (and contest) contextually relevant points of view without having to attribute them to other participants in an explicit way (e.g. Ducrot, 1984; Nølke, 1992), shifts in gaze direction and/or pointing gestures are used to refer to participants who actually or potentially endorse such contested points of view. These complex multimodal resources appear as a politeness strategy to indirectly refer to the origin of the disagreement and therefore to counterbalance the New Zealand preference for mitigation.

This combination of resources taken from different semiotic repertoires in salient, sequential points of turn-at-talk – i.e. what Stukenbrock (2015) calls “Multimodaler Verdichtungsraum” [Multimodal Compaction Zones] – suggest the relevance of potential “Multimodal Gestalts” (Mondada, 2014) whose identification and description consist of interesting theoretical and analytical challenges for Politeness Theory and for Pragmatics in general.

***Famous politicians, infamous progeny: being ordinary onscreen when you are a dynastic heir apparent in the Indian context*** (Contribution to *Constructing Ordinarity across Media Genres*, organized by Weizman Elda [et al.]

Constructing ordinarity onscreen can routinely signal ‘trouble’ (Schegloff, Jefferson and Sacks 1977; Schegloff 1987) wherever public figures are involved since the presupposition is that they are up there precisely because they are not ordinary. This quasi-paradox is especially marked in the case of political leaders who have inherited their leadership roles by virtue of being dynastic scions. Indeed, one of the commonest features attributed to the structure of political parties in India, which is by far the world’s largest democracy, is that powerful positions within a party are inherited rather than earned. Since this is hardly the most democratic of procedures, the progeny of political leaders in India also inherit a major conversational burden whenever they face the media. They have constantly to ‘prove’ in speeches, interviews and other public forums that they are ordinary folk who understand the aspirations of ordinary people and the difficulties they face, even though they are themselves often extremely well off and highly privileged. Based on a microanalysis of the videotaped speeches and interviews of two of the most prominent political inheritors in India, who appear to be indelibly cast in the public consciousness as the undeserving progeny of justly famous forefathers, this paper tracks their efforts at conversational mitigation (Fraser, 1980) in episodes where references to their birth and status are anticipated, implied or directly mentioned. These relatively youthful politicians are Rahul Gandhi (b. 1970), Vice-President of the historic Indian National Congress, despite being much less experienced than others in that party; and Varun Gandhi (b. 1980), Rahul’s estranged first cousin, member of Parliament and General Secretary, no less, of the Congress’s major opposition party, the right-wing Bharatiya Janta Party (BJP) which is currently the ruling party in India having won a thumping electoral victory in 2014. In Rahul Gandhi’s case, his great-grandfather (Jawaharlal Nehru), grandmother (Indira Gandhi) and father (Rajiv Gandhi) were all Prime Ministers of India; and it was the same with Varun Gandhi although his father, while being groomed for a major political role, was not Prime Minister since he died early in a plane crash. So, how do this politically prominent pair of first cousins, belonging to rival political parties, adjust their speech styles to mitigate the very public facts about their personal identity in an age of intense media scrutiny? How different are the conversational stances they adopt and why? Using a ‘mixed methods’ approach that combines conversational analytic techniques with Goffman’s notion of face-work extended in this instance also to non-verbal cues, within the broad parameters of a Gricean theory that allows for a contextual examination of presuppositions, implicatures, metaphors and perlocutionary effects as well as speech acts such as apologies, this paper identifies foci of ‘trouble’ in certain conversational sequences produced by Rahul and Varun Gandhi that seem to necessitate repeated onscreen displays of ordinarity in the Indian political context.

***Collaborative deliberation and metaphors as processes for effective healthcare provision in multicultural medical settings*** (Contribution to *Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.]

Changing geo-political scenarios, especially in Europe, Northern Africa and the Middle East, are displacing populations and reshaping societies. In this context, the provision of health care becomes even more challenging as the cultural and linguistic gaps add complexity to the institutional asymmetry of roles and knowledge, typical of medical interactions. In the effort to propose evidence-based indications regarding communication strategies for the effective provision of health care, researchers can be overwhelmed by the complexity of the context they are observing and by the need for appropriate models and methodological tools. The paper aims to reflect on a model of communication that could be particularly appropriate to tackle the challenges implied in the new scenarios offered by multicultural and multilingual medical settings. We propose that such model could be the ‘socio-cognitive approach’ (SCA) outlined by Kecskes (2008, 2010) and Kecskes and Zhang (2009). The model describes the process of meaning construction and comprehension as it develops around three different types of knowledge: ‘collective prior knowledge’, ‘individual prior knowledge’, and ‘actual situationally created knowledge’. It also highlights the dynamics between intention and attention in the process of meaning

production and the role of salience and relevance for the interpretation of meaning (Kecskes, 2014). In this respect, the SCA focuses on discourse segments, instead of utterances, as the level of analysis for intercultural interactions, and pays attention to the verbal and nonverbal means through which interlocutors create sense out of apparently meaningless units. The focus on the dynamics between salience and relevance is useful to explain cases of misunderstanding that can be traced back to the different 'collective prior knowledge' each interlocutor proceeds from, often generated by insufficient competence regarding the meaning of single words or phrases in the L2. On the backdrop of such a model, we consider in particular the role of collaborative deliberation (Elwyn & Miron-Shatz, 2010; Street, Elwyn & Epstein, 2012; Bigi, 2014a) and metaphors (Rossi, Macagno & Bigi, 2016) as pivotal strategies for the construction of common ground (Bigi, 2016a). Both dimensions are exemplified through the analysis of excerpts taken from a corpus of video-recordings of consultations in an Italian diabetes setting (Bigi 2014b). The discussion of collaborative deliberation and metaphors aims to clarify the mechanisms by which these two processes can contribute to bridge the cultural gap in multicultural and multilingual medical contexts (Bigi 2016b). We propose that a deeper understanding of the pragmatic and cognitive mechanisms that rule both intracultural and intercultural communication can be the starting point for designing new theoretical and methodological agendas to address the complexity of multilingual health care communication.

#### *De-colonising place-name historiographies: (Urban) Africa via Europe and Israel/Palestine* (Contribution to *The Pragmatics of Place: Colonial and Postcolonial Perspective*, organized by Levisen Carsten [et al.]

Embracing a synoptic perspective, we shall analyse research tendencies in place-name studies (toponymy) regarding sub-Saharan Africa, in light of their wider interference with other area-studies research traditions in toponymy, that is, of Europe and Israel/Palestine. While the last two decades are characterised in a 'critical turn' in place-name scholarship and self-conscious engagement with critical theories of space and place, only meagre number of references touches sub-Saharan Africa (and Latin America and Asia). In addition, the recent research is over-concerned with the understanding that place naming reflects the power of modern political regimes, nationalism and ideology. The preoccupation with political power's control over both landscape and history is especially true for publications in English, which tend to be centred on the West and Eastern Europe, with only few geographic exceptions. The Euro-centrism is even enhanced considering the manifested uni-directionality of some of the research, such as that on street-renaming policies in European cities following revolutionary changes of political regimes, often disconnected from bottom-up responses on the part of the urban residents. It

is also enhanced because of the classical methodological problem within the field of human geography, of the reliance on maps and gazetteers to study place names, on the expense of participant observation, interviews, and ethnographic methods. Similarly, in the case of the highly ideological and contested environment of Israel/Palestine, the Jewish-Arab conflict has engendered not only a divided and split space along status, ethnic and national lines -- but also split place-name historiographies with a remarkable contextual arrogance. By referring to some recent pioneering collective projects in place-name studies regarding the global South and by showing their potential enriching quality in terms of methodology and content, we strive to contribute for a de-Eurocentrisation of toponymic scholarship. This is through pointing on some inspiring and inclusive research directions, highlighting urban histories and colonial legacies.

***Regrading as a conversational practice*** (Contribution to *Upgrading/Downgrading in Interaction*, organized by Prior Matthew [et al.]

The purpose of this paper is to initiate the topicalization of upgrading and downgrading (regrading) in conversational interaction; that is, to offer some fundamental considerations for viewing regrading as an object of study rather than as a taken-for-granted conversational practice. I begin by noting that regrading is a manifestation of scaling. Regrading, from the CA (as opposed to linguistic or linguistic pragmatic) perspective, involves the relocation on a scale of some object or expression—it involves a positioning followed by a repositioning, and so is inherently sequential. The regrading makes a scale salient even as the positing of a scale is what makes it possible to perceive regrading. I first consider a couple of basic issues involving types of regrading and the nature of regrading as an analytic notion. Then, through the examination of a transcribed segment of talk, I comment on the prevalence of regrading as a conversational practice, and on scales as constituting, to a large extent, the underlying structure of talk. I try to show that looking at conversational exchange with a special sensitivity to regrading produces a particular and analytically interesting description. I want to claim that (1) Interaction consists, to some considerable extent, of movements on various scales. (2) Understanding of those scales guides interpretation, especially implicature and implication. And (3) understanding word choices as scaling choices is a key to the analysis of how utterances function. Regrading is one way in which scales are made evident in talk and are made to do interactional work.

***Multimodality and affectivity in adults' storytelling for children*** (Contribution to *Storytelling in adult-child and children's peer interactions*, organized by Burdelski Matthew [et al.]

The present paper examines storytelling activities routinely enacted in adult-child interactions in Swedish preschool settings. The study is based on a video-ethnography (20 hours of recordings) conducted in two Swedish preschool groups for 1-4 year olds. The story-telling activities were analysed by using multimodal interaction analysis (Goodwin, 2000). Whereas children's narrative skills and linguistic capacities have received considerable attention in pragmatics (Hickman, 2006), children's (interactional) participation in storytelling as an audience has thus far not received much attention. A growing number of studies have examined how adults, during storytelling, ask questions and initiate children's verbal responses (Heath, 1983; Markova, 2015). In the present study, we direct attention to the multimodal and affective features of storytelling for children. We investigate in detail how the participants, adults and children, draw upon a range of modalities, such as voice, intonation, facial expressions, gaze and gestures in the affective indexing of the story (soliciting attentive listening, inviting affective alignment, enacting story events and modelling audience's affective responses). By directing our focus towards multimodal features of children contributions (e.g. audience responses) to the story told, we highlight the ways storytelling is permeated with and involve a close coordination of children's and adults' affective stances.

***Teaching formulaic language: The case of discourse markers*** (Contribution to *Teaching Formulaic Language to L2 Learners*, organized by Bladas Marti Oscar [et al.]

To date research in Second Language Acquisition suggests that L2 learners tend to use discourse markers (DM) differently from native speakers. In general, L2 learners seem to use fewer DMs, and less frequently, than native speakers, and to use these particles for a limited set of pragmatic functions only (Müller 2004, 2005; Fung and Carter 2007). As a result, non-native spoken discourse may seem disfluent in the eyes of native speakers (Romero Trillo 2002, Aijmer 2004, Hellerman and Vergun 2007). However, research in the field tends to focus on DMs as isolated elements, that is, without taking into consideration that DMs are prototypical examples of formulaic language. Typically, DMs are formally fixed; they can be highly idiomatic, and they are associated with a variety of pragmatic functions. Yet these particles are rarely analysed as a type of formulaic language, particularly in relation to non-native spoken discourse. This paper aims to shed light on this issue by analysing how DMs, as prototypical formulaic elements, are used in non-native spoken discourse. To do so, L3 English discourse produced by bilingual Catalan/Spanish speakers is examined. A total number of 36 spoken tasks from Corpus Audiovisual Plurilingüe (Payrató and Fitó 2008) are analysed quantitatively and qualitatively. Findings indicate that participants produce coherent L3 discourse but *a)* they do not master completely the usage of DMs, and *b)* they generally make limited use of formulaic elements. Consequently, participants' L3 spoken discourse is coherent, but non-typical. It is argued that participants' underuse of DMs is a consequence of a limited use of formulaic elements in general. In terms of language learning and teaching, these results suggest that a greater focus is needed on the teaching of typical formulaic elements, including DMs, among bilingual Catalan/Spanish learners of English, particularly in the area of spoken discourse.

***Reaching out to everyone – language use and regulation in multicultural and multilingual churches in Germany*** (Contribution to *Language regulation in professional contexts*, organized by Nissi Riikka [et al.]

Church services have mainly been monolingual in Germany. With the decline of members over the last decades, many churches have tried to change the style of worshipping to be more attractive, incorporating different styles of speech into the traditional ritual (e.g. services for bikers, for young people). Yet, the services remain monolingual. There are, of course, many religious communities with a non-German background that use their heritage language in services. But joint services of communities with different linguistic and cultural backgrounds are still an exception.

Many elements in services can be understood without knowing the language in use because they are part of the shared religious knowledge and are performed similarly in all languages (e.g. the Lord's Prayer). But in order to follow the sermon – the 'horizontal communication' between the pastor and the congregation – and to fully understand the message for one's own life, it is crucial to know the language in which it is presented (Paul 2009). The pastor has to decide when to use which language to convey certain meanings, values and opinions to everyone.

Focusing on language use in two African churches in Germany, my research aims to analyse how pastors deal with their multilingual congregations and especially how this influences the design of their sermons. While still in the process of data collection (audio and video recordings of sermons, interviews, participant observation), some preliminary findings show similarities as well as differences in language regulation: Both communities use two languages in the services. Although the pastors decide on all issues concerning the worship, including language use, it is not a pure top-down regulation. They have to be in close contact with the church members and consider their linguistic competences as well as preferences.

In one church, the second generation's growing lack of competence in the heritage language Akan and – as a consequence – the declining interest in the services was the reason to add English; but not yet German. The other church offers a joint service with the resident German community, where two pastors preach together in dialogue form in English and German. Each is supposed to use only one language and to give a gist translation of what the other one said before. In the course of the sermon, however, this structure is not always followed. Phenomena such as code-switching and forms of language negotiation can be noticed and will be analysed in detail.

The language regulation is closely intertwined with the aim of the institution 'church': to transmit the message of the sermon to everyone in the congregation in order to strengthen the belief in God as well as to attract new members and to keep the old ones. The use of two or more languages does serve this goal in that more people have access to the service in general and the sermon in particular.

#### Grit Böhme

***“He just sounded like he wanted to go home” – Speech styles of radio presenters described by German and Danish listeners*** (Contribution to *Intercultural Pragmatics and Cultural Linguistics*, organized by Schröder Ulrike [et al.]

According to insights from cognitive science, frequently encountered patterns of associations among features we perceive, are represented by stronger connections between neurons, which have a greater influence on our cognitive processes. A common culture tends to lead us to experience certain regular occurrences, and may thereby result in schemata we share with people who were socialized in a similar fashion. Linguistic styles are being perceived and categorized in this manner as well. The meaning of such styles is learned through subjects interacting with each other and in so doing synchronizing their stylistic resources. One way of approaching these meanings empirically, is through metapragmatic labels people use to describe their impression of a certain style. These labels, however, are also learned through socialization processes.

If one is to research the meaning of styles, this can lead to methodical issues. The same stylistic features can be of varying degrees of salience for language users, depending on their previous experiences. They may be categorized in different ways, different meanings could be attributed to them and they may be described with differing labels

utisoftLocal.ByteClass and even the same label does not necessarily have the same meaning for everyone. This makes it hard to compare subjects with diverse social and/or cultural backgrounds, and even harder to do so in the form of quantitative surveys. The same goes for qualitative approaches if there cannot be found a structured way of comparing.

An attempt to address the issue will be presented here. The aim of this project is to find out how radio listeners differentiate among presentation styles of different radio stations and formats. Today's radio formats are highly influenced by US-American and British traditions, while simultaneously great efforts are made to cater to the needs of local audiences. In a first study, a sample of 32 German radio listeners had been interviewed, using the

Repertory Grid technique: Participants listened to three presentation takes at a time, which were randomly selected from a number of different radio stations. After listening, they were asked to decide which two of these takes they perceived as being more similar, which one was different, and then to describe these similarities and differences in their own words. This way, it is possible to collect metapragmatic descriptions from a specific target group, building a network of perceived differences and similarities that is being grounded by the stimuli they refer to. This method can give insight into how stimuli are spontaneously categorized and which features might be especially salient. In an additional pilot study, 6 Danish radio listeners of the same age and educational background as the German sample were interviewed in the same manner, using the same German radio presentation takes. Comparing both samples, remarkable similarities were found in the descriptions the participants used, even though the Danish subjects spoke little or no German. This indicates that voice and prosody may be an important cue to differentiate among presentation styles, which had so far been somewhat underappreciated in “disembodied” linguistic research.

***“Could you be so kind and help this man?”: Entitlement and contingency in requests for help to the 9-1-1*** (Contribution to *Orientations to Low Entitlements and/or High Contingencies During Request Sequences*, organized by Kent Alexandra [et al.]

This study examines the practices that callers use when requesting help to the 9-1-1. The data for this study come from audio-recorded telephone calls to the 9-1-1 Costa Rica. The corpus consists of a random selection of 7300 audio files recorded during the 2013; however, not all of them are emergency calls (e.g. some are just the institutional automatic recording). Preliminary findings show that callers use various practices when requesting help: (a) practices orienting to contingencies of the outcome via the phrase “para ver si” (“to see if”), (b) practices orienting to less entitlement in the request via the “favor” construction, and (c) practices orienting to low contingencies via presenting the incident as self-evident. For example, one practice that callers use when requesting help orients to the contingencies of the outcome via the phrase “para ver si” (“to see if”; excerpt 1 below). The caller explicitly requests an ambulance (line 5). The linguistic composition of the request using the verb “ver” (“to see”) and the conditional “si” (“if”) build upon a request that shows low entitlement and high contingency (Curl & Drew, 2008).

#### Excerpt 1. (ECR-87 Vaginal infection)

*of San Isidro of Alajuela;*

008 (3.7) ((typing sounds))

009 CT: Y la dirección exacta?  
And the address/direction exact  
*And the exact location?*

Other practice that callers use when requesting help orients to less entitlement in the request via the “favor” construction. In excerpt 2 below, the caller requests the help (lines 3-5). The composition of the request is made as “a favor” showing low entitlement (“el favor”; line 4) and acknowledgement of high contingencies (“if”; “could do”; lines 3-4). In the data, this lexical choice was found only in cases where the callers called a second time to request the help (that was not delivered in the first call). In such cases, the callers seem to be acknowledging the contingencies for not getting the assistance in the first call, and displaying low entitlement in the request by soliciting the assistance in the second call as “a favor”.

#### Excerpt 2. (ECR-02 Papaya color house)

001 CT: Emergencias nueve uno uno;  
Emergencies nine one one  
*Nine one one emergency;*

*>What is your name?<*

Other practice that callers use when requesting help orients to low contingencies of the outcome via presenting the incident as self-evident (excerpt 3 below). The caller presents the problem (lines 6-11). The request of help is build up in the form of a description, since the caller provides information about the context: the type of incident (lines 5-6), the victim (lines 6-7), and the condition of the victim (line 7). The composition of the request for help shows high entitlement and low contingency, as it presents the problem as self-evident.

This paper sheds light on the interactional functions of the composition of the request for help in calls to the 9-1-1, and a potential to improve provision of 9-1-1 services by having a better understanding of the practices that callers use when requesting help. Examining other languages rather than English will also help us understand culture-specific practices within broaden activities that occur in social interactions (e.g., understanding different ways to formulate place, or variations in the opening sequences of emergency calls such as greetings).

***Requesting medication changes in psychiatry*** (Contribution to *Orientations to Low Entitlements and/or High Contingencies During Request Sequences*, organized by Kent Alexandra [et al.]

In psychiatry, as in other medical fields, practitioners are encouraged to adopt a patient centered approach that emphasizes the sharing of decisions with their clients. In this paper, we shed light on this process by analyzing how clients with severe mental illnesses (schizophrenia, bipolar disorders, etc.) advocate for their treatment preferences. Our focus is on how clients request changes in their medication regimen, e.g. request to eliminate or lower dosages of psychotropic medications or to prescribe a new medication. The paper uses Conversation Analysis to examine audio-recorded consultations between a psychiatrist and her clients in a long-term intensive community treatment program. We show that clients launch medication change requests opportunistically at activity transitions and may do so in several distinct ways. First, clients may directly request a change. Participants orient to such requests as requiring an account that grounds the request in the client’s negative experiences with the medication; and if none is offered, the psychiatrist will solicit one:

CLT: I wanna be taken off Seroquel.

PSY: >Why’s that.< (.)

CLI: Because I don’t like the side effect that makes me eat like horse

While here the client’s request is designed as a demand, a majority of requests for medication changes are mitigated (e.g., “I was wonderin’ if you could take it away”) to convey a stance of low entitlement, high contingency, and low deontic authority (Curl & Drew, 2008; Stevanovic & Peräkylä, 2012). Second, medication changes may be requested indirectly by reporting a problem: e.g., by reporting a possible side effect (“I’m having a tremendous tremor”) or by reporting an issue with a medication (“Geodon is the problem now”). Problem reports preserve the boundaries of medical authority and expertise, inviting the psychiatrist to offer a solution to the client’s problem. We show that the psychiatrist treats all such reports as (virtual) requests for a medication change.

Overall, the paper advances our understanding of patient advocacy in psychiatry and across medical contexts (Angell & Bolden, 2015, 2016; Kushida & Yamakawa, 2015; McCabe, et al., 2013; Quirk, et al., 2012), as well as, more generally, of requesting as a social action.

***“And... and... you see, sweetheart?”: Verbal and gestural pragmatic markers to remain involved in the conversation at very old age*** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

It is now recognized that Pragmatic Markers (henceforth, PMs) can contribute to the cohesion and coherence of speech by revealing expressivity and stance and regulating intersubjective processes (Fitzmaurice, 2004). Through their indexical and metalinguistic dimension, they help the speakers co-build a contextualized representation of the ongoing discourse (Aijmer & Simon-Vanderbergen, 2011: 224). By contrast, we still know very little about how PMs can also be instantiated by gestural and prosodic features (Fernandez, 1994). Early psychosocial and therapeutic support for old people in situation of cognitive frailty (Rockwood, 1994) requires the ability to decipher their pragmatic, emotional and conversational abilities to ensure individual care. Studies in applied linguistics have shown that frail older people develop compensatory strategies to maintain their involvement in the exchange (Davis, Maclagan & Cook, 2013; Tacconat & Lemaire, 2014) as well as their psychological identity, by using verbal and gestural PMs (either together or separately) that could inform about

their cognitive resources. With respect to Halliday's (1970) threefold categorization, PMs are thought to be used by older people (i) to organize their speech and structure the information conveyed (structuring function), (ii) to express their views and feelings as to preserve their identity through narration (expressive function), and also (iii) to optimize the interaction between speakers (interactive function). We assume that the use and combination of PMs in various communication modes can provide relevant information about methods to preserve empathic and conversational abilities in late life. It can also give useful insight into the preferential strategies used by the aging person as cognitive deterioration develops, depending on the discursive task at stake. Our study is based on the CorpAGEst protocol, which includes a multimodal tool (Allwood, 2008) designed to analyze the verbal and nonverbal behavior of very old people (75 y. old and more) in their natural environment. The corpus is twofold: (i) the transversal subcorpus comprises 16.8 hours of audio and video recordings, corresponding to 18 interviews in Belgian-French (9 old speakers; mean age: 85; sex: 8 F, 1 M; average MoCA-Test score: 25/30); (ii) the longitudinal subcorpus includes 20 hours of audio and video recordings, corresponding to 36 interviews in French-French (9 old speakers; mean age: 83; sex: 9 F; average MoCA-Test score: 20/30). The present study focuses on the comprehensive analysis of 4 video samples per subcorpus (total duration: 53 min.). The longitudinal data under investigation correspond to 2 video samples from a reminiscence task based on a visual stimulus and 2 video samples based on the narration of past remembering (old speaker 1: Constance, 86 y. old, MoCA 17/30; old speaker 2: Tristane, 81 y. old, MoCA 21/30). The transversal data correspond to 2 video samples based on the narration of milestones in aging and 2 video samples whose topic is about the old person's self-perception of aging today (old speaker 3: Albertine, 84 y. old, MoCA 29/30; old speaker 4: Anne-Marie, 82 y. old, MoCA 28/30). Among the physiological articulators involved in the interaction, we will examine hand gestures and head movements produced by the old speakers to uncover how these nonverbal cues combine with speech, and especially with verbal PMs. Preliminary results emerged from two exploratory studies. First, the analysis of a 5 min. sample among the longitudinal data indicated functional patterns in the use of PMs and an increase over time in their use and combinations of verbal and gestural markers. These results tend to confirm the hypothesized role of PMs used by frail old speakers to compensate for cognitive decline, in order to remain involved in conversation. Secondly, the analysis of some data from the transversal subcorpus showed that cognitively unimpaired old speakers tend to use recurrent combinations of multimodal PMs to fulfill specific functions in use (e.g. expression of common-ground vs. planning device), but that they also vary from each other in their gestural choice to express the same function (e.g. palm-ups vs. shoulder shrugs to express common-ground). This functional approach to PMs in very old people's speech, as well as approaches induced by linguistics and specifically pragmatics, undoubtedly contribute to the urgent need for non-medicinal and psychosocial methods (Van der Linden & Juillerat Van der Linden, 2014). We also believe that such evidence-based methods will contribute, in the end, to ensure older people's well-being by answering more closely to their 'real' needs with respect to their 'real' behavior in 'real'-world settings.

*Translating Yoruba medical interactions to English: Problems and prospects for a*

**conversation analysis based research** (Contribution to *Interpreting and representing non-English language data in discourse studies*, organized by Zabielska Magdalena [et al.]

This paper discusses the implications of translating and adopting Non-English language data for analysis in the English language. Specifically, I focus on the problems of adequately translating select transcripts of medical interactions in the Yoruba language to English language, and adopting the translated data for analysis with Conversation Analysis (CA) approach. Data for the study is derived from audio recordings of 70 doctor/patients encounters, i.e., interactions between female HIV positive patients and doctors within HIV specialized outpatients' clinics in general and state hospitals in Southwestern Nigeria.

The translation procedure usually involves mediating between source-text (source language, SL) and target-text (target language, TL) elements and transferring these text elements in small linguistic parts from the SL to the TL (Schaffner 2001; Nord 2007). During this process, translation problems may occur. And by translation problems, I refer to what Nord (2007) describes as "objective or at least intersubjective" problems. She further categorizes translation problems into pragmatic, intercultural, interlingual and text-specific problems. This paper focuses on interlingual translation problems which centers on the structural/linguistic differences (including vocabulary, syntax and suprasegmental features) between two languages. In my corpus for example, I find that during the translation process, lexical items which did not exist in the SL sentences were transported to the interlinear gloss and the final translation (FT) strands in the TL. The following questions and declarative sentence in Yoruba, and their FT in English, exemplify this. Q1: 'Sékòsí tí e fì bèwá wò o?'; FT: 'Hope no problem has necessitated your visit with us?' Q2: 'Sékòsí nkankan? 'Sékòsí ìyonu?'; FT: 'Hope there are no issues or problems?' S1: 'Epèlè mà'; FT: 'Well done madam'. The FTs in Q1&2 and S1, have gone through an explication process. While certain information was compounded in the SL clauses, the FT de-compounds them. For Q1&2, the compound word *Se+kosi* is derived from a full clause and needed to be explicated into several lexemes in English i.e., "Hope no problem" and 'Hope there are no issues...' respectively. And for S1, the compound word *E+pèlè*, 'to greet' is also represented with more than one lexeme in the FT. Probably the most crucial aspect of the translation process is that the word 'Hope' (as in Q1 & 2) and clause 'Well done' (as in S1) are not literally present in the SL, but are inserted in the translation process, to fit the translation purpose. Other possibilities for the translation are possible without the lexical insertions. However, the derivations were found to suit the context of the talks within the medical institutional setting.

The method used for data analysis is conversation analysis (CA; for review see Atkinson and Heritage 1984; Drew and Heritage 1992; Heritage and Maynard 2006). The basic structures of CA, which include turn-taking, adjacency pairs and interactional sequences, describe the rules that apply in analyzing data in any interactional contexts. Central to these rules, is that talks should be examined, of naturally occurring interactions. In other words, the data and its analytic representation must reflect as closely as possible, what the research subjects are naturally using the talk for. And here lies the conflict between the translation process and the actual use of the translated data. For the transcriber, the translation process may initially pose no challenges but for data analysis, the FT may distort how utterances are interpreted, different from how the research subjects mean them. This paper discusses this interconnectedness between the translation process and its use for data analysis. The discussion will therefore focus on these two objectives.

**Topics of empractical communication** (Contribution to *Empractical speaking and knowledge construction*, organized by Hauser Stefan [et al.]

Utterances like the following are frequent in empractical communication: 1) eighty (captain to first officer, US Airways Flight 1549, 2009) 2) A-D-I (second officer to captain, Birgenair Flight 301, 1996) 3) længere ned (Gliding instructor to student glider pilot, True, 2016) 'further down' 4) it's three thousand RVR (Captain to first officer, Southwest 1248, 2007) 5) der trækkes kun med fem en halv bar (Hang glider pilot to airfield attendant, FASTERHOLT, 2015) Lit: there pull[PRESENT-PASSIVE] only with five and a half bar 'the pull force is only five and a half bar' 6) der er åbent fra den side (Sports director to riders on a semiprofessional cycling team, Hobro, 2014) 'there is open from this side' 7) hold hastigheden (Gliding instructor to student glider pilot, True, 2016) 'keep the speed' 8) flyv rent (Gliding instructor to student glider pilot, True, 2016) Lit: fly purely 'keep it straight' 9) så skyd for helvede ude fra (Handball coach to handball players, Nordsjælland, 2016) Lit: so shoot bloody hell from outside Within the established descriptions of natural language message structure utterances like 1-9 have primarily been negatively characterized. The common trait of 1-9 in this perspective, thus, is the *absence* of a referential subject. In line with this, holophrases and short forms like 1-3 have been characterized as elliptical/incomplete; thetic constructions like 4-6 have been characterized as topic-less; and imperatives like 7-9 have simply been left out of the descriptions. The starting point of this paper is that these characterizations and exclusions are based on the assumption that the categorical judgment is the fundamental cognitive unit, and thus, that the predication is the basic semantic structure. This assumption might be warranted in the analysis of communication where the listener is a spectator to the activity that the utterances relates to semantically and has no activity specific knowledge and no activity specific need for information. But it is not necessarily so when we are dealing with communication where the listener participates in the activity that the utterances relate to semantically: Skilled performers of activities are actively seeking information in order to select and control actions; their ability to perform the activity consist in knowing which variations in the environment that are relevant to attend to. The main point of this paper is that participants of activities are using utterances to regulate attention and share information about the state of known variations in the environment. Thus, 1 is about velocity, 2 is about attitude, 3 is about altitude, 4 is about runway visibility range, 5 is about pull force, 6 is about topographical effect on wind speed, 7 is about velocity, 8 is about sideslip angle, and 9 is about shooting distance. The observations and suggestions presented in this paper is based on a study of empractical speech in scheduled air transport, semi-professional cycling, hang gliding, recreational scuba diving, glider pilot students training and handball. The paper suggests two new semantic distinctions: mode-value and sharing-nesting. These distinctions serve as an alternative to the subject-predicate distinction and enable a description of utterances like 1-9 as full-blown messages.

*"Tute mir Leite, ich verstehe Ihre Akzente nicht" - English and ethnolectal accents in the*

***U.S. original and German dubbed versions of "South Park"*** (Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

Research on linguistic variation in fictional discourse is a recent phenomenon (cf. Stamou 2014: 6f.). Sociolinguistic comparisons of fictional TV-shows and their dubbed or subtitled counterparts are particularly rare. A useful object to study the problems and strategies involved in rendering linguistic variation crossculturally is *South Park*, a U.S. animated TV-series about a town in Colorado and its inhabitants. The show is famous for its provocative humor and satire, and contains a wide range of accents which prove difficult to reproduce in dubbed versions.

An earlier study on *South Park* in English and German was conducted by Keseberg (2010). However, Keseberg focuses more on the translation of culture-specific elements and puns than on linguistic diversity as such. To fill this gap, my presentation will (a) take stock of the most frequent accents in both the original version and its German dubbed counterpart and (b) systematize the translation strategies applied to different accents.

Regarding the translation of different languages in a single source text, Zabalbeascoa and Corrius (2014: 256) distinguish two strategies:

(1)  $L1 + L3^{ST} \rightarrow L2$ , where both the “unmarked” (L1) and “marked” language (L3) of the source text (ST) are translated by the same language (L2) in the target text (TT), basically ignoring the linguistic diversity in the original;

(2)  $L1 + L3^{ST} \rightarrow L2 + L3^{TT}$ , where the language used in the TT to translate the “marked” language in the ST is also “marked”, in an attempt to preserve the linguistic diversity of the original.  $L3^{ST}$  does not necessarily equal  $L3^{TT}$ .

By analogy, these two strategies can also be applied when translating different accents:

(1)'  $A1 + A3^{ST} \rightarrow A2$ ;

(2)'  $A1 + A3^{ST} \rightarrow A2 + A3^{TT}$ .

The present study analyzes four *South Park* seasons (= 21.3% of all episodes) for linguistic variation and compares the most frequently occurring “marked” accents in both versions, distinguishing between English and ethnolectal accents. The English accents are British, New Yorker, and Southern U.S.; the ethnolectal accents are Chinese, Japanese, and German.

The data shows that different strategies are used for different accents. All English accents are simply translated into Standard German ( $A1 + A3^{ST} \rightarrow A2$ ), whereas all ethnolectal accents under investigation are rendered by “marked” varieties in the dubbed version ( $A1 + A3^{ST} \rightarrow A2 + A3^{TT}$ ). Not only does the use of these accents provide insights into dominant indexicalities, language ideologies, and stereotypes in both source and target cultures; the translation strategies also reveal which accents have functional equivalents in the two cultures, thus making them “transferable”, and which ones don't. Thus, German has functionally equivalent accents indexing Chinese and Japanese stereotypes, but none indexing British, New Yorker, and Southern U.S. stereotypes.

***Spanish retailer-consumer interactions on Facebook: A variational pragmatics perspective***

(Contribution to *Service Encounters in the Spanish-Speaking World from a Variational Pragmatics Perspective*, organized by Placencia Maria E. [et al.]

This presentation examines the multimodal ways in which service providers communicate with their clients on Facebook. Language research in the areas of service encounters and Facebook interaction have very seldom intersected. Service encounters have received great scholarly attention over the years, with studies mainly investigating the transactional and interpersonal aspects of face-to-face and telephone-mediated communication (M>Irukez Reiter & Bou-Franch *in press*). However, the world of business has currently increased its presence in the social media, among these, in Facebook. Paradoxically, there is hardly any language-based research into corporate communication on Facebook (but see Bou-Franch 2016), as Facebook researchers have mostly explored personal sites (Tagg & Seargeant 2016). This talk seeks to bring together these areas of research by examining retailer-consumer interactions on Spanish commercial Facebook. More specifically, it focuses on multimodal markers of (in)formal and interpersonal communication in the status updates of four stores based in Spain. We hypothesized that these will vary depending on social factors like the affluence of the store or the type of product. To carry out this research, a corpus of 40 commercial wall interactions from different stores was compiled and analysed from a variational pragmatics perspective (Barron & Schneider 2009; Félix-Brasdefer 2015, Placencia 2008, 2015). Findings reveal multimodal variation, which can be related to the identity the corporations wish to construct for themselves and for the consumers they target.

*Early responses to requests: The precise timing of first vs. second actions* (Contribution to *Early responses*, organized by Deppermann Arnulf [et al.]

This paper deals with embodied actions that emerge in a sequential environment in which requests are produced. Requests are a first action that projects the relevance and normative expectation of a response granting them. These responses are often formatted in a silent embodied way (Mondada, 2011, 2014, De Stefani & Gazin 2014, Goodwin & Cekaite, 2013, Lindwall & Ekström 2012) – such as when a surgeon directs the hand of his assistant and the assistant, in response, silently moves his hand. Here, we focus on actions that are made by a participant in an environment in which requests occur, and that are achieved within a specific temporality, as ‘early’ responses to requests and even as responses ‘anticipating’ requests. Typical settings in which these actions are observed in our data are surgical operations as well as sports and games – which are activities undertaken in a context of temporal pressure – but also non urgent actions such as in commercial encounters. In all these settings, requests are often uttered (to coordinate the surgical procedure, instruct gamers, ask for a product, etc.) and formatted thanks to verbal resources as well as embodied ones. The analysis focuses on actions that could be seen as responses to requests (as second pair parts) but could also be seen – because of their early temporality – as first actions. In the latter case, these actions can be described as orienting to the same circumstances and contextual features as the request and as being produced at the “same time” as the request, resulting in the achievement of an action that is the same as the one requested. These particular cases are interesting to study because a) they address the importance of fine-grained temporality in the analysis of sequentiality (Deppermann & Günthner 2015), b) they show the consequences of the temporal organization of complex multimodal Gestalts (Mondada, 2016), c) they discuss key concepts such as ‘responsivity’ and ‘firstness’/‘secondness’, d) they consider what the participants do within a continuous stream of actions, and their orientation to previous actions and context as a source for the emergent formation of the next action.

***Reactions to the Brexit on Facebook and Twitter: A multimodal content analysis of shared images, in search of European identities*** (Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

On 23 June 2016, Britain voted to leave the European Union, which led to the greatest political crisis since World War Two, also known as the *Brexit* (White 2016). In this context, our research question is the following: After the Brexit announcement, what were the images which citizens posted on social media to share their feelings and opinions? Our corpus is based on images posted and shared in different European languages (English, French, German, Spanish and Italian). With such a multilingual corpus, we seek to identify possible differences between language-based practices, in order to analyse the different approaches to European identity, intensified in such political watershed moments.

**Methodology** We aim to analyse Flickr messages posted between 24.06.06 and 23.07.16, that contain images, gathered under the international hashtag #brexit. We decided not to use hashtags such as #UKIP or #LeaveEU, as they are mostly exclusively used in Great Britain.

Our work is a content analysis based on a grounded theory approach. We aim to classify the images into three types of categories: Firstly, we will see how our dataset responds to the claims developed during the campaign. Stevens and Banducci (in Jackson 2016 : 22) identified two claims made by the Leave and Remain camps during the campaign. "First, there were arguments that reflected fundamental values and revealed differences in visions for the UK. These were about regaining sovereignty or maintaining a shared destiny and security within Europe. A second type of claim rested on dystopian visions of remaining (unbridled immigration for the Leave side) or leaving (economic devastation by the Remain side)." Secondly, beyond the topic of the post as such, we aim to frame the dataset according to two frames that reflect the tone of the post: -

- Which performative functions are fulfilled by the post? Fact, opinion, and/or emotion? (Seo 2014) -

- Are the posts embedded in personal stories or not? (Papacharissi 2015)

Thirdly, additional categories will undoubtedly emerge from the corpus, as this study is merely exploratory for the most part. One hypothesis that we would like to verify is whether these shared images show an approach to European identity that is based on nation states, in which national points of view are up against each other, or on Europe as a collective community, beyond national stances. Multimodality is a key concept in our work (Jewitt 2014, Rose 2016) : the images will not be considered as separate entities but as part of posts, which means that the comments that accompany the images will be analysed with discourse analysis tools. Our research is qualitative and manual, without automatic image annotations.

### **Antonio Bova & Francesco Arcidiacono**

***Children's acquisition of argumentative and explanatory discourse competence:***

***Examining the contribution of family interactions at mealtime*** (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.]

Mealtime practices represent privileged moments to investigate how family members interact, since they can bring all family members together daily (Blum-Kulka, 1997; Bova & Arcidiacono, 2015; Fiese, Foley & Spagnola, 2006; Pontecorvo, Fasulo & Sterponi, 2001). This study sets out to examine the contribution of family interactions at mealtime to support children's acquisition of argumentative and explanatory discourse competence. The data corpus is composed of 48 discussions between parents and children aged 3-6 years selected from 30 video-recorded meals (constituting about twenty hours of video data) of 10 middle to upper-middle-class Swiss and Italian families. The criteria adopted in the selection of the Italian families were the following: the presence of both parents and at least two children, of whom the younger is of preschool age (3 to 6 years). All participants are Italian-speaking. The method of analysis relies on the integration of two theoretical and methodological approaches: the first one is the model of a critical discussion, derived from the pragma-dialectical perspective (van Eemeren & Grootendorst, 2004). It represents an ideal argumentative discussion against which real-life interaction can be analytically reconstructed and evaluated. The second one is the conversational and discursive approach that aims at identifying the sequential patterns of discourse produced by participants (Antaki, 1994; Edwards & Potter, 1992; Psathas, 1995; Sacks, Schegloff & Jefferson, 1974). The findings of this study indicate that discussions at mealtime appear as areas of language socialization in which children have frequent opportunities to engage in argumentative and explanatory discussions with their parents. On the one hand, the presence and involvement of children in family discussions represents a stimulus factor, inducing parents to reason with their children. For example, parents engage in argumentative discussions with

their children to teach them how to behave appropriately not only at the meal-table, but also in all situations in which children can be in contact with other people outside the family context. On the other hand, through their continuous questioning, in particular why-questions, children request their parents to explain the – often implicit – reasons on which their standpoints are based. It is a responsibility of parents to take advantage of the opportunity offered by children's questions, providing the responses, i.e., arguments and explanations, that children need. This feature is connected to the value of family discussions as spaces in which dynamics of generational positions can be developed as part of language socialization and interactional events. Further research in this direction is needed in order to better understand specific potentialities of language in the everyday process of socialization within the family context.

##### ***The politics of anti-politics: Three populist parties in the transition to mainstream politics***

(Contribution to *Personal and collective identities in populist discourse*, organized by

Levonian Raluca Mihaela [et al.]

A stance favouring “the people” against mainstream political parties has been a recurring theme in recent European politics, understood by many commentators as representing a “populist turn” (Taggart 2000). By positioning themselves discursively against the political establishment, parties situated at different points along the political spectrum have been able to capitalise on broad dissatisfaction with local, national or European politics, and attract substantial numbers of disaffected voters to their cause. However, it is clear that such a strategy is hard to maintain: as such parties gather momentum and parliamentary representation, they effectively come to form part of the establishment that they have denigrated. This paper considers three recent examples of parties that have crossed the divide into mainstream politics in the last four years: *Alternative für Deutschland (AfD)*, *UKIP*, and *Podemos*. Despite their contrasting histories and ideologies, these parties all construct politicians as at best, out of touch, at worst, traitors. *AfD* was launched in 2013 to combat “die Zwangsjacke der erstarrten und verbrauchten Altparteien” (the straitjacket of the paralysed, burnt-out old parties), but now couches its accusations in terms that are more theoretical, alluding to sinister collusion: “the inviolable sovereignty of the people has been shown to be fiction”, since power secretly lies in the hands of “a small, powerful political elite group” within the different parties. Their campaign literature attacks “Berufspolitiker” (“professional politicians”) motivated by self-interest, while claiming a special status for *AfD*'s own representatives. *Podemos* initially launched highly inflammatory attacks on Spain's established parties, which it grouped together as “la casta” (“the caste”), but stopped using this word altogether in the run up to the 2015 general election, when it was able to gain a substantial proportion of the vote. Since then, it has replaced this word with subtler allusions, as in their current slogan “nunca más un país sin su gente” (“never again a country without its people”), backed up with promises of greater grassroots democracy. *UKIP* has maintained its barrage of criticism of politicians – especially MEPs – with direct attacks delivered orally (“you’ve never done a proper job in your lives”), but has adopted a written style which favours a narrative-based approach: “the establishment parties have repeatedly and knowingly raised the expectations of the public, only to let us down, time and time again”. In all three cases, it seems that the discourses of these parties are more extreme in spoken genres than in webs or manifestos, and that their strategies for attacking established politicians become more subtle as they come closer to gaining real power.

*Variability of Russian forms of address in authentic oral speech* (Contribution to *Address Forms across Cultures: A Cross-Cultural Comparison of Address Terms in Indo-European, Uralic and Altaic Languages*, organized by Bayyurt Yasemin [et al.]

Forms of address in Russian have been studied from mainly two perspectives in previous research: (i) with regard to recent changes in the address system after the Perestroika (cf., e.g., Krouglov 1996, Krongauz 1997, 2004); (ii) concerning the inventory of nominal and pronominal address forms in Russian. The latter studies often take a contrastive perspective (cf., e.g., Afonin 2011, Berger 1995, Buchenau 1997 or Rathmayr 1992) and rely on data obtained from questionnaires, corpora of literary language or random observations. Another common feature is that they try to systematically investigate the impact of contextual factors (social distance and status of interlocutors, degree of formality of speech situation) on the distribution of forms of address in Russian. By doing so, they suggest a certain kind of sociolinguistic stability and predictability in the selection of address forms in different types of encounters. However, if these predictions are confronted with actual addressing behavior, the limited value of existing accounts gets evident. The purpose of the present paper is to shed new light on Russian addressing behavior by adopting a microanalytic perspective. Our goal is to investigate the variability in the use of nominal and pronominal forms of address in contemporary Russian. After introducing the main components of verbal address in Russian, we will use data from the “One Day of Speech Corpus” (ORD) to document and explain the variability of forms of address in authentic everyday discourse. The “One Day of Speech Corpus” contains recordings from individual speakers who were equipped with a micro digital voice recorder throughout a whole day. This offers excellent insights into the use of various forms of address by a single speaker depending on the persons addressed, but also with regard to forms of address used to address the speaker him/herself. These data attest a wide variety of address forms, among them forms that are not mentioned in existing surveys on address in Russian. Furthermore, they reveal an extremely flexible degree of combinability of nominal and pronominal address forms which allows for expressing very fine-graded shades of (temporary) social and personal relationships between interlocutors. Russian address, thus, seems to be governed much more by pragmatic considerations of speakers than is commonly assumed. They are definitely not just encodings of (presumably rather stable and predictable) social semantic properties of the interlocutors.

*Umbria: Attitudes and practices of address* (Contribution to *Address Forms across Cultures: A Cross-Cultural Comparison of Address Terms in Indo-European, Uralic and Altaic Languages*, organized by Bayyurt Yasemin [et al.]

In the diverse linguistic landscape that characterises Italy, the repertoire of a native speaker may include a local dialect, i.e. one of the many languages that developed from Latin parallel to Italian, as well as a ‘regional Italian’, i.e. a regional variety of contemporary spoken Italian (Tosi, 2001). This contribution has the main purpose of investigating a potential relationship between address practices in local dialects and address practices in regional varieties of Italian. Within a large scale research on language variation in service settings in Italy, restaurants in particular, Umbria has been selected as a case study for this purpose. The reason for this choice is the documented distribution of two distinct systems of address pronouns in the local dialects spoken in two parts

of Umbria (Moretti, 1987). In north-western dialects, three address pronouns are used: the local versions of the T pronoun 'tu' (2sg) and the local versions of the two V pronouns 'lei' (3sg) and 'voi' (2pl). In south-eastern dialects, in contrast, 'tu' is traditionally used to address any single interlocutor, without a T-V distinction in pronouns.

Do respondents in north-western Umbria report different address practices from respondents in south-eastern Umbria? If so, to what extent? This investigation addresses the questions above based on quantitative data from 84 local speakers surveyed, as well as qualitative data originating from 7 interviews and 2 focus groups conducted on site.

Results show differences in the address practices reported in the two parts of Umbria. Results also suggest that different pragmatic behaviours reported in regional varieties of Italian could be related to different address resources in local dialects. However, many more variables could be at play, including perceived social prestige. Umbrians' perceptions of dialect use show various degrees of dialect stigmatisation in the two geographical areas. This issue of prestige and stigmatization is of relevance to this study, because it can influence the way speakers report on language practices.

***Diasporic healthcare providers: An analysis of multilingual healthcare interactions in Hong Kong*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

This presentation examines the underexplored intersection of two international research agendas: the impact of globalization on healthcare, and health literacy and communication. Researchers in the fields of health, psychology and sociology have established a causal relationship between clinical communication and patient outcomes in general healthcare, both in terms of satisfaction and health status, with work also examining the relationship between real-time interactions and such outcomes (Heritage et al 2007). Research exploring diasporas has predominantly examined the issue of macro transitions and healthcare provision from the patient perspective (Crosby, 2013). Our interdisciplinary team's publicly-funded project (GRF: 760112) is examining the notion from the perspective of the clinical provider, specifically, the globally mobile clinical academic using English as the lingua franca in an Asian hospital. Recent findings on 'mediated interpreting' have indicated how the assisting para-professional, in this case a bilingual or multilingual Dental Surgery Assistant (DSA), performs the dual capabilities of clinical assistant and interpreter for expatriate clinical academic dentists in Hong Kong (Bridges et al., 2011, 2015). In this presentation, we explore the overarching question, *how do global intersections impact on the health literacy and clinical communication of multilingual communities in Asia?* We adopt a multivariate framework (Heritage et al., 2007) to examine the relationship between patient functional oral health literacy, patient satisfaction and interactional analysis from a video corpus of multilingual primary care consultations (n=120). In a sub-set of 61 recorded multilingual consultations, patients agreed to undertake additional instruments measuring oral health literacy and satisfaction. Conversation Analysis (CA) of interactional patterns supports detailed analysis of the layers of complexity involved in the management of communicative and social interactions critical to effective healthcare delivery, in the specific case of clinical dentistry.

***Pragmatic enrichment in drama*** (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.] )

The present research project is concerned with Grice's (1975) account for pragmatic meaning with considering dramatic texts as a data source. Drama is especially fit for this investigation as here, two communicative layers interact: the internal level of communication among characters (IC), and the external level of communication between the play and the audience (EC). Specifically, we hypothesize that the cooperative principle and the conversational maxims are valid in drama, but that the two levels give rise to different kinds of pragmatic enrichment that each trigger different effects. The following example shall illustrate our point:

(1) *Liebelei*, Arthur Schnitzler (Situation: The audience knows that Fritz is having an affair with the lady in the black dress)

**Christine:** Wer war denn die Dame im schwarzen Samtkleid?

*Christine: Who was the lady in the black velvet dress?*

**Fritz:** Kind, ich hab gar kein Gedächtnis für Toiletten.

*Fritz: Child, I don't have any recollection for dresses at all.*

Fritz's utterance in (1) is a violation of the maxim of relevance, as he is not directly answering Christine's question. Christine and the audience still deem Fritz to be cooperative. The implicature arises that Fritz is not familiar with the lady. However, the audience is aware that the implicature itself violates the maxim of quality: Fritz knows the lady. Here, on the external level EC, the audience is able to detect this violation and identifies Fritz as an uncooperative speaker: He intentionally wants to deceive Christine. On IC, the internal level, Christine is not aware of the violation of quality. Instead, she considers the implicature to be true. The difference between IC and EC captures that on each level, a different pragmatic enrichment takes place: While in IC, Christine draws the implicature that Fritz does not know the lady, in EC, the audience observes the false belief of Christine and the resulting deception of Fritz. On the global level of the overall dramatic text, the pragmatic enrichment in EC contributes to the meaning of the play: Here, the implicature drawn by Christine and the resulting deception of Fritz are part of the overall meaning and serve to characterize Fritz as deceptive. Furthermore, the interaction between the two layers and their respective pragmatic inferences serve to reinforce the tragedy of the play. By considering a wide variety of plays, we aim at clarifying Grice's account by including a theoretical explanation of additional pragmatic effects that come about because of the embedding of several communicative levels. We want to substantiate this theoretical investigation by differentiating between the "Common Ground" (Stalnaker 1987), the shared information state of all participants in the conversation, and "Individual Grounds," which we define as the information states of each participant. Furthermore, we seek to systematize which specific effects arise because of this embedding. Possible effects as identified in the example above serve as characterization, generic markers, or to trigger emotional effects such as tension for the audience. We will discuss whether the same effects can be observed across the board.

***Multimodal microphenomena. On the co-occurrence and synchronization between gaze events, speech and gesture*** (Contribution to *Mobile Eye-Tracking in Interaction*, organized by Stukenbrock Anja [et al.] )

Research in a variety of fields, including conversation analysis, human-computer interaction research and cognitive psychology, has focused on the role of human eye gaze behavior, both as an index of cognitive processing and as a communicative instrument in face-to-face conversation (see Van Gompel et al. 2007, Rossano 2012, Risko et al. 2016 for overviews). With the development of **mobile eye-tracking systems** (in the form of eye-tracking glasses or table-top systems), researchers can now collect fine-grained information on people's eye movements while they engage in natural action and interaction. In a series of recent studies, mobile

eye-tracking was used to investigate the distribution of visual attention of speakers and hearers in multiparty interactions (Vertegaal et al. 2001, Jokinen 2010, Holler & Kendrick 2015, authors 2016). These studies, at least in part, confirm some of the early findings based on video analysis, reported by Kendon (1967), Goodwin (1980) and Argyle & Cook (1976), while at the same time presenting more detailed temporal information on gaze patterns, based on aggregated data of multiple speakers and addressees engaged in face-to-face conversation.

This talk will continue on this novel line of investigation and explores the potential of mobile eye-tracking for research on **multimodal microphenomena**, for which highly detailed temporal information is needed. Using a multimodal video corpus which consists of two- and three-party interactions, with head-mounted scene cameras and eye-trackers tracking all participants' visual behavior simultaneously (authors 2015), we first singled out all participants' micro-gaze events, i.e. short gaze aversions or gaze shifts between interlocutors with a maximum duration of 500 ms. In a second step, we looked at which (micro)phenomena typically co-occur with these gaze events, both at the level of speech and gesture. This co-occurrence analysis yielded a range of recurrent multimodal pairings, of which the following are treated in more detail in this study:

**1. Speaker gaze behavior:**

- gaze + speech: fillers (uh, uhm)
- gaze + gesture: gestural holds

**2. Hearer gaze behavior:**

- gaze + speech: listener feedback (uhum, yeah)
- gaze + gesture: feedback (headnod, headshake)

What this set of phenomena shows, is that gaze and other (non)verbal markers build strong **multimodal pairings** that are used in the realization of specific interactional functions, even within a minimal time-frame. This time-frame was explored in more detail in a third step, in which we measured the temporal synchronization between eye gaze and speech/gesture in the above-mentioned phenomena, using the technique of **cross-recurrence quantification analysis**. This analysis, based on a comparison of recurrent patterns in two time series, set off against a baseline, reveals a minimal time-lag between the onset of the gaze event and the co-occurring phenomena. This provides additional evidence for a tight coordination of multiple communicative resources in spontaneous social interaction.

***“Doing deference” through nonverbal behavior in Korean*** (Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

Doing deference, defined as “submitting to or showing regard to a superior” (Haugh, Chang, and Kadar 2015), is a pervasive relational practice in Korea. Korean indexes deference through an honorific speech register: *contaymal*. Recent studies show that deference is also indexed through voice quality, since *contaymal* speech is slower, lower-pitched and breathier (Winter and Grawunder 2012). However, the role of nonverbal behavior in

the expression of deference has not been studied until now. The current paper examines how Korean speakers use nonverbal behavior to do deference by examining both clips from Korean televised dramas, and video recordings of natural interactions. The position of the body and head, as well as bodily orientation, were the most common nonverbal indices of doing deference. The subordinate typically oriented their body towards the status superior and maintained eye contact on them, whereas the status superior oriented their body slightly away from the subordinate and withheld eye contact. This finding mirrors Burgoon and Saine's (1978: 181) observation that being faced by other interlocutors while withholding eye contact is a marker of power. However, it complicates the assumption that eye contact indexes a lack of respect in East Asian cultures. Consistent with previous studies on non-manual gestures in Japanese sign language (George 2011), we found that a lowered and forward leaning chin and head position was associated with deference, whereas status superiors used a heightened chin and head position as a sign of power. The analysis showed that manual gestures, self-touching and physical contact are indices of casual/informal behavior, which are therefore not used when doing deference. Superiors initiated these forms of behavior, but they were not reciprocated by the subordinates. The absence of these gestures confirms to Winter and Grawunder's (2012) observation that deferential speech is acoustically more restrained and less animated. Thus, words, acoustics and gestures work together in "doing deference."

***"Don't talk out loud, you lower the IQ of the whole street": Representation of impoliteness strategies in Sherlock across AVT modes and languages*** (Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

As is widely recognized, the language of television is a relevant area for investigation for a plurality of reasons: TV series in particular, be they dramatic or comic, have gained in popularity all over the world, as the phenomenon of fandom clearly testifies (cf. blogs, fanfiction, etc.), and have developed their own narrative strategies and conversational features, which have often become so popular and well spread that some set phrases have promptly been adopted in spontaneous speech too (Richardson 2010). Quite often these products are viewed and enjoyed by a wide if not global audience in translation, mainly as dubbed or subtitled products, whose challenging aim is that of mediating a representation of a lingua-cultural scenario from a source to a target-domain by replacing the spoken dialogues. In this contribution, we will investigate into the representation and mediation of impoliteness strategies in the British drama series *Sherlock* (Hartwood Films, BBC Wales, WGBH, 2010 - in production). This series boasts a huge international fandom, not only due to the interest of spectators in the narrative and the cast, but also for its remarkable qualities, i.e. setting Holmes and Watson's adventures in present-day London and adopting contemporary English preserving at the same time some typical landmarks of the Conan Doyle saga, most notably a plotline which abounds in twists and turns. In addition, as happens for other TV dramedies (e.g. *House*), *Sherlock* "represents a return to the hero-based format" (cf. Richardson 2010: 171). The fact that Sherlock behaves oddly, shows very little emotion - when dealing with murders -, ignores social conventions and even labels himself as a "high-functioning sociopath" directly impinges on his idiolect (Porter 2012, Stein and Busse 2012). He often results abrasive or sarcastic so much so that he can be defined as a good provider of impoliteness events (on impolite characters in TV series cf. Richardson 2010 and Mandala 2012). After highlighting the narrative function and stylized effect of impoliteness strategies at work (Culpeper 1996, 2005, 2011; Culpeper, Bousfield and Wichmann 2003; Leech 2014) in Sherlock's speech, the paper will scrutinize linguistic and cultural (a)synchrony between the English source and various target texts (Guillot 2016), i.e. the Italian dubbed version, the Italian subtitles and a selection of subtitles in different languages, in relation to impoliteness dynamics (Bruti 2009a, 2009b, Gartzonika and Șerban 2009, Pinto 2010). The research avails itself of a corpus of the scripted dialogues (original and dubbed) and of subtitles in different languages, which will be analyzed through a corpus-linguistic methodology, relying on different software, i.e. W-Matrix and AntConc. In particular, the construction of the character of Sherlock will be compared in the different modes and languages by means of both qualitative and quantitative analysis (see Bednarek 2010, 2012; Mahlberg 2013; McIntyre 2012). We will thus evaluate whether the visual cues, which remain inevitably the same in mediated texts, are compatible and coherent with the aural code, verbal and non-verbal (e.g. prosody and voice qualities), in the target texts.

***Change in psychotherapy needs dyadic states of consciousness (DSC)*** (Contribution to *The Pragmatics of Change in Therapy and Related Formats*, organized by Graf Eva-Maria [et al.] )

The DSC-hypothesis was developed for the details of proto-conversation between mother-infant interaction by Ed Tronick (Boston) before infants speak. Infant observation showed that there is a coupling needed between baby and caregiver so that the insufficient problem solving capacities of the baby can be enriched by another consciousness offering more complexity in problem solving capacity. However, this must happen in a way not to endanger the infant's self coherence. Thus, a balance between coherence and complexity enrichment is to be handled by both participants. Tronick's hypotheses includes that the same "dyadic state of consciousness" is to be achieved in psychotherapy sessions between adult persons. However, this hypothesis was never documented via transcribed sessions nor tested in experimental designs. Clinical intuition of many psychotherapist leads to the assumption that Tronick's general idea can be extended to therapeutic conversations between adult participants. To achieve a state of DSC is a singular experience for most patients. This can be documented in transcripts if one uses Tronick's concept in a combination with Tomasello's concept of "joined attention" and linguistic concepts of "common ground". It can be shown how the achievement of mutually recognized states of joined attention contribute to the establishment of a common ground. Entire "technical" procedures of psychotherapy can be applied in a meaningful way only if these important precursors of establishing "contact" are considered as consistent and mutually confirmed by participants. Testing technical operations in psychotherapy process designs without this important precursors of establishing a dyadic state of consciousness should be reflected in process research, then. Analyses of transcripts taken from the Berlin CEMPP-Project conducted at IPU, Berlin, form the empirical base analyzed by conversation analysis.

***Diabetes and (multilingual) communication: Towards a difficult liaison*** (Contribution to

*Increasing mobility in health care and challenges to multilingual health care communication, organized by Hohenstein Christiane [et al.]*

In this paper I would like to explore the communicative challenges of so called “diabetes education” encounters. A rough review of research shows that successful communication plays a very important role with respect to the patients’ adherence. Nevertheless conceiving and performing a communication of ‘empowerment’ (Rappaport 1987) seems to be rather delicate. The focus of my analyses will encompass the way in which recommendations and requirements which are addressed to the patients are communicated. Within a detailed analysis (in terms of the framework of ‘functional pragmatics’ cf. e.g. Rehbein 2001, Redder 2008) the effects of the different medical doctors’ verbal communication will be reconstructed. The data stem from monolingual and multilingual audiotaped situations. A part of them belongs to the corpus *Interpreting in hospitals* ([https://www.corpora.uni-hamburg.de/sfb538/de\\_k2\\_dik.html](https://www.corpora.uni-hamburg.de/sfb538/de_k2_dik.html), cf. Bührig et alii 2012) which includes doctor-patient interaction where so called ‘ad hoc-interpreters’ are involved.

***Calling Mr Speaker Mr Speaker: The strategic use of references to the Speaker of the House of Commons*** (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

Prime Minister’s Questions (PMQs) is the central British parliamentary institution and its highest profile parliamentary event. Every week in the House of Commons, Members of Parliament (MPs) have the opportunity for half an hour to pose questions to the Prime Minister (PM) on any topic of their choice, frequently utilizing quotations from various sources, e.g. allies from the quoter’s political party, political opponents, experts, or ordinary people. The Speaker presides over the House’s debates, determining which members may speak, and is also responsible for maintaining order during debate. There are a number of ritualistic conventions governing the discourse of PMQs. In particular, MPs must address their remarks to the Speaker of the House rather than directly to the PM. MPs must also refer to other MPs in the third person (rather than as “you”), and may use formal and honorific titles, such as the Right Honourable Gentleman, or the Foreign Secretary. These conventions are enforced by the Speaker, who may suspend a Member from sitting in the House (referred to as “naming”). So, for example, a left wing Labour MP (Dennis Skinner) was suspended for a day (11 April, 2016) from the House of Commons for persistently referring to David Cameron not as Prime Minister but as “Dodgy Dave“, in relation to a controversy over Cameron’s personal tax affairs. This paper examines interactional rituals in PMQs, utilising illustrative examples of third party language, especially forms of address and references to the Speaker. So, for example, David Cameron when Leader of the Opposition (LO) launched this wholesale attack on former Labour PM Gordon Brown (Bull & Wells, 2012):

Mr Speaker, for 10 years the PM plotted and schemed to have this job—and for what? No conviction, just calculation; no vision, just a vacuum. Last week he lost his political authority, and this week he is losing his moral authority. How long are we going to have to wait before the past makes way for the future?

If Cameron’s comments had been addressed more directly to the PM (e.g., *you* have plotted and schemed to have this job .....*you* have lost *your* political authority, and this week *you* are losing *your* moral authority”), it would make the attack much more personal, and would be regarded as beyond the bounds of acceptable parliamentary language. Certainly, Cameron would have been corrected for not addressing his remarks to the Speaker. In this paper, our illustrative examples will show that the inherent formality of third person language occurs primarily in loaded contexts coloured by a high degree of controversy. In other situational contexts, such

practices might suggest a high degree of formality and deference; however, in PMQ discourse they are often combined with intentional face-threatening acts (FTAs). In the context of PMQs, they arguably serve to mitigate FTAs. Thereby, they keep the discourse within the bounds of acceptable parliamentary language (Harris, 2001; Bull & Wells, 2012), and help to avoid mud-slinging, name calling, and personal abuse.

***Embodied socialization in preschool: Preparation for a graduation ceremony in a Japanese as a heritage language classroom*** (Contribution to *Touch in Social Interaction: Integrating Haptics into Embodied Interaction Research*, organized by Cekaite Asta [et al.]

Schools are central sites for socializing children's bodies. As the sociologist Chris Shilling (2003 [1993]) has observed, "schools are not just places which educate the minds of children, they are also implicated in monitoring and shaping the bodies of young people" (p. 19). From mundane actions such as raising a hand before speaking and standing in line to formal actions such as participating in school ceremonies, children acquire various 'techniques of the body' (Mauss, 1973 [1936]), that is, the ability to use their bodies in culturally specific ways as part of their 'habitus' (i.e. set of dispositions for acting and being in the social world) (Bourdieu, 1991).

This paper explores embodied socialization in a Japanese as a heritage language preschool classroom in the United States. The analysis is based on audio-visual recordings made during three months of ethnographic and linguistic research in this classroom. While previous research on Japanese preschools has shown how children's bodies are operated upon and socialized within a range of everyday activities (e.g., Ben-Ari, 1997; Burke & Duncan, 2015; Hayashi & Tobin, 2014), this research primarily examines more 'everyday rituals' (Enfield, 2009), such as co-sleeping, bathing, mealtime, and play. This paper, in contrast, considers a more 'formal ritual,' which occurs only once during the academic year but is nevertheless a powerful site of socialization. This ritual is a graduation ceremony in which children will receive a certificate one-at-a-time from the school principal on the auditorium stage. The ritual entails the performance of a fixed series of embodied moves involving gaze, posture, hand and foot work, bowing, and handling of the certificate. The analysis focuses on the rehearsal in the classroom on how to receive this certificate from the school principal. It shows how teachers use touch and guided manipulation of children's body parts in instructing and correcting their bodily moves and bodily orientation at various points during the rehearsal. The paper also considers how touch and guided manipulation socialize children to deeper socio-cultural meanings of their heritage culture, especially to pay attention to the details of (embodied) form.

### Marcel Burger

***When world leaders react to terrorist attacks: A multimodal analysis of discursive affectivization in statements addressing multiple audiences.*** (Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

In the wake of the Charlie Hebdo attacks, there was a strong political reaction from around the world in a symbolic act of "joining together in condemnation of the terror attacks on Charlie Hebdo in Paris" (<http://www.telegraph.co.uk/>). As that case showed terrorist attacks constitute a particular type of tragic event which not only leads to a critical situation, but also puts the political and public sphere into global crisis. In these specific contexts, it is the role of world leaders to react quickly by the means of public statements that are multi-functional and multi-faceted in terms of the emotions and affect encoded as they address multiple audiences.

So far there has been increased scholarly attention to reactions on social media and less so to reactive discourses of politicians themselves. This paper examines the statements of politicians from around the world immediately after the terrorist attack in Nice on 14th July 2016, that killed 84 people attending the French National Day. It looks at the co-patterings of verbal and non-verbal affect cues deployed in front of cameras and relayed by written statements e.g. on Twitter in an attempt to convey a balanced stance of empathy, compassion and resilience.

The paper first theoretically anchors the political statements into the domain of public communication and social media which implies conventional modes and genres of discourse and conventional modes of staging the body language of the politicians and the overall setting (Burger 2013). It is suggested that the frame of public communication in a digital era favors specific emotions to be displayed. They have to match with the expectations of news media and at the same time align on sharing practices (e.g. Androutsopoulos 2014) and modes of affectivization (e.g. Giaxoglou 2015) proper to digital communication and social media (Papacharissi 2015). The analysis presented focuses on the statement made by the French president François Hollande right after the attack and on the reactions that followed immediately by Barack Obama, Angela Merkel, David Cameron, Boris Johnson between 14th and 15th July 2016 via their government's official media and on Twitter. A multi-method approach is used combining argumentation & mediated discourse analysis (Burger & Delaloye 2016; Jones 2015), multimodality (Jewitt 2017) and small stories narrativity in digital communication (Georgakopoulou & Spilioti 2016). The close examination of Hollande's multi-faceted statement and comparative considerations of the data set show emerging common properties of a public statement "in the critical context of a terror attack" beyond stylistic singularities. The research in progress could therefore lead to question these political statements as part of a new communicative practice based on the link between politics, the news media and social media.

***Laughing about food in CASE – "Little green round ones" and other delicate topics***

*(Contribution to Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German, organized by Szatrowski Polly [et al.]*)

This paper investigates laughter in the context of Skype conversations about food in the Corpus of Academic Spoken English (CASE, forthcoming), compiled at Saarland University, Germany. CASE consists of conversations between English as a Lingua Franca (ELF) speaking students from Europe and the US. For the purpose of this study, we analyse instances in the transcript where participants discuss food with their conversation partners. These instances include explanations of culture-specific dishes, the discussion of culinary stereotypes, food preparation methods, and evaluative comments, for example about the consumption or the quality of food. The conversations occur in the absence of the food item in question, and without a shared sensory experience.

CASE conversations about food contain a statistically significant amount of laughter, when compared with conversations concerning other topics. As laughter fulfils various functions in the conversations and is an essential element of meaning construction, its frequent occurrence in food discourse will contribute to meaning-making. Laughter is not only motivated by humorous contexts, but is also used to reduce situational awkwardness (cf. Chafe 2007) and create rapport (Schmidt 2015). Its functions can roughly be grouped into three main domains: metalinguistic, evaluative, and joking (Stewart 1997). Laughter often creates ambiguity, as it allows for a possibly non-serious interpretation of the interaction by interlocutors without having to affirm their stance (Brunner et al. forthcoming). Delicate situations can thereby be mitigated and diffused and harmony established. This relates to the social, interactional effect of laughter (cf. Gervais and Wilson 2005, Warner-Garcia 2014). In CASE, we differentiate between nine easily retrievable types of laughter. The taxonomy used for the transcription of laughter in CASE merely describes the laughter form, but leaves the analysis of its function to the researcher's interpretation (Schmidt et al. 2014, Schmidt 2015, Brunner et al. forthcoming). Results suggest that laughter often occurs not directly in relation to food itself. Conversations about food often contain cultural expectations and stereotypes. The unacquainted speakers mix descriptive and evaluative speech and are prone to develop diverging stances (Du Bois 2007). In a corpus such as CASE, where there are many non-native English speakers, subjective views on food and culture and uncertainty about (English) food terminology (Brunner et al. 2014) create possibly delicate situations which draw, among other things, on laughter to reframe situations as non-serious or unproblematic. The positive effect on the communicative setting is visible in the creation of rapport between individuals and their increasing ability to understand each other's culture. Laughter within food discourse therefore rather reflects the necessity to continually reframe and reinterpret situations.

***We laughed, we smiled: A microethnographic examination of smiling and laughter in first-time interactions between L1 and L2 speakers of Japanese*** (Contribution to *The Pragmatics of "Bonding" in Cross-Cultural Encounters: East Asian Perspectives*, organized by Ide Risako [et al.])

The purpose of this research is to examine the function of smiling and laughter in the moment to moment construction and management of rapport in first-time interactions between first and second language speakers of Japanese (JL1 and JL2 below). The data comes from a corpus of video recordings of dyadic interactions between JL1 and JL2 participants who are interacting for the first time in order to discuss a number of topics written on strips of paper. Using a microethnographic methodology, which draws primarily upon conversation analysis and context analysis (LeBaron, 2008), we describe the concrete ways in which the participants deploy smiling and laughter during their interaction, and how such actions work to facilitate and modulate their interactional space. In particular, we focus on moments when the participants engage in joint decision making in regard to a next course of action, and on post sequential expansions, where the participants momentarily depart from the task-at-hand to engage in interactional work with the ostensible focus of building rapport. During joint decision making, the smiling and laughter was observed during what we have named "water testing," and during the "proposal" (Stevanovic, 2012) stage of decision-making sequences. It is suggested that such laughter may serve to display amicability, and to construct a proposal as being naughty, among other things. In post sequences, smiling and laughter are shown to be part of a set of resources used to reframe the interaction as "rapport-relevant" (see Bushnell, 2009 on laughter in reframing a task as play). In this capacity, laughter may be used to modulate delicate moments during which the participants negotiate the revelation of personal information. The findings of the analysis are considered in light of how they may contribute to our understandings of L2 smiling and laughter as an interactional competence (see Bushnell, 2014, forthcoming).

## Lieven Buysse

**'It was a bit stressy as well actually'. The pragmatic markers "actually" and "in fact" in learner English** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

The adverbials *actually* and *in fact* have been described as markers of unexpectedness (Oh, 2000), fulfilling a range of pragmatic functions, most of which can be described as adversative and elaborative (Aijmer, 2013). The differences between the two appear to be extremely subtle: *actually* expresses a denial of expectation more often than *in fact*, which in its turn rather strengthens an expectation (Oh, 2000); *actually* is more common in spoken English than *in fact* (Oh, 2000; Aijmer, 2013); and the function of *actually* is strongly determined by its position in the clause, which can be initial, medial or final (Oh, 2000; Clift, 2001; Taglicht, 2001; Aijmer, 2002, 2013; Defour *et al.*, 2010). Although they have not examined English equivalents in their study, Mortier and Degand (2009) show that Dutch and French have markers that occur with similarly high frequencies in these languages as *actually* and *in fact* in English and that perform similar functions, most notably Dutch *eigenlijk* (and to a lesser extent *in feite*) and French *en fait*. This begs the question whether native speakers of Dutch and French make use of *actually* and *in fact* in learner English, and if so to what extent and to what end. Apart from a rare exception (Cheng and Warren, 2001) these markers have so far not been in focus in the study of pragmatic markers in EFL discourse at all, let alone in that of learners with Dutch or French L1. This investigation will, therefore, analyse the Dutch and French components of the Louvain International Database of Spoken English Interlanguage (LINDSEI; Gilquin *et al.*, 2010). Each sub-corpus consists of 50 informal interviews with second- or third-year university students majoring in English. These two learner sub-corpora will also be juxtaposed with a native speaker reference corpus (the Louvain Corpus of Native English Conversation, LOCNEC), which was compiled along the same format as the learner data. A preliminary quantitative analysis has brought to light that (i) the Dutch learners use *actually* considerably more often than the native speakers whereas the French learners do so significantly less often; (ii) the French learners use *in fact* to almost the same extent as the Dutch use *actually*, which sets them off from the Dutch learners and the native speakers, who hardly make use of it. A more in-depth qualitative analysis will map the functional scope of both pragmatic markers in the learner and native discourse, comparing the learners' use of *actually* and *in fact* with native practice as well as with functions attributed to their equivalents in Dutch and French. As such this study will help build a completer picture of the pragmatic language behaviour of learners, which can inform pedagogic tools aimed at improving the pragmatic skills of EFL learners.

***Mitigating/appraising mechanisms in Spanish. Inventory of forms and prosodic description in a corpus of conversations and interviews*** (Contribution to *The Interrelation between Evidentiality, Mitigation and Appraisal across Genres*, organized by Figueras Bates Carolina [et al.]

The present contribution aims to delve into the interface between mitigation and appraisal in Spanish, especially from a prosodic perspective. To do so, a cross-generic corpus study has been carried out, considering two oral genres, namely free-wheeling conversation and interviews. The corpus considered consists of three main sources: the Val.Es-Co. oral corpus (Briz et al. 2002; Cabedo and Pons online), containing spontaneous, non-directed conversations; the PRESEEA corpus, containing (sociolectal) interviews, and a self-compiled corpus consisting of ten episodes of the reality TV show *Gandía Shore*, containing both fragments of conversation and interview. A two-stage filter has been applied to the corpora mentioned above. Firstly, those sequences were isolated in which appraisal of any kind was detected. Second, the fragments obtained in the first stage were searched for in order to find those where mitigation occurred, be it mitigation aimed to protect the speaker's self-image or to prevent a potential harm to the conversationalist's. After this process, a set of elements have been identified that function as mitigating and appraising (M/A) devices. The set of evidential mechanisms obtained have been analysed A. Cross-generically, in order to find different distribution/behaviour/inventory of forms in conversations vs. Interviews, and B. Prosodically, in search of any prosodic patterns distinguishing M/A functions from other instances of the same linguistic form where this meaning triad does not apply. The preliminary results point to A. An uneven distribution of mechanisms in both genres, in terms of frequency; also a specialisation of their functions is observed, being self-protecting functions more frequently found in interviews and preventing functions, in conversations. B. A separate prosodic behaviour of the M/A devices, that appear frequently accompanied by a marked prosody

***Narratives of inequality: Felicity conditions and the telling of violence, exclusion and stigma in contemporary Brazilian contexts*** (Contribution to *Some Are More Equal: Constitutive and Regulative Rules in Pragmatics Revisited*, organized by Bhaya Nair Rukmini [et al.]

In this paper, we look at narrative performances in different contemporary sites of inequality, considering connections between higher order social structures and the interactional moment. Inspired by Goffman's (1983) understanding of felicity conditions, we will focus on the introduction of topics in communicative action, and on the relationship between narrators and listeners, and on how these relations are displayed and made relevant in actual talk. According to Goffman (1983), "the felicity condition behind all other felicity conditions" would be "our sense of what it is to be sane", or, as he puts it in other moments of the text, our sense of not sounding strange. Pragmatic analysis, therefore, has to deal with the description of "how we are obliged to display that we are sane during spoken interactions, whether through the management of our own words or the display of our understanding of the words of others". Along these lines, we revisit several analysis of narrative performances developed within our research group (in a social-interactional approach to discourse), including narratives enacted by women victims of violence in police stations; by poor and stigmatized patients in medical consultations; by young political activists in urban occupations; by adolescents in popular social projects; by prisoners convicted of drug trafficking; as well as by socially stigmatized individuals in different research interviews. These analysis of narrative performances (Mishler, 1986; Bauman and Briggs, 1990), now following Goffman's pragmatic path, concentrate in issues of topicality, location in the discursive sequence, and, above all, the hierarchy of participants and their acquaintance status (intimate, acquainted, strangers). Relying on data from such different contexts (of violence), and with such different participants (in different positions in the social hierarchy), it is possible to observe how fluid and situated (locally and socially) can our understanding of the other be. Rules concerning felicity conditions will then have to consider that certain topics can be forbidden in certain moments of the conversation, but can be introduced in others; shifts in frames and power relations occur during some interactions, but not in others. This kind of analysis offers us the opportunity to understand more profoundly the complexities involved in talk about violence (in interviews) or talk in violent settings (in police stations, poor communities, prisons), as well as to understand how we "render our behavior understandably relevant to what the other can come to perceive is going on" (Goffman, 1983, p.192).

***Prosody and evidentiality: About how some intonational features pertain the roots of discourse in the Spanish of Buenos Aires*** (Contribution to *About subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.]

From a dialogical perspective of polyphony and argumentation –Enfoque dialógico de la argumentación y la polifonía enunciativa (EDAPE)-, evidentiality is defined as the staging of viewpoints that orient interpreters towards the appreciation and consideration of the discursive frame which triggers off the act of enunciation (García Negroni, 2016a y b; García Negroni y Libenson, 2016). Such discursive frame unveils the locutor's stance and boosts the interlocutor's interpretation. Based on a corpus of formal previously planned speech, read-aloud discourse and colloquial spontaneous Buenos Aires Spanish, the present study focuses on the prosodic marking of evidentiality. We will first briefly show the intonational behaviour of utterances in which evidentiality is structurally or lexically marked. Then, we will focus our attention on the quotative role of the *circumflex* pitch contour and the dialogical behaviour of *marked prominence* in order to explore the *evidential* function they serve. We propose that the *circumflex* tone as well as the allotment of *marked prominence* pertain *evidential* meanings that are compatible with the discursive frame: <they say x, however, neg-x>. We posit that intonational features may themselves unveil *self's* argumentative stance and the polyphonic bearing of its utterances as they simultaneously stimulate *other's* interpretation. In fact, through the study of phonological marks, we seek to demonstrate that, contrary to traditional definitions, which relate evidentiality to the way speakers have acquired the knowledge they enunciate, *evidentials* should be seen as discursive marks that reactivate the hearer's knowledge, without which, interpretation would be unviable or at least incomplete.

### **John Campbell-Larsen**

***Teaching fluency: Discourse markers, general extenders and reported speech as key L2 targets*** (Contribution to *Teaching Formulaic Language to L2 Learners*, organized by Bladas Marti Oscar [et al.]

The importance of formulaic language in the L2 classroom is becoming increasingly reflected in teaching and learning materials (Meunier 2012). But not all formulaic constructions are equally useful for learners to incorporate into their active speaking skills. Colorful idioms and proverbs, whilst often interesting or culturally insightful are not central to sounding or, more importantly, interacting like a native speaker. Rather, it is common formulaic utterances such as discourse markers, (e.g. *I mean, you know*) vague expressions and general extenders (e.g. *something like that, and stuff*) and reported speech structures (e.g. *I said to him I said, I was like*) that are key indicators of fluency. (See McCarthy, 2010, McCarthy 1998, Hasselgreen, 2005, Overstreet, 1999, Channell, 1994). However, discourse markers often seem to lie below speaker's cognitive horizon, disattended to by transcribers (Lindsay & O'Connell, 1995), or judged negatively (Schiffrin, 1988, Watts, 1989). Similarly, reported speech is often taught from the perspective of backshifting of tenses (Campbell-Larsen 2015) with formulaic reporting structures often neglected in the classroom (McCarthy, 1998). Likewise, vague expressions and general extenders (Overstreet 1999) are poorly represented in most course books where information gap type exercises and may "stifle the cognitive and linguistic development which is facilitated by a more creative open-ended approach to language learning." (Evison, McCarthy & O'Keeffe, 2007, p.154). This presentation will report action research carried out by the author in university EFL classes in Japan to answer the questions "What do we need to teach?" and "How can we teach it?" Analysis of transcripts of student talk prior to instruction showed a lack of formulaic language, especially common discourse markers such as 'well', 'you know' and 'I mean'. In addition, learners often used Japanese language discourse markers such as 'eto' and also used Japanese language chunks in self-repair sequences. In subsequent lessons the interactional architecture of the classroom was reconfigured from an institutional space to a social space where students were given ample opportunity to interact with one another in English. Specific focus was given in instructional sections of the lessons to discourse markers, vague language, general extenders and reported speech. At the end of the semester, after extensive teaching and practice of these items, with constant monitoring of student conversations and real-time interventions by the teacher to prompt usage, conversations were recorded, transcribed and analyzed. This analysis revealed multiple instances of formulaic language use by learners, especially discourse markers and general extenders, uttered as hearable chunks in a way which was similar to native speaker usage in terms of speed and placement. The use of L1 formulaic utterances was much reduced. The presenter will illustrate the analysis with before and after video of classroom interactions showing the changes in students' spoken output. The presenter will conclude by suggesting that formulaic speech can be teachable and can have a

large impact on the interactional abilities of students, helping them to transition from language students to language users.

***Right-wing populism and women: A comparative discursive analysis of collective identity construction*** (Contribution to *Personal and collective identities in populist discourse*, organized by Levonian Raluca Mihaela [et al.]])

In recent years, an increasing number of scholars of right-wing populist (RWP) discourse have recognized RWP as a burgeoning discursive ‘type’ in the global political-public sphere, seeking to identify the exclusionary, xenophobic, and nationalistic tropes that have come to be associated with various RWP politicians and political parties (van Leeuwen & Wodak 2014, Wodak 2015, Bolonyai & Campolong forthcoming). However, relatively few have addressed the issue of gender within the current global upsurge of RWP influence. This paper aims to provide a comparative discursive analysis of the representation of women in two recent and influential RWP contexts, each led by an authoritative male figure: 1) Viktor Orbán, the Prime Minister of Hungary and leader of the RWP FIDESZ party, along with other right-wing politicians within the ruling government, and 2) Donald Trump, the United States Republican presidential nominee, and Trumpian-Republican politicians influential in support of his RWP platform and campaign.

Our data comprises recent political speeches, parliamentary debates, campaign events, and other official political avenues that address gender or the representation of women. Our goal is to elucidate the discursive-pragmatic means by which these RWP actors draw upon and enmesh discourses of morality, patriotism, feminism/liberalism, and proper motherhood (often rationalized through economic or legal terms) to solidify hierarchical, asymmetrical power relations between men and women. RWP representations of the ‘ideal woman’ are enforced through epistemic modalities (women ‘should/must’ act a certain way), prepositional or adverbial chrono-spatializations (glorifying prior eras or locating women in gendered spaces), implicature, and other pragmatic features in the discursive construction of an imagined identity for women. In the Hungarian context, the role of women is often essentialized through patriarchal ideals of child-bearing, (im)morality, and blame/shame (cf. Annus 2014). In the American context, accusations of abuse against women are readily met with strategies reminiscent of discursive work on RWP racism, including the outright denial of sexism or sexual abuse, followed by its trivialization, the reversal of victimhood, and the invalidation of women through delegitimation strategies. These transnational contexts provide discursive representations of women that are slightly variant yet compatible, further justifying the notion of a global RWP discourse.

***Les tensions présuppositionnelles comme élément du processus de formation des identités***

***dans les interactions orales conflictuelles*** (Contribution to *About subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.]])

Dans ce travail à visée aussi bien descriptive que théorique, nous nous proposons de mettre au jour le rôle d'un phénomène sémantique, la « tension », dans la formation d'identités au cours de délibérations. Le corpus est constitué d'enregistrements d'assemblées de la commune de Marinaleda (Espagne), du mouvement contestataire français « Nuit debout » et du Nouveau Parti Anticapitaliste. Notre approche se concentrera sur les éléments d'ordre sémantique qui participent à la construction des identités dans l'interaction, éléments bien souvent laissés de côté dans les analyses de ce type de corpus. Cet aspect du problème sera traité en convoquant et en enrichissant les outils développés par Lescano dans son analyse des controverses sociales<sup>1</sup>. Nous reprendrons en particulier sa conception du conflit comme structuré par un espace sémantique en constante évolution, composé essentiellement de schémas de production de discours (des « concepts »), et qui constitue le terrain des opérations effectuées par les discours. L'adaptation de cette hypothèse au cas des délibérations nous permettra de mettre en évidence certaines particularités du processus de formation des identités individuelles et collectives des interactions orales conflictuelles étudiées. Dans une délibération, chaque intervention participe à la construction des identités en même temps qu'elle modifie l'ensemble de l'espace sémantique en opérant sur des concepts. Nous nous intéresserons aux cas de mise en tension de ces concepts. La tension est une relation entre des concepts (ou ensembles de concepts) qui fait obstacle à la défense ou au combat simultanés des membres de la relation, et qui est spécifique à une (ou des) phase(s) particulière(s) d'un espace sémantique donné. Notre corpus nous permettra d'étudier ce phénomène propre aux processus de création des identités dans des interactions conflictuelles. Nous caractériserons la tension *présuppositionnelle* en distinguant les tensions *modérées*, opérées par des présupposés incompatibles, des tensions *fortes*, déterminées par des présupposés contraires ou antonymes.

***Stance in asynchronous discussion forums*** (Contribution to *Stance-taking in educational contexts*, organized by O'Boyle Aisling [et al.]])

Stance is regarded as a key element in the construction of argumentation and effective communication in educational contexts. Previous research into stance features has been mostly limited to published academic writing and students' essays (Hyland & Guinda, 2012). There has been an increasing interest in stance-taking in spoken academic discourse (e.g. Fung & Carter, 2007; O'Boyle, 2014). However, little attention has been paid to hybrid genres (Egbert, Biber, & Davies, 2015) which can be considered as a bridge between written and spoken discourse. In higher education, online discussion forums, which can be regarded as a hybrid genre, provide a platform for asynchronous communication, and they have been used for assessment purposes since 1990s. This study aims to investigate stance-taking in MA students' posts in the discussion forums and compares L1 English and L2 English MA students' use of stance features on Blackboard. In their posts on discussion forums, MA students, who study educational technology at a UK university, are expected to engage with the topic, critically evaluate the previous literature on the topic and discuss the issues with their peers. This study focused on the first personal singular pronoun *I*, clusters of *I*, and stance verbs + *that/to*-clauses (Biber, 2006). The preliminary results indicate that L2 English MA students used stance verbs that convey attitudes and desires more frequently than L1 English MA students. The features of both L1 and L2 students' stance-taking in discussion forum posts will be discussed, and implications for English for academic purposes training will be provided.

***From image to word: The transcendent abjection of the Zombie or how the Zombie metaphor entered the lexicon.*** (Contribution to *Going viral: The socio-pragmatics of iconic communication in a shared world*, organized by Cantero-Exojo Monica [et al.]

In his book *In the Dust of This Planet* (2011), Eugene Thacker states that “the genre of supernatural horror is a privileged site in which this paradoxical thought of the unthinkable takes place. What an earlier era would have described through the language of darkness mysticism or negative theology, our contemporary era thinks of in terms of supernatural horror” (10). With the ability to operate at the level of the abjection, and subvert the category of what it is considered conventional, horror narratives allow the unknown to challenge normativity. Moreover, filmic horror narratives encapsulate the visual construction of fear and its mirroring effect in the audience’s emotional response (Carroll 1990). It is within this realm of the horrific imaginary that society thinks about unrelenting issues that need to be answered by unearthing them and placing them into reality through cultural categories.

Drawing from the works on Conceptual Metaphor Theory (CMT) (Lakoff and Johnson, 1980) and conceptual metaphors in filmic discourse (Fahlenbrach, 2016; Eggerstson & Forceville 2009; Forceville 2006; Coëgnarts and Kravanja, 2012; Carroll 1990) this presentation explores narratives that construct the disintegration of human identity by using the zombie figure as a catalyst for the metaphor. Thus, the zombie is studied as a source domain for human’s fears over societal changes and challenges. I argue that the zombie character is an image that triggers a structural-conceptual metaphor for society’s fear of extinction as a modern and shared human emotion. Hence, the zombie metaphor articulates metaphorical expressions of HUMAN IS SUBHUMAN. Since its earlier filmic inception in *White Zombie* (Halperin, 1932) to mainstream films like *Night of the Living Dead* (Romero, 1968) and recent TV shows, *The Walking Dead* (AMC 2010-2017), and through different geographies, the abstract concept of the undead has been widely understood and gone viral by evolving and adapting itself to society’s crises and being widely used as a popular culture icon that embodies humanity’s worst fears: dying, human identity, corporal violation, biological and chemical disease, capitalism, wars, hunger, etc. on the basis of the abject. As a result, this metaphor given shape originally in the visual discourse of film, and later comics and video games, has transcended the visual to enter the lexicon as a source of evidence of how this visual metaphorical thinking has replicated itself as a “unit of cultural transmission” (Dawkins, 1976) and it is relevant in processing language structures that embody a given meaning (zombie economy, zombie-like, zombification, zombie bank, zombie bank accounts, etc.) understood and evaluated in terms of threat and repulsion.

***‘A September morning’: Are forced construals governed by constitutive rules?***

(Contribution to *Some Are More Equal: Constitutive and Regulative Rules in Pragmatics Revisited*, organized by Bhaya Nair Rukmini [et al.]

Constitutive rules are classically understood to define how certain communicative acts are to be counted. Thus, giving a hug shows affection, smiling can show friendliness, paying attention counts as respect, etc. In verbal communication, they prescribe ways in which speech acts are interpreted as felicitous or infelicitous. For example, a promise that follows the rules such as futurity, beneficialness to hearer, etc., is considered felicitous and an utterance that includes the word ‘promise’ but still breaks one or more constitutive rules, is not. The simplicity of making such a distinction makes it tempting to believe that virtually all speech acts can be identified and classified with respect to different but always finite sets of constitutive rules defining felicity conditions for their correct performance. This conclusion is, however, premature, as it covers mostly direct acts. There are in fact many indirect speech acts which rely for communicative success on violating their constitutive rules, rather than following them. In this talk, I discuss the acts which derive their illocutionary force from forced conceptualizations involving temporal analogies and confluences. My specific focus is on indirect warnings, which break the conventional rule of futurity to construe the centrality and momentousness of the present. The force of this construal is especially salient in political discourse, where it serves a prompt mobilization of the warned party to respond preventively. Using examples from anti-terrorist interventionist discourse, I demonstrate that the futurity rule is violated conceptually and linguistically in the use of temporal markers which employ the mechanism of analogy to extend their reference both retrospectively and prospectively, along the time axis. These formulas, such as the famous “A September morning” phrase used during the last Iraq war, seem to need a separate framework of constitutive rules to define their felicity.

**Bert Cappelle & Ilse Depraetere**

***Short-circuited implicatures: A view from construction grammar*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

How can we integrate *pragmatics*, which consensus tells us is about ‘extra-linguistic’, context-generated meaning, and *constructions*, which in Construction Grammar are defined as stored form-function units comprising pragmatic information? To answer this question, we would like to reassess Morgan’s (1977) notion of ‘short-circuited implicature’ from a constructional perspective. Short-circuited implicatures are (in principle cancellable) inferences which the hearer arrives at directly, without having to calculate them. It is well known that Morgan introduced them to adequately deal with conventionally indirect requests of the type *Can you pass me the salt?* What is usually less in the foreground, though, is that Morgan used the concept of short-circuited implicatures to explain a far wider range of cases, which he subsumed under the label of ‘conventions *about* language’, to be distinguished from ‘conventions *of* language’. We will start by giving a quick overview of the examples that Morgan discussed. We will argue that his ideas involve a kind of constructional approach *avant la lettre*. However, we will take his approach one step further, proposing that there can be short-circuiting, i.e., fast, non-computed determination of meaning, not just of (pragmatic) implicatures but also of context-dependent semantic values. Drawing on cases discussed in Cappelle and Depraetere (2016), we will illustrate the viability of this proposal with substantive (lexically filled) and more formal (more schematic) constructions (cf. Croft and Cruse 2004) containing modal auxiliaries (e.g., *Not if I can help it; I can’t complain; If I could just VP; How can we VP?*). We will demonstrate that these cases are constructions in the usage-based sense (i.e. frequently used linguistic units) by adopting a quantitative approach highlighting the collocational strength among the lexical elements contained in these (constructional) idioms, as revealed by mutual information scores obtained from the Corpus of Contemporary American English (COCA). We will complement this corpus-based method with a qualitative approach, in which we explain how the short-circuited meaning in each case is situated at the pragmatic level, at the semantic level, or at both levels. We will also position the constructional view and Morgan’s short-circuitedness with respect to other non-explicitly constructional notions such as ‘pragmaticalization’ (Leech 2014) and ‘conversational routines’ (Aijmer 1996). Finally, we will address the question: If short-circuitedness can play at the level of constructional semantics and constructional pragmatics alike, is it necessary to maintain the distinction between semantic and pragmatic information within constructions? We will answer this question positively. The common portrayal of constructions as form-meaning pairings, with a single, undifferentiated functional pole, too often fails to recognize that constructional semantics and constructional pragmatics should be kept distinct.

***Transnationalism in Cape Verdean linguistic landscapes: South-North trajectories, expectations and contestations*** (Contribution to *Postcolonial linguistic landscapes: Reading globalisation in the margins*, organized by Juffermans Kasper [et al.]

In 1992 the young nation of Cape Verde changed its flag from a red-yellow-green design with a black-starred coat of arms to a blue-white-red design with ten yellow stars representing the nation's ten islands located in the ocean and under the sky. This change indicates a symbolic move away from Africa towards more proximity to Europe and North America in the country's changing self-imagination since Independence (1975). This 'creative destruction' carried iconic expectations of progress and peace (encoded in the new colour scheme), but was also contested for its erasure of the pan-African colours that replaced the earlier colonial flag. This material change of the national symbol is illustrative of transformations in postcolonial Cape Verde at large, as more broadly visible in its linguistic landscapes. This article draws on data from an ongoing project at the University of Luxembourg on language and migration between Lusophone West Africa (Guinea-Bissau and Cape Verde) and Europe (Luxembourg) and adopts a southern perspective to language and migration, investigating South-North entanglements and affinities from the vantage point of ethnographic and material linguistic landscaping. Following the vignette of the 1992 flag change, we consider a series of semiotic moments and objects that capture Cape Verde's changing relations with the outside world, focusing in particular on relations with Luxembourg. These include a bilingual painting, transnational street names as well as portable linguistic landscape items sent as *inkumendas* (remittances, transnational gifts). The paper argues that linguistic landscapes are a useful analytical tool for understanding the local and present significance of migration and international relations between the global South and North. Reading the linguistic landscape multimodally for transnational and diasporic affinities rather than purely multilingually for distribution of languages or as signs of ethnolinguistic vitality in this diglossic Creole-Portuguese society allows us to see the past, present and future of Cape Verdean transnationalism in terms of trajectories, expectations or aspirations and contestations. It also lets us raise questions about authorship in the linguistic landscape and to problematize the top-down/bottom-up distinction in public signage. We conclude by arguing that linguistic landscape research can fruitfully be engaged as a 'mobile method' in understanding global connections in local place-making.

### **Marta Carretero**

***"Evidentiality, epistentiality, manner and stance: The case of English clearly and Spanish claramente"*** (Contribution to *Evidentiality: Discourse-Pragmatic Perspectives*, organized by Carretero Marta [et al.]

This paper takes as point of departure a definition of evidentiality as the linguistic expression of the kind or source of the evidence that someone, typically the speaker or writer, has at his / her disposal concerning the communicated content (Carretero and Zamorano-Mansilla 2013), and a definition of epistemic modality as the estimation of the chances that a proposition has for being or becoming true (Nuyts 2001). From the semasiological point of view, a third category will be considered, that of 'epistential' expressions (Lampert 2015), which express evaluation of evidence for (or against) the truth of a proposition. The English adverb *clearly* and its Spanish correlate *claramente* will be shown to have an epistential meaning 'it is clear that' and a meaning of manner 'in a clear way' (Simon-Vandenberg and Aijmer 2007), thus being polysemous. Both meanings will be shown to be of a semantic kind rather than conversational implicatures, since they cannot be cancelled or suspended. The epistential meaning consists in the expression of high commitment to the truth of a proposition based on evidence; the role of the conceptualizer as source of the epistential qualification is not highlighted and the evidence is coded as (having the potential to be) easily accessible to others. Due to these semantic traits, the adverbs may be considered as intersubjective (Nuyts 2001), and as belonging to the category of *Concur* in Martin and White's (2005) Appraisal framework.

Through the analysis of examples from two comparable corpora, the *British National Corpus* and the Peninsular Spanish part of the *Corpus Oral de Referencia del Español Actual* (CREA), the two adverbs will be shown to have clear cases of each of the two meanings as well as cases of co-occurrence of both meanings, in which the epistential meaning is best treated as an implication of the meaning of manner. The weight of this implication is influenced by the syntactic factor of clausal position and the pragmatic factor of communicative

relevance. Remarkably, the meaning of manner, even when it is more prominent, has a pragmatic effect related to epistemic stance in the sense of Marin-Arrese (2015), since it can reinforce the strength of the commitment to the information transmitted. In other cases, occurrences with the meaning of manner with no epistential implication also express high commitment due to the linguistic contexts in which they occur. For example, when combined with verbs of proof or perception (*indicate, prove, show...*), the adverbs are part of constructions that pragmatically have similar effects to those of epistentials, since they express commitment to the information transmitted based on evidence. Similarly, if combined with verbs of saying (*say, state...*), the adverbs communicate a Generalized Conversational Implicature of high commitment to the information transmitted and to the validity of the original source of information.

The paper will end with a pilot comparative study of *clearly* and *claramente*, based on examples from the corpora mentioned above and the MULTINOT parallel corpus (Lavid et al. 2015, 2016). The study includes a discussion of the similarities and differences in the relative frequencies of the kinds of cases mentioned above.

#### *The new face of hate speech: Mechanisms and social effects of the discourse of hatred*

(Contribution to *Conflict, public sphere and mediated experience: perspectives on proximization*, organized by Kopytowska Monika [et al.]

Political discourse in some democratic countries has been changing in an unprecedented way over the past few years. To some degree, these changes may simply reflect the populist turn in political discourse across Europe and in North America. In this paper, we examine the recent developments in the political discourse of two distinct political movements as defined by their most striking current contexts: Polish nationalism and US populism. The two situations may seem very different but they share several characteristics, thus allowing for interesting comparisons and more general conclusions. Both countries take pride in their longstanding tradition of societal tolerance and acceptance of multiple viewpoints. Thus, the current waves of boorishness and xenophobia are both atypical and worrisome. Throughout history, political discourse (and political propaganda) have used stereotyping to single out individuals or groups as the proverbial “other.” Most recently, the influx of refugees from North Africa and the Middle East is testing many of the values and principles declared by both European and North American societies. We are witnessing new phenomena which require a thorough analysis, for example, the rejection of the moral obligation to help the less fortunate is justified; the linguistic mechanisms for judging people and putting them into different categories (“better” and “worse sorts” in Poland and “terrorist threat” in the US) have increased. We examine the shortcomings of the corpus linguistic methodology since the impact and meaning of hate speech are not based solely on words but rather on larger

discourse units as interpreted in specific contexts. Our analysis of the use of language in recent political debates and speeches carried by the media in both countries, highlights a marked tendency towards stereotyping based on those characteristics of the individual that are independent of volition and not a matter of choice (Hilton & von Hippel 1996, Löschmann & Stroinska 1998). In the current refugee crisis, the concepts of ethnicity and religion are intertwined in the political discourse reported by the media, contributing to the confusion. The language used in public debates of these issues is strikingly rude and unapologetically offensive. In the US presidential debates, abusive language is used mostly by one candidate but its destructive force spreads exponentially to both his political supporters and to online fora. In Poland, hate speech is practiced by the new ruling party, which sanctions its widespread use in the official media. From there it trickles down to online *hejt* in comments and discussions. We believe that this linguistic shift is a very strong indication of a dangerous change in societal attitudes: changes that have led to violent conflicts in the past. We use examples of the stereotyping characteristics found in the discourse around the ethnic conflict in Kosovo (Stroinska & Popovic 1999) and compare them to the linguistic mechanisms of ethnicity- and religious- based stereotyping characteristic of political discussions in Poland and the US today. Using empirical linguistics as a diagnostic tool, we identify specific mechanisms of exploiting language for propaganda to target minorities and any political opposition.

##### ***Social touch and 'carnal intersubjectivity': Lamination of affection and control in embodied social interaction*** (Contribution to *Touch in Social Interaction: Integrating Haptics into Embodied Interaction Research*, organized by Cekaite Asta [et al.]

The present paper aims to discuss the concept of the 'carnal' intersubjectivity, or 'intercorporeality' (Merleau-Ponty, 1964; Crossley, 1995) by engaging in an empirical examination of touch as it is utilized in adult-child interactions in Swedish families and preschools. It is argued that exploration of touch in social encounters provides a fruitful avenue for demonstrating the social interactional anchoredness of human intersubjectivity defined as an "intertwining of 'flesh' of "sentient-sensible beings" (Merleau-Ponty, 1964; Crossley, 1995). Touch plays an important role in human interaction, including areas such as achieving another person's compliance and displaying intimacy, affection, or status (Cekaite, 2010; 2016; forthcoming; Goodwin & Cekaite, 2013). The study examines the interactional organization of affectionate and control touch used in adult-child interactions (in preschools and families in Sweden with 1-5 year old children). Video-recorded data involves 24 hours of recordings. Multiple characteristics of touch conduct are examined: type, location, approximate duration, function, and interactional context. The present study deploys a multimodal interactional approach, examining the organization of situated activities (Goodwin, 2000; Depperman, 2013). The analytical focus is on touch behavior and what can be identified as the interactional uptake of touch, displayed through the publicly visible actions of the participants. It is demonstrated that adults recurrently use multimodal interactional design of affectionate and controlling acts, involving lamination of touch, talk, gazes and facial expressions. Such acts are deployed in, for instance, disciplining encounters, where adults' disciplining talk is coordinated, i.e., simultaneously or consecutively embellished, with affectionate touch (stroking, patting, half-embracing the child), and facial expressions. It is shown that the communicative potentials of touch are commonly bidirectional and contingent on the participants' progressively evolving embodied actions. Touch can be accepted or rejected, such as when a recipient complies, or moves away, grimaces, or withdraws from corporeal contact.

#### Irene Cenni

##### ***The representation of tourist-staff encounters in negative reviews in TripAdvisor.***

(Contribution to *Analyzing Online Prosumer Discourses: Consumer Reviews, Customer Feedback, and other modes of eWOM*, organized by Vasquez Camilla [et al.]

Within the Web 2.0 setting, tourism is a widely discussed topic and travel reviews are among the most popular online reviews. As a consequence, online travel reviews have not only attracted the attention of tourism marketing researchers (Zehrer, Crotts & Magnini 2011), but also of discourse analysts (Vásquez 2011, 2014; De Ascaniis & Gretzel 2013:157).

In this contribution I will explore a specific feature of online hotel reviews, namely the representation and evaluation of interpersonal interactions between tourists and hotels' staff. This study draws upon previous research (Cenni & Goethals 2017) in which we found that comments on tourist-staff encounters represent a recurrent topic in negative hotel reviews in TripAdvisor, but also that both the frequency and the content of these comments may vary according to the language group of the review authors, and according to their status as domestic or foreign tourists. We came to the conclusion that this specific aspect of hotel reviews can provide very interesting input for examining possible intercultural tensions or sensibilities in tourism contexts, and for examining how these sensibilities are worded in 2.0 tourism discourse.

In order to get a deeper insight into this specific dimension a corpus of 900 negative reviews from TripAdvisor.com has been created. The corpus consists of 300 reviews written in English by travelers who reportedly reside in the U.K., 300 written in Italian, and 300 in Dutch, by travelers who reportedly reside in the Netherlands. The reviews concern hotels in Rome and Venice (Italy), London (UK) and Amsterdam (NL).

Our main goal is to study which are the discursive functions and content characteristics of interpersonal interaction narratives in negative hotel reviews. Moreover, we will examine to what extent this aspect is commented about in negative reviews, and whether the comments on this aspects have a positive or negative orientation. Additionally, we aim to explore the similarities and divergences that emerge among the three different languages groups.

The qualitative analysis of our dataset is carried out within the rapport-management theory framework developed by Spencer-Oatey (2002, 2008). This framework allows us to study how tourists perceive and represent their interactional relations in tourism contexts in a comprehensive way, including aspects such as face management, interactional goals and the management of sociality rights and obligations.

Preliminary results indicate that comments on the interpersonal interaction between tourists and hotel staff can be defined as a stable characteristic of negative hotel reviews in the three language groups. Moreover, divergences in both discursive and content aspects emerged especially between domestic and foreign tourists. In particular, domestic tourists' evaluations seem to include less negative comments and more positive comments, which points towards the hypothesis that cultural distance may lead to a different tourist satisfaction (Tuna 2006). Moreover, specific intercultural and language-related issues emerged, as for instance the issue of linguistic barriers mentioned by foreign tourists travelling in Italy, and the presence of racist comments performed by Italian reviewers towards foreign staff members working in hotels in Italy.

*A comparative study of questioning in Q&A sessions in academic presentations by professionals and students* (Contribution to *The interfaces between Pragmatics and Language Education*, organized by Lee Cynthia [et al.]

Previous studies have researched questioning in various settings such as news interviews, medical consultations,

and teacher-student interaction. The present study focuses on a less-researched setting -- the Q&A session in an academic presentation. The Q&A session in an academic presentation is very different from the presentation session by nature. The Q&A session involves impromptu interaction between the speaker and the audience and therefore poses a greater challenge to the speaker and the audience. It is more difficult when the Q&A session takes place in a course assessment setting and when there is limited input to the students on asking and answering questions at the end of a presentation.

This paper examines the turn design of questioning from a discourse analytic perspective. It draws on video recordings of academic presentations given by professionals and students in the field of health sciences. The student participants consist of medical and pharmacy students of an English-medium university in Hong Kong. Questioning, as a form of social action, can be accomplished through a range of linguistic forms and be used to serve different purposes. Our data shows that in the student presentations there is a lack of such components as praise and tokens of appreciation which are frequently found in the professional presentations, suggesting the students pay less attention to the relational aspects of communication when asking questions. Moreover, the students tend to relate their questions to what was said in the presentation and use more WH-questions (especially why and what questions) while in the professional presentations the most frequently used question type is the Yes/No-question type and no why-questions are found. An analysis of the purposes of the questions reveals that nearly one-fourth of the questions in the student presentations appear to serve the function of asking for confirmation or challenging the speakers while only a small percentage of the questions in the professional presentations serve such functions. These findings can be attributed to the embedded assessment setting in which the student presentations take place. Building on the findings of the present study we discuss pedagogical implications for teaching questioning skills

***Getting acquainted across cultures: Self-presentation sequences in initial interactions amongst Australians and Taiwanese*** (Contribution to *Current issues in intercultural pragmatics*, organized by Kecskes Istvan [et al.]

Getting acquainted with others is one of the most basic interpersonal activity types. Yet research on the interactional practices through which such unacquainted persons become acquainted and establish (passing or ongoing) relationships has been undertaken primarily from a social psychological perspective, with only a limited number of studies being grounded in the actual details of face-to-face interaction (e.g. Haugh 2010, 2011; Haugh and Carbaugh 2015; Maynard and Zimmerman 1984; Pillet-Shore 2010, 2011, 2012; Svennevig 1999), and even fewer focusing on getting acquainted in intercultural settings (Brandt and Jenks 2011). In the current study we focus on analysing audio/visual recordings of initial or “getting acquainted” interactions between first language speakers of English from Australia and speakers of English as an additional language from Taiwan. Drawing from approaches in interactional pragmatics (Arundale 2010a, 2010b; Haugh 2010, 2012), we analyse 10 recordings of initial interactions between Australian and Taiwanese participants, and compare these with 10 intracultural interactions in which Australians are getting acquainted, and 10 intracultural interactions where Taiwanese are getting acquainted. The analysis of this interactional data is supplemented with follow-up interviews with participants in the intercultural interactions. In the course of this analysis we identify self-presentational practices as a key locus of difference and thus potential misunderstanding or misconstrual in initial interactions between Australians and Taiwanese. Our analysis focuses on the environments in which “self-presentation sequences” (Svennevig 1999) arise and the responses of recipients to them. We suggest that differences arise with respect to the relative frequency of prompted versus unprompted self-disclosures (Haugh and Carbaugh 2015), as well as the degree to which participants reciprocate presentation-eliciting questions. These differences reflect the different emphasis placed on the multiple preference structures at play when self-disclosing in initial interactions across Australians and Taiwanese, namely, the value placed on talking about oneself (Carbaugh, 2005; Scollon & Wong-Scollon, 1981), avoidance of self-praise (Pillet-Shore 2015), and the overall preference for agreement (Sacks, 1987; Schneider, 1988).

### **Siobhan Chapman**

***'She only remembered occasionally that she was a woman': Implicature, subjectivity and gender identity in George Moore's "Albert Nobbs"*** (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.]

George Moore's novella *Albert Nobbs* originated as an extended anecdote in his 1918 collection *A Story-Teller's*

*Holiday*. It is the story of an orphaned and impoverished young woman who assumes a male persona, follows a successful career as a waiter, and lives for many years undetected as a man. Critics have noted that subjectivity and the narration of point of view are central to the portrayal of Albert's story (e.g. Friedman 1983). More recently, it has been argued that the text's themes of sexual inequality and gender performance indicate that it is explicitly concerned with feminism (Jaime de Pablos 2006; Grubgeld 2013) or with transgender identities (McIvor 2013). In this paper I will argue that the themes of identity, gender and social disenfranchisement are best understood in relation to choices made in the text concerning thought presentation. I will use pragmatic analysis in the neo-Gricean tradition (Horn 2004, 2007, following Grice 1975) to illustrate ways in which the balance between explicit and implicated meaning ensures that Albert's inner life is the main subject matter of the novella, rather than the external events of her story or the reactions of those she encounters. This effect was heightened by the small but significant revisions that Moore made to the text before it was republished in the collection of short stories *Celibate Lives* (1927). In this later text, also, it is mainly in the relationships of implicature and inference between narrator and reader that the full significance of Albert's experience becomes apparent.

**(Old) age identities in everyday conversations of Greek Cypriot women** (Contribution to *Stage of life categories: Morality and identity work in talk in interaction*, organized by Weatherall Ann [et al.]

This contribution will discuss the language and social practices of older Greek Cypriot women. It looks at the casual, every-day interactions of an all-female group, with a long interactional history (most of them in their seventies). The ethnomethodological approach to identities is adopted (see e.g. Antaki & Widdicombe 1998), and a toolkit from membership categorisation analysis and conversation analysis (Sacks 1995) is used. The data used are eighteen hours of self-audiorecorded interactions, collected over a period of two years, and supplemented by participant observation and ethnographic interviews. In all but one of the self-recorded conversations the membership categorisation device of age and, more specifically, categories of *old* age were made explicitly relevant (90 instances of old-age categorisations). The presentation focuses on how the participants employ various terms to explicitly categorise self and others as 'older women' and what meaning and associated features they attribute to old-age categorisations from various registers, including Standard Modern Greek (e.g. 'ηλικιωμένη' *elderly woman*) and the Cypriot Greek dialect (e.g. 'κοτζιάκαρη' *old woman*). It will be shown that members employ a nuanced machinery for age categorisations with different classes of old-age categories (be it generic categories in noun form, age-in-years categories, categories in verb form, or old-men categories) with different attributions and rules of application that are quite different from age terms used in other contexts. The interactional organisation of old-age labels -and specifically instances of (self-) repair of age categorisations shows that old-age categories are hierarchically positioned, inference-rich and that members orient to a very intricate set of expectations of who can be categorised by whom, with what specific age category term and at which context. Literature on peer-elderly naturally-occurring interactions (e.g. Degnen 2007; Hurd 1999; Paoletti 1998) has shown that older women construct a positive self image by claiming the category 'not old', which, however, places them in the precarious position where health problems,

changes in the body image and loss of spouse continually endanger their membership to the category 'not old'. In contrary, the participants of this study through their local system of self- and other- age categorisation participants are able to categorise self and others as old, without necessarily accepting association of age-related decline. On the whole, this bottom-up, empirical analysis of interlocutors' categories provides a glimpse to older women's conversational practices and situated understanding of their age (and gender) identities and how the deployment of various category labels ultimately achieves positive self-presentation.

***Profanity in authoritative assessment*** (Contribution to *Stance-Taking in Interaction*, organized by Imo Wolfgang [et al.] )

This study explores the use of profanity in informal interactions among college-aged women at a public university in the western United States. In the corpus of over 100 instances of swear words, we see a recurrent practice through which profanity is used by the recipient of an extended telling to assess a facet of the telling. Through a profane assessment, the telling-recipient positions herself as authoritative. In these interactions, the roles of narrator and listener mostly remain consistent, with one woman as narrator and another as listener. In two- and three-person dynamics, the listener, or one of the listeners, will additionally take on an assessor role beyond assessments that can also be continuers (Goodwin, 1986). These assessments work to problematize the narrator's story, in particular the opinion or stance (Du Bois, 2007) the narrator has taken regarding the events she is recounting. Through this practice, the assessor constructs her contrary stance and asserts her authority to contradict the narrator. These stances are taken by other participants in the interaction as more definitive—a stronger stance—in a kind of one-upmanship to the narrator. These stances, in turn, accumulate to something like Ochs and Taylor's *problematizer* (1995), in which the assessor (in their work, 'the father') takes on the role of ultimate judge, which is accepted by the narrator. The use of swear words by young women within the interaction thus points to the repurposing of profanity to create an authoritative identity.

***The pragmatic mechanism of offence in Online polylogue*** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.] )

This study aims to explore the pragmatic mechanism of offence in online polylogue from the perspective of moral order. Drawing upon the data collected from Baidu *Tieba*, the largest online Chinese asynchronous communicating community, the study firstly will conceptualize the offence by sketching those methodological and theoretical challenges in previous studies. Accordingly, online offence is defined as a sequential face-attacking acts performed by the offender to damage the multi-layered face of the offence-taker in online interaction. Then, taking an interactional approach the study will examine the linguistic realizations of online offence, which are further divided into (1) assertive derogating, (2) directive compelling, (3) commissive warning, and (4) expressive swearing. Finally, the study will analyze the types of face attacking acts in online offence, and discuss how various face-attacking acts are designed to challenge different facets of moral order,

since it is argued that online offence is a challenge to moral order in nature. This study is expected to reveal pragmatic mechanism of offence in online polylogue, and provide insights into some differences between online and offline (i.e. face-to-face) interactional polylogues.

#### Xinren Chen, Jia Qiu & Mengxin Li

*Advanced L2 Chinese learners' relational work in peer tutoring* (Contribution to *The interfaces between Pragmatics and Language Education*, organized by Lee Cynthia [et al.]

By and large, existing research on the development of L2 pragmatic competence has long focused primarily on secondary and tertiary-level learners on the one hand and their development of general pragmatic competence on the other. However, given that the level of L2 linguistic development does not necessarily have a positive correlation with L2 pragmatic development and that communication in special domains involves genre-specific norms and principles, it would be a serious oversight not to heed the development of L2 pragmatic competence among more advanced learners, who are more immediately and extensively linked to intercultural communication, or not to examine their development of genre-specific pragmatic competence. This study seeks to look into Chinese advanced learners' development of L2 pragmatic competence for managing interpersonal relations in the context of peer tutoring. It proposes to answer the following research questions: 1) Do the advanced L2 learners manage rapport differently when they do peer tutoring in Chinese and in English respectively? To what extent is their management of rapport influenced by their own cultural background? 2) Do MA and PhD learners differ in their management of rapport when they do peer tutoring in English? Which group is less influenced by their own cultural background? To address these questions, this empirical study will adopt Spencer-Oatey's (2002, 2002, 2005, 2008) rapport management model in the analyses of the naturally occurring data involving Chinese advanced learners' peer tutoring. It will demonstrate that while peer tutoring is an important site of maintaining and developing interpersonal relation, significant pragmatic transfers occur among the Chinese advanced L2 learners, especially the PhD students. The findings suggest that the Chinese advanced learners be advised on the mainstream academic culture of relational work in the context of peer tutoring apart from being only trained on how to do research.

#### Yuan-shan Chen

*What are students' thinking?: The case of email requests to faculty* (Contribution to *The interfaces between Pragmatics and Language Education*, organized by Lee Cynthia [et al.]

The present study examined L2 learners' cognitive processes when engaging in an email task involving two requests to faculty. The email task was chosen as an object of investigation because the widespread application of emails in academia has revolutionized student-faculty interactions from face-to-face communications to cyber-consultations. Previous research has also shown that L2 students' email requests to faculty consist of

different kinds of pragmatic errors for two reasons. First, most L2 learners are left to their own devices regarding linguistic and stylistic rules for institutional email when writing an email to faculty. Second, since making requests is a face-threatening act, it requires sophisticated pragmatic competence on the part of the learner to maintain institutional asymmetry to ensure compliance from the faculty recipient (Biesenbach-Lucas, 2006, 2007). As a result, probing learners' cognitive processes when they are drafting email requests to faculty becomes a fascinating area of investigation for ILP researchers. In the present study, the data included concurrent and retrospective verbal reports collected from 15 pairs of intermediate-level Chinese EFL learners. Paired verbal reporting was employed in this study because compared to single-subject verbal reporting, it may add to the naturalness of data collection, produce more elaborate verbal protocols, and reduce the learners' processing load to a greater extent. The procedures are as follows. First, each pair was asked to write two different emails to get permissions from the professor to add and drop a course. The collaborative verbalizations were audiotaped. Next, immediately after they finished the task, the audio recording was replayed as recall cues. Then, fixed and probing questions were asked about how they planned or executed such an email task. The retrospective verbalizations were audiotaped as well. Finally, all the concurrent and retrospective verbal reports were transcribed, coded and analyzed using Ericsson and Simon's (1993) coding scheme consisting of four categories: *intention*, *cognition*, *planning* and *evaluation*. Overall, the present study widened the scope of existing verbal report studies in ILP research. In addition, pair work can be used not only as a research tool, but also a classroom activity because collaborative dialogue can make students understand their own problems and monitor their productions, making individual novices become collective experts (Donato, 1994; Swain, 2000).

#### *Perceptions and performance in evaluation speech acts by Koreans and Chinese*

(Contribution to *Intercultural Pragmatics and Cultural Linguistics*, organized by Schröder Ulrike [et al.]

As observed by the panel, cognitive aspects are often neglected in intercultural pragmatics and/or cross-cultural pragmatics. It is often the ways of reaching communicative goals than the intercultural/cross-cultural understanding being discussed, according to Wolf (2005). To understand cross-culturally, it is important to understand the actual contents that cultures load on people's cognition and their language use. Cultural schemas and categories are thus investigated from the Cultural Linguistic point of view. Coming to the intercultural pragmatics, a cognitive exploration to the existing theories may result in new discoveries as the Cultural Linguistics proposes. For example, the culture schema of 'family' has been evidenced to be different between aboriginal and non-aboriginal English groups (Sharifian 2003). The aboriginal schema of family may include distant relatives or even others' families which non-aboriginal people do not normally refer to. Here, the notion of 'social distance' is one of the frequently discussed issues in pragmatics, although it is rarely considered from the cognitive path. The current study aims to connect people's cognitions to their pragmatic performance. It investigates the perceptual differences between three different groups with regards to their perceptions of social distance, power and the degree of imposition (*P*, *D*, *I*). It also investigates how the way that *P*, *D*, *I* tend to be perceived affects people's language use. The target of language use to be investigated is evaluation speech acts, which has rarely been studied before. The groups involved in the study are Korean native speakers (KNS), Chinese native speakers (CNS) and Chinese learners of Korean language (CLK). Both the perceptual and performance data are collected via written questionnaires, following two previous studies – Bergman & Kasper (1993) and Economidou-Kogetsidis (2010). In the process of investigation, the collectiveness of *P*, *D*, *I* perceptions within-group has been statistically proved. The KNS and CNS groups appear to have a holistic difference in perceiving the *I*. They are also found to react reversely to *D* perceptions. In CLK's performance,

the perceptions of *P, D, I* are found in competition with the perceived distance of their L1 and L2. It is interesting that the current pragmatic findings match a claim from Cultural Linguistics: the learners may have their own cognitive systems which do not necessarily correspond to either of the L1 or L2. Furthermore, the perceptions of *P, D, I* are culture-specific as some cultural schemas are. In Cultural Linguistic terms, the perceptions of *P, D, I* are distributed unevenly not only within one group but also across different groups.

***Near and far, in and out: What DST is all about*** (Contribution to *Conflict, public sphere and mediated experience: perspectives on proximization*, organized by Kopytowska Monika [et al.]

In this paper I would like to focus on DST — the deictic space model of language that I developed in Chilton (2014). This theory was framed in terms of a small set of geometrical concepts (coordinates, vectors, frames of reference), which provided a way of clarifying and exploring what appeared intuitively to be a basic property of human linguistic communication, namely deixis. The aim of the paper is to explore and clarify two aspects — an 'internal' one and an 'external' one. Looking at deixis in the 'internal' perspective, a speaker always has to take their own physical, temporal and intentional 'position' into account. These three dimensions must have cognitive counterparts, i.e. be neurally implemented in the brain. The paper will thus consider the cognitive and neural grounding of the three axes of the DST model, with particular emphasis on the axis that has been variously called 'modal', 'epistemic', 'axiological' or 'intentional'. Looking at deictic phenomena in the 'external' perspective, the language faculty evolved in a social context with social functions that are manifest in what can loosely be called 'discourse'. The claim is that deictic mental phenomena, grounded in spatial cognition, are emergent in language as discursive, i.e. social, behaviour. Now, according to current proximization theories, the key spatial component is relative 'distance' (physical or metaphorical). However, I expect to show in the paper how additional geometrical (but cognitively grounded) concepts are required, and in particular the cognitive topology of 'containers'. From a theoretical point of view, this will integrate proximization models with several strands of cognitive linguistics and cognitive science. From an applied discourse analysis point of view, I will try to show, by brief analyses of contemporary discourse specimens, how the discursive manipulation of both proximization and containment cognitions contribute to the construction of self at both the individual level and the socio-political level

***Strategies of humorous otherising the political opponent. The case of recent Polish political struggle*** (Contribution to *Laughing at the 'other': Critical pragmatic insights into the humorous construction of opposing groups*, organized by Chovanec Jan [et al.]

The paper deals with the unfolding political situation in Poland seen through the prism of the prolonged outburst of political humour, the end of which is not in sight. I am going to discuss the humour in political communication (cf Tsakona and Popa 2011) in terms of *us* vs *them* dichotomy, which is crucial in the Polish case since the government and the opposition perceive the European Union as *them* and *us* respectively. The latter difference concerns the macro level of social practice (Fairclough 1992) as it deals with value systems. In my analysis I will refer to discursive practices (esp. satire, in terms of Simpson 2003) in social media (cf. (Dyrel and Chovanec 2015) but will focus on specific micro-level discursive strategies. Specifically I will deal with humour examples (encountered mainly on Facebook pages of the Committee for the Defence of Democracy) that will include visual humour, memes, verbal satire, parody, heavy irony, allusion, with special emphasis on

Logical Mechanisms in Attardo's (2001) terms. Saturation (inflation) and attenuation (deflation) in Simpson's (2003) terms do occur, but do not seem to exhaust the list of satirical mechanisms. The major satirical mechanisms described by Draitser (1994), namely infantilisation, animalisation and reification seem to be clearly in evidence too. The most general method of humorous political struggle seems to be recontextualisation of the non-humorous stimulus, which results in the occurrence of exaggeration, false parallelism or simple juxtaposition as leading Logical Mechanisms. I am particularly interested in the influence of various macro-level contextual elements on the operation of these mechanisms, which will be subject of detailed analysis.

***Eating together multimodally: Co-constructed action in mukbang, a Korean livestream of eating food*** (Contribution to *Food for thought and social action: Constructing ideologies in food-related communication across digital and cultural contexts*, organized by Gordon Cynthia [et al.]

Mukbang is a livestreaming online eating show (hosted at [www.afreecatv.co.kr](http://www.afreecatv.co.kr)). It has become a new eating trend in Korean popular culture especially among Korean youth. In mukbang, a broadcaster, called BJ (Broadcast Jockey), shows mouthwatering dishes and enjoys them as hundreds of viewers watch. Importantly, the broadcaster and viewers multimodally interact with each other: the eater 'speaks' to the viewers while eating and the viewers 'write' each other and the eater through a chat room while watching it. This spoken-written interaction of mukbang significantly influences the eater's eating action. In Korea, eating traditionally has been considered a group activity. However, as single-person households are gradually increasing (Kim and Lee 2014), mukbang provides an alternative eating companion and a new, online, means of interacting while eating. Mukbang participants may feel a sense of 'togetherness' while eating alone. Also, mukbang gives viewers vicarious satisfaction, serving as a kind of 'food porn'. It is a stimulating visual and audio representation of eating foods that arouse a desire to eat. I bring together Tannen's (2007) sense of involvement (emotional connection through sound and sense); Goffman's (1981) concepts of move (a unit that constitutes sequential organization of talk) and footing (alignment); and the notion of recruitment, the idea of getting others to do things (e.g., Kendrick and Drew 2016; Drew and Couper-Kuhlen 2014; Zinken and Rossi 2016; Rosaldo 1982) to discuss how the joint activity of eating is multimodally created and invites involvement in mukbang. Through analysis of BJ Chang-Hyun's 67 mukbang videos uploaded on YouTube during September and October, 2015, I identify three types of eating action: 1) eating through recruitment; 2) eating through constructed action; and 3) eating as busking. In 1) eating through recruitments, eating is uttered and embodied by viewers and the broadcaster. Specifically, speech acts like requests and directives are used to recruit and non-verbal actions are taken to respond to those speech acts. I observe that recruitments are the overall basis of eating moves in mukbang. Also, I note that the eating recruitments produce a chain of recruitments between the viewers and the broadcaster where they take turns to recruit and be recruited. In 2) eating through constructed action, borrowed from Tannen's (2007) constructed dialogue including ventriloquizing, or the idea that people animate the voice of another while speaking, I suggest that the eating action is accomplished via the eater's embodied animating a viewer's written voice and the viewers' puppeteering the broadcaster's eating moves. In 3) eating as busking, mukbang is characterized as show business in that many viewers voluntarily send the broadcaster digital currency that is actually converted into real cash in return for the food entertainment he provides and for vicariously satisfying their eating needs. The busking example indicates how a social form of benefaction is constructed online through the act of eating and watching eating. The analysis highlights that mukbang participants jointly and multimodally construct eating moves and this contributes to creating involvement among the mukbang participants. I argue that what lies behind the co-construction of eating actions is both the symbiotic relationship and the moment-by-moment hierarchy between the viewers and the broadcaster. This

study of mukbang interaction demonstrates that action is another involvement strategy along with sound and sense, while also highlighting how the mundane and social activity of eating is performed online by using discursive and multimodal resources.

***Humorous comments and self/other positioning in online news forums*** (Contribution to *Laughing at the ‘other’: Critical pragmatic insights into the humorous construction of opposing groups*, organized by Chovanec Jan [et al.]

This presentation deals with humorous comments in online news forums from the point of view of critical pragmatics. It identifies several typical formats of humorous comments, ranging from ironic remarks to joke-telling, and interprets them as complex acts of self- and other-positioning (Davies and Harré 1990). In this way, individuals use the comments to construct and articulate their collective membership in specific ingroup(s) while simultaneously differentiating themselves from numerous others and expressing the mutual contrast in evaluative terms (cf. van Dijk 1998).

The analysis, based on data from online discussion forums on the recent migrant crisis in Europe, indicates that the construction of opposing groups through humour is a complex process that involves multiple dimensions. First, users’ humorous remarks function as a commentary on the primary media texts (news reports), serving as a form of public social critique that deconstructs what is seen to be the official policies articulated through the institutional voice of the mainstream media. This counter-establishment standpoint is further enhanced through the dialogic and polylogic interactions between users (Fetzer 2013) within the confines of the post-medial discourse space of online news comments (Chovanec 2017). Second, while some targets of humour are typically articulated explicitly in the comments, there are often additional indirect targets involved. Arguably, it is such indirect targets that are more central to the self-positioning of the ingroup than the explicitly mentioned outgroups. The humour then serves not only for the disparagement of the explicit outgroup, but also for the implicit self-construction of the ingroup as superior to the others.

Humorous comments, thus, have an important ideological and political dimension (Tsakona and Popa 2011). While their meanings are confirmed, contested and negotiated through online interactions between ingroup members, they can be used as a tool for the delegitimization of the positions of others taken with respect to, for instance, the current socio-political situation. Comments in online newspapers need to be dealt with on the macro-level of social practice (Fairclough 1992) since they are closely dependent on the socio-historical contexts in which the humour in the comments is embedded (Reisigl and Wodak 2001).

***Entity metaphor and object gesture in Taiwan Mandarin discourse*** (Contribution to *Multimodality and diversity in Chinese interaction*, organized by Li Xiaoting [et al.]

The present study investigates the manifestation of the IDEA-IS-AN-ENTITY metaphor across the linguistic and manual modalities with regard to the use of the object gesture in everyday conversation, to understand the relationship between metaphor and discourse in metaphorical conceptualization. The object gesture is typically a cupped hand shape with fingers loosely apart and curled. Since it enacts the entity metaphor, it is also a metaphoric gesture. The entity metaphor is divided into ‘cross-modal entity metaphor’ and ‘gesture-only entity metaphor’, based on the involvement of modalities for the expression of the metaphor. For the former, the lexical idea being conceptualized as a physical object is manifested by metaphorical speech and a corresponding object gesture simultaneously; for the latter, the metaphor is manifested in the single modality of gesture, expressing the conceptualization of a stretch of talk as a discrete object. The data consisted of everyday face-to-face conversations among adult native speakers of Mandarin contained in the NCCU Corpus of Spoken Mandarin. For the present study, the speech and the gestural data were gathered from the conversational excerpts for a total length of about 580 minutes of talk. 67 instances of the cross-modal entity metaphor and 73 instances of the gesture-only entity metaphor were found. These two sets of data were analyzed and compared with regard to linguistic form, gestural form, and the temporal alignment of the object gesture and the accompanying speech. For the cross-modal metaphorical instances, a wide variety of abstract ideas were represented as referring, characterizing, and quantifying referents in speech. In gesture, the metaphor was represented by an object gesture that could be configured in numerous ways. For the temporal alignment of speech and gesture in the stroke phase, the average duration was 714 milliseconds, during which the overwhelming majority of the object gestures co-occurred with the corresponding linguistic referents. For the gesture-only instances, the configuration of the object gesture mainly depicted a spatial boundary by the use of curled fingers for a stretch of speech as a metaphorical object. The average duration of the stroke phase was 1744 milliseconds, within which clauses predominated, and the minor phrasal segments were mostly verb phrases. Together, the results attested that the thinking of phrasal-clausal ideas as entities is as common as that of lexical ideas as entities in conversational discourse. Moreover, the way the object gesture is configured reveals what the speaker is considering real-time about a metaphorical object, and which facet of the conceptualization is the speaker’s focus of attention at a particular moment of speaking. The object gesture also provides evidence that the conceptualization of a lexical segment aligns with the linguistic context for coherence, and that the conceptualization of a phrasal-clausal segment is dynamic and emerges only in discourse. In conclusion, the metaphorical thinking emerges in discourse and is inseparable from cognition and the context of use.

***How ‘lazy’ reading sometimes makes sense: Exploring responses to Eimear McBride’s “A Girl Is A Half-formed Thing”*** (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.]

This paper explores a specific hypothesis about contrasting reader responses to the novel *A Girl Is A Half-formed Thing* by Eimear McBride. The novel is challenging at first but some readers report moving beyond the initial challenges of the book and being captivated by it. Others decide that the reward will not be worth the effort and put the book down. One idea developed here is that readers who enjoy the book are able to continue reading despite a great deal of indeterminacy in their developing interpretations. Characters have no names. Referring expressions do not have clear referents. It is not clear whose voice is thinking or saying particular expressions. This poses challenges for readers and involves complex pragmatic processes. This paper explores the nature of these processes, suggesting a paradox with regard to the complexity involved. Readers who put down the book decide not to engage in highly complex pragmatic processes. However, readers who enjoy the book need not put in the highest amount of effort in arriving at an interpretation. In an interview with McBride, the critic and literary scholar John Mullan distinguished ‘lazy’ and more analytical readings of the novel. This paper suggests that what Mullan called ‘lazy’ readings are most likely to give rise to effects which McBride was aiming for and which lead readers to value the book highly. These readings might be thought of as ‘lazy’ in that

readers give up on assigning referents, identifying speakers and thinkers, etc. However, they involve complex inferential processing and are more likely to lead to readers experiencing the text as McBride intended. McBride has said that she had the aim of ‘binding the reader closer to the character’s experience than “wideawake language” normally allows’ so that the reader ‘experiences the narrative from the girl’s perspective’ (McBride 2016). Analytical readings, which take time to follow all clues and resolve referential indeterminacies, decide who is thinking or speaking particular expressions, and so on, can be seen as recreating a 3rd person perspective. The paper also explores how these different kinds of readings can be understood with reference to ideas about different kinds of inferential processes, including Furlong’s (1996, 2001, 2011) suggestion that interpretation can be more or less spontaneous and Mercier and Sperber’s (2009, 2017) distinction between intuitive and reflective inference. One significant feature of the kinds of reading processes discussed here is that they can be more or less ‘lazy’ rather than involving wholly distinct kinds of processes.

*Negotiating being ‘old’ in nurse practitioner-patient health assessments* (Contribution to *Stage of life categories: Morality and identity work in talk in interaction*, organized by Weatherall Ann [et al.]

Many developed nations define older people or the ‘elderly’ as those over the age of 65. Although somewhat arbitrary, such chronological categorizations of age and aging are ubiquitous. For example, chronological age is used as a basis to determine a range of social, bureaucratic, and/or legal rights, obligations, and entitlements (such as retirement age or the eligibility to claim a pension). However, research following in the tradition of Sack’s (1992) pioneering work in conversation analysis and membership categorization analysis has demonstrated that categories are not simply neutral descriptions of facts. Categories are inference-rich and provide a framework for organizing a vast array of cultural knowledge about what could be expected of category members in terms of behaviour, knowledge, and competencies. This paper considers age and stage-of-life categorizations, particularly being ‘old’, as a members’ category in nurse practitioners’ healthcare consultations with older patients (over 80 years of age). In particular, analytic attention is focussed on how participants use age and stage-of-life categorizations as a resource for understanding and evaluating the patients’ health status and capabilities. Following written consent, audio and video recordings of 11 consultations between nurse practitioners ( $n=2$ ) and older patients ( $n=11$ ) were collected. The consultations were health assessments undertaken in the nurse practitioners’ usual place of practice—in a clinic and in patients’ homes. A total of 11 hours and 46 minutes of data was collected with consultations ranging in length from 35 minutes to 1 hour 27 minutes. Data were transcribed and analyzed using principles of conversation analysis and membership categorization analysis. In the data, nurse practitioners and patients employed age and stage-of-life categories to accomplish important institutional, moral and identity work. Age-relevant categorizations were used, for example, to proffer candidate explanations for symptoms, to manage the moral implications of responsibly taking care of oneself, to account for patients’ future plans or expectations, to legitimize complainables, to re-characterize potential problems of functional decline as ‘normal’, and to endorse or praise patients’ health status or activities as highly positive. Age and stage-of-life categories and category-bound activities associated with being ‘old’ were variously aligned with and resisted by the participants. Using illustrative data examples, this paper will show how age and stage-of-life membership categories are used as an inferential framework by the participants as they negotiate and construct the patient’s health, well-being, and capabilities as normal, positive, or problematic. In this way, membership categories are shown to be an important resource for institutional

sense-making in healthcare interactions.

*Using the body in space to re-align 'self' and 'other' relations in the production of situationally-recoverable types of ellipsis* (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.]

This paper studies activities of a non-institutionally goal-defined kind. Though Levinson (1992: 69) remarks that “focal members [of activity type] are goal-defined”, the position taken here is that non-institutionally goal-defined talk is “a highly structured, functionally motivated, semantic activity” (cf. Eggins and Slade, 2004: 6). Within such phatic or interpersonal activities, the activity-move of interest here is that of ascriptive evaluation and, furthermore, how this activity-move is manifest in a co-ordination of verbal and embodied communicative resources. More specifically, I am interested in instances of what in the linguistics literature (e.g. Quirk et al., 1985) has been labelled ‘situationally-recoverable ellipsis’ – the use of some syntactic structure in language where one or more of its fundamental elements have been omitted but are predictable because they are recoverable from the non-linguistic context. I here aim to challenge the linguocentric assumptions (Gregory, 2002: 320-321) of work on this phenomenon in linguistics – namely, that only linguistic forms can function as antecedents in social interaction. The alternative position taken here is that certain patterned behaviours in the embodied modalities make ellipsis in the linguistic modality a favourable choice for interlocutors. Using four episodes of the UK version of the reality television show ‘Big Brother’ as data, my analysis (Clarke, under review) revealed a significant correlation between instances of so-called ‘situationally-recoverable ellipsis’ and two-person only interactions. In these, the distinction between ‘self’ and ‘other’ in the participant framework composition (Goffman, 1981; Levinson, 1988) is self-evident where in multi-party (i.e. three-plus people) interactions it becomes increasingly complex and has to be semiotised by means of embodiment relative to communicative space. That is, looking across cases of ‘situationally-recoverable ellipsis’ in such multi-party interactions, interlocutors can be observed to display patterned embodied behaviour relative to the communicative space in order to demarcate ‘self’ and ‘other’ distinctions. For example, the mirrored body alignment of the interlocutors in the background of the following video still at which point one of these interlocutors produces an instance of so-called ‘situationally-recoverable ellipsis’:

#### Figure 1. Big Brother data example

**Nikki:** oh look (it [S] is [O/M] a) perfect opportunity (.) she’s loving it

This regularity across embodied and space modalities appears to help achieve communicative success when ellipsis in the linguistic modality has the potential to lead to ambiguity in the social interaction.

*Economics generalizations as generics: Implications for economic expertise* (Contribution

to *Economics & Language Use: The pragmatics of economics experts' engagement with non-specialists*, organized by O'Rourke Brendan [et al.]

Generics are a common type of generalization. They bear syntactic forms such as *bare plural* (Ks are P), *bare singular* (K is P), *definite singular* (The K is P), and *indefinite singular* (A K is P). Despite their commonness, they have proven to be very difficult to analyze semantically. Since the past decade, philosophers and psychologists have shed light on the role they play in our cognition. It is now clear that generic language is a default form of generalization and is central in our acquisition of concepts. Our paper starts from the premise that many generalizations in economics, especially those used by economists in public communications, are generics. We draw two implications from this premise (one solid, the other more tentative). First, characteristics of generics explain part of the widespread miscommunication between experts and laypersons. This miscommunication is due to the fact that the acceptance of generics tend to be very flexible regarding the prevalence level of a property among a category, while their interpretation, when done with no information on the category generalized upon, implies that most of the category members bear the property ascribed. Thus, while experts accept (and sometimes ought to accept) generics on a low prevalence level, laypersons might think that the property ascribed in an expert-produced generic has a high prevalence among the relevant category. Second, the theory-ladenness of generics provides a potential explanation for why social scientists disagree about generalizations across disciplines. Our hypothesis is that being committed to a specific disciplinary outlook makes some properties more striking, thus making it easier to ascribe said properties to categories in generics. In making these points, our paper relies on a variety of conceptual and empirical materials in literatures that are rarely combined.

*"You know" as an adjunct to self-repair* (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

The phrase *you know* is ubiquitous in interaction, and has been subject to substantial previous research on its patterned use in various action and sequence environments. Here we consider its positioning *within* turn constructional units, and in particular in relation to self-repair. For instance, *you know* may appear following the initiation of repair, prefacing the repair solution as in (1) and (2) below

#### (1) NB.IV.10.R

01 Lot: iYea:h uh she's comin ba:ck tuhmo:rrow with uh: Clau:de'n  
 02 ther gunnuh pick up the kids en'er mother'n then ther goin  
 03 down there **fer the ho:lid uh:: yihknow fer Thanksgiving**  
 04 the[n F r i]dee morning ther gunnuh leave fer La:s Vegas=  
 05 Emm: [°Mm hm,°]

#### (2) Chinese Dinner

01 Bet: Well it wz a s-it wz a **cloze-y'know closeout sale**;  
 02 Don: =[Mmhm,  
 03 Bet: =[So they didn' have everything of everything...

Alternatively, *you know* can also appear after the repair solution, as in (3) and (4):

#### (3) TCIIA – EJ & Croft

01 EJ: Well uh: this uh:m (0.2) ki:ln1 I I would treat uh this thing  
 02 like I would a: a drjer er something thet pulls in about (. )

In this presentation, we identify and discuss the various positions that this interactional resource can occupy vis-à-vis self-repair, the specific forms of self-repair with which it is associated, and the interactional consequences that follow from its use.

### Rebecca Clift

***Is that your coat on the floor? Agency and autonomy in indirection*** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

This presentation will explore how the examination of interactional sequences can shed light on a traditional pragmatic conundrum: indirect utterances. So why, for example, might a parent say to a child 'Is that your coat on the floor?' as a means of getting them to pick it up, rather than using a directive, 'Pick up your coat'?. Linguistic work on indirect utterances has overwhelmingly used single utterances or utterance pairs to focus exclusively on what the *speaker* is assumed to gain from indirectness. In contrast, I shall examine data - both audio- and video-recorded - using the methods of Conversation Analysis to illuminate observable *recipient* conduct as a means of identifying the interactional motivations for a speaker to be indirect. I shall focus on directive utterances in family interaction, exploring the relationship of direct to indirect turns across sequences of action. Central to the investigation will be the observation that recipients do work of various kinds to exert agency in response; to establish that what they are doing has a degree of autonomy, rather than being purely acquiescent in response to a prior turn. I shall concentrate on the linguistic mechanisms deployed in the pursuit of autonomy, and in particular those used in the domain of reference. Schegloff (1996), discussing anaphoric reference, notes a distinction between initial and subsequent *forms* (such as 'President Kennedy' and 'he' respectively) and the initial and subsequent *positions* that they may occupy. This work shows how the use of initial forms in subsequent position may be one such mechanism in the exercise of agency in responsive behaviour; in doing so, it offers an empirically-grounded account of indirectness.

### Eva Codó

***English and contemporary regimes of precarization: What ethnographies of CLIL reveal*** (Contribution to *The neoliberalization of educational systems: Englishization policies and the creation of flexible workers*, organized by Codó Eva [et al.]

This paper aims to examine how the large-scale introduction of English as a vehicular language in primary and secondary schools in Catalonia (in the northeast of Spain) through CLIL is effecting a process of precarization of the teaching profession. The paper draws on a body of ethnographic data gathered during the academic year 2015/16 in two different educational institutions (one primary and one secondary; one public and one private but publicly-funded school) located in the Barcelona metropolitan area. Although the dynamics of precarization are

distinct in each setting owing to key differences in hiring procedures and job stability, some common trends can be identified: in both cases, English has transformed the institutional order of the school, introduced tensions amongst staff members, and symbolically and practically undermined non-language teachers' professional competences and career development chances.

This paper is framed within a political economic perspective to applied linguistic research which has as its central understaking to understand language-mediated real-world problems (Block, 2017). It advocates a historically, institutionally and economically-situated perspective on CLIL implementation which ties it in with the introduction of a (neoliberal) market logic in education and the promotion of entrepreneurial worker subjectivities. Though a fairly recently required professional competence for teaching at primary and secondary school levels in Catalonia, English is being discursively represented as teachers' personal development project and as an index of their being morally-responsible workers (Gao and Park, 2015). Thus, while Englishization brings benefits to schools in the form of growing/non-declining enrolment rates, this language policy is at high personal costs to teachers, as they are "forced" to engage in self-training to the expense of their personal lives, or else, run the risk of experiencing the worsening of their labour conditions in the form of lower wages or less attractive courses or timetables. Teachers are caught in a tension between meeting their students' needs, asserting their professionalism and commitment to innovation and quality education and defending their rights as workers (Robertson, 2008).

#### Caroline Elisabeth Collet & Stefan Diemer

*"Mhm, ... okay so u:h, maybe we should start" – The use of 'so' and 'okay' in English as a Lingua Franca Skype conversations* (Contribution to *CMC Pragmatics of L2 Discourse*, organized by Vandergriff Ilona [et al.])

This paper examines the use of the discourse markers (DM) 'so' and 'okay' in computer-mediated conversations (CMC) by English as a Lingua Franca (ELF) speakers. While both have attracted considerable attention in the context of face-to-face conversations, particularly in a native-speaker context, their use in computer-mediated conversations between non-native speakers has not yet been documented. The study uses examples from CASE, the Corpus of Academic Spoken English (forthcoming). CASE consists of Skype conversations between ELF speakers from different European countries. Its multimodal composition allows research on a wide range of verbal and interrelated non-verbal aspects of informal spoken CMC discourse. In addition to its central role as indexing causality, Bolden (2006, 2009) describes sequence-initial 'so' as implementation signal for incipient action and a marker of other-attentiveness. 'So' signals inference (Blakemore 1988), prefaces topic development questions (Johnson 2002), and acts as a follow-up prompt in ordinary conversation (Raymond 2004). In a study of academic consultation settings in ELF, House (2013) describes 'so' as self-attentive, functioning as a hesitation and a transition segment marker (Redeker 2006). She also finds a deictic use, looking both forward to plan new moves and backwards to sum up what has been said. House points to potential interference of the German DM 'so' as a possible reason for a relative lack of other-attentiveness. The discourse marker 'okay' has been characterized in native-speaker conversation as a pre-close (Schegloff & Sacks 1973), closing marker (Edmondson 1981), backchannel (Swales & Malczewski 2001), or to mark the return to a topic after a digression (Bangerter & Clark 2003). House (2013) points to its versatility as reason for its frequent use in ELF conversation, permitting speakers to achieve "maximum interactional functions with a minimum of linguistic and cognitive effort in a variety of different interactional positions" (House 2013: 63), resulting in an even more varied use than in native speaker conversations. A quantitative and qualitative analysis of 'so' and 'okay' in a subcorpus of CASE shows all functions mentioned above, including numerous instances of other-oriented use of 'so', in contrast to House's (2013) observations. In addition, both DMs frequently interact as part of a sequence of two (and possibly even more) DMs in CASE. This co-occurrence has also been observed by Koops & Lohmann (2016) who point out that the combination of 'so' and 'okay' may actually fulfill different functions than the single items on their own. CASE data indeed suggests that the sequence may combine self-attentive and other-attentive functions, pointing to both a high pragmatic competence and a creative ELF use. The use of 'so' and 'okay' is also situated within an embodied performance (Goodwin & Goodwin 2000), with paralinguistic aspects (such as intonation, timing, pitch, vowel length, and laughter) and non-verbal aspects (in particular

gestures and facial expressions), all of which contribute to its situational meaning in CASE. In sum, the use of ‘so’ and ‘okay’ in spoken ELF Skype conversations illustrates uses established in native speaker research while at the same time also showing the considerable complexity and flexibility inherent in lingua franca communication.

### Isabel Colon de Carvajal & Heike Baldauf-Quilliatre

*Encouraging in videogame interactions* (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.]

Our presentation investigates videogame interactions as a particular activity type. According to Robinson (2013) and Schegloff (1992), the notion of activity is related to an overall structural organization which needs to be shown as “relevant to, and procedurally consequential for, participants” (Robinson 2013., 260). Based on different interactions (involving various numbers of participants) we focus on “encouraging” as a very frequent conversational action in this activity type which might be a device of this kind of overall organization. “Encouraging” therefore seems to be a good point of departure to describe videogame interactions: It shows first the specific hybridity of the environment (Spagnolli & Gamberini 2002) where the players are represented by avatars on the screen. The players can interact among themselves, as human beings who are able to analyse the game. But sometimes, avatar and player have to be considered as a kind of hybrid, especially when it comes to actions, which have to be realized by the avatar in the game. Encouragements are one of the actions which reveal this hybridity (Baldauf-Quilliatre & Colon de Carvajal 2015). Second, “encouraging” points to a particularity of the participation framework: In videogame interactions, especially with a larger number of participants, players watch sometimes what happens on the screen and can therefore be engaged in a social para-interaction (Ayass 1993, based on Horton / Wohl, 1956) with an avatar. This means for instance that a player may encourage his own avatar. At the same time, not all participants are always engaged in gaming, some might be spectators and therefore act as spectators. In both cases, the encouragements are related to encouragements in sports’ competitions (Burkhardt 2009), e.g. by the use of directives or assessments, by repetitions or by a particular emphatic prosody (Baldauf-Quilliatre 2014). In our paper we will present different types of encouragements in different French videogame interactions. They are either part of the database CLAPI ([www.clapi-ish.lyon.fr](http://www.clapi-ish.lyon.fr)) or recorded in the interdisciplinary project Ludespace (Boutet et al 2014, Colon de Carvajal 2013). By following a conversation analytic approach and with a detailed linguistic, sequential and multimodal analysis we will show that encouragements in videogame interactions are specific actions which use particular resources and occur on particular places in the sequence and in the activity. We will argue that they allow understanding the overall structure of videogame interaction as activity type and therefore investigate

them as a specific functional resource to constitute the activity.

### Jonathon Coltz

*Epistemic stance markers and conditionals in the expression of dislike in focus groups on food* (Contribution to *Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German*, organized by Szatrowski Polly [et al.]

This study examines the degrees of belief in epistemic stance markers used by participants in expressing their dislike toward foods presented to them for evaluation in focus groups. I analyze participants' use of epistemic stance markers within and outside of conditional constructions, and I discuss the observations that (1) in utterances expressed as conditionals, participants tend to express dislike using epistemic markers that indicate higher degrees of belief (e.g., "I know") and (2) outside of conditionals, participants often express dislike using markers that indicate lower degrees of belief (e.g., "I guess", "I think"). The data corpus consists of 8 hours of videotaped focus groups with a total of 24 participants (3 per group).

The findings suggest that in utterances outside of conditional constructions, markers that indicate lower degrees of belief may be used to serve a face-saving or softening function (Kärkkäinen 2003:112), thereby downgrading a more overt expression of dislike; within conditionals, which themselves serve a face-saving function (Declerck and Reed 2001:95), no further face-saving or softening (via lower degree-of-belief markers) may be necessary. The findings also shed further light on the successive use of lower degree-of-belief markers among some speakers in forming opinions about food (Szatrowski 2014:148-152).

In example (1) below, the participant Alan expresses his dislike of a granola bar using the higher degree-of-belief marker "I knew" within a conditional (lines 1-2). In line 1 (protasis), Alan says that if he "knew" the bar had "qualities" that he likes (i.e., if he could taste the individual ingredients), he could "taste what [he] wanted" (i.e., eat the bar he truly wishes to eat; line 2, apodosis). But as this bar was "blended" (line 5, post-conditional), he could not.

1	ALAN	You know if <u>I knew</u> it had qualities that I like=	PROTASIS
2	ALAN	(0.4) I could taste what I wanted.	APODOSIS
3	ALAN	I could taste the nut.	
4	ALAN	You know I could taste the honey.	
5	ALAN	This one it was just blended together for me.	

In example 2, the participant Isaac had earlier (prior to line 1) described a granola bar as tasting like "astronaut food." In line 3, Isaac uses a lower degree-of-belief marker ("I think") to say that the "gooiness" of the bar prompted this description. When, in line 4, the Moderator asks whether Isaac's description was related to the bar's texture, Isaac responds in the affirmative, repeating his use of "I think" in line 5.

1	ISAAC	The flavor was fine somewhat.	
2	ISAAC	The flavor didn't bother me.	
3	ISAAC	<u>I think</u> it was more of the complete gooiness of it=	
4	MOD	=Was that the texture that led you to describe it as astronaut food?	
5	ISAAC	<u>I think</u> it was.	
6	ISAAC	I mentioned earlier (0.3) just all mashed up.	

This study contributes to work on epistemic stance markers as used within and outside of conditional constructions, to work on modality and evidentiality, and more generally to the growing body of research on language and food.

***Discourse practices of denial on TripAdvisor*** (Contribution to *Analyzing Online Prosumer Discourses: Consumer Reviews, Customer Feedback, and other modes of eWOM*, organized by Vásquez Camilla [et al.]

Reviews tell us where to eat dinner and what to order there, what to see at the cinema, where to go on vacation and what doctor to call if we are sick. A growing number of users consider WOM an essential information source and in addition to consult it, they judge important to nourish it by sharing their experiences on rating sites, in other words websites that collect evaluations and opinions about different alternatives of a product. The fundamental objective of rating sites is to provide comments, ratings and rankings in the provision of a given sector (Dabholkar, 2006). So it is crucial for owners to monitor these contents, manage the image of their own online business and interact with users, whenever possible. The present work aims to analyze the customer/owner interaction with particular attention to those negative reviews where the owner of the structure systematically refuses to accept bad reviews accusing customers to write fakes. There are, of course, various measures to assess the veracity of a review: TripAdvisor added, for example, the "Star badge" system that allows giving recognition to the users, providing visitors the opportunity to see which reviewers are more experienced, so reliable. Furthermore many scholars have identified the criteria to identify fake reviews: Keates (2007) spoke of isolated reviewer, Yoo, Lee, Gretzel and Fesenmaier (2009) claimed that fake reviews are different from real ones in terms of lexical complexity, use of pronouns in the first person, the presence of personal feelings, admitting that it might be difficult to distinguish reviews based on structural properties. Vásquez (2011) affirmed that the inclusion of positive comments around those negative means that the reviewer is seen as more reasonable, able to grasp what is beautiful and what is lacking or it is below standards. More research revealed similar factors and concluded that most of assessments generated by users are authentic (O'Connor, 2010). Finding interactions on TripAdvisor, compared to millions of reviews on the site, is hard. Facebook page *Insultare su Tripadvisor sentendosi grandi chef* has been a great help. This page acts as a catalyst, it collects many interactions, in particular insults between customers and managers by referring to the original link found on TripAdvisor. So we collected a corpus of practices of denial in online reviews and we analyzed it thanks to the concordancer AntConc. What happens with a social media that uses the contents of another social media, is a kind of re-interaction (interaction based on another interaction). We analyzed our negative reviews applying the criteria provided from the mentioned scholars and we found that even in front of true reviews supported by evidences such as photos or high "Star Badge" some owners often refuse to negotiate the incident by attacking and accusing customers of fake, refusing the feedback. Consider the following review and its manager's response:

*Pessima qualità. Pessimo servizio. Conto salato. Non parliamo dell'igiene: non è che se hai i tavolini per strada non devi garantire un minimo di decoro o pulizia. Da evitare come la peste.  
Rispondere ad una recensione come la tua è come rispondere al nulla!!!! forse gelosia di qualche individuo che ci vede sempre pieni di gente????!!!! ah ah ah*

This example shows us an important process: instead of responding to the negative point listed, the owner denies the criticism and accuses the customer of nonsense. Moreover it does not respect the Netiquette using a very informal form of speech and using an onomatopoeia to mock the customer.

***Subject, language and trauma: The case of homeless people*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

This paper aims at criticizing idealized models coming from classic pragmaticians concerning intentionality, transparency of language and the notion of a rational subject in analysing speeches of people living in the streets of Campinas (SP, Brazil). If linguistic models are helpful to analyse and understand communicative exchanges between two individuals, taken as being rational and having previsible reactions, in some cases (or in everyone?) they prove to be problematic. Normally, intentions are made transparent in speech action revealing a logocentric subject, who knows naturally the 'speech laws', forgetting that these rules are linguistic and cultural at the same time and that the speaker has no possibility to control the effects of meaning in what they are saying. Otherwise we should remember that certainly every way of speaking is cultural, but culture cannot be considered as fixed, or emerging frozen features: saying depends on the pragmatic situation, on the speaker, on the interlocutor, on time and space as well; they also depend on the discursive formation participants are inscribed. This paper is inserted in an ongoing research about "Gender, Discourse and writing of oneself: itinerant lives", sponsored by CNPq, a Brazilian public organization that improves academic researches. Theoretically speaking, it is relevant to say that we take the notion of unconscious subject, language as opaque and equivocal thus there is no definitive truth. This work is empiric: data were obtained from life stories of homeless people (more women than men), when they were walking on Campinas streets or they were in a catholic shelter as they went to eat some snack, take a bath and/or do the laundry. When they agreed to participate in the research telling their stories, they had to sign a document which was also signed by the researcher and the shelter coordinator. The discursive and pragmatic analysis show that the participants take into consideration the interlocutor: they speak to her/him explaining some words belonging to their jargon; they make lapsus or a kind of 'errors' like "I was at home", when we knew that she was under a bridge; they repeat the same phrase several times denouncing that they are embarrassed by the circumstances in which something happened to her, mainly for women ("I don't want to remember" or "I don't want to speak anymore", but they continued to speak); they omitted important words for understanding what they were saying, maybe because they could not go into details about their traumatic experiences, such as a rape. ("the guy got up and looked around and ran away / I was crying / I didn't know anything / just I saw blood running down my legs / I was ten years old"). Sometimes they continue their narration without paying attention to the interviewer. Traumatic situations change participants' language unexpectedly, contrary to, for instance, some Grice's conversational maxims (such as qualitative or quantitative maxims and cooperative subject). The participants in our research, living in particular situations of suffering, show us that they are not able to control what they say or what they want to say...

**Josep-Maria Cots**

***"Measuring' students' imaginaries of study abroad before and after the stay: Beyond culture, language, and personal growth? Researchers' and researchees' discursive co-constructions of expectations for mobility experiences***, organized by Sabaté Dalmau [et al.]

Intercultural development, language learning and personal growth constitute three key elements of the rhetoric of study abroad (SA) (Bishop, 2013) that is employed by educational institutions to promote students' participation in study-abroad programmes, as can be seen in this quote from the website of the non-profit international student organisation Erasmus Student Network (ESN), which describes the experience of studying abroad as "the best opportunity to "establish intercultural contacts, have a valuable insight into a different culture, learn a language and grow as a person" (ESN, n.d.). This paper is intended as a contribution to the study of the impact of study abroad, but it proposes an alternative emic methodology to measure it. Rather than adopting an etic methodology in the form of pre-existing tools such as the Multicultural Personality Questionnaire (Van der Zee & Van Oudenhoven, 2000) or the Intercultural Development Inventory (Hammer, Bennet and Wiseman, 2003) and comparing pre- and post-stay measures, this study aims at a systematic comparison of students' imaginaries of study abroad (Härkönen and Dervin, 2015) before and after the stay. The analysis is based on a series of written statements that were made by a total of 50 students from a university in Catalonia (Spain) in response to three open-ended questions which focused on the following aspects: (i) positive experiences; (ii) problems and ways to deal with them; (iii) personal changes. From an analytical point of view, the study involves, in the first place, a qualitative perspective, represented by systemic functional grammar,

which aims to identify and classify the types of communicative resources used by students to represent the world in terms of specific nouns, verbs, and clauses. The second stage of the analysis introduces a quantitative perspective in order to explore the frequency of use of the different types of communicative resources as well as the order in which the students mention them. The analysis of the students' discourse sheds further light on the extent to which institutional promotional discourses of study abroad are actually resorted to and transformed by students in their imaginaries of study abroad. The study can also contribute to a better understanding of the impact of the study abroad experience by taking into account the degree of consistency of students' verbalized imaginaries of SA in a diachronic perspective. Finally, the study can also be seen as a contribution to the definition of the concept of 'cosmopolitan capital' (Block, 2010) and the role that a study abroad experience may have in generating it.

***Unpacking university-workplace partnerships in the big city and the county town: Understanding variation in communication and context*** (Contribution to *Research versus Practice: Towards a Stronger Partnership between Academia and the Real World in the Study of Institutional Discourse*, organized by Vandendaele Astrid [et al.]

The UK higher education sector has spent enormous effort enabling university partnerships with "outside-world" enterprises including industry, government, and charities. In addition to cross-fertilizing research and knowledge provision, a particular focus of these partnerships has been increasing the "employability" of students (Cole and Tibby 2013), a concept that in practice is often associated with jointly supervised employment through internships or work placements. These student placements are thus a key locus of university-partner contact, evidenced through the situated discourse of all three parties, which is the focus of this paper. We problematize the notion of partnership, focusing on variation across urban and regional contexts, and utilize as data written policy documents, interviews with partners, and feedback from students through their reflective assessments. We argue that variations often arise from embedded forms of "local culture," which can be seen in the discourse data, and should be taken into account. Our approach, then, is an ethnographically informed comparative one looking at communicative practices that occur in student placements in the local community, whether urban or regional. When students undertake placements during their degree, the expected outcomes include intellectual and ultimately economic enrichment for the student, awareness of how knowledge in the classroom can be applied outside of it for both partner and university, and kudos to the university for demonstrating the relevance of education. At the same time, the basis of the partnership - whether it is an exchange or a mode of supply - may be contested. These factors play out differently in our two case examples. One is a university in a "county town" outside of London, where student placements in local media make it clear how local practice intercedes with academic intention. The other is at a university in the city, where student placements in the private and public sector demonstrate a greater degree of equality and difference. Taking as given that professions, institutions, and workplaces have their own communication norms and community of practice routines (Schwartzman 1983, Lave and Wenger 1991, Marschall 2004, 2012, Cotter 2010), our research works to recognize these profession-specific values and how they are communicated internally and externally in the "urban" and "regional" cases we address. The intention is to show how communication factors and shared local knowledge come into play in the achievement of a diverse set of partner goals: across differently situated institutions as well as between the academy and the workplace. Our discussion contributes to notions of reflexivity and research-in-practice in professional settings, and how this is realized in discourse, with particular attention to the reception of the university contribution by partners. Our case studies also show that determinants of success in the academic-partner collaboration are not automatically transferable across contexts, and account should be taken of local culture in attempting to forge policy at various levels. For this, we need a greater

ethnographic understanding of local value and practice, as well as political, economic and cultural factors that exist, and a more macropragmatic awareness of difference on the respective institutional levels.

*Linguistic formats for suggesting and advising in everyday talk* (Contribution to *Linguistic structures and actions: does function follow form?*, organized by Seuren Lucas [et al.]

This paper is part of an ongoing project dealing with the language of mundane directives (cf. also Couper-Kuhlen 2014, Thompson and Couper-Kuhlen 2016, Sorjonen et al, Forthcoming). It reports on the conversation-analytic investigation of a growing collection of everyday contexts in which one interlocutor is suggesting, recommending, or advising on a plan of action for the other to follow. The data are English and come from video-recorded face-to-face and audio-recorded telephone talk-in-interaction. While prior research has focused on the asymmetries involved in advice-giving (Heritage and Sefi 1992, Shaw and Hepburn 2013), our focus is on the linguistic resources mobilized for implementing the actions of suggesting and advising. Included in the study are four of the most common formats documented in our collection, illustrated here with the predicate 'try it': (a) *Why don't you try it*; (b) (**Just**) *try it*; (c) *You could try it*; (d) *I'd try it* (see also Shaw 2012 and Shaw et al 2015). These formats are not necessarily interchangeable with one another: each has different affordances and is fitted to the specific sequential positions and activities at hand. The format *Why don't you try it* appears to be locally occasioned by the interlocutor formulating a problem or a trouble in prior talk (Jefferson and Lee 1981, Thompson and C-K 2016); it allows for the possibility that there are reasons speaking against the recommended action. By contrast, a simple imperative such as (**Just**) *try it* carries no such implication: it assumes that there are no contingencies involved at all and that the action can be carried out unproblematically (Sorjonen et al, Forthcoming). Compared to these formats, *You could try it* and *I'd try it* are less deontically implicative (Stevanovic and Peräkylä 2012): they merely recommend an action conditionally, in the case of *I'd try it* very indirectly, as something the speaker would do in a similar situation. The different affordances of these formats affect the design of an appropriate response. For instance, if advice is offered with *Why don't you try it* or (**Just**) *try it*, the recipient is expected to respond by either accepting or rejecting it in next turn. A rejection can be done by claiming that there is a reason for the rejection, but in such a case a turn-initial causal marker such as *because* can be used only in responding to *Why don't you. I'd try it*, on the other hand, can be responded to epistemically as an informing: it does not require any commitment to accept or reject what is being suggested in next turn. Our paper explores the sequential and interactional environments in which these different formats for suggesting and advising are deployed and examines their implicativeness for subsequent talk. Much as Curl (2006) finds in the case of offering assistance, our data show that there is a systematic distribution of different linguistic means for a single social action.

***Linguistically diverse ad hoc mediated ED consultations (1): The dynamics of miscommunication*** (Contribution to *The interpreter's role in healthcare conversations: A multimodal analysis of a multimodal reality*, organized by Van Vaerenbergh Leona [et al.]

**Background** [This paper is the first part of the presentation of the results of the research *Doctor patient communication via an ad hoc interpreter in the Emergency Department: what is lost in translation?*] Emergency medicine is a predominantly oral activity in which medical errors often result from poor communication. Due to the increasing diversity of patients in Emergency Departments (ED), especially in the light of the current refugee influx into Europe, emergency physicians have to take history from patients with whom they do not share a language. Sometimes, these patients bring along companions with some (often-limited) knowledge of the hospital's language to support the communication process. While these companions are often helpful, they may add additional sources of uncertainties to the communication process and hence of potential miscommunication. So far, the literature on language barriers in the ED has mainly focussed on health outcomes in the presence of language barriers, and the impact of interventions such as interpreting on these outcomes. This study aims to contribute to insights on the process of communication, by dissecting different levels of miscommunication and describing how they are interrelated.

**Methods** We audio-recorded linguistically diverse 16 multi party consultations in an ED and collected the corresponding contextual information via ethnographic participant observation (including note taking and after action interviews with clinicians). The consultations were transcribed, translated, and multimodally analysed from a medical, interactional sociolinguistic and social psychological or role dynamical perspective. This paper presents the interactional sociolinguistic analysis. Both talk and bodily movements were analysed with regard to miscommunication. We performed also member checking with the clinician in question, with members of the community of practice of ED medicine and members of the speech community of the patients and their companions.

**Findings** We identified a set of recurrent interaction patterns that lead to miscommunication at different levels. Based on these, we developed a taxonomy of different levels of miscommunication that lead to problems of clinical significance. Miscommunication was often ascribed to linguistic, social psychological and (non-)verbal reasons or aspects. Our taxonomy is dynamic in that one aspect may trigger or resolve the other one. We also noticed that a language barrier is not absolute. Depending on the questions asked, the tasks performed or the role dynamics, a language barrier can be at times thick and at other times thin during the same consultation.

**Discussion** Miscommunication can be the result of linguistic, social psychological or (non-) verbal reasons; however, these are often interdependent and complex. Our dynamic taxonomy allows researchers to track communication problems within a linguistically complex multi-party ED consultation, based on a multi-angled and multi-disciplinary approach. Knowing in detail why and how miscommunication arises can help to produce tailor-made guidelines for clinical skills training on linguistically diverse doctor-patient consultations and other interventions.

***"And now this is me": How the interpreter marks "self" and "other" in British Sign Language / English interpreted discourse*** (Contribution to *Pragmatics in the real world of signed and spoken languages*, organized by Turner Graham H. [et al.]

Vicky Crawley, York St John University, United Kingdom v.crawley@yorks.ac.uk Most of an interpreter's work is spent being "other". A BSL/English interpreter will use her body to represent the English speaker(s), and her voice to represent the BSL user(s). When she needs to participate as herself she must show that the participation originates from her rather than from either of her clients. Having already assigned her voice for one

set of clients and her body for the other set of clients, the interpreter must use additional strategies and discourse markers in order to display this shift. Locker (1992) outlined discourse markers deployed by American Sign Language using lecturers when changing stance from formal to informal – to mark an aside, and when signing directly to their interpreters. She also found markers to denote a change from formal to more formal – the start of quotes. Using repair, the self-righting mechanism used by speakers in order to deal with problems to do with hearing, speaking or understanding (Schegloff, Jefferson and Sacks 1977), as a display of interpreter participation, I observed the strategies used by two professional interpreters. In my data I found markers similar to Locker’s (1992) being used by interpreters to display footing shifts from “interpreting” to conversing directly with either or both parties then back into “interpreting”. These shifts are accompanied by a system of bi-modal obtaining of attention, stopping of either or both parties, and then accounting for what is seen by the primary participants as abnormal behaviour, that is, the interpreter participating as herself. I also show that the primary participants in my data are unequal in their familiarity with the process of interpreting. Through their replies, both sets of participants display what their understanding has been of the strategies used by the interpreter.

***How to be (dis)fluent in English, French and Spanish: Discourse markers within repetitions and repairs across languages*** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

Discourse markers (henceforth DMs, e.g. Schiffrin 1987) have been the focus of a strong – and still growing – trend in pragmatics investigating in particular their multifunctionality and context-sensitivity. These frequent expressions (such as *you know*, *well* or *so*) are characterized by their role as structuring devices, addressee-oriented cues for interpretation and flexible syntactic status (formally varied, optional). The paradox of DMs is that, while very frequent and essential for successful communication (e.g. Crystal 1988; House 2013), they often go unnoticed during an interaction or, on the other hand, can be perceived as superfluous and even detrimental if used in the wrong conditions: an example from outside academia is provided by an article from the LanguageLog website which reports on US Senator Caroline Kennedy who was receiving bad press during her campaign because of “some cringing verbal tics that showed her inexperience as a speaker”, pointing out that she produced more than 200 *you knows* and many *ums* in a 30-minute interview (<http://languagelog ldc.upenn.edu/nll/?p=964>).

Yet, authors in fluency research tend to agree on the positive effects of DMs, especially in second language acquisition where they are associated with naturalness, automaticity and efficient planning strategies (Hasselgren 2002; Götz 2013). DMs are indeed intrinsically linked to fluency: they constitute windows on the cognitive processes behind speech production and perception, with many of their functions being directly connected to either fluent or disfluent (i.e. (dis)fluent) moves such as reformulation or planning. This paper aims to explore contrastively the (dis)fluent usage of DMs occurring in two (dis)fluent structures in spontaneous conversations: overt self-repairs (based on Levelt’s 1983 typology) and repetitions (based on Crible et al.’s 2016 typology). We hypothesize (1) that there are recurrent conversational patterns of DM usage within sequences of self-repairs and repetitions in English, French and Spanish and (2) that these sequences can give an insight into the difference between the fluent and disfluent use of DMs, based on Crible’s (2017) proposal.

In our study we carry out a fine-grained corpus-based analysis of the co-occurrence of DMs, repetitions and repairs in the *Val.Es.Co 2.0* corpus for Spanish (Cabedo & Pons 2013) and the *DisFrEn* dataset for English and French (Crible 2017). By cross-tabulating sequences of repairs and/or repetitions containing one or more DMs, we uncover positional and functional patterns of DM use which transcend crosslinguistic variation, thus recommending them as potentially universal discourse “constructions” (Fischer & Alm 2013). Our analysis will also identify language-specific uses which cannot be transferred from one language to another. The presence and types (function, position) of DMs in repairs and repetitions are highlighted in order to identify more or less fluent uses of DMs in conversations.

This project thus takes Denke’s (2009) study one step further by merging three phenomena in a single approach and by employing multilingual data. In the presentation, we will briefly present our contrastive methodology for segmentation and annotation of DMs, repetitions and repairs (cf. Pascual 2016 for the *Val.Es.Co. 2.0* corpus and Crible et al. 2016 for the *DisFrEn* corpus), before turning to major corpus findings and the resulting suggestions for language learning. This study contributes to filling a gap in crosslinguistic fluency research.

## Maria Josep Cuenca & Jacqueline Visconti

### *Suspended and isolated uses of discourse markers: Some cases in Italian, Catalan and Spanish* (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

The development of discourse segmentation theories has prompted new ideas bringing considerable advances in studies on conversation (see the contributions collected in Pons 2014, which review most European models of discourse segmentation developed for Romance). Peripheral units, in particular, have become the focus of intensive scrutiny, as functions at the left and right periphery have proven interesting in cross-linguistic investigations of both language use and language change.

Discourse segmentation is especially relevant for the analysis of discourse markers (DMs), including sentence connectives such as conjunctions. DMs typically relate two sentences or more complex utterances: “S1 DM S2”. This prototypical configuration has become the centre of interest in the already huge literature on connection and discourse marking. However, corpus analysis, especially when dealing with conversation—but not only—, shows interesting variants, as the example in (1), included in Goethals (2010: 2214):

(1) [...] No crea, no atiende a cualquiera, pero como somos compañeros de docencia. . .  
‘Don’t you think he receives anyone, but since we are teaching colleagues. . .’

The ‘defective’ construction in (1) falls under the concept of insubordination, that is, the process by which a formally subordinate clause (‘como somos compañeros de docencia...’ in (1)) is conventionally used as an independent clause (see, among others, Evans 2007, Gras 2011 and especially the volume edited by Evans & Watanabe 2016).

If we are dealing with structures including DMs at text level, another variant of the prototypical construction “S1 DM S2” is that of absolute initial uses, as in example (2) from Estellés & Pons (2014):

(2) (At the beginning of a plenary session)

*Bueno. Por cierto, ante todo quisiera expresar mi agradecimiento a los presentes por estar aquí y quisiera darles la bienvenida a este simposio.*

‘Bueno. By the way, first of all I would like to express my gratitude to the attendants and to welcome you to this Symposium’

As Estellés & Pons (2014) point out, both *bueno* ('well') and *por cierto* ('by the way') are absolute initial in this context. As in the case of insubordination, there is no need to resort to ellipsis to account for them. In fact, assuming that there is some elliptic S1 would be misleading (Evans 2007).

This presentation explores another 'defective' configuration of the DM/connective construction, in which there is no S2, because S2 remains implicit ("S1 DM (S2)") or even disappears as a necessary slot ("S1 DM"). These *suspended uses* can be found as a recent development of Italian *anzi*, Catalan *ans al contrari* and Spanish *al contrario/todo lo contrario* (Visconti 2015; Cuenca & Visconti in press). The semantic and pragmatic properties of this construction are investigated in relation to its intonation contour, which is not suspensive as may be expected from an elliptical construction, but rather a pitch patterns sequence ending in a fall.

- (3) a. A me interessa, per esempio, un reale decentramento dei poteri, ma con uno Stato centrale non certo annullato, *anzi*. Bossi non è d'accordo? (*La Repubblica*).

'I'm interested, for example, in a real delegation of powers, but with a central State that is not at all weak, on the contrary. Bossi does not agree?'

b. No obstant això, volem dir que com a experimentació i recerca no rebutgem cap sistema o procediment, *ans al contrari*. Altres aparells complementaris han vingut a perfeccionar el funcionament i manipulació dels forns elèctrics... (CTILC)

A further step in the evolution of the construction is that in which the DM can be used in isolation, from a structural point of view.

- (4) a. 'Resta Woody Allen, il cui nome però non ha ricevuto lustro (*anzi!*) con Radio Days, che fa sbadigliare (*La Repubblica*).

'We are left with Woody Allen, who has not received fame (on the contrary!) with Radio Days, which makes us yawn'.

b. [...] si verament fossin allò que diuen o espanyols mai per mai parlarien de Catalunya com ho fan... *ans al contrari*. (Internet)

'If they were really what they say or Spanish they would never, never talk about Catalonia as they co... *On the contrary*'

c. Ha existido una cooperación excelente entre el Parlamento, la Comisión de Control Presupuestario, el Tribunal de Cuentas y la Comisión, pero esto no quiere decir que no hayan surgido disparidades de criterios; *todo lo contrario!* (CREA)

'There has been an excellent cooperation between the Parliament, the Budgetary Control Committee and the Commission, but this does not mean that there have not been different opinions; *on the contrary!*'

In summary, this presentation tries to shed some light on the problem of the defective variants of the construction "S1 DM S2" by (i) identifying and describing suspended and isolated uses in Italian, Catalan and Spanish, and (ii) accounting for these uses in the framework of the interactional constructional approach as proposed in Fischer (2010).

***Requests, prosody and (im)politeness*** (Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

The importance of prosody in communication hardly needs justification or demonstration, yet the vast bulk of research on politeness or impoliteness has paid woefully little attention to prosody. Brown and Levinson (1987), for example, confine themselves to a few sweeping generalisations. The single major exception of note is the work of Arndt and Janney (e.g. 1985, 1987). However, over the last ten or so years politeness and prosody has been attracting increasing attention, both in pragmatics (e.g. Nadeu and Prieto 2011; Brown et al. 2014) and in speech science (e.g. Borràs-Comes et al. 2015). As far as studies focusing specifically on impoliteness are concerned, prosody has been a distinctly minor concern, though one should acknowledge a steady trickle of significant studies (e.g. Cheang and Pell 2008; McKinnon and Prieto 2014). A particular aim of our research project is to discover whether a request, which for contextual and other reasons is likely to be construed as impolite, is exacerbated (i.e. perceived to be even more impolite when said with an aggressive sounding prosody rather than a tentative sounding one. We explored combinations of: three requestive expressions varying in directness; three different prosodies perceived to be tentative, neutral or aggressive in a pre-test; and two situational contexts varying in power, low-to-high and high-to-low. These combinations were rated by undergraduate students on six (informant generated) perception scales: rude, impolite, inappropriate, patronising, aggressive and hurtful. Our approach allows us to reveal how particular phenomena only have an effect on specific perception scales when in combination with certain other phenomena. For example, a tentative prosody only has a significant effect on one perception scale, patronising, and only when combined with the non-conventionally indirect expression. An earlier version of this paper was presented in a parallel session at the Linguistic Impoliteness and Rudeness conference in Manchester in July 2016. Since then, we have revisited and revised some aspects of the data, and completely changed the way the results are visualized, leading to a clearer understanding of what is going on.

***Mandarin, German and Spanish speakers' attitudes to Vague Language compared***

(Contribution to *Current issues in intercultural pragmatics*, organized by Kecskes Istvan [et al.]

English vague language (VL), as in general noun phrases, general extenders and general verbs, is central to casual conversation. It can have discourse functions and create an informality and solidarity. The rationale for the study described here was a concern that L2 learners' associations of VL with indifference and incompetence in their own language could constitute a possible barrier to learning English VL. It was hypothesised that attitudes towards VL vary from language to language. This paper describes a comparative questionnaire study of Mandarin, German and Spanish speakers' attitudes to VL in their languages. Subjects were invited to translate English VL to their languages and to think of other vague forms: Mandarin speakers noted 'na ge', 'dong dong', 'shen me de', also suggesting 'mei yi jian'; German speakers volunteered 'Dingsda', 'Dingsbums', 'und so', also suggesting 'geht so'; Spanish speakers suggested 'chismes' 'cómo se llame' and 'o algo así', also noting 'es cómo ... sabes?' Subjects were also asked to describe social variables, domains and functions associated with their VL: Mandarin speakers responded that VL was a marker of friendly informality and solidarity but they mostly associated it with indifference, laziness, impatience, irritation, anger, disappointment, contempt and dishonesty; German speakers saw VL as creating closeness but many felt that it made addressors sound unreliable and mildly impolite; Spanish speakers mostly saw VL as a way of showing a relaxed, close, comfortable, friendly, but a few saw it as an sign of laziness and impoliteness. The paper concludes with suggestions of ways to incorporate tasks on VL into English language teaching classrooms, and to raise

language teachers' awareness of English L2 users' beliefs and intercultural differences in terms of VL, in order to challenge negative attitudes.

***Self and the other across languages: A comparison between Indo-European and East-Asian languages*** (Contribution to *Emancipatory Pragmatics: Approaching Language and Interaction from the Perspective of Ba*, organized by Saft Scott [et al.]

The topic of this contribution is the analysis of the way in which the notion of "I" was (and is) expressed in two macro-linguistic and cultural domains: East-Asian and Indo-European languages. Cross-linguistically, the most obvious indicators of the first person are personal pronouns and verbal agreement: personal pronouns are almost universal (with some exceptions: see Heath 2004:999); on the contrary, verbal agreement is not universal. As Bhat (2004) pointed out in his monograph on pronouns in cross-linguistic perspective, a question has been raised as to whether some of the South-East Asian languages like Burmese, Thai and Japanese can be regarded as not possessing any personal pronouns at all; as it will be shown, these languages use different nouns in place of pronouns in order to indicate social status, politeness, etc. According to Siewierska (2004), in the functional literature pronouns in the main continue to be viewed as a morpho-syntactic category but often the distinction between pronoun and noun is considered to be not discrete, but scalar, with some pronoun exhibiting less prototypically pronominal and more nominal characteristics than others. Lehmann (2016) also thinks in terms of prototype and remembers that the Latin personal pronoun is completely different from the Ancient Greek personal pronoun; but this has never impeded anybody, starting with the Roman grammarians, to cover the Latin variety by the same concept that the Greek grammarians had used for their variety. According to Hinds (1986) personal pronouns in Japanese differ from the pronouns of other languages like English in several respects: i) in having nominal origins; ii) in being terms of occupation or status titles; iii) in being very large in number, with different forms being selected depending upon sex, age, perceived social status, and emotional correlation; iv) in showing most of the nominal characteristics like occurring after demonstratives, and being modified by adjectives or relative clauses. The fundamental difference between East-Asian and Indo-European personal pronouns is that while in Indo-European languages first person forms are generally autonomous, context-independent, East-Asian person forms are highly relational. Another interesting property that distinguishes Japanese personal pronouns from Indo-European personal pronouns is the characteristic described by Whitman (1999:358): "A striking fact about the history of Japanese is the frequency with which pronouns shift over time to designate different speech act participants". This behaviour has been explained through the concept of *ba* (Fujii 2012), the semantic space where the speech event takes place. According to Otsuka (2011: 5) "underlying *ba* theory are the Buddhist thought and the Japanese philosophy". The paper will analyze the expression of (inter)subjectivity in Japanese and in other East-Asian languages (Korean, Chinese) in comparison with European languages, in the framework of Emancipatory Pragmatics (Hanks/Ide/Katagiri 2009).

### Saori Daiju

***Distal demonstrative ARE 'that' for unspecified referents in Japanese everyday talk***  
(Contribution to *Deixis in Discourse*, organized by Yang Ying [et al.]

The Japanese demonstrative *are* has long been discussed with regard to its anaphoric use (Kuno 1973, Kinsui and Takubo 1992, Iwasaki 2013, etc.). Recently, its cataphoric use has been highlighted by Hayashi (2004), who suggests that *are* can serve as a 'dummy' to project a subsequent specification. However, I have found that speakers sometimes use *are* even when it doesn't have a specific referent, as illustrated in (1):

- (1) M gives advice to K, who has no time to eat  
M: daietto mo soo da kedo  
'(I know you're) on a diet, but'

**are** shinai to hontoni karada okashiku natchau yo.  
'unless (you) do **that**, (your) health will suffer.'

- K: ... dakara, maa, ima saisho da kara, yooryoo wakannai shi=,  
'Because, well, because now (we) are at the beginning (of the term), (I) don't know how to manage (my schedule)'

Though the context contains no clear referent to which *are* refers, the participants do not have trouble continuing the conversation. This type of *are* (hereafter, unspecified *are*) occurs when the speaker may not have an exact referent but more or less recognizes its presence.

This study is based on 86 cases of *are* taken from 31 conversations totaling 4.5 hours of talk. They contain anaphoric (44), cataphoric (21), and unspecified (21) uses of *are*, which shows that the unspecified *are* is fairly common. With unspecified *are*, participants typically continue talking while leaving the referent unspecified as if they share an understanding that a less than exact identification of the referent is good enough to go on. This is possible perhaps because, using common sense, the addressee seems to be able to come up with some understanding of the unspecified referent rather easily: for instance, for *are shinai to* ‘unless (you) do **that**’ in (1), multiple similar candidate understandings are easily obtained:

- 2) chanto tabenai to ‘unless (you) eat properly’
- 3) chanto shinai to ‘unless (you) do properly’
- 4) ki o tsukenai to ‘unless (you) take care of (yourself)’

Interestingly, most of the unspecified *are* in my data occur in two structural configurations, either with the copula *da* (8/21) (e.g., *are dattara* ‘if (it) is **that**’) or the verb *suru* ‘do’ (11/21) (e.g., *are shinai to* ‘unless (you) do **that**’). These expressions have, thus, been grammaticized as formulas (Bybee 2006) which allow the speaker to continue talking without having to make the referent fully specified. A close examination of conversation data has allowed us to discover a use which escaped the attention of prior research.

***The sociopragmatic functions of English-origin transidiomatic practices in Dutch social media discourse*** (Contribution to *CMC Pragmatics of L2 Discourse*, organized by Vandergriff Ilona [et al.]

Young Dutch speakers are coming of age in a world where English is playing an increasingly visible role. Within this world, not only are the various media they consume in the form of music, books, television, film, and magazines overwhelmingly English, but it has also become the main language of many Dutch universities and workplaces as well (Edwards 2014). In fact, as far back as the nineties, Preisler (1999: 244) was arguing that an informal use of English-origin transidiomatic practices “has become an inherent, indeed a defining, aspect of the many Anglo-American-oriented youth subcultures which directly or indirectly influence the language and other behavioural patterns of young people generally”—a trend that has only increased in more recent decades.

Against this backdrop, this paper deals with the pragmatics of one Dutch social media community’s English-origin transidiomatic practices within their otherwise native-language interactions online. As such, this paper deals with “L2 discourse” not in the sense of learners interacting in a classroom setting or the use of one’s L2 to communicate with a native speaker of that language, but instead with the sociopragmatic functions that switching into one’s L2 can serve within conversations with one’s own fellow citizens. While my data comes from a much larger comparative study of two social media communities, one Dutch and one German (Dailey-O’Cain 2017), the focus in this paper is on the Dutch community.

The approach used to analyze these practices is Auer’s (1998) conversation-analysis-based approach to code-switching in bilingual interaction, which distinguishes between *discourse-related* switches (i.e. those that serve to structure interaction), and *participant-related* switches (i.e. those that relate to the preferences or identities of the interactants) as different types of contextualization cues. This is a distinction that can help us better understand what is going on with the transidiomatic practices in this community, since analyzing discourse-related switching can reveal whether the language alternation structures conversation similarly or differently to the ways it does in face-to-face bilingual communities, while analyzing participant-related language alternation

can point us toward the way that switching from one language to another can serve as a tool in positioning and other kinds of identity work. Six main sociopragmatic functions for the use of English in Dutch social media conversations are identified (three discourse-related and three participant-related), and representative excerpts from each of these categories are analyzed. The discussion focuses first and foremost on the pragmatic detail, but also on what these kinds of uses of English by non-native speakers can tell us about global English more broadly.

***Healthcare interpreting quality 2014-2015 corpus: A corpus-based quality evaluation study***  
(Contribution to *The interpreter’s role in healthcare conversations: A multimodal analysis of a multimodal reality*, organized by Van Vaerenbergh Leona [et al.]

The EU Commission White Paper of 2007 (AA.VV. 2007) enshrines four principles envisaging access to healthcare as a universal right. The Italian Constitution has been proclaiming the right to access to healthcare for all since 1948. And yet, legislation is still lacking in terms of definition of access for non-Italian-speaking individuals, as well as professionals supposed to grant such access. Drafts of bills have been presented to the Italian Parliament in the past decades (e.g. AA.VV. 2010), but the identification of a professional figure satisfying law-related requirements and, at the same time, users’ expectations, is still object of a heated, ongoing debate. Specific regional authorities have been actively involved in the definition and acknowledgement of language- and culture-experts able to facilitate contact between foreign citizens and host institutions, as well as access by the former to public and private services (AA.VV. 2006). Such experts are defined as *cultural and linguistic mediators* (Rudvin/Spinzi 2013). Cultural and linguistic mediators (CLMs) have to be able to direct and favour immigrants’ access to local services, assisting them in the exercise of their fundamental rights and facilitating communication, information provision and cultural exchange between immigrant foreign citizens, locals and institutional service providers on the territory. As comprehensive as this definition might be, the indication of *who* and *how* should train CLMs is (conveniently) missing. So the ball is now in the academic field. The University of Trieste is host of the SSLMIT, one of the oldest Interpreting and Translation Faculties in Europe, and yet healthcare interpreting in Trieste is rarely provided by professionals with a degree in interpreting, but rather by non-Italian citizens with migration history and extensive knowledge of the Italian language and culture, on the one hand, and foreign patients’ background and culture, on the other. This is due to the fact that interpreting curricula, particularly in Italy, rarely provide interpreting students with the necessary tools to tackle the multifaceted challenges healthcare interpreting poses (Pöchhacker/Shlesinger 2007). This study aims at investigating healthcare interaction first and foremost as a form of institutional talk-in-interaction (Schegloff 1990), which, when interpreter-mediated, requires an adjustment of discourse practices and configuration, with a shift in the distribution of powers in terms of turn allocation and interaction coordination (Gavioli/Baraldi 2012). Real-life data are collected in the Healthcare Interpreting Quality 2014-2015 Corpus (HCIQ.1415), which comprises both real-life interpreter-mediated doctor-patient interactions (HCIQ.1415\_p) and classroom simulations of interpreter-mediated doctor-patient interactions (HCIQ.1415\_s). By necessarily drawing on disciplines such as Conversation Analysis (Sacks *et al.* 1975) and interactional sociolinguistics (Gumperz 1982), recurring phenomena in the examined interactions will be identified and studied from a functional point of view. Particular attention will be dedicated to the use of English as lingua franca (ELF) by non-Italian-speaking patients and its implications on mediated doctor-patient interaction (Reithofer 2014). Results shall ideally serve as orientation for institutions devoted to interpreters’ education and training, providing for a set of guidelines to develop and/or update community interpreting curricula that may bridge the gap between the academic world and the profession.

### *Empractical communication in synthetic situations of street protest* (Contribution to *Empractical speaking and knowledge construction*, organized by Hauser Stefan [et al.] )

Street protest is essentially constituted by the communicative practices carried out by its participants. In temporally and spatially unfolding protest situations with several parties involved, participants coordinate protest by means of digitally mediated communication. This paper addresses the research question: how, i.e. by which communicative practices in digital media, are joint activities of protesting constituted? Bühler's (1934) notion of empractical speaking has been developed into the concept of empractical communication (cf. Baldauf/Klemm 1997). The conceptual scope has been widened from linguistic practices, which mainly focus on face-to-face-interactions, to communicative practices, which include technically mediated and thus spatially and temporally stretched speech situations (cf. Ehlich 1984) and consider their mediality (Habscheid/Gerwinski 2012). Linguistic and communicative practices, alongside other bodily practices, constitute social practices (Habscheid 2016). In other words: social practices such as protesting are being constituted by and large through situative empractical communication whereas 'empractical' here refers to its embeddedness into 'larger' social practices. As a consequence, empractical communication can no longer be treated as a mere spin-off of so called 'non-linguistic practice' but has to gain center stage in empirical analyses of joint activities (Clark 2005). Analysed data is taken from Twitter conversations during two events of street protest in early 2014. In the respective protest situations, antifascist and democratic protestors mobilise and coordinate counterprotest against marches of extreme right-wingers in two German cities. The analyses focus on the indexical expressions (cf. Garfinkel 1967) of participants by which they co-construct situative knowledge that is relevant to protest activities. These joint accomplishments of protest situations are analysed with regards to the mediality of Twitter communication (Dang-Anh/Rüdiger 2015). Text analysis is multi-perspectively informed by an ethnographic approach, i.e. audiotaped participant observation was conducted by two researchers during the protest situations as well as interviews with protest organisers and participants. Situation-related analyses of characteristic communicative protest practices lead to the conclusion that street protest is increasingly enabled by digital mobile media. Participants constitute synthetic situations (Knorr-Cetina 2009) of street protest by means of technically mediated empractical communication (cf. Dang-Anh forthcoming). Data analyses reveal varying capabilities of knowledge access and distribution among the participants, contingent upon their level of organisation. Thus, synthetic protest situations are characterised by ongoing and complex joint knowledge constructions by spatially dispersed participants that mobilise and coordinate joint activities of protesting.

#### ***Self-presentation and self-praise in enterprise social media collaboration tools: Visibility and transparency as part of corporate culture*** (Contribution to *Self-presentation and self-praise: the neglected speech acts*, organized by Dayter Daria [et al.]

This paper explores some specific enterprise social media tools as channels of digital self-presentation and self-praise. Extensive anonymised empirical data are used to determine and analyse various categories and triggers of self-presentation and self-praise (Dayter 2014,2016; Wu 2011; Krämer & Haferkamp 2011), as well as the audience's responses. Enterprise collaboration is a system of communication among corporate employees that encompasses the use of enterprise social networking tools and the corporate intranet. Business users can trade knowledge, store and exchange files, create and jointly modify documents, and interact with each other in real time in collaborative workspaces. Social media strategies are closely aligned with key business goals. Social network collaboration software resorts to gamification of business processes and corporate communication. To offer tools that match the way people naturally interact, game-like motivational elements are utilised that centre on the fundamental desires people have for status, reward, achievement, self-expression, and competition (Burke 2014; Hamari 2015). Self-presentation – engaging in attempts to lead people to think of us in a particular way, creating desired impressions; part of impression management (Schlenker 1980; Leary, M. R. 1996; Krämer & Winter 2008), demonstrating capability, presenting a confident front can persuade others that one is capable and desirable (Brown 2007; Hogan & Briggs 1986) - is used as a means of achieving corporate success, that is of gaining material and social rewards (or avoid material and social punishments) within an organisation. It can also be strategic and controlled: this form of social influence to gain power over the audience is mostly represented as selective disclosures and omissions and is a matter of emphasis and timing, rather than blatant deceit (Jones 1990; Walther 2007). In the data, positive self-presentation and self-praise manifest themselves in a textual form (messages and chats), visuals (images, infographics), as well as links posted in chatting and other collaborative tools, e.g. with reference to users' profile information, number of badges, contacts, posts or 'likes' or groups followed.

Qualitative content analysis of the data at hand shows a considerable impact of the corporate culture of positive self-presentation on national cultures of the employees. In the revenue-driven corporate environment of modern corporations, the pressure to perform constantly increases (Danielewicz-Betz 2016). This translates into continuous pressure to self-disclose and manifest other- and self-recognition, which in turn may occasionally come across as excessive self-presentation and self-praise.

### ***Lebanese news broadcasts between Standard and Lebanese Arabic: Şawt al-Ġanūb as a case*** (Contribution to *Tensions within the repertoire of prescribed, prestige, and non-prestige forms*, organized by Netz Hadar [et al.]

In 2000, the withdrawal of Israeli troops from South Lebanon also meant the end of *Şawt al-Ġanūb* (The Voice of the South). Because of the ‘light programs’ and the popular Arabic and Lebanese songs it broadcasted, this Lebanese radio station was also quite popular in surrounding Arab countries. What few non-Lebanese listeners seemed to know at the time is that this station was administered by the South Lebanese Army (SLA), a Christian militia which was since its formation a close ally of the Israeli forces in South Lebanon. Apart from popular programs and songs *Şawt al-Ġanūb* also broadcasted news bulletins every hour, alternatingly in *fuṣḥā* Arabic (Standard Arabic) and Lebanese Arabic. This is interesting for several reasons. First of all, in most countries news bulletins tend to be broadcasted in the standard language, rather than in spoken varieties. This is definitely the case for so-called diglossic societies, such as Arabic-speaking societies, in which the linguistic (meta)norm for ‘serious programs’ is the standard language (e.g. the High variety, *fuṣḥā* Arabic). Secondly, the bulletins which are read in Lebanese Arabic can be said to have a hybrid character, meaning that they contain linguistic items that can be easily recognized as ‘typically Lebanese’ (1), items that are saliently *fuṣḥā* (2), shared items (meaning that they are identical in both Lebanese and *fuṣḥā* Arabic) (3) and items that combine features of Lebanese and *fuṣḥā* Arabic (4). Alternatively, this hybridity can not only be read as combinations of *fuṣḥā* and Lebanese items on phonetical, morphological, syntactical and discursive levels, but also as switches between these items, and as such they can also be analyzed in terms of intra- and inter-word code-switching. In this paper a close reading of bulletins that were broadcasted in January 1998 will be presented. The ways in which the code-switches take place, or the ways in which *fuṣḥā* and Lebanese items are combined on all linguistic levels, will be identified. Apart from this, an attempt will be made to clarify how the choice to broadcast these bulletins in Lebanese Arabic, rather than in *fuṣḥā* (or in other words, the choice to deviate from the pragmatic norm for news bulletins), interrelates with the SLA’s view on Lebanon’s national identity, especially in the view of the SLA’s relation to internal (e.g. Hezbollah, the Lebanese state etc.) and international actors (Syria, the PLO, Iran, Israel etc.) in the complex Lebanese political field.

**Anupam Das**

***Appealing images and patterns of complimenting behavior: The case of young Indians on Facebook*** (Contribution to *Complimenting behaviour in social media*, organized by Das Anupam [et al.]

There have been a few studies on complimenting behavior on social media (e.g., Eslami et al., 2015; Maíz-Arévalo, 2013; Maíz-Arévalo and García-Gómez, 2013; Placencia and Lower, 2013). These studies indicate that the complimenting behavior on social media is triggered by the contents (i.e., primarily the photos and other forms of personal status update) that members of users' networks view. Yet, there does not seem to be any language-focused CMC studies that have considered various aspects of these contents as controlling factors that influence complimenting behavior. In order to bridge the current gap in online politeness research, this study investigates what types of photos receive compliments of the members of the users' networks on Facebook and why. The study analyzes the photos and forms of compliments paid on the photos posted by 47 young urban Indian users in their 20s between August and October in 2012. Furthermore, the users were categorized in three groups based on the total number of members in each individual's network. Besides, a multimodal coding scheme was developed to analyze the foreground and background of the photos. Additionally, the comments that are posted on the photos were analyzed formulating yet another coding scheme to identify different forms of compliment. Drawing from the existing definition of compliments (Holmes, 1986; Wolfson and Manes, 1980), a compliment was identified as a form of CMC which explicitly or implicitly attributes credit to someone other than the one who produces it, usually the person addressed, for his/her possession, characteristic, skill, etc. Moreover, the photos that were tagged were segregated from the ones that were not. Similarly, the photos that had a textual caption were segregated from the ones with no caption. Finally, an inter-rater reliability test was performed on the randomly selected 10 percent of manually coded photos and compliments. The first round of analyses revealed that a total of 4537 photos were posted during this period in which there were 3578 photos that were part of the users' albums and 959 stand-alone photos. Interestingly, there were only a limited fixed number of members in a network who repeatedly comment. However, when the Facebook 'like' is included in the count, the members' participation range varies between 15-33% across three different types of users. The results further indicate that nearly 30 percent of the album photos received a total of 2988 comments. In contrast, a total of 4511 comments were posted over 80 percent of the stand-alone photos. Similarly, close to 90 percent of stand-alone photos receive one or more "likes" and most of them received far more likes than comments. However, the photos that are part of the albums received either a very few "likes" or no "like" at all. A deeper analysis of the comments revealed that close to 80% of the comments are compliments. Further, it was observed that the photos those were tagged and/or had a caption received far more textual compliments and "likes" than others. These results were further segregated with regard to the users' network strength. The findings were explained linking them to technical and social contexts of CMC (Herring, 2007). The study helps understand how timely and thoughtful posting of photos on one's timeline socially engages the members of one's network and maintains interpersonal relationships in this fast-paced life.

***Killer hugs, mad skills and no one trick ponies: self-presentation on pick-up artists' online***

**forums** (Contribution to *Self-presentation and self-praise: the neglected speech acts*, organized by Dayter Daria [et al.]

The ‘pick up artists’ (PUA) community unites men who learn and practice speed-seduction for short-term mating. The main means of contact for this community are online platforms that incorporate forums where members exchange tips, strategies and reports of their exploits. The PUA movement is highly commercialized: the so-called “gurus”, the experienced members of the community who are successful in the game, go on seminar tours around the world and are well-represented on TV and in the self-help sections of bookshops.

The essence of the PUA method is building confidence in the adept. This is achieved through a number of techniques, for example, providing scripts for flirting to help those who are shy and tongue-tied, or more generally, casting the whole encounter within a “training frame”. As such, the encounter is perceived as successful whether or not the woman reacted favourably: as in an athletic training session, the emphasis is placed on the process rather than the result (Dayter&R?<diger 2016).

Because confidence is the key element of “The Game” (the pick-up artists’ seduction process), the discourse of PUAs is ideally placed for the study of self-praise. Positive self-presentation happens on two levels: on the one hand, the man constructs a desirable identity within every encounter with a woman; on the other hand, PUA community members strive for the status of ratified members in their reports. Since the former type of data is very difficult to obtain, short of going undercover in popular PUA locations (a sacrifice which the two female authors are not yet prepared to make for science), our research focuses on the self-presentation practices within PUA online forums.

We build on our earlier quantitative work on the microlinguistic elements that PUA community members employ to construct their game as successful in the “field reports” (an online genre in which members give detailed accounts of their activities). In the present paper, we conduct a qualitative analysis of three field reports representative of the genre and the replies to these reports. We aim to find out (1) Whether the interactional norm against self-praise holds in the seduction community; (2) How is self-praise realised linguistically in the field reports. The results demonstrate that explicit self-praise is an appropriate behavior in the PUA community: it is encouraged in the novices and applauded in experienced members. In this manner, self-praise is awarded the status of a norm rather than a deviant linguistic behavior, as earlier literature implied (Pomerantz 1978, Speer 2012). Further, we investigate three types of self-praising behaviors in our data: bald-on record self-praise, proxy brags, and evidential brags. The first type involves an explicit dispositional positive statement about self, e.g. “I’ve got great game, especially when it comes to pulling at work”. The second type involves citing someone else’s praise of the author which lends the self-praise an objective air. The third type is more interpretative and involves reporting the events and behaviors that are recognized as laudable in the PUA community, but without an explicit linguistic evaluation.

***Interpretation and children's sound games: A challenge for the language acquisition researcher*** (Contribution to *On ‘interpretation’ in the context of language acquisition and in clinical settings: under the effects of speech errors and symptoms*, organized by Lier-DeVitto Maria Francisca [et al.]

The pragmatic approaches to language interaction elect as an axial point, successful communication events thus bringing to the center of research the steady relationship between the partners in dialogue. Under such a perspective, the adult-child relationship in language acquisition is dealt with from a communication point of view in which mutual knowledge and recognition of communicative intentions take place an acquire enhancement. In a quite different viewpoint, De Lemos’s theoretical approach includes, within the dynamics of the interactional relationship, the language (*la langue*) in its structural function, i.e., metaphoric and metonymic operations as mechanism of change, assuming at the same time the concept of the subject introduced in psychoanalysis. Thus, both the child’s speech and the interpretation of the other would come as an effect of the above mentioned language operations. The concept of communication is suspended as that of interpretation is

dislocated. From the child's point of view, knowledge, intentions, previous meanings are not assigned to her/his utterances. As an unavoidable consequence, the researcher's interpretation is deeply affected face-to-face the child's enigmatic productions. The remarkable heterogeneous nature of children's speech, especially at a very early stage of the child's linguistic development, increases that interpretative challenge. At this point, it is worth pointing out the intense playful relationship the child has with the language, or rather, the intense and insistent play with speech sounds, showing that the child is especially sensitive to the sounds of the signifiers he/she listens to (not to the meanings they might convey). We highlight, then, the child's speech sound manifestations which resound in the mother, returning back to the child. A continuous circular sound movement, including echoes inside the very speech of the child, constitutes the so-called *resonance games* or *sound games* between the child and the other-speaker. Eric Porge calls such a structuring dialogue type as *eco stadium* and assumes it as a structure for the subject to appear, highlighting the extent to which the quality of *sound interactions* between the baby and its parents is critical to its future blossoming as a speaker. From the perspective herein assumed, the investigator could not, then, exclude from his/her interpretation those sound interactions, as they do in other trends of research on dialogue in language acquisition, given that such interactions could not meet the criterion of knowledge or meaning assignment. Thus, children's *sound games* occupy a privileged place on the investigator's listening to the early child's speech, although they constitute a challenge to their interpretation, since they raise difficult questions and create deadlocks. I intend, therefore, to call into question the challenge posed by listening to the sound games, seeking to empirical support for this presentation on the child's sound productions at a very early point in his/her linguistic trajectory.

***The self of caregivers and patients: Co-responsibilisation in Q&A-pages concerning diabetes*** (Contribution to *Knowing me and knowing you – reference and identity markers in public discourse*, organized by Nevala Minna [et al.]

In this paper, I will present an analysis of self- and other-reference in public doctor-patient communication concerning diabetes, with a focus on whether the doctor and patient are construed as jointly performing the activities related to the treatment or not. Type 1 diabetes implies that patients play an active part in (decision-making concerning) their treatment, including self-controlling glucose levels in the blood and self-administering insulin injections. Thus, in addition to the generally increasing co-responsibilisation (Salvador & Macián 2009) of the patient in many medical interactions, the active role and co-responsibility of the diabetes patient is potentially much more important than with other medical conditions. This makes it particularly relevant to study whether doctors represent themselves, the patients, or both as responsible for carrying out the caring actions. In other words, I will analyze whether the caregivers construe the treatment as a 'joint purpose' in partnership (cf. Antaki & Crompton 2015: 649). The study will be based on a Spanish-language corpus of online public question and answer-pages of Spanish-language diabetes patient organizations and general health services, where diabetes specialists answer questions from the general public (both patients and non-patients). In this analysis, I will focus on the strategies used for self- and other-reference through the use of deixis and impersonal constructions, and on whether the self and other are construed as empowered (co-)responsible participants or not. Preliminary results show that FAQ-pages concerning diabetes generally prefer rather impersonal or passive constructions without an expressed agent (1), which leaves a certain vagueness as to who is responsible for the action. This may be due to the essentially written nature of the answers and to the fact that there is not a specific ratified interlocutor in this type of interaction. However, a Q&A-session on the Facebook page of a community health initiative (subsequently made available to the public through their website), implying a more direct interaction between the specialist and patients, provides different results, with the specialist using more deictics. Some of these uses include 1<sup>st</sup> person plural forms to (pseudo-)inclusively (De Cock 2011) refer to specialists and patients (2).

- (1) *En diabéticos tipo 1 [la insulina rápida] debe administrarse junto a insulinas lentas.*  
'In diabetics type 1, rapid insulin has to be administered together with slow insulins.'
- (2) *(2) Lo que podemos hacer es mantener el peso normal, hacer algo de deporte.*

'What we can do is maintain the normal wait, do some sports.' The identity of the patient is represented in different ways, with a clear influence of whether the question is formulated by a patient or a non-patient, the latter leading to more generalized answers than the former. Among the questions by patients, the highly specific ones trigger a more deictic address of a ratified interlocutor, whereas more general questions (e.g. concerning the possibility of doing sports) are answered with more generic structures. Thus, both the interaction situation

and the perceived personal implication of the question influence how the specialists represent their own and their patients' responsibility in the treatment.

#### ***The sincerity of friendship: A historical-pragmatic analysis of sincerity, politeness and emotional self-disclosure in the correspondence of a 19th-century monastic network***

(Contribution to *Sincerity and Epistolarity*, organized by Fitzmaurice Susan [et al.]

The broad range of meanings associated with the notion of friendship has stimulated historical and historical-pragmatic studies on the language of friendship in epistolary communication. Linguistic research has often focussed on the relationship between the polite and conventional nature of friendly language and the sincerity of the writer's feelings and self-disclosure (Haseldine 2011a; Fitzmaurice 2012; Williams 2013: 165-174).

Like politeness, the linguistic expression of subjectivity is characterised by socio-historical variation (Biber 2004; Fitzmaurice 2002; 2003). With regard to the expression of feelings, studies in the field of the history of emotions have shown the existence of conventionalised and ritualised emotional practices, including linguistic practices, among different social groups throughout history (Reddy 2001; Scheer 2012). When constructing their discourse, the speakers, or writers, "navigate" the emotional style of their group, to which they conform with greater or lesser success (Reddy 2008). In this perspective, sincerity of feelings cannot be simply described as inner thoughts matching their external linguistic expression. Instead, sincerity and its appreciation become a constitutive element of the emotional values and linguistic practices of the emotional community (Rosenwein 2006) to which the speaker belongs.

Bringing together current knowledge in both historical pragmatics and the history of emotions, this paper describes the interaction of sincerity, politeness, and emotional self-disclosure in the negotiation of relationships labelled as 'friendships' in 19<sup>th</sup>-century epistolarity. This century is of particular interest for the study of the Western notion of sincerity, since it has been argued that, during this century, sincerity became a central element of both emotional practices (Reddy 2001: 139-314) and positive politeness (Patemoster 2015: 219-223). As a case study, the paper analyses the multilingual correspondence in Italian, Spanish and French of a group of European Benedictine missionaries in Australia between the 1840s and 1900. Two considerations show that monastic correspondence offers unique perspectives. First, friendship and epistolary friendship have a long-lasting tradition in monastic intellectual speculation and social practices (Haseldine 2006; 2011b). Secondly, the monastic environment has been identified as an exemplary case of emotional community (Rosenwein 2006: 79-99; 2010), in which emotional practices are performed within the interaction of solidarity and hierarchical relationships.

The methodology of the study is twofold. On the one hand, the paper describes the pragmatic functions of the lexicons of sincerity and friendship, focussing on those linguistic structures (such as speech acts and epistolary formulae) where these lexicons are functional in reaching pragmatic goals or in defining the relationships between the correspondents. On the other hand, working within the analytical framework of appraisal theory (Martin & White 2005), the paper investigates the interpersonal functions of the lexicon of emotions in the letters. Through comparison with electronic corpora of 19<sup>th</sup>-century letters in the selected languages, the paper describes conventionalised emotional self-disclosure in the letters. Particular attention is paid to lexical elements located at the border between sincerity markers and emotional expressions.

***Entextualizing health: Social media uptake of health messages from a Belgian infotainment TV show on food and nutrition*** (Contribution to *Food for thought and social action: Constructing ideologies in food-related communication across digital and cultural contexts*, organized by Gordon Cynthia [et al.]

This paper examines the Twitter and Facebook uptake of health messages from an infotainment TV show on food, as broadcasted on Belgium's Dutch-language public broadcasting channel. The interest in and amount of health-related media coverage is rising (Hallin & Briggs, 2016), and this media coverage is an important source of information for lay people, and impacts health behaviours and therapy compliance (Grilli et al. 2002). This is unsurprising, as media do more than just represent information provided by health professionals, but also model health knowledge and frame who should attend to it and how (Hallin & Briggs 2016). Ethnographic fieldwork at the editorial board shows that the shows' editors also model and frame the information in a particular way: they want to inform the audience about food to empower them as critical patient consumers, i.e. a patient who is well-informed and aware of risk factors, and makes active choices on health (including nutrition). This, however, requires trust in the media, and research has shown that trust in the media is currently at an all-time low (Bakir & Barlow 2007). We have therefore conducted a quantitative content analysis, to examine (1) to which elements in the show the audience reacts, to gain insight in how much traction the nutrition-related content generates (the show also contained items on production, and we hypothesized the entertaining style might also elicit reactions) and (2) whether audience members are accepting or resisting the health information in the show. Our findings show that the information on health (18,9%) and production (21,6%) elicit most reactions, and that the reactions that evaluate the health-related claims are mixed: 23% express refutation, 4,8% of reactions express doubt, and 31,7% express acceptance. Social media users' reactions reflect a critical attitude towards health-related claims, but also the complexity of food choices, which are not solely driven by health-related incentives.

***Refusing complaints in CMC. From theory to practice and back*** (Contribution to *Research versus Practice: Towards a Stronger Partnership between Academia and the Real World in the Study of Institutional Discourse*, organized by Vandendaele Astrid [et al.]

Marketing studies have shown that customer satisfaction in complaint management not only depends on economic and procedural fairness (see, a.o. Hess, Ganesan, & Klein 2003, Orsingher et al. 2010), but also on interactional justice (Mattila and Patterson 2004), i.e. the way in which the complainee is treated and the message is framed and formulated. The importance of this delicate balance between problem-oriented approaches and people-oriented approaches has also been expressed in linguistically oriented, cross-cultural pragmatics (House 2006, Kraft and Geluykens 2004, Tanck 2004, Meyer 2007, Felix-Brasdefer 2012) and in guidelines, instructions and manuals on proper and appropriate language- and complaint handling procedures. Interestingly, the analysis of actual B2B complaint management data (see authors, submitted) reveals an interesting tension between theory and practice in its virtual absence of interpersonal moves (e.g. the inclusion of apologies, gratitude and empathy), which in itself raises questions regarding the effectiveness of the linguistic strategies that are suggested in the literature and those that are actually implemented in practice. In this paper, we will further explore this tension in two ways. First we will set up an in-between group experiment in Dutch, English and German in which we test the impact of actual data samples and samples that were manipulated according to guidelines on customer outcomes (including a.o. customer satisfaction, loyalty, perceptions of politeness, professionalism and justified decision taking) of two target groups: a convenient sample of student populations and a sample of sales representatives of the company the data was harvested from. Secondly, we will report on post-experiment interviews in which sales representatives reflect on the results of both scenarios across both populations and on the feasibility of implementing these interpersonal strategies in their complaint management. As such, practitioners can gain a better insight into the possible benefits of personalized approaches while academics can introduce know-how and hands-on knowledge regarding B2B complaint management in theoretical frameworks that have hitherto mainly been oriented to B2C contexts. Ultimately, these results and those offered by the additional B2B perspective can be used to optimize actual complaint management and theorization regarding complaint management as well as inducing the sales representatives metalinguistic awareness.

**Lizeta Demetriou**

***Phrasal verbs in textbooks: An in depth investigation*** (Contribution to *Teaching Formulaic Language to L2 Learners*, organized by Bldas Marti Oscar [et al.]

Phrasal verbs have been widely discussed by linguists due to their frequency in English Language, the difficulty they present to language learners and their pedagogical value (e.g. Bolinger, 1971; Darwin and Gray, 1999). However, so far, only a limited amount of research has investigated the selection criteria and repetition of phrasal verbs in ELT textbooks (e.g. Koprowski, 2005; McAleese, 2013; Zarifi and Mukundan, 2013). Moreover, although phrasal verbs are highly polysemous, since on average every phrasal verb has 5.6 meaning senses (Gardner and Davies, 2007) none of these studies have examined which phrasal verb meanings are taught in textbooks and how often they are repeated. Motivated by this lack of research on polysemous phrasal verbs in ELT textbooks, this study aims to investigate the selection criteria and repetition of phrasal verbs and phrasal verb meanings in the selected textbooks. Research has shown that repetition of lexical items facilitates vocabulary learning (e.g. Nation and Wang, 1999; Rott, 1999; Webb, 2007). Therefore, investigating how often phrasal verbs and their meanings are recycled in the textbooks can potentially have useful implications for second language material design.

This study examines the selection of phrasal verb meanings and their repetition in ELT textbooks. Specifically, six EFL textbooks at intermediate, upper-intermediate and advanced proficiency level are examined. The identification process of the phrasal verbs and their meanings is based on a phrasal verb frequency list by Garnier and Schmitt (2015) which lists the 150 most frequent phrasal verbs in English language along with their most frequent meaning senses. Preliminary data analysis indicates that i) phrasal verb selection in the textbooks is not based on frequency criteria and ii) there is not adequate repetition of neither phrasal verbs nor their meanings presented in the textbooks. Limitations of the study and necessary future research will also be discussed.

***Interactional routines in teacher-child and peer interactions: The case of a preschool in Northern India*** (Contribution to *Interactional routines in caregiver-child and peer interactions*, organized by Nomikou Iris [et al.]

Organizing interaction in large groups on a regular basis requires routines, particularly interactions with small children who do not yet fully dispose of cultural conventions of social conduct. Routines are hence a common feature in preschool interactions. They facilitate transitions between daily activities and are important for the functioning of instruction in the class. The social organization of preschool routines not only develop out of a recurrent interactional format within a given classroom but always also constitute cultural practices that have socio-historically evolved and are dialogically interwoven with broader discourses of good child pedagogy. Routines in teacher-child interactions hence not only provide a platform for the acquisition of conventionalized means of communication but of culturally appropriate interactional roles that go beyond the classroom. The present talk will look at interactional routines in a preschool in North India that has recently adopted a Montessori approach, which leads to novel and hybrid forms of interactions in the classroom. Analysis is based on a 3-months ethnographic study including several hours of video recording as well as interviews. It uses multimodal interaction analysis (Goodwin, 2000; Mondada 2011) and particularly looks at the use of diverse semiotic modalities, not only oral communication but also haptic scaffolding (Cekaite, 2015, 2016) and material devices (e.g. the use of a bell) to investigate how routines are organizing classroom interactions. Particularly, it looks at how children come to take up their role in routines and the ways in which children's participation is scaffolded by the teacher and peers. The study shows that these routine practices served as multifaceted sites not only for organizing classroom interactions but also for socializing moral conduct in which children are assigned specific rights, duties, and obligations.

***Negative evaluative uses of demonstrative-classifier di in Wugang Xiang*** (Contribution to *Deixis in Discourse*, organized by Yang Ying [et al.]

The Wugang dialect, a typical variety of new Xiang dialect, has a general plural classifier *di*. Similar to Mandarin *xiē* and Cantonese *dil*, it can be used as a quantity classifier (Zhang & Tang 2014) referring to a small amount of things in the construction [DEM+*di*+N], or as an indicator of a slightly higher degree as in the [ADJ+*di*] and [ADV+*di*] constructions, with examples such as *gao di* '(a bit) taller' or *me di* '(a bit) more slowly'. However, it is interesting to note that different from Mandarin *xiē*, which seldom appears independently without any pre-modifier, a common phenomenon in Wugang dialect is to elide the demonstrative in [DEM+*di*+N] constructions to form [*di*+N] constructions which are frequently associated with negative evaluations. In this study, we will examine how Wugang *di* constructions develop from referential to evaluative uses.

More specifically, we analyze tokens of [*di*+N] constructions used in daily conversations, and classify them according to the following structural types and functions: (i) indefinite referent [*di*+N] with an indefinite quantity reading equivalent to English 'some', as in (1), (ii) definite referent [*di*+N] without negative evaluation, as in (2), (iii) definite referent [*di*+N] with a distancing effect ~~or~~ and/or contextualized negative evaluation, as

in (3), and (iv) indefinite referent [*di+N*] with negative evaluation, in which *di* is fully grammaticalized from a classifier into an attitudinal marker, as in (4). Our data also shows how the function of *di* as an attitudinal marker is further expanded in [*di+ni/go+ge+N*] constructions, which yield negative evaluations in the sense of ‘N (=someone/something/someplace) *such as this?!.*’

Using an interactional linguistic framework (see Selting & Couper-Kuhlen 2001), we analyze how [*di+N*] constructions are used to evaluate others negatively. The findings of this study show how demonstrative classifiers can be used to express speaker’s subjective stance in interactional talk. Our analysis reveals that the possible source for the emergence of [*di+N*] with negative evaluation, i.e. type (iv), may be ~~it’s~~ the psychological distancing effect from the covert distal demonstrative *ni* ‘that’ in the source construction (i.e. [*di+N*] < [*ni+di+N*]). Data for our analysis comes from a 9-hour database of casual conversations among native speakers of Wugang Xiang.

***On the integration of natural order into social order: The case of bird of prey demonstrations*** (Contribution to *Talk in/with the Environment and Other Life Forms*, organized by McIlvenny Paul [et al.]

Over the last two decades, there has been a rising interest in the (social) relationship between humans and animals (e.g. De Mello 2012). Studies of interaction between humans and animals mostly rest on ethnographic work (Hurn 2012). In order to understand better how human-animal relationships is shaped in terms of situated practices and trajectories of interaction, video-based research is needed, which is, however, still very rare (but see Mondémé 2013). The talk draws on an ongoing study of social interaction in bird of prey shows in Germany and France (lasting 30-50 mins. each). Currently, data from five shows have been recorded. The study follows the approach of multimodal interaction analysis (Mondada 2016), based on principles from conversation analysis and ethnomethodology. In bird of prey shows, two participation frameworks intersect: The interaction between falconer and the birds and between the falconer and the audience. Combining information with entertainment, bird of prey shows are performances in which ordinary people are offered an experientially based kind of access to natural phenomena beyond the scope of their everyday lives. A key feature of the artful construction of such events lies in the falconer’s practices of integrating the natural logics of the behavior of the birds into the socio-logics of human interaction. This involves treating birds as human-like actors with cognitive

and emotional properties. Birds' behaviors which from an ethological point of view are based on instincts, classical or operant conditioning, are sometimes interpreted as intentional and even strategic actions (cf. Sanders 1993), vocal expressions are treated as emotion displays (cf. MacMartin et al. 2014) or as human-like speech and assuming intersubjectivity of meanings. In short, the animals are sometimes treated as meaningful social actors, whose behavior can be understood analogous to social action. The integration of natural phenomena into the logics of social interaction adopts different shapes:

- a) coordinative (multi-)activities involving the integration of the trajectories and requirements of the two streams of behavior (interaction with audience and interaction with birds),
- b) anthropomorphizing (re-)framings of animal behavior by the ascription of (communicative) intentions and human-like psychological motives (like jealousy, laziness, etc.) , and
- c) exploitations of animal behavior for concerns of humorous entertainment. In the following extract, the falconer (FA) treats the eagle owl's (EO) vomiting as if it was caused by excessive drinking, jocularly displaying mock-empathy with the bird's subjective state:

01 FA un darum hat er sich entschieden nachts zu jagen, (0.4)  
*and therefore he has decided to hunt at night*

02 FA un nachts is et natürlich ganz ein (0.8)  
*and at night it is of course very simp*

***Debates on "something called 'capitalism': Metalinguistic strategies in online user comments on financial and economic news reporting*** (Contribution to *Financial literacy – a key to the real world*, organized by Whitehouse Marlies [et al.]

Studies that have focused on financial and economic news discourse have amply demonstrated how media conceptualisations of economic crises are rarely, if ever, value-free. At the same time, less discourse-oriented attention has been paid to conceptualisations and communicative strategies on the part of laypeople engaged in the discussions. In order to do so, as a first step it is necessary to acknowledge that the field of economics relies on what Resche (2000) calls “oddly flexible terms”, an analysis that also applies when these terms enter the

mediatised public sphere of online news reporting. This acknowledgement brings to the fore long-standing debates about audience news reception in either structuralist vs. constructionist theoretical frameworks. At the same time, existing discourse-analytical work has already paved the way for thorough investigations into how laypeople 'talk' economics and finance. Such investigations may illuminate how news users (mis)appropriate economic/financial concepts to construct their own arguments along the way, hence also offering insights into news users' varying financial/economics literacies.

The current paper will attempt to make a contribution by investigating online user comments on *The Guardian* and *The Times* message boards. The analysed comments, posted underneath relevant news articles, were produced during 3 time-frames in April 2010, November 2010, and April 2011, when resp. Greece, Ireland and Portugal first applied for IMF/EU/ECB financial aid. The paper seeks to address the following research questions: To what extent do news users explicitly comment on financial/economic terminology in the news reports? Concurrently, to what extent do they show awareness of the newspaper's own discursive strategies? And, in general, how may their practices influence the potential of online message boards to productively function as platforms for debate? In order to provide an answer to these questions, the paper applies a framework that originates with the insight that linguistic reflexivity and metapragmatic awareness permeate our language use to varying degrees (Agha, 2007; Verschueren, 2000). Thus building on a renewed focus on all aspects 'meta' of language use, the framework employs tools of linguistic pragmatics and conversation analysis to describe news users' debates on economics and economics news reporting. The paper argues that in these types of exchanges the varying ambiguity of financial/economic concepts and arguments influences the ease with which a productive debate may take place, as well as the amount of semantic manipulation of the terms on the part of users taking place. To a limited extent, moreover, the data demonstrate news users' awareness of the varying connotations and uses of certain terms and arguments. This may lead to strategically motivated 'comments on the code', where users problematize, modify, and redefine terms. With, so to speak, politics enveloping lay economics, the paper suggests future work on identifying discrepancies between specialised finance/economics terms and their usage in the public sphere, and on identifying to what extent newspaper conceptualisations of the crisis align with the financial/economic literacies of the target audiences.

*Understanding implicature in films: All is not lost in subtitling* (Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

Within the thus far limited body of literature on the pragmatics of audiovisual translation, studies on the cross-cultural relay of implicatures remain extremely scarce, despite the salience of the latter within pragmatic enquiry and the fact that their use and interpretation can be significantly culture-bound. This paper reports on a study of the reception of implicatures in the multimodal, cross-cultural environment of subtitled film (Desilla 2014), thus representing a step towards enhancing our understanding of the way target-audiences comprehend pragmatic film dialogue meaning in comparison to source-audiences. Drawing on theoretical and methodological tools from cognitive (experimental) pragmatics, film studies and multimodality, this paper aims to shed light on the comprehension of implicatures by British and Greek viewers of 'Bridget Jones's Diary' (2001) and 'Bridget Jones: The Edge of Reason' (2004). In particular, it will be demonstrated that allusions to British literature, TV and film, presented the Greek audience with substantial difficulties. These results accord with Leppihalme's (1997) empirical finding that allusions to the SC when translated literally tend to be *culture-bumps* for target audiences. Overall, data analysis has clearly shown that viewers did not always understand intertextual references in the way the filmmakers would like them to. Interestingly, though, this finding, albeit in different degrees, is applicable to both British and Greek viewers, indicating that implicit meaning is not only lost in translation. As individuals, audience members always personalise their film experience: private meanings inevitably emerge as each viewer embodies a unique combination of life experiences, values, and beliefs (Phillips, 2000). Ultimately, this paper aspires to bring into sharp relief that a failure to understand the allusions intended by the filmmakers does not always prove detrimental to film comprehension or viewer enjoyment. Besides, in scenes with intertextual features, cinematic signifiers are not deployed in order to convey "fixed meanings but are instead intended to allow the spectator to (...) engage with the film in a playful way" (Stafford, 2007: 83-84). In fact, many of the participants' responses in the present case-study clearly evidence that viewers are active meaning-makers who draw inferences by creatively combining visual and acoustic information, as well as by linking what they perceive to previous experience, thus managing to understand

implicatures, as well as their comedic and narrative functions, even if only in part (Desilla, 2012; 2014). ----

***Tense, aspect, argumentation, or: What drives the anterior cycle?*** (Contribution to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.]

In Western Romance as well as in the neighboring Germanic languages, HAVE-resultatives have evolved into various types of anteriors. According to a classical model proposed by Harris (1982), these constructions represent different stages of an evolutionary cycle. At stage 1 they denote the current result of a past event (e.g. *I have finished now*); at stage 2 they come to refer to iterated or durative events extending from the past to the moment of speech and beyond (*until now, I have been pretty pleased with Spybot*); at stage 3 they refer to past events with an abstract impact on the moment of speech (*his father has died from cancer recently*); finally, at stage 4, they come to denote perfective past events which are part of narrative event chains and thus are no longer anchored in the moment of speech (e.g. French *et puis je lui ai dit que ...* 'and then I told him that ...'). Thus, there seems to be an overall tendency for these constructions to gradually lose their connection with the moment of speech as they move on in the cycle. My paper focusses on two Spanish constructions, namely the *perfecto compuesto* (*se lo he dicho* 'I have told him') and resultative *tener + past participle* (*se lo prometido hecho* 'I have promised it to him'). Based on diachronic and synchronic corpus data, I will show that - due to their strong connection to the moment of speech - both constructions lend themselves to certain types of argumentative operations; as these become sedimented, they can give rise to new grammatical functions. In my talk, I will substantiate two major claims: a) all of the aforementioned operations follow a simple extralinguistic principle, and b) it is this principle that ultimately drives the anterior cycle. Ultimately, I will present a hypothesis concerning the specific differences between the motivational patterns underlying grammaticalization in the narrow sense (instantiated by the anterior cycle) and the forces behind the cyclic evolution of discourse markers.

#### Laura Devlesschouwer

***Cancelability vs. conventionality: The case of Garden-Path Puns*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

In this paper, I will question the cancelability test for identifying generalized conversational implicatures (GCIs), by arguing that it fails to distinguish implicated from conventional content. I will illustrate this problem by reanalyzing Dynel's (2009) examples of garden-path puns. Garden-path jokes depend on the cancelability of interpretations that apparently arise by default. Compare:

- (1) "I've never carried a torch for her! It's the 21<sup>st</sup> century; electricity is everywhere!" (Dynel 2009: 141);
- (2) "He told me I was in shape. It was nice with the exception that round is a shape as well" (Dynel 2009: 1);
- (3) "I'm a wonderful housekeeper. Every time I get divorced, I keep the house" (Dynel 2009: 268).

Dynel (2009: 216) notes a tension: on the one hand, the 'default' meanings of the punning elements (*to carry a torch for someone, to be in shape, housekeeper*) are conventional and encoded, but on the other, they seem cancelable (since their normal interpretation is overridden). Dynel (2009: 216) concludes that some

conventional meanings need to be reanalyzed as GCIs. However, not only is this conclusion counterintuitive, but there are also other reasons for regarding these meanings as non-pragmatic.

Puns such as (1) exploit the *ambiguity* of phrasemes between their idiomatic and their literal meaning. Although disambiguation is a defeasible mechanism involving pragmatic inferences, the inferences concern the *selection* of an encoded meaning, rather than that they *generate* a meaning (as is the case with genuine implicatures). Puns such as (2) and (3) require the assumption that linguistic *conventions* are broken, rather than that implicatures are canceled. In (2), “in shape” is given a meaning that it does not have (*viz.* ‘to have a shape’). In (3) the speaker creates a new word, *viz.* “housekeeper” with the meaning ‘person who keeps the house after a divorce’. The reason why Dynel (2009) gives a unified analysis of (some) conventional meanings and GCIs is that they behave similarly in terms of cancelability. However, the latter fact opens the way for an alternative analysis whereby these GCIs are conventional. For example, instead of saying that an implicature is canceled in “I don’t dislike my work. I practically loathe it” (Dynel 2009: 249), one could analyze the double negation as systematically *ambiguous* (cf. puns of type 1) between a metalinguistic reading (‘It is not that I DISLIKE it’) and a non-metalinguistic reading (‘I don’t mind it’) –normally disambiguated by intonation. In “I like kids but I don’t think I could eat a whole one” (Dynel 2009: 218), the collocation *to like kids* can be considered a *formulaic sequence* (Wray 2002) bearing one conventional meaning, which the speaker subverts by endowing *to like kids* with a meaning that it does not have (cf. puns of type 2/3), *viz.* ‘to like eating kids’. In sum, the cancelability test fails to distinguish implicature cancellation from disambiguation and meaning creation. This raises the question whether ‘default implicatures’ (GCIs) can be distinguished from conventional meanings at all.

***The interaction between duration of study abroad, diversity of loci of learning and sociopragmatic variation patterns: A comparative study.*** (Contribution to *Student mobility and pragmatic competence*, organized by Barron Anne [et al.]

Whilst the field of Interlanguage Pragmatics has produced a rich and diverse literature in recent years, the majority of studies have focused on the acquisition of certain sociopragmatic variants rather than the acquisition of the ability to vary language output in a way that is congruent with the situation. With the aim of filling that gap, the current study, working from an expanded definition of Study Abroad (SA), explores the interplay between duration of SA and sociopragmatic variation patterns in three groups of highly-advanced non-native speakers of English. It does so through the paradigm of Loci of Learning - that is the study of the intensity and diversity of micro-learning contexts that learners may encounter. In order to examine the correlation, a two-fold study was conducted. Firstly a language contact profile (LCP) questionnaire was completed, which provided detailed data regarding the duration of SA experiences and the diversity of loci of learning to which the participants had access. Three groups were then formed and participants were put into dyads to enact the speech act of asking for advice in two socially-differentiated situations. The performance data were subsequently analysed, using a discursive practice framework, to show how differential duration of SA and the consequent differential interaction with loci of learning shape learners’ patterns of sociopragmatic variation vis->0-vis the strategies of conventionalization and directness as well as the substrategies of solidary and non-solidary moves. Results indicate that those who have spent more than one year in SA have access to a wider range of loci of learning and as a result index sociopragmatic variation via a wider and more complex range of (sub) strategies.

#### Jennifer A. Dickinson

***[thumbs up][laughing Meep][Pusheen heart]: Ukrainian deaf expression and alignment in pictorial and text comments on Facebook posts*** (Contribution to *Between Graphic and Grapheme: Representation in Writing*, organized by Dickinson Jennifer A. [et al.]

This paper examines the pragmatics of written and pictorial (emoji and sticker) comments on Facebook posts in groups oriented towards users of Ukrainian Sign Language. As Keating and Mirus (2003), Keating et al. (2008) and Schneider et al. (2012) have argued, electronic and computer mediated communication have had a considerable impact on Deaf communities, enabling both text-based and sign-based strategies for remote communication such as video, email, texting and image-sharing. At the same time, linguists have also begun to examine posts and comments on social networking sites from the points of view of conversational structure (Farina 2015; Fullwood et al. 2013), expression and interpretation of emotion (Vandergriff 2013; Wang 2016) and the negotiation of linguistic repertoires (Androutsopoulos 2014; Birnie-Smith 2016). This paper considers both of these perspectives in the Ukrainian context, where Facebook and other social media sites are utilized at platforms for sharing user-made narrative videos in Ukrainian Sign Language, memes or other picture-and-text items, and to a lesser extent, text-only posts in either Ukrainian or Russian. Comments in these groups are most frequently picture “stickers” or emoji, or textual (written) responses. Relying on both a review of over 50 posts and the responses accompanying them, I consider whether these three kinds of posts: video, picture-with-text, and text only, prompt different types of comments. In my analysis, I focus on two factors that contribute to users’ choice between a pictorial (sticker) and text-based comment response: whether the initial post was primarily sign/pictorial (e.g. a video or picture), and thus a pictorial response signals accommodation to the posters’ preferred communication mode; and the extent to which the post elicits strong emotional responses as stickers/emoji aligned with sentiments in the original post, or prompts a debate conducted through written comments. In this way, the modality of both posting and commentary offers multivalent means for expressing alignment or disalignment with a post both on the level of modality and content, both of which I argue are relevant for the linguistic negotiation and expression of Deaf Ukrainian identity in these social networking forums.

***Bodily practices for managing mobile phone activity in ordinary conversation*** (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.]

As a result of their ubiquity, mobile phones are frequently used—and become a target of participants’ collective attention—during face-to-face activities. The current paper examines how participants coordinate both verbal and embodied conduct to manage mobile phone activity in the course of co-present interaction. While research has begun to address the limits of technology-enabled multi-tasking and attention (e.g., Ralph, Thompson, Cheyne, & Smilek, 2014; Reinsch, Turner, & Tinsley, 2008; Stephens, Cho, & Ballard, 2012; Wang, Irwin, Cooper, & Srivastava, 2015) and the ways in which mobile telephony is managed during face-to-face social interactions (DiDomenico & Boase, 2013; Humphreys, 2005; Raclaw, Robles, & DiDomenico, In Press; Weilenmann & Larsson, 2002), relatively little work has examined the embodied means by which communicators attend to the audible chimes or vibrations that indicate an incoming text (or SMS) message (what we term a “mobile text summons”). Analyzing data from a collection of video recordings of naturalistic interactions involving mobile phone use, we focus on participants’ embodied shifts in participation framework as participants move between attending to mobile phone activity and the local activities of the co-present interaction.

In Extract 1, for example, one participant (Amy) shifts her eye gaze toward her mobile device in response to a mobile text summons while simultaneously displaying her reciprocity to an in-progress telling:

Figure 1 Amy embodying reciprocity while holding her mobile phone in hand (line 08).

Figure 2 Amy gazes down toward her mobile (line 17).

Extract #1 [MS01 artsy fartsy now 21-00]

01 B: And he was like u:m: (.) he was like o::h. (0.4) >He's  
 02 like< well then we'll just hang out during the during the  
 03 week I was [like yeah ]  
 04 [((A's mobile chimes))]  
 05 B: [we'll do like Starbucks=  
 06 A: [((gazes down at mobile))]  
 07 B: =or something [he was like (.) .hhh] [he was like (0.2)  
 08 A: [((picks up mobile)) ] [((gazes at B))]  
 09 B: >he's like< what are you like artsy fartsy now,  
 10 [He was li(hh)ke hē was like]  
 11 A: [((gazes down at mobile))]  
 12 B: .hh videos an- and Starbucks [and I was lik(hh)e I w(h)as]  
 13 C: [Hu:ah hehe  
 14 B: lik(h)e< hh[h ]  
 15 C: [.hhh]  
 16 B: [I was like] I love Starbucks [Hehh [he ]  
 17 A: [((typing))]

In lines 01 to 06, as Bri is engaged in a storytelling that involves a mutual friend (and thus invites Amy's reciprocity), Amy visibly embodies her participant status as a recipient to this talk: Both her head and eye gaze are turned toward Bri, who is seated to Amy's immediate right, while her hands are at rest. In line 07, Amy's mobile emits a chime indicating an incoming mobile text summons; Amy orients to the summons by briefly turning her head and gaze away from Bri (still the current speaker), then picking up her mobile while returning her gaze to B. Amy coordinates her gaze away from Bri and toward her mobile following as Bri's talk reaches a point of syntactic completion (lines 7-8), and Amy begins to type (presumably constructing a text message response) after the talk has moved into an episode of shared laughter between the other two participants. Amy's use of embodied resources such as eye gaze and the visible, tactile manipulation of her phone thus allow her to move between participation frameworks, displaying attentive reciprocity to Bri's in-progress telling and shifting out of that framework to attend to her mobile phone at points in the talk where there is a projectable shift in the local activity toward the possible completion of an ongoing action.

Building on recent scholarship addressing the way mobile technologies can become intertwined with co-present communication (e.g., DiDomenico & Boase, 2013; Haddington & Rauniomaa, 2011), our analysis contributes to understandings of the notion of "activity" in interaction (Robinson, 2013). This includes how participants manage the transition between activities (whether mobile-mediated or co-present) and how co-present activity is locally organized in the midst of simultaneous embodied, mobile-related activity. Thus, the present analysis work provides a glimpse into how interactants navigate the multiple, potentially overlapping contingencies that are increasingly relevant as mobile phone use invites streams of multi-activity amidst episodes of everyday talk-in-interaction.

**Elke Diedrichsen**

***Linguistic expressions as cultural units: How a cultural approach to language can facilitate the description of modern means of communication and expression*** (Contribution to *Intercultural Pragmatics and Cultural Linguistics*, organized by Schröder Ulrike [et al.]

Many philosophers and anthropologists agree that not only from a functional-pragmatic, but also from a cognitive and semiotic perspective, language is shaped by culture on a number of levels (cf. Sharifian 2015, Wolf and Polzenhagen 2006, Everett 2012, Evans 2014). Linguistic meaning is based on conventions of use with linguistic expressions (Wittgenstein 1960). According to Eco (2002), a linguistic sign is a cultural unit. In order to use it properly, a speaker relies on communicative experience with this unit within a culture. A linguistic sign is coined in interaction. Its size and shape may vary, and it may contain non-linguistic material, like eye gaze or gesture. The sign emerges and is shaped within and through culture. It is a cultural achievement shared by speakers within that culture (Feilke 1996, 1998). Common ground in terms of shared knowledge is not a static background resource, and the extent of its use for communicative interaction is not predictable. Rather, it is dynamically created and re-created in the communicative exchange. Common Ground can be understood as a socio-cultural resource (Barr and Keysar 2007, Kecsk>9s 2008, 2010, Kecsk>9s and Zhang 2009). As linguistic utterances are always part of the sociocultural setting in which they are used, the pragmatics can become a component of the utterance meaning by convention. Each communication can be seen as a cultural ritual, in which participants take on roles and use expressions that have a part in that ritual, which, again, is known to interlocutors by cultural experience (Silverstein 2004). The term “culture” is mostly associated with the idea of “different cultures” in terms of different geographical regions, religions, and organisations of civilization. For the talk, we apply a general definition of culture, as this allows us to include sign use in subcultures, for example, and in particular internet culture: *Each setting in which people share experience, and where communication and tradition happens can be called a culture, and it comes with its own style of communication and its own linguistic expressions.* The paper will make a strong case in favour of including cultural aspects in the description of linguistic utterances. We will expand the notion of ‘cultural unit’ for the description of linguistic expressions by including Internet Memes. The term builds on Richard Dawkins’ 1976 definition of a ‘meme’ as a unit that is the cultural equivalent of a biological gene. An Internet Meme is a schema for content that can take multiple forms. Milner (2013:2359) describes Internet Memes as “multimodal symbolic artifacts”, and Shifman (2013:367) defines them as “units of popular culture that are circulated, imitated and transformed by Internet users, creating a shared cultural experience”. The concept “meme”, used in particular for communicative interaction, has the descriptive advantage that it can extend beyond the realm of linguistic items and comprise non-linguistic content in a variety of channels like the Internet and its social forums, street art and many other forms of human interaction.

**Stefan Diemer & Marie-Louise Brunner**

***Describing likes and dislikes regarding known and unknown food items in German Taster Lunches*** (Contribution to *Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German*, organized by Szatrowski Polly [et al.]

The paper looks at the way likes and dislikes regarding known and unknown food items are expressed in an interactive meal setting. Our dataset consists of a series of three Taster Lunches, each with three German native speaker participants, recorded at Saarland University, Germany, in July 2016. Participants were given three different meals to taste, one Japanese, one Senegalese, and one German, without providing information about the respective backgrounds of the meals (see Szatrowski 2014: 27ff. for the concrete setup of the Taster Lunches). The conversation during the meal was recorded and selectively transcribed. For the purpose of the current paper, we focus on the analysis of lexical and nonverbal means of interactively evaluating both known and unknown food.

Results suggest that likes and dislikes are first expressed in terms of visual impression and then either corroborated or relativized in terms of smell and taste. This expression is achieved through verbal means, but also in an embodied performance (Goodwin & Goodwin 2000, Szatrowski 2014) employing nonverbal resources such as gestures (e.g. pointing or head-shaking), body movements, facial expressions (smiles, expressions of disgust), evaluative exclamations, or laughter (Szatrowski 2014, Bassene & Szatrowski 2014, Brunner, Diemer & Schmidt, forthcoming).

Known food items, in particular, German national dishes such as “sauerkraut” and “bratwurst”, are placed in an experiential context, contributing to the construction of personal identity (Koike 2014), and also providing a

prompt for personal descriptions and anecdotes (see also Brunner, Diemer & Schmidt 2014). This individualizes the food experience, while at the same time allowing direct or indirect comments on the national stereotype from an in-group perspective. Unknown items are preemptively evaluated by appearance, with expressions covering the spectrum from positive to negative evaluation (including indifference). In several instances this first evaluation is achieved through the construction of an experiential reference from components that seem familiar, often in an unspecific way or by creating ad-hoc categories (Koike 2014, e.g. a perceived “Asian” food setting). This allows individual participants to create an expert identity which is then used to prescriptively position the food items and influence the impression of the other participants. The primary evaluation is verbally specified in the course of the actual tasting, through descriptions of smell and taste.

Participants frequently perform a final evaluative exchange and discussion before moving on to the next meal, though in contrast to observations by Szatrowski (2014) on Japanese (and to a lesser extent) American Taster Lunches, participants in our dataset do not seem to consider a shared common evaluation to be necessary before moving on to a different item. In conclusion, our findings suggest that the tasting experience in our setting is expressed on several levels, illustrating sensory experiences with verbal and nonverbal expressions of like or dislike, and positioning known and unknown food items in the broader context of personal and national identities.

#### ***Pre-post editing on Facebook: The defensive and protective orientations to ‘Face’***

(Contribution to *The micro-analysis of online data (MOOD): Using discourse and conversation analytic methods to analyse online interactions*, organized by Meredith Joanne [et al.]

This paper is focused on a chapter of a PhD thesis that explores how the affordance of pre-post editing aids the construction of self within Facebook messages and posts. Here, a pre-post edit refers to changes made in the *construction* phase of an interaction. That is, edits made before a message or post is shared within an inbox or on a newsfeed or Facebook profile. Such edits are thus never seen by the recipient/s and have been referred to in literature as ‘message construction repairs’ (Meredith and Stokoe, 2014). The process of such ‘message construction repairs’ in computer mediated communication has been studied minimally, with existing work focusing on the frequency of pre-posts edits and on *who* is involved in the edited interactions (both in terms of the typers and recipients) (Das and Kramer, 2013; Walther, 2007). Meredith and Stokoe (2014), however, extended this field of work by collecting real time recordings of Facebook ‘Chat’ interactions focusing instead on the *content* of edited posts and exploring the similarities and differences between ‘repair’ in online and offline talk. What this paper intends to do, then, is expand this line of work focusing on real time recordings of Facebook interaction but extend exploration to consider pre-post editing in other, more ‘public’, Facebook communicative modes, such as comments on wall posts and status updates, as well as Facebook chats and

messages. This paper's primary concern is also on the relationship the affordance of editing has on processes of self and impression management. To address this, this analysis is framed by the Goffmanian concept of 'face' and examines not only how such an affordance is utilised to defend the 'face' of the typer but also how it is utilised to protect the 'face' of the recipient (Goffman, 1967). Through applying analytical lenses of discursive psychology (DP) and conversation analysis (CA), the screen capture data collected from this project reveals how interactional acts such as disclosing information, accepting apologies and justifying decisions can be re-designed, re-orientated to and completely avoided in the pre-post construction phase of social media interactions. Discussion of this analysis will also be reflective in nature, addressing methodological challenges encountered in terms of collecting real time data from, and applying methods of DP and CA to, Facebook talk.

***How and why reported speech is (and is not) framed: Grounding in Indonesian youth conversation and literature*** (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.]

How and why reported speech is (and is not) framed: grounding in Indonesian youth conversation and literature  
Dwi Noverini Djenar & Michael C. Ewing

Studies on reported speech in interaction have shown that speakers routinely quote others to serve their interactional goals, including providing a basis for asserting a particular state of affairs (Pomerantz 1984, Holt 1996) and making claims to authority (Clift 2006). Quoting what others purportedly say can create an impression of objectivity and enable speakers to indirectly assert and support claims. These insights notwithstanding, little attention has been paid to the role played by reporting frame

utinsoftLocal.ByteClass that is, the explicit attribution of the source of quotation. Based on data from Indonesian youth conversation and teen fiction, we examine the various types of reporting frames used, how these are deployed and, crucially, the extremely common practice of un-framed reporting, in which no framing device is used to explicitly mark the source of quotation. In this presentation we address the following questions. What social actions do people perform when they use different types of reporting frames or choose not to use any sort of reporting frame? What role does sequentiality play in the choice and interpretation of framing? To what extent is framing, as part of the common conversational practice of 'reporting', also a common practice in other domains of language use such as fiction? Drawing on discourse functional and interactional linguistic approaches, we argue that the primary function of framing is for grounding (Englebretson 2003). Frames ground the framed speech by orienting hearer/reader to it in a particular way. The use of reporting frames in reported speech at the beginning of a story episode in both conversation and fiction serves to establish a shared object of attention that the participants or characters can subsequently talk about. Non-framed reported speech, on the other hand, indicates either that the referent whose 'speech' is 'reported' is known, or that their identity is not important although their speech is nonetheless useful for supporting a speaker's or character's claims. Absence of frame can also contribute to a more highly performative or stylized reporting of other's speech, which can create a greater sense of engagement between speaker and hearer or between author and reader. Our findings contribute to an understanding of reporting frame as an interactionally significant part of the reported speech structure, whose meaning only fully comes to light when considered in relation to the function of non-framing.

***Learning an “enemy language” as the heritage language: Politicization of language and family in a Japanese TV show “Massan”*** (Contribution to *Nationalism, Courtship, Elitism, and Enemy Language: Linguistic Ideologies in the Japanese TV Show “Massan”*, organized by Suzuki Satoko [et al.])

Heritage language education is often encouraged with the understanding that knowing one’s heritage language helps build self-esteem of the learner (Cho 2000; Fishman 2001). However, not all heritage language education can be empowering, because the position of the language in the mainstream society influences the meaning of learning that language. Depending on the context, learning one’s heritage language could mean being forced to take side, being the target of harassment, and creating a rift within the family.

This paper illustrate this by analyzing a popular daily TV show aired in 2014-2015 for six months in Japan from a public broadcasting station, NHK. The show features the life of a couple, Massan (Japanese husband whose dream is to create Japan’s own Scotch Whisky) and Eli (his wife from Scotland who migrated to Japan after marrying Massan), and their struggles in pursuing Massan’s dream and surviving as a “mixed-race” couple in the first half of the twentieth century Japan. First, this paper provides text analyses of the TV show. I focus on the WWII period when speaking English was demonized as an enemy activity. In the show, through the portrayal of struggles between Massan and Eli and their daughter, Emma, as well as Emma’s relationships with her Japanese friends, however, speaking English was also linked to (1) being anti-war read progressive, (2) speaking one’s mind, and (3) having material wealth. I argue this link is problematic because it (1) perpetuates the stereotype of the “West-Japan” binary despite the fact that the Allied Powers were not anti-war at the time, (2) not being allowed to speak one’s mind to the degree portrayed was specific to the war-time Japan, and (3) Massan family’s material wealth is racialized through Eli (not Massan) providing candies to poor Japanese children reminiscent of post-War portrayal of Japanese children begging to American soldiers for chocolate, respectively. Also, English is flattened as the “enemy language” without a mention of Scottish being forced to use English through English colonialism. Second, this paper examines this show in light of the actual biography of the family it is modeled after and the current political atmosphere in Japan. In the real life of the family, Massan and Eli had a fall out with Emma during WWII due to her struggles to come to terms with her mother’s background; they never did reconcile. However, in the show, they support each other throughout this difficult time, some disagreement being solved through discussions. I analyze this change of story in the current context some see as similar to pre-WWII Japan (Fujiwara 2016), as the right-leaning Abe administration pushes towards militarization of Japan, seeking to change the Japanese Constitution’s Article 9 that prohibits Japan from going to war besides self defense and signing the collective security treaty. Through these analyses of what it means to learn English as a heritage language in the war-time Japan, this paper argues for more detailed examination of the wider contexts when investigating the role of heritage language education.

***Evidentiality and epistemic modality in United Nations Security Council Resolutions on post-Syrian conflict terrorism*** (Contribution to *Evidentiality: Discourse-Pragmatic Perspectives*, organized by Carretero Marta [et al.])

The United Nations Security Council, whose main responsibility is the maintenance of international peace and security, has issued a number of United Nations Security Council Resolutions (UNSCRs) on terrorism since the outbreak of the Syrian civil war in 2012. This study aims to unveil the attitude of the Security Council towards terrorism in all its forms and manifestations through the exploration of the function, frequency, and distribution patterns of evidential and epistemic markers in these resolutions – UNSCRs 2170 (2014), 2178 (2014), 2199 (2015), 2253 (2015), 2254 (2015), all of them founded on previous resolutions such as UNSCRs 1267 (1999), 1373 (2001), 1618 (2005), 1624 (2005) and 2083 (2012). Even if the language of resolutions can be classified into the category of legal discourse, characteristics of diplomatic discourse – with a high degree of vagueness – can be also traced in the language of texts of this nature. This ambiguity may be motivated by the ultimate goal of resolutions to reach agreement on especially controversial issues in the quest for peace and security (Endicott, 2000; Scotto di Carlo, 2013).

Against this backdrop of vagueness, evidentiality and epistemic stance (Chafe & Nichols 1986; Willett 1988; Hoyer 1997; Aikhenvald 2004; Wiemer and Stathi 2010; Boye 2012; Marín Arrese 2013, 2015; *inter alia*) are expected to contribute to shed light on the strength of the commitment of the Security Council to the information transmitted. Information source will be key to the analysis of the expression of this commitment in the case of evidentiality. The study in question follows a corpus-based methodology as well as a combined

qualitative and quantitative approach aimed at revealing frequency of distribution and usage patterns of the evidentials and the epistemic modals under study.

***Empractical speech: From Bühler to multimodal approaches*** (Contribution to *Empractical speaking and knowledge construction*, organized by Hauser Stefan [et al.]

In spite of a growing research in multimodal interaction, the concept of empractical speech (Holly/Baldauf 2001, Baldauf 2002, O'Connell/Kowal 2012), is rarely used to explain the particularities of action, turn or sequence constructions. In our presentation we will argue that the fundamentals of Bühler's (1934) "empraxis" join the groundings of multimodal analysis and that it makes sense to describe a particular type of interaction or rather language use as "empractical speech" if and when the concept is defined more clearly. Our analysis is based on Bühler's observation that speech is not always a continuous flow; it may appear as "'islands' of terse speech, floating on the sea of action" (O'Connell / Kowal 2012, viii). In these cases, interaction passes by other modes (e.g. joint "silent" actions) and speech is used only when "a choice among several options has to be and can conveniently be engaged through the insertion of a word" (Bühler 1934/1982, 156 translated by O'Connell/Kowal 2012, 86). Following consequently this approach, we argue that the participants or rather writers only verbalize what needs to be explicated at a specific moment. Traditional linguistic concepts like ellipsis, even as *Handlungsellipse* (ellipses embedded in nonlinguistic activity, Klein 1984) or *empraktische Ellipse* (empractical ellipses, Zifonun et al 1997), are hence ambiguous and mistakable. Two different examples will exemplify our argumentation: First, we show with French data that assessments during video game sessions are commonly reduced to the evaluative adjective. Other elements of the assessment (e.g. what is assessed) are irrelevant because a) there does not seem to be "a choice among several options" and b) the assessment is more used to call the co-participant's attention to something (that is, as demonstrative, as "traffic signal" in the terms of Bühler 1934/1982, 31; translated by O'Connell/Kowal 2012, 87) than to assess an event. Second, we analyse German signposts (in particular signs with deontic infinitives), which are used literally as "traffic signal" and are placed in a particular surrounding including both the local placement and the text's materiality (Domke 2014, 2015). Deppermann (2006) describes deontic infinitive constructions in German and shows how syntactic characteristics become an interactive resource. We draw on these observations and show a) that signposts like *Ausfahrt freihalten!* (Keep driveway clear!) are only fully understandable as signal in their surroundings and materiality, b) that the signpost explicates only what needs to be explicated and c) that the terse infinitive construction and the prohibition sign in general serve as deictic resources aiming at calling the attention to something.

### Gonen Dori-Hacohen

***"I can do math, but I'm not that smart. I'm not brilliant": Stressing ordinariness in USA radiophonic financial mentoring*** (Contribution to *Constructing Ordinariness across Media Genres*, organized by Weizman Elda [et al.]

Radio call-in shows, mainly political ones, are prevalent in discursive research, dating back to Hutchby's influential work (1996). This presentation discusses the leading US economic radio call-in show, "The Dave Ramsey show". This show enjoys a weekly audience of about 8 million listeners. In it, Dave Ramsey, the host, advises callers, and the audience, regarding their economic behavior, as part of the neoconservative ideology, which centers on the ordinary man, his actions, and economic responsibilities. The callers often have economic dilemmas, including changing jobs, repaying their loans, etc. As part of a larger project, answering how economics is discussed in mediated environment, I found that this counselling creates a paradox: a millionaire advises ordinary people regarding their economic struggles. The socioeconomic gap between media personalities and their followers is not unique to this mediated arena; however, Ramsey needs to address it in order to demonstrate he is not too removed from the caller's living circumstances so they can relate to, or accept, his advice. Therefore, this presentation discusses the following questions: what discursive strategies does Ramsey use to solve this paradox? How are these strategies relate to "doing being ordinary"? The finding suggests that whereas for Sacks (1984), "doing being ordinary" in mundane life is done so participants can break this ordinariness, for Ramsey, in this mediated environment, ordinariness is a rhetorical accomplishment to claim an "authentic identity" (cf. Tolson, 2001) in interacting with "ordinary persons".

In the corpus various strategies were found, and are exemplified in (1). In this interaction, Ryan called the show saying Ramsey's advices are not useful for him since he is too poor. Ramsey needs to show that he is similar to Ryan, so Ryan can use his advice. The first strategy Ramsey uses to construct ordinariness is using the personal narrative. This genre is central for constructing identity (cf. Gergen & Gergen, 1997), and Ramsey seems to tell his story like anyone else tells their story. Moreover, Ramsey in his story strategically stresses his commonalities with his listeners, such as, like Ryan, starting from nothing (1:1). A Second strategy for ordinariness is explicitly presenting oneself as being average (meaning ordinary, 1:7-8): Ramsey uses strong contrastive-three (actually four)-part list rhetorical structure (Atkinson, 1984) for being "not that smart". A third strategy of ordinariness is using the family as a denominator; Ramsey stresses his family (1:10), in a way callers may share.

Answering the question how in this economic discourse, small discourse and Discourse are interlaced, the presentation illustrates that according to Ramsey anyone can succeed (1:11). Hence, Ramsey (must) use strategies to present himself as an ordinary person who succeeded, and his audience can succeed as well, if they follow his advice and ideology. This presentation of the discursive strategies a media star uses to construct his ordinariness connects this construction to ideology, showing the importance of ordinariness to the neoconservative ideology (Phelan, 2007).

### Marina Dossena

***The Prince and the Sassenach: Construing group homogeneity through labels (and anachronisms) in Late Modern times and beyond*** (Contribution to *Knowing me and knowing you – reference and identity markers in public discourse*, organized by Nevala Minna [et al.]

Political communication is a prototypical example of clear-cut identity construal: especially in texts meant to encourage solidarity within groups and indeed meant to persuade through more or less emphatic propaganda, the presupposed homogeneity of the groups themselves is a crucial element. As a result, the beliefs and behaviour of opponents are stigmatized and/or ridiculed, while one's own party is praised and set up as an example of bravery, probity, and any other positive quality may be highlighted concerning it. This implies that any differences within groups are levelled out while differences between groups are stressed. In addition, this process of group homogeneity construal may be shown to be at work both synchronically and diachronically; not only are differences described as key features of the groups under discussion at the time of the events and as the debates rage: they are also important elements in their historical (re)construction and (re)interpretation. In this respect, the Jacobite cause is a significant example: nowadays even users whose familiarity with Scottish history is minimal will recognize and understand labels like "Bonnie Prince Charlie", "Redcoats" and "Sassenachs", mostly thanks to narrations of historical events in popular culture, whether in nineteenth-century songs and ballads or in twenty-first century fiction and TV drama. Such narrations, however, are often anachronistic, in the sense that they reconstruct events on the basis of what is known and, at least occasionally, of what is imagined, thus interfering with the reliability of the text for the sake of its empathetic appeal. In this contribution I will attempt to assess labels used in different Late Modern English documents pertaining to the Jacobite rebellions, in order to study the origins of some persistent labels identifying both events and people. Within this framework, special attention will be given to ego documents and popular culture, on account of their viability across a wide range of language users.

### Kathy-Ann Drayton

***Impoliteness and conflict in an online football fandom*** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.]

(Im)politeness is a complex issue in the postcolonial spaces of the Caribbean, linked as it is not only to

individual-level issues of face and identity, but to wider issues of race and class (Mühleisen & Migge (2005). Abrahams (1983) summarising common patterns found in speech communities in the area, described a basic dichotomy of *rude* and *behaved* in verbal performance, both taken to the level of “artful language” (57). The *behaved* aspect involves the artful use of eloquence and formality of language to display manners; while the equally prized *rude* included biting repartee, and mock and real verbal acts of impoliteness. This type of language use can be a source of interpersonal conflict as the impoliteness is often face threatening (Culpeper 2011). Managing this type of conflict is further complicated when the interactions between speakers take place online. Social media has been shown to be an area of increased conflict as relative anonymity allows for the use of linguistic and other modes of impoliteness and aggression (Hardaker 2013; Graham 2007). Fandom in general is a particular area where there is often conflict between group members, and sports fandom represents a special case, as the nature of most sports is challenge, aggression, and conflict, often reflected in the behaviour of the fans themselves (Benkwitz & Molnar 2012). This study will examine an online community of fans of an English Premier League team in a closed Facebook group of 700+ members based in Trinidad and Tobago. Strong cognitive, affective and behavioural aspects of team identification underlie individual fans’ affiliation to their team (Wann 2006, Porat 2010). This fan identity is defined externally through comparison to fans of rival teams, but also internally, in comparison to other members of the group. Intragroup identity is defined through perceived authenticity, that is, who by their linguistic and other performance, is viewed as a true fan and who is not (Waysdorf 2015, Guschwan 2011), with authenticity often portrayed through aggressive linguistic displays, and deep knowledge of the team and game. As part of this aggressive support, the group allows for a great deal of impoliteness in language and multimodal communication during member interactions, to such an extent that it can be argued that it is a norm of community practice, reinforced through constant and diffuse use throughout the group. The administrators occasionally post pleas to members to stay civil, but equally, not to take the aggressive language personally. Indeed, most posts welcoming new members state some variation of “Welcome! This is a hot group, if your skin thin you won’t last.” I will examine how conflict within the group is triggered, and managed through the use of (im)polite language. This language serves multiple functions within the online discourse. It is a sign of disagreement, and hostility between community members (temporary or longer term), but it also functions as a source of humour and entertainment, and ultimately bonding of group members through their shared experience of conflict.

### **Paul Drew & Kobin Kendrick**

***"The baby cried. The mommy picked it up": The role of trouble alerts in recruitments of assistance*** (Contribution to *The recruitment of assistance in interaction*, organized by Kendrick Kobin [et al.]

In his famous paper *The baby cried. The mommy picked it up*, Sacks (1972) was exploring how that story constituted a possible, coherent and recognisable description of a social scene - his aim being to specify the general analytic properties of any possible description of a social scene. So his focus in that paper and in many of his lectures at the time was, what makes a description possible, what analytic resources underpin (coherent) descriptions of ordinary social scenes. It may be noted that although the story describes an interaction between a baby and (its) mother, it is not the interaction itself that interested Sacks; rather he focused on the textual congruence of the categories ‘baby’ and ‘mommy’. However, the insistent fact is that the story describes a social interaction, in which one person (the baby) alerts the other (the mommy) to a trouble, through the mechanism of crying - a *trouble alert*. Setting aside what may or may not be known about what specific trouble the ‘quality’ of a baby’s cry might signify, it is clear enough that one person’s trouble alert recruited the assistance of the other. This paper will explore the conduct by means of which someone can alert others to a trouble or difficulty they have, a trouble that they (i.e. others) may assist in resolving. This is based on research that we are conducting on recruitments (Kendrick & Drew 2016); in the presentation we will ‘define’ the phenomenon of trouble alerts (i.e. set the boundaries of the phenomenon and describe some of the forms it takes); explore the interactional process from trouble alerts to the recruitments of assistance; and specify the core ‘dimensions’ of that process, including e.g. how the trouble is ‘specified’, the zone of co-operation, persistence of the trouble, and laughter in response to troubles.

**“wtf!”: Disagreement and CMC Cues in Live-stream gaming communities** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.]

The recent popularity of user-generated video content in the form of gaming live-streams has led to the emergence of hundreds, if not thousands, of gaming communities, each typically formed around a particular gamer who manages his or her own channel. “The world’s leading social video platform and community for gamers”, TwitchTV, reports 9.7 million users a day with an average of 106 minutes watched per user each day (Twitch.tv). Despite the rapid increase in the popularity of social live-streaming, few if any studies have been conducted on the pragmatics of disagreements within this mode of computer mediated communication. Popular streamers generate enough income from ad revenue, channel subscriptions, and viewer donations to stream as a full or part-time job. As streamers aspire to create sizable, stable communities, they will regularly interact with viewers, take their opinions into consideration, and maintain an entertaining atmosphere.

In online gaming communities, frequent disagreements occur across multiple channels of communication which are asymmetrical in the ways they distribute access, voice, and power. While the streamer has full access to all channels, chat participants have limited access and must employ different strategies to claim a voice. While the streamer can convey prosody via microphone and body language via webcam, viewers can communicate only through text and CMC cues (e.g. emoticons, emojis, and emotes). With these limitations, chat participants rely heavily on emotes to assert their stances both with regard to the topic at hand and their place in the community. Building on recent research on the pragmatic functions of CMC cues (e.g. ellipses and punctuation (Vandergriff, 2013), vocal spelling and capitalization (Lin, 2016), and emoticons (Skovholt, Grønning, and Kankaanranta, 2014)), this study takes a post-modern approach to better understand the ways that impoliteness, disagreement, and community intersect. More specifically, this study will answer the following research questions: How does the multimodal environment affect the negotiation of disagreement in asynchronous chat? And, how do chat participants claim a voice when conflicts arise?

***Epistemics and reality construction in telephone-mediated dispute resolution.*** (Contribution to *Complaints in Institutional Settings: Accountability, Affect and Identity*, organized by Rhys Catrin S. [et al.]

Telephone helpline interactions can be characterised by an asymmetric distribution of access and rights to certain knowledge between speakers. Institutional call-takers are often treated as having greater access and rights to know the policies and procedures of their institution. Whereas, callers are treated as having greater entitlements to know their own experiences. Our research investigated how the latter was managed in calls to telephone helpline services that handle complaints with, and attempt to resolve disputes between consumers and their utility providers. We investigated how callers displayed and asserted their epistemic rights to knowledge in the calls. An institutional task in these calls was for parties to construct and establish an intersubjective understanding of the details of the complaint. One way this was accomplished was through call-takers questioning callers about their complaints. We restricted our focus to declarative request for confirmation sequences, where speakers were positioned on almost equal epistemic footings. We examined a corpus of 183 calls to two helpline services in New Zealand and Australia. We used conversation analysis and discursive psychology to analyse 78 cases of these sequences. There were two main outcomes of our work. First, we identified the different response formats to declarative requests for confirmation and showed how they managed and displayed callers’ epistemic rights to the detail at hand. We proposed that the responses could be placed along a continuum, whereby they displayed increasingly stronger assertions of callers’ epistemic rights to the relevant information. Second, we documented how epistemic matters were implicated in speakers constructing the complaint as a version of reality. :0 Our work shows how speakers construct and establish an intersubjective understanding of the complaint as a version of reality. We also show how epistemic matters and reality construction are bound up with, and implicated in achieving intersubjectivity in telephone-mediated dispute resolution.

***The pragmatics of change in dental hypnosis: An empirical study in Indonesia***

(Contribution to *The Pragmatics of Change in Therapy and Related Formats*, organized by Graf Eva-Maria [et al.]

This preliminary research aims to describe how a dentist interacted with her patients by applying hypnosis to take the patients to the relaxed conditions in the therapy process. In Indonesia, the dental hypnosis has recently also been conducted and a study from speech acts shows that the language style of the process has permanent and repetitive structures and systems (Darmayanti, et al., 2014). Accordingly, pragmatics is still relevant to the contemporary focus of clinical theory on the dynamics of the relationship between the dentist and patients. The aim of dental hypnosis as a communication activity structurally performed by the dentist to the patients is to take the patients' consciousness level to be equal to their unconsciousness level. The dental hypnosis is performed by means of suggestion that is able to make the patients more relaxed to generate the bigger patients' tolerance limit to dental anxiety (Simon, 2007). Therefore, the change process of patients' consciousness and behavior toward pain and illness is expected to occur through the hypnosis process. The data were collected from 20 audio video recordings with total 7,5 hours of interaction between the dentist and her patients during the hypnosis practice. This empirical study is qualitative by using pragmatic and conversation analysis methods. The research focuses on the questions: How is change manifested in interaction between the dentist and her patients? And how can change be traced linguistically? Which actions and interaction formats pursue processes of change and how are they co-constructed by the dentist and her patients? The change is not only therapeutic but also related to the discourse formats mainly the interaction between the doctor and the patients (Graf/Pawelczyk 2014; Busch/Spranz-Fogasy 2015). Therefore, it is significant to conduct the research to observe further the hypnosis process linguistically in the context of Indonesian language and culture. The results of the analysis indicate that the patient's responses given to the dentist can be tangible verbal, nonverbal and paraverbal. At (1) the opening and introduction stage, the responses are more verbal. This is because at the introduction stage, the patient's awareness level has not been fully subconscious. This means that patients can still hear, ask, and answer what is delivered by the doctor. Meanwhile, at (2) the stage of action, the patient showed more nonverbal responses or very short verbal responses, or paraverbal responses such as laughter. This is due to the stage of action, the level of awareness of the patient has begun to be subconscious. In addition to marking the introduction stage and stage of action, the perlocutive act in form of verbal and nonverbal or paraverbal can also indicate the successful or not successful dental hypnosis process performed by the dentist. At this stage the change from the patients can be detected. And from the data analyzed, cultural factors are not very influential in the process of dental hypnosis. Changes occurred more in the linguistic level.

***The benefactive –te ageru construction in Japanese child-caregiver interaction***

(Contribution to *Multiplicity in Grammar: Modes, Genres and Speaker's Knowledge*, organized by Iwasaki Shoichi [et al.]

Whether speakers have knowledge about grammar and knowledge about situation separately or these two kinds of knowledge are indivisible has been one of the central issues in Construction Grammar and Frame Semantics (Fisher 2015). This study investigates the use of a benefactive –te ageru construction in Japanese in family interaction and argues that situation plays a critical role in choosing the appropriate grammatical form.

The form and meaning of –te ageru construction is schematized as below. (1) Form: [ <Subject>-ga ] [ <Goal>-ni ] [ Verb-te ageru ] Meaning: “<Subject> do something (=Verb) for the sake of <Goal>” In the field of Japanese pedagogy, it is argued that –te ageru construction should not be taught at the elementary level, because misuses of –te ageru construction may cause a serious trouble in interaction; since –te ageru construction conveys that the subject is doing something for others, it may sound intrusive when the speaker and the subject are the same person (Tanaka, 2005).

The data for this study are taken from a corpus of more than 400 hours of video-recordings of family interaction. 18 families participated in the recording, and all families have two or more children. The quantitative analyses of the transcript revealed that caregivers mostly use –te ageru construction in a directive form to an elder child, with the goal being a younger child. Verbs that are frequently used in the construction are *kasu* ‘lend’, *yaru* ‘do’, *ireru* ‘put in’ and *miseru* ‘show’. The common pattern is that caregivers use –te ageru construction when they ask an elder child to do something for his or her younger sibling, as in the example below. (2) (Hana is an elder child and Ken is a younger child.) *Hana, Ken ni omocha kashite agete.* “Hana, please lend the toy to Ken (for the sake of him).” In such uses of –te ageru construction in family interaction, there is a clear asymmetry and

difference in the status in the family between the subject and the goal. That is, the subject, who is “doing something for the goal” is older than the goal, and is treated by the caregiver as a person who can and should do something nice for the younger. Thus, the problem of being intrusive does not apply. For native speakers of Japanese, this is the most basic situation in which *-te ageru* construction is used. Such situational information, or Frame Semantics, is a necessary element in using the construction in an appropriate manner. To put it differently, the elder child is socialized as an *oniisan* ‘elder brother’ or *oneesan* ‘elder sister’ in each family through the use of *-te ageru* construction. This finding is in concordance with the previous arguments on the features of Japanese child-caregiver interactions that empathy is valued in Japanese interaction and that morality is generated and learned in the process of interaction (Clancy 1986; Burdelski 2013; Takada 2013).

## Renata Enghels

***Defining the interpersonal epistemic stance construction in Spanish: The case of *sabes* ‘you know’ and constructional variants*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

This talk explores the functional and formal behavior of the interpersonal epistemic stance construction in contemporary Spanish. This construction houses a series of routinized expressions which the speaker (a) directly addresses to the interlocutor using a second person verbal form (hence “interpersonal”, House (2009)), (b) to assert the probability of the described state of affairs being true (thus “epistemic”, Nuyts (2001)), and (c) to negotiate his own point of view towards the content of a proposition (hence “stance”, Traugott 2014). Previous studies have mainly focused on the pragmatic marker status of the second person form *sabes* ‘you know’, and have come to opposite conclusions. Whereas, based on its functional properties, most authors (e.g. Vázquez Rozas (2006); Cuenca (2013)) do not hesitate to include *sabes* in the category of grammaticalized discourse markers, Martín Zorraquino and Portolés (1999) are more reluctant, mainly because 2<sup>nd</sup> person markers are said not to fulfil Hopper’s (1991) “freezing condition”. This analysis aims at going beyond the traditional account in terms of grammaticalization, and provides a constructional approach. On various accounts it has indeed been argued that grammaticalization is probably not the best framework to capture the development of pragmatic markers and related phenomena (e.g. Aijmer 1997), and, that even a broad definition of grammaticalization, encompassing the development of lexical items which come to serve discourse-related functions, cannot capture the complexity of the different types of change at work within this domain (Hilpert 2013; Kaltenböck 2013; Traugott in press).

As a starting point, I posit that the development of *sabes* as pragmatic marker can hardly be understood without taking into account the composite network of epistemic expressions a Spanish speaker has at his/her disposal when performing particular discourse related functions. This network includes expressions such as: *ya sabes* ‘you already know’, *como sabes* ‘as you know’, *sabes lo que pasa* ‘do you know what happens’ or *sabes que* ‘you know that’, and many more. In line with this idea, the analysis pursues a double goal. First, with regard to the specific case study, it aims at providing insight into the taxonomy of the interpersonal epistemic stance construction in general, and the mechanisms of change which have led towards the entrenchment of *sabes* as a pragmatic marker in present-day Spanish. Second, on the theoretical level, it further argues in favor of a constructional approach to discourse related phenomena. The central idea is that different expressions with analogous and overlapping functions and formal characteristics, are instances of an overarching construction (Fischer 2015). Besides demonstrating that different stance expressions clearly share functional behavior, it is shown that they also share structural characteristics. The Val.Es.Co model of discourse segmentation (Val.Es.Co group 2014) contributes to a better definition of the construction at its most abstract level, as well as of the different micro-constructions it encompasses. The empirical analysis is documented by spoken corpus examples extracted from nine corpora (including COLAm, CORLEC, Coral-Rom, VAL.ES.CO, PRESEEA, and COSER), collected in recent decades (1970s-2010), and is mainly informed by frequency data measuring different properties of the construction and its variants.

#### ***Stance-taking, scale-jumping and the dialogic emergence of learnables in an EFL classroom*** (Contribution to *Stance-taking in educational contexts*, organized by O'Boyle Aisling [et al.]

Complexity of contextualization has been one of the major concerns in recent developments in the study of language in society, while Erving Goffman's classic oeuvre consistently reminds us that the social meaning of any given action depends on how it is 'framed' often in a laminated manner (Goffman, 1974; Silverstein, 1992, 1993; Blommaert, 2010, 2015; Carr & Lempert, 2016; Agha, 2005; Wortham & Reyes, 2015). The aim of this paper is to show how the study of stance-taking in educational contexts can be benefited by incorporating these perspectives.

To achieve this, the concepts of 'scale-jumping' (Blommaert, 2010) and 'learnables' (Majlesi & Broth, 2012) are introduced, in addition to stance-taking. Scale-jumping performed by participant(s) shifts the TimeSpace relevant to the ongoing interaction, thereby bringing it under a different social order. By adopting 'learnables' as an analytic concept, we can avoid reifying what learners learn, and can start to explore interactional processes in which different specific objects are turned into relevant objects of learning. I suggest that the tripartite relationship between stance-taking, scale-jumping and learnables can be an effective heuristic framework to illuminate 1) the non-unified nature of stance-taking in a given educational context and 2) how objects of learning can simultaneously have disparate kinds of significance depending on the ground of communication brought about by acts of scale-jumped stance-taking.

The empirical site of this study is a high school EFL (English as a foreign language) classroom in Saitama, Japan. Particular attention will be paid to interactions among three male students who first engage in group work and later participate in a whole class activity to interview their new assistant language teacher from the United States. In order to investigate what happens in terms of the aforementioned framework, I analyze multiple sets of discourse data, focusing on both linguistic (explicit metapragmatic comments) and non-linguistic (mock crying and the gesture of pointing) resources employed by the students. The analysis reveals how the students' adroit stance-taking and scale-jumping turn English into at one moment the object of learning and instruction, and at another the target of metacommunication. Also, behind this phenomenon is the process of dialogization (in Bakhtinian sense), which points to competitive co-existence and interplay of social voices.

One of the intriguing practical implications of this study seems to be related to why many Japanese students often struggle to use English though they study it for years. The key to answer this question, I argue, lies in the ways in which English is involved in the business of 'being a student' at school. Students experience English as a semiotic body of learnables resulting from complex social acts of stance-taking grounded upon constant scale-jumping. This might cause what may be called object-meta linguistic (and pragmatic) glitches when they actually have to calibrate social relations by using English in non-classroom settings. An even further outlook from this is that the study of stance-taking in educational contexts may embrace a larger philosophical issue on the making of humans as sociolinguistic facts.

### **Michal Ephratt**

**"M N D T H G P": The forms and functions of graphic silences** (Contribution to *Between Graphic and Grapheme: Representation in Writing*, organized by Dickinson Jennifer A. [et al.]

This paper focuses on the nature and functions of spaces replacing expected but intentionally omitted graphic signs. Focusing here on the graphic rather than the phonetic, we confine ourselves to omissions that appear visually (compare "*Avis. We try harder*" with "*M n d t h g p*" above). The materials for such communicative graphic silences come from any printed source such as literature (conventional and visual poetry, prose and plays), commercial advertisements and political propaganda, forms, web pages, comments and blogs. Typically, spaces - as formless areas - serve as background, directing the attention of the reader/observer to the resulting differentiated figure (the classic example is Rubin's 1923 gestalt vase and profiles - switching figure and ground). But spaces can also serve as the ground, in which case they are semiotically and pragmatically meaningful. We must first determine the relationship between the text and the ground. Do the spaces or the graphic signs occupy the figure? In that text, what serves as the background? Visual spaces serving as ground equal pauses and stillness in the acoustic channel. The absence of verbal graphic signs (or a combination thereof) is the figure of the text if that missing sign is expected in the specific context. Such meaningful spaces can range from empty pages, blank lines and truncated lines, to empty spaces alluding to the omission of words, letters, numerals, punctuation marks, and the like. Tracking such forms and analyzing their functions within semiotic and pragmatic contexts and co-texts reveals many varied expected and surprising functions. One core function is the iconic (image, diagram, or metaphorical) representation of a void or the absence of someone or something (e.g., of life; of a partner; of humanity; of speech; of a commodity; of knowledge, feeling, desire etc.). Another core function is elusiveness: utilizing the undetermined, ambiguous, container qualities of spaces and silences to preserve possibilities ruled out by the representation of verbal, graphic signs. Other functions include spaces as the outcome of censorship and compliance with legal or moral restrictions, and meta-linguistic signs indicating that the text should be seen (visual channel) but not read aloud. (acoustic channel). We conclude by pointing out that meaningful spaces can replace specific verbal signs such as lipograms in the form "*C M P I G N*" for promoting blood donation. Alternately, they may express a void or lack, and not stand for a specifically expected sign. Nevertheless, both formats are in themselves meaningful, communicative modes of expressions. Thus, verbal spaces and non-verbal spaces (e.g., poker face, localities "bebelplatz") share many features and play similar roles as phonetic silences.

***Gender-based agency bias in the processing of thematic roles in German and French***

(Contribution to *Language, Gender and Cognition*, organized by Alvanoudi Angeliki [et al.]

The ability to efficiently resolve ambiguous linguistic input is critical for the understanding of mechanisms that are at play during natural language comprehension. Previous research has shown that certain characteristics (e.g., prominence features like animacy) may be used to anticipate which thematic role an entity in a sentence is likely to take in such ambiguous cases (in English, see McDonald, Bock & Kelly, 1993; in German, see Van Nice and Dietrich, 2003; in Spanish – Prat-Sala, 1997). In the present study we examined whether grammatical, stereotypical and lexical gender of role nouns can be seen as a prominence feature influencing readers' expectations about their thematic role assignment in German and French. In a series of eye-tracking experiments we manipulated gender characteristics of thematic roles in temporarily ambiguous sentences with subject- and object-extracted relative clauses (German) and with a gender-ambiguous indirect object pronoun *lui* [him/her] as a backwards anaphor (French). These syntactic structures were used as tools to identify whether readers create expectations about thematic roles of role nouns based on their gender characteristics. The results showed that readers were sensitive to the gender information provided and used it in a systematic way to resolve linguistic ambiguities. More specifically, participants demonstrated more difficulties when reading role nouns possessing female-like characteristics (e.g., as in stereotypically female role nouns or indicated by grammatically feminine suffixes) in agent than patient roles. In contrast, processing neutral and male-like role nouns was associated with fewer difficulties when they appeared in agent than patient roles.

The changes in participants' reading behavior observed in our experiments indicate that different types of gender cues may influence readers' expectations about how likely an entity is to receive (patient) or to perform (agent) an action. These patterns reveal a phenomenon that can be referred to as an agency bias, where animate

entities with female-like characteristics are expected to be patients, while gender-neutral entities or those with male-like characteristics are expected to be agents. Following the idea of the thematic hierarchy hypothesis (Jackendoff, 1987), we suggest that – together with animacy, person, and definiteness – gender may be another dimension along which prominence can be assessed. The findings encourage to relate the social psychological concept of agency (e.g., Koenig, Mitchell, Eagly, & Ristikari, 2011) with the linguistic concept of prominence (Silverstein, 1976) in order to gain a deeper understanding of the mechanisms involved in the processing of ambiguous sentences.

### Zohreh Eslami & Lu Yang

#### *Chinese compliment responses on Renren* (Contribution to *Complimenting behaviour in social media*, organized by Das Anupam [et al.]

Computer-mediated discourse analysis is a growing area of research aiming to explore everyday interactions and the ways different medium-related affordances impact communication as well as social norms. A number of recent studies on compliments and compliment responses (CRs) in the context of social networking sites (Eslami, Jabbari, and Kuo, 2015; Placencia and Lower, 2013; Placencia, Lower, and Powell, 2016; Maíz-Arévalo and García Gómez 2013; Maíz-Arévalo, 2013) have revealed differences in complimenting behavior in online vs. face-to-face settings. However, more research on how technology enhances or displaces discourses and practices of tradition (Wilson & Peterson, 2002) is needed. In order to expand the research on cyber-pragmatics to other languages and examine how the tools of new media are changing the communicative practices, this study focuses on Chinese speakers' compliment response patterns on Renren (the Chinese version of Facebook) and compares the findings to previous studies on face-to-face complimenting behavior. The participants (34 Chinese Renren users) were selected from one of the researchers' Renren friends. In order to have a balanced distribution of data, and develop a manageable corpus, the researchers recorded 5 randomly selected compliments and CRs from each participant's timeline on Renren (170 Chinese CRs). Building on previous work on complimenting behavior in face-to-face environment (Holmes, 1986) and recent work in online settings (Eslami, Jabbari, and Kuo, under review; Maíz-Arévalo, 2013; Placencia, Lower, and Powell, 2016), we analyzed the data and compared our findings with previous researches on face-to-face compliment responses in Chinese (Chen, 1993; Loh, 1993; Yuan, 2002; Yu, 2004, Tag & Zhang 2008; Chen & Yang, 2010). Our results show that compared to face-to-face findings, Renren enables Chinese complimentees to use more diverse kinds of strategies (verbal, non-verbal and a combination of verbal and non-verbal strategies). In general, Chinese complimentees used more Accept strategy and less Reject strategy online than what has been reported for face-to-face interaction. Employing affordances of technology (e.g. emoticons) helped complimentees keep rapport and modesty in balance when accepting compliments.

***Conversational structures and discourse genres: A contrastive study of informal conversations, sociolinguistic interviews and broadcast interviews*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

The discourse segmentation system proposed in Val.Es.Co. (2014) includes eight unit types which are ordered from smallest to largest as follows: subact, act, utterance, turn, turn alternation, exchange, dialogue and discourse. Based exclusively on the units of analysis that are equal or greater than the turn, a visualization tool has been applied (Briz, 2006; Espinosa-Guerri, 2016) to study the specific relationships between them and find interactive patterns. In a previous study (Espinosa-Guerri and García-Ramón, 2016) we established a provisional typology of eight graphic patterns. In this presentation we compare three dialogical genres (informal conversations, sociolinguistic interviews and broadcast interviews) based on the typology described in Espinosa-Guerri and García-Ramón (2016). The main aim is to observe which patterns appear in each genre and compare their frequency. The interactive characterization of genres has typically been based on features such as turn-taking systems and overall structural organization. As opposed to these characterizations, our starting point is what Sacks referred to as utterance tying rules or techniques (1992 [1956-8]), i.e., the specific relationships between consecutive utterances during a given interaction. Therefore, our analysis complements previous descriptions and gives a more precise picture of the structural characteristics of different types of interaction.

***From discourse markers to grammatical constructions: Integrating grammar, prosody and discourse*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.])

One of the most difficult aspects in the linguistic analysis of discourse markers and modal particles is their considerable polyfunctionality. As it has been repeatedly observed, these units can give rise to multiple and often unrelated pragmatic meanings. One interesting case study is the lexical sequence *a ver si* ‘let’s see if’, which has been treated in the literature as a polyfunctional discourse marker that expresses several (un)related meanings/functions, such as polite wishes (1), requests (2), questions (3), expressions of fear (4) or metalinguistic comments (5), amongst many other (cf. Beinhauer 1978, Santos 2003, Fuentes 2009).

- 1) *A ver si me va bien el examen* (‘I hope I pass the exam’)
- 2) *A ver si puedes sacar al perro* (‘Can you walk the dog?’)
- 3) *A ver si llevo suficiente* (‘Let me check if I have enough money’)
- 4) *A ver si se va a caer* (‘(I’m afraid) she could fell down’)
- 5) *A ver si me entiendes* (‘Let me make myself clear’)

In this paper, we argue that polyfunctionality can be better modelled if, instead of considering *a ver si* as a lexical discourse marker/modal particle, we consider it as the lexical part of a network of different grammatical constructions, each of them with its own grammatical, prosodic and discourse features (cf. Fried & Östman 2004). Therefore, the meanings/functions just sketched should not be attributed to *a ver si* itself, but to a cluster of grammatical, prosodic and discourse features that together define a grammatical construction. Our analysis builds upon the distinction between internal and external structure of a construction (Fillmore 1988, Linell 2009). The internal structure must specify the features of the constituents of the construction, in our case the lexical sequence *a ver si* followed by a finite clause with its own TAM restrictions. On the other hand, the external syntax must specify the features on the construction such as its prosody and the discourse contexts in which it can occur. In order to describe the discourse contexts, we need to rely on a system that allow us to formalize units beyond the clause, such as the Val.Es.Co. model of discourse units (Val.Es.Co. 2014).

**Methodology.** The analysis is based on three corpora of spoken data: the CORLEC corpus (Marcos Marín), which contains Peninsular spoken data from different genres (conversations, news, interviews, etc.); the COLAM corpus, which contains data from interaction amongst teenagers living in Madrid (Spain), and the VAL.Es.Co. corpus, containing free-wheeling conversations from Valencia (Spain). Each occurrence is analysed taking into account four types of features: (i) meaning/function (interrogative, optative, counterexpectation), (ii) grammatical features (interrogative word, TAM features of the verb), (iii) prosodic features (pitch, syllable length, pauses) and (iv) discourse-structural features (type of discourse unit, position within the unit).

**Results.** The analysis allows us to set apart three different semi-schematic grammatical constructions with their own grammatical, prosodic and discourse features.

***The emotionality of character loss: Collaborative problem-solving narration and moral accountability in children’s social networking*** (Contribution to *Storytelling in adult-child and children’s peer interactions*, organized by Burdelski Matthew [et al.]

This study highlights how embodied displays of negative affect, such as anger and indignation, intensify the moral layering of children's collaborative problem-solving narration (Ochs & Capps, 2001). The selected data are drawn from a larger videoethnographic study investigating young children's (9-10 years) media literacy practices in peer groups in schools and afterschool centers. In our paper, we explore how expressions of emotions and moral accountability figure into the organization of children's communication with other children engaged in social networking on and offline, at the interface of the physical and the virtual (cf. Burnett, 2016). Drawing on linguistic ethnography and multimodal conversation analysis, the focus is on the embodied and dialogical character of affect, morality, and stance (M.H. Goodwin et al. 2012; Du Bois & Kärkkäinen, 2012) in the sequential context of collaboratively performed narratives that centers around reportable unexpected problematic events where the interchangeability and loss of characters on social networking sites becomes a shared topic of concern.

The analysis traces trajectories of collaborative problem-solving narration by which the participating children manage unexpected actions and events, and scrutinize the conduct and identities of the protagonists in ways that become consequential for the shaping of moral accountability. We track the launching of a problem-solving narration concerning the loss of a character (avatar) and the bewildering disappearance of its belongings. The narration is built up through rhetorical structures (accusations, personal ascriptions and recapitulations) in conjunction with prosodic features (high pitch voice, vowel length, emphatic stress), vivid gestures and facial displays of stance that intensify the dramatic and affective significance of the reported event. It is found that the children's aggravated displays of negative affect invite the others being present to produce aligning actions and affiliate with the moral stances taken. The collaborative affective stances taken by the children imbue the telling with moral weight and build a common moral framework for interpreting and solving problematic incidents. Thus, a narrative is constructed where the moral stances taken come to focus both on identifying the identities and actions of protagonists and remedying the problematic event. The study highlights how emotionally intense problem-solving narration, is located in mutually performed affective relationships and communities of practice, reflecting the participating children's intimate, longstanding and shared peer group experiences of one another.

*The interactional efficacy of unattached NPs in Colloquial Indonesian* (Contribution to *The Pragmatics of the 'Noun Phrase' across Languages: an Emergent Unit in Interaction*, organized by Thompson Sandra [et al.]

This study investigates unattached (free, detached) NPs (Ono and Thompson 1994, Tao 1996, Helasvuo 2001, Laury and Helasvuo 2016) in a corpus of Colloquial Indonesian conversational data. NPs have been understood prototypically to be referring expressions that have the role of argument within a clause (Hopper and Thompson 1984). Unattached NPs thus appear to be atypical in that they are not arguments of a clause and often have a predicating rather than referring function. Unattached NPs have not yet been systematically investigated in Indonesian, yet Colloquial Indonesian is particularly interesting for studying unattached NPs due to a combination of features, including the prevalence of unexpressed arguments, lack of copula, no cross-referencing between predicates and arguments, and indeterminacy of word classes (Ewing 2005). How then best to identify and analyse unattached NPs, not to mention predicates and the notion of constituency more generally? At the same time, this study investigates how speakers deploy unattached NPs to accomplish specific social actions interactionally. Key findings for Colloquial Indonesian include the following:

- Rather than forming a binary distinction, attached and unattached NPs form key loci of syntactic, morphological, prosodic, pragmatic and turn constructional features, with intermediate cases forming a cline of (un)attachment.
- Consistent with findings for other languages, e.g. English (Ono and Thompson 1994), Indonesian unattached NPs can be classified as referring or predicating, with the majority having a predicating function.
- Talk in interaction links forward to upcoming, anticipated talk and backward to previous talk (Enfield 2011). Referring unattached NPs tend to help link forward by setting up referents to be utilised in subsequent talk, while predicating unattached NPs tend to link backwards, building on previous contributions. Some unattached NPs can be both forward- and backward-looking and thus display indeterminacy or dual-functionality between referring and predicating functions (as also observed by Ono and Thompson 1994).
- Contributions from different speakers can be subtly linked together through co-constructions or dialogic resonances (Du Bois and Giora 2014) and these can often be produced through the use of unattached NPs.
- The exploration of unattached NPs sheds additional light on the nature of predicate nominals and of predicate structures more generally, both in Colloquial Indonesian and cross-linguistically.
- A usage based exploration of unattached NPs in colloquial Indonesian forces us to confront flexibility, multi-functionality and indeterminacy in grammar. Rather than adversely affect the efficacy of linguistic structures for

speakers, these qualities in fact provide affordances that speakers can use advantageously.

This investigation demonstrates the work that unattached NPs can do for speakers of Colloquial Indonesian. It also contributes to furthering our cross-linguistic understanding of the role of NPs for social action and the organisation of talk.

***Communication ideologies in conflict-ridden online “conversations”*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

Virtual spaces are said to “provide a new arena for the enactment of power inequities such as those motivated by sexism, racism, and heterosexism” (Herring *et al.* 2002:371). As circulation increases discourse friction, the more sensationalist and polemic the content of texts in motion, the more flourishing their ramifications. The latter - known as trolling - has to do with individuals insistently seeking to disrupt online conversations with arguments intended to insult, provoke and aggravate. Considering the central role semiosis play in contemporary communication and the way different signs (verbal, gestural, visual and so forth) intermingle in digital texts, rapidly disseminating through blogs, microblogs, social platforms, video sharing sites and so forth, my aim in this paper is to approach a cyber-interaction generated by a YouTube video clip presenting a Brazilian viral funk hit enacted by three black performers. The exchanges on the comments area, totaling 38043 posts, include trolling activity involving racism and bigotry which lasts over four years. By focusing on one specific moment of such online “conversation”, I zoom in on the injurious signs participants employ, on how their repetition stimulates, titillates, and intoxicates, and on the escalating tension they promote. By drawing on the Bakhtinian chronotope and on the concept of scales (Blommaert 2015; Lempert 2016), I seek to reconstruct the indexical nexus between historical and momentary semiotic actions and show how this online conflict-ridden talk challenges cherished communication ideologies and the notions of intentionality, reference and cooperation underlying them.

#### Martina Faller

***Backgrounding and foregrounding of reportatives*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

One of the main debates in the study of evidentiality is whether evidentials contribute to the propositional content of an utterance or some other meaning dimension such as illocutionary content, conventional implicature or presupposition. The latter are backgrounded in that they do not contribute to the main point of the

utterance. Meaning in the propositional dimension, however, can be foregrounded as well as backgrounded. At the discourse level, the foregrounded/backgrounded distinction corresponds to that between at-issue and not-at-issue content, which, following Simons et. al (2010), I define relative to the Question under Discussion (QUD). In this talk, I discuss the German reportative modal *sollen*, which contributes to propositional content. *Sollen* is typically backgrounded, that is, does not answer the QUD. Consider (1), which is part of a police description of a suspect. The QUD it answers can be taken to be *What does he look like?*

- 1) Er **soll** kurze dunkle Haare und eine kräftige Statur haben.  
 'He is said to have short dark hair and is of stocky build.'  
 (Holsteiner Allgemeine, 14 November 2016, <https://tinyurl.com/15gnclt>)

However, *sollen* may also contribute to the QUD. Consider (2).

- (2) In der kleinen Gemeinde Bokholt-Hanredder ... hat die Polizei einen 28-Jährigen vorläufig festgenommen,  
 weil er mit Betäubungsmitteln ... gehandelt haben **soll**.  
 'In the small locality Bokholt-Hanredder ... the police temporarily arrested a 28 year-old because he was reportedly dealing narcotic substances ....'  
 (Holsteiner Allgemeine, 14 November 2016, <https://tinyurl.com/15gnclt>)

The QUD addressed by the *because*-clause is *Why was he arrested?* Both the prejacent of *sollen* on its own (that he was dealing), as well as the reportative modal plus the prejacent (that he is reported to be dealing) constitute plausible answers to this question.

I will compare *sollen* to the Cuzco Quechua reportative enclitic =*si*, which has been analyzed as an illocutionary modifier (Faller 2002), and to propositional attitudes such as *they say*, which are lexical evidentials when backgrounded (Simons 2007, Boye and Harder 2009), and show that it shares properties with, but differs from both. Of particular interest is the status of the prejacent *p* when the reportative is backgrounded. Even though *p* is at-issue, it is not asserted, and it is felicitous for the speaker to deny the truth of *p* without contradicting themselves, as shown in (3).

- (3) a. Er **soll** es getan haben, hat er aber nicht.  
 b. **They say** he did, but he didn't. (Boye and Harder 2009)  
 c. Juan=**si** pita-n, ichaqa mana-n hina=chu.  
 Juan=rep smoke-3 but not=bpg like=neg  
 'Juan reportedly smokes, but that is not so.' (elicited)

Because Quecha =*si* is illocutionary, it is expected that it affects the force with which the at-issue proposition enters into the discourse. Faller (2002) proposes that this force is presentation, which does not require speaker commitment. In the case of propositional-level *sollen* and *they say*, however, we have to assume that what is asserted is the reportative, despite only the prejacent being at-issue. I propose that an assertion of a backgrounded reportative applied to at-issue *p* is equivalent to a presentation of *p*.

*A multimodal study on declarative questions in Beijing Mandarin* (Contribution to *Multimodality and diversity in Chinese interaction*, organized by Li Xiaoting [et al.]

According to Quirk et al. (1985), declarative question is a type of question which is identical in form to a declarative except for the final rising question intonation. Stivers (2010) also claims that declarative questions are used more commonly in conversation than would be suspected by traditional grammars of English, and

questions are used for a wider range of functions than grammars would suggest. From a multimodal perspective, gaze is a practice to solicit responses (Stivers and Rossano 2012), and body movements also contribute to turn organization in naturally occurring conversation (Li 2014). Based on 10 hours video-taped spontaneous conversational data of Beijing Mandarin, this paper discusses multimodal resources mobilized for declarative questions in question-response sequences. In our data, some declarative questions occur as echo utterances to the prior speaker's turn, but others are completely different from echo questions on information delivering. Unlike echo questions, declarative questions without rising intonation present new information and invites the hearer's verification. Frequently, declarative questions are produced with multimodal practices such as speaker's gazing, leaning to the addressee, and sometimes with the speaker's slight *head tilt*. C. Goodwin (1981) proposes two principles of gaze in interaction which describes the importance of gaze among participants in face-to-face conversation. In our data, the speaker frequently turns to the listener with gaze to solicit responses. In that way, gaze concurrent with declarative questions is used as a bodily-visual means to ask for responses. Li's (2014) study shows that leaning is relevant to the organization of the recipient intervening question--answer sequences in Mandarin conversation. Our study also proposes that leaning is an important multimodal feature of declarative questions which do not have to be a intervening questions in Beijing Mandarin conversation. Additionally, slight head tilt also solicits responses in our data but not as strong and compulsory as gaze does. Our study shows that paralinguistic practices are necessary in constituting question-response sequences in interaction, especially in use of non-echo declarative questions in conversation.

***Teaching formulaic language and idiomaticity in a bidirectional (Spanish-Swedish) mediation class*** (Contribution to *Teaching Formulaic Language to L2 Learners*, organized by Bladas Marti Oscar [et al.]

*Abstract:* In recent years, the traditional translation class for third-semester students of L2 Spanish at a Swedish University, due to the increasing number of students with Spanish as their L1 or as a heritage language, who share an interest in consolidating their knowledge of Swedish as well as of academic and other elaborate genres of Spanish, has been redefined in terms of a class of 'bilingual mediation'. The main goal of this class has been to increase the students' ability of transferring content from one language to the other while observing a high level of idiomaticity. Identifying formulaic sequences and mediating these into the opposite language (Swedish into Spanish and vice versa) has been a main endeavor in this class. This paper will account for details in the pedagogical approach for identifying formulaic structures and increasing the students' ability to transfer these between both target languages. A symmetrical situation was created between L1 and L2 speakers since all had to work with both their stronger and their weaker language. The multilingual setting proved a fruitful tool for the students to identify formulaic sequences and their semantic-pragmatic uses. Differences and similarities between the languages could be highlighted thanks to the collaborative interaction in the classroom, based on systematic code-switching. Surveys and interviews have been carried out showing the students' attitude to the pedagogical approach. Also, a pre-test measuring the ability to translate formulaic structures has been delivered, the results of which has allowed for a comparison with the results of the mediation exam at the end of the one-semester class.

***First things first: The use of preliminaries in early mother-infant interactions***

(Contribution to *Interactional routines in caregiver-child and peer interactions*, organized by Nomikou Iris [et al.]

Interactions between caregivers and infants have been increasingly explored as places where joint meanings are negotiated and communicative development has its roots. Since shortly after birth infants make experience of interacting with their caregivers in daily routines scaffolded by the caregiver (Fantasia et al, 2014; Nomikou et al, 2011). If, on the one hand, scaffolding makes adults-infants interactions structured and similarly shaped as adults' interactions (Bruner, 1983), it is also true that adults can rely on their experience in recognising emergent structures of action-in-progress in their communicative interactions. Infants need to learn and practice those structures to become skilled communicative partners. In daily interactions with young children, caregivers create opportunities for this to happen not so much by teaching explicitly how turn-taking or sequencing rules work, but rather by using those features naturally in their interactions, or simply by getting things done sequentially (Berducci, 2010). Does this happen with infants too? A recent study has found that some key features of the interactional organisation of adults' communication could be recognised in early interactions between mothers and 3-months-old infants. In particular, pre-sequences (Schegloff, 1980) were used by mothers to introduce upcoming actions to the infants. These features seemed to have a key role in supporting the infants' participation in the interaction (Fantasia, Galbusera, Fasulo, in prep). The question of what resources caregivers use to interact with their young infants, in term of structural features, and what role these may have in the co-construction of the interactional organisation, needs a deeper exploration. In the present study, we aim to explore two interactional "preliminaries": pre-sequences (Schegloff, 1980) and pre-closings (Schegloff & Sacks, 1984). Preliminaries are used in adults' conversations as recurrent types of conversational turns that preannounce the possible type of next turn. In early routine activities, preliminaries may have the function of showing infants the sequential organisation of interactions, as well as make the caregivers' action predictable enough to develop expectations on it, which seems crucial in early cognitive development (Lamb, Malkin, 1986). For our analysis we draw from three data collections: 1) 24 semi-structured interactions with mothers and 3-months-old infants playing nursery games in the University Lab; 2) 17 mother-infant dyads filmed monthly during diaper changing, when infants were 3-months-old for five months; 3) 20 mother-infant dyads playing peek-a-boo when the infants were 2, 3, 4, 6, 8, 10 and 12 months old. A preliminary data analysis revealed that when engaged in nursery rhymes, which are a special kind of early social games with a tight kinetic and vocal structure (Fantasia et al., 2014), mothers make adjustments to the game structure in the form of pre-openings, preliminary to the start of the game, to a) get the infant's attention; b) announce their intentions to initiate the game; c) request the infant's "approval" to do so. Along with the caregivers' behaviour, the present work also addresses infants' behaviour; we believe that our observations may strengthen the understanding of how

activities are organised and accomplished, and meanings are negotiated between preverbal infants and their caregivers.

**Nicholas Faraclas & Research Group on Marginalized Peoples and Creolization**  
***Indigenous peoples and discourses of ‘Land Rights’: The pragmatics of place in an era of post-/neo-colonialism*** (Contribution to *The Pragmatics of Place: Colonial and Postcolonial Perspective*, organized by Levisen Carsten [et al.]

In their critical reading of dominant contemporary discourses on land and place, indigenous peoples worldwide have demonstrated how the language commonly used when referring to such constructs as ‘land rights’ is founded upon the same set of presuppositions that has been responsible for the state-sanctioned theft of indigenous lands and places since the onset of the colonial era. This has led many indigenous people to avoid the term ‘post-colonial’ because it is too often construed as implying that we have somehow reached a stage ‘beyond’ colonialism. They argue that a term such as ‘neo-colonialism’ is more appropriate to describe the unprecedented rate of enclosures of indigenous lands and places that is occurring as a result of the current wave of Corporate Globalization. Based on our ongoing work around issues of land and place with indigenous peoples in the South Pacific, Latin America and West Africa, we describe and analyze both instances of discursive coercion that presently accompany the invasions of indigenous lands and places, as well as instances of discursive resistance to those invasions that are being articulated by indigenous peoples. We do so to acknowledge and document the significant intellectual work being undertaken in indigenous communities to unpack the presuppositions and implicatures that saturate contemporary understandings of land, place, power and rights which are propagated by corporate elites and agents of neo-colonialism such as the World Bank/IMF/World Trade Organization. Contemporary efforts by indigenous peoples to discursively re-center their ancestral worldviews and lifeways in the defense of their lands and places has led them to challenge prevailing conceptualizations of indigeneity itself. This challenge goes beyond the unmasking of the suppositions that typically underpin discussion of indigenous peoples in non-indigenous societies, to the reformulation of ever more inclusive and potentially paradigm-shifting definitions of what it means to be indigenous. For example, when indigenous peoples assert that anyone who claims sovereignty over land and place is indigenous, they qualitatively transform struggles for ‘land rights’ into a fundamental challenge to the presupposed universal nature of concepts such as ‘ownership,’ ‘rights,’ and ‘space’. Beyond this, however, they also invite all of the peoples of the world to remember and reclaim the inalienable powers that all of our ancestors enjoyed, since all of our ancestors were indigenous prior to the ever more systematic and hegemonic enclosures of their lands, their places, their minds, their bodies, their loves and their lives that have accompanied every successive wave of globalization, from the colonization that accompanied the expansion of the ‘civilizing’ empires of antiquity, to the colonization which accompanied the expansion of the ‘religious’ empires of pre-modernity, to the colonization which accompanied the ‘enlightened’ expansion of the empires of the colonial period, to the colonization which accompanies the ‘development-driven’ expansion of the contemporary empires of corporate greed.

**Chiara Fedriani & Piera Molinelli**  
***At the origin of a pragmatic cycle: Latin temporal expressions *tum*, *tunc*, and *dunc****  
 (Contribution to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.]

This talk focuses on competing uses and functions of three Latin temporal expressions, namely *tum*, *tunc* (‘then’, ‘at that time’), and Late Latin *dunc* (‘then’) by considering their diachronic development in terms of an onomasiological semantic-pragmatic cycle (Hansen 2015), whereby the same function comes to be expressed by different forms over time, which gradually replace one another. *Tum* and *tunc* refer to a previously specified point of time, also regarding temporal sequences and, at a more abstract level, connection between events, often implying a consequence (‘then’, ‘hence’). These forms constitute an interesting case of polifunctionality, since they express similar values which developed along the same lines of semantic enrichment (from temporal distance to consequential relation), their uses being intriguingly intertwined in the history of Latin. We first show that in Early Latin *tum* constitutes the unmarked form, whereas *tunc*, derived from *tum* (\**tom* > \**tom-ke*: De Vaan 2008: 633) was originally more emphatic (‘at the very moment when’) and used sparingly (e.g. only five occurrences in Plautus). Moreover, *tunc* was originally associated with a lower register and “considered the

less urbane form of the two” (Rosén 2009: 379). In Classical Latin *tum* still constitutes the basic form: Caesar uses it in the 95% of cases, Catullus has 28 *tum* against 1 *tunc*. In Post-Augustean Latin, however, the relative frequency of *tum* and *tunc* changes, with *tunc* being progressively bleached of its pragmatic markedness and freely used in a larger variety of contexts. In Seneca’s *Epistulae* the ratio is already inverted (10:95); in Apuleius is 13:120. *Tum* is not attested in the *Vulgata* and in the *Peregrinatio*, being totally replaced by *tunc*. In Late Latin, however, yet another competing form emerges: *dunc* ‘well then’, a marker of continuation or conclusion (Rosén 2009: 395), probably derived from *dum* + *donec* (ThLL s.v. *dum*, col. 2199, 60-65) as an analogical formation reproducing the doublet *tum/tunc* (see Hansen 1998: 322 for a synopsis). Crucially, it is precisely *dunc*, and not *tunc*, which gives rise to Romance developments such as Merovingian Latin *dumque* > OldFrench *don/donc/dont/donques* (Chrétien de Troyes’ *Chevalier au lion*, XII cent.), French *donc*, OldSpanish *doncas*, Italian *dunque*, among others (Meyer-Lübke 1935: 179-180). Such forms can be used with both temporal and resultative/discursive functions, thus constituting another stage of innovation in the cycle under scrutiny. Lastly, we will briefly consider also the relationship with a related form, *illa hora* ‘at that time’ (> Fr. *alors*, It. *allora*). We will look in detail at the diachronic competition of the forms *tum/tunc/dunc* within a long time span, to shed light on the process of alternation and substitution which constrained their emergence, use, and demise. More specifically, we will analyze their syntactic contexts and semantic-pragmatic values to assess their role in this cycle. We will also discuss how changes in markedness values between competing forms lead to changes in frequency of use, and in what terms a process of ‘markedness reversal’ could be said to be at the root of the cycle described.

***Responding to rudeness in L2 English study abroad contexts: Methodological issues and pragmatic competence*** (Contribution to *Student mobility and pragmatic competence*, organized by Barron Anne [et al.] )

Research on learners’ pragmatic competence has mainly focused on speech acts and linguistic politeness. This research has been conducted in study abroad and non-study abroad contexts (Bardovi-Harlig 2013; Bardovi-Harlig & Bastos 2011; Félix-Brasdefer & Koike 2014; Ren 2015), but little attention has been given to the learning of L2 impoliteness (Félix-Brasdefer & McKinnon [forthcoming]). Based on Beebe & Waring’s (2005) study on pragmatic development in impolite speech acts, the present study refines their method to examine instances of rude behavior among advanced learners studying English in the United States, with a focus on oral production. Method: 40 subjects participated in the present study: 20 learners of English in the United States (low advanced; with different L1s; LoR 1-2 years) and 20 NSs of US English. A computer-delivered oral DCT was used to examine instances of rude behavior across four different situations in institutional settings common to students. Results showed that exposure to natural input had some effect on the learner’s ability to respond to rude behavior. Overall, the learners showed a preference for acquiescent strategies (apologize, thank, agree, opt out) compared to NSs, who showed a preference for aggressive strategies (insults, criticism, sarcastic remarks). Both groups showed a similar preference for persistent strategies (arguing, justify, request). In addition to analyzing responses to rude behavior, I will review prosodic features that convey various aspects of rudeness in L2 English. This talk ends with ways to refine the methods used to collect data on impolite behavior in order to improve our understanding of rude behavior as one aspect of pragmatic competence.

**Milan Ferencik**

***Im/politeness on the move: A case study in the sociolinguistics of globalization***

(Contribution to *Postcolonial linguistic landscapes: Reading globalisation in the margins*, organized by Juffermans Kasper [et al.]

Semioscapes of tourist **destinations across the globalised world** are generally designed to cater for the international travellers' semiotic needs, esp. their need to experience authenticity while at the same time maintaining a comfortable degree of familiarity (cf. Kallen 2009). Specific configurations of semiotic resources and practices traceable in these semioscapes arise from the operation of multiple agents involved in tourism through which a 'place' is turned into a tourist 'destination' (cf. Piller 2007). As the regulation of flows of people, goods and services in tourist destinations necessarily involves also a regulation of behaviour of actors in tourism industry, power-relations and the concomitant **im/politeness issues** form an inherent, albeit less salient, 'structuration principle' of the 'linguistic landscapes' (Ben-Rafael 2009) of these destinations. In my proposed **ethnographic study** I wish to explore the **im/politeness practices** that have been taking place in the *Štrbské Pleso* mountain holiday resort, a Slovakia's prime site of year-round tourism. My empirical data for analysis come from 1. the **public signage of the place**, i.e. multimodal/lingual signs which form a recognisable semiotic layer of its 'linguistic landscape' which is targeted at the tourist clientele. The photographs of the signs will be taken using a GPS-equipped digital camera and will be processed through the use of geo-referencing methods. My focus will be on the ways of how, **in the 'regulatory discourse'** of the signage, power relations as perceived by **sign authors/principals** are encoded through their **deployment of (im)politeness strategies**, 2. semi-structured **interviews** with the **sign authors/principals** (service providers, shop owners etc.) and with **interpreters/accounters** (tourists) which will enable me to access their emic evaluations of the im/politeness practices from two complementary perspectives. The *Štrbské Pleso* resort is in many aspects on the 'periphery' (of the township, region, state, EU, etc.), yet as a tourist destination it has not been immune to the processes of '**geocultural globalisation**' (Blommaert 2010). As a result of the synchronisation of historical, geopolitical, socioeconomic and cultural influences its unique semiotic 'ecology' is marked by a **hybridity and amalgamation** of linguistic resources and discourse practices which index both globally-uniform and locally-endemic (vernacular) discursual features. My preliminary analysis of the signage suggests that *Štrbské Pleso* is a site in which im/politeness **practices represent different 'orders of indexicality' simultaneously** and are oriented to multiple 'centres' with their respective norms (Blommaert 2010). Also, they occur at different scale-levels: their orientation to the '**global scale-level**' leads to homogenisation, which is not dissimilar from other globalised tourist semioscapes. This is manifested through the appropriation of the Western/Anglo-world discourse practices, of English as a lingua franca and its standardised norms. Their orientation to the '**national**' and/or '**local scale-levels**' results in the appropriation of the vernacular socio-cultural idiom (such as a higher level of directness). As a result, it seems that globalisation does not necessarily yield a large-scale homogenisation and/or uniformity of practices but leads to their **multiplicity** and hybridity (cf. 'vernacular globalisation'; Appadurai 1996). The principal theoretical-methodological approaches used are the '**sociolinguistics of globalisation**' (Blommaert 2010) and '**politeness as social practice**' (Kádár and Haugh 2013), and the analysis is broadly conceived within the 'linguistic landscape' research field and its recent elaborations (Blommaert 2013; Blommaert and Maly 2015). The study also aspires to be an addition to a rather modest stock of research into **politeness phenomena in the post-communist countries**; the few existing studies (for example, Hickey and Steward 2005, Ogiermann and Suszczyńska 2011, Ferencik 2014, 2015) trace the changes in im/politeness following a major societal shift.

### **Lucía Fernández-Amaya & María de la O Hernández López**

**“¿Todo bien?”: Conversational structure and rapport in closing sequences at Spanish hotels** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

Closing sequences have always been considered a sensitive part of interaction in terms of politeness and rapport (Gallardo 1993; Cameron 2001; Takami 2002; Fernández-Amaya 2004, 2007, 2010; Coppock 2005; Spencer-Oatey, 2008), since interlocutors have to negotiate when exactly the conversation will end. When it comes to hotel interaction, this is crucial to make a good impression in travellers. This talk addresses the closing sequences of reception desk interactions at different Spanish hotels, from both a conversation analysis standpoint (Schegloff and Sacks, 1973; Gallardo, 1993, 1996, 1998) and a pragmatic perspective to focus on how rapport and politeness are managed. The data comprise more than 7 hours of recorded encounters between receptionists and customers in 4 different hotels in Seville (Spain). The results show that while the traditional structure proposed by Schegloff and Sacks (1973) is mainly followed, some particular features appear to be characteristic of this particular conversational genre, such as unexpected interruptions or the inclusion of new information. In line with previous studies (Félix-Brasdefer 2015), we found that the conversational closings were characterized by both transactional (i.e. check-in, check-out, complaining or making a request) and relational talk (i.e. small talk or phatic communication). Thus, interlocutors seem to cooperate not only to enhance rapport but also to maintain each other's face while finishing the conversation (Placencia 1995, Fernández-Amaya 2004, 2007, 2010). In contrast with recent studies on Politeness<sup>1</sup> at Spanish hotels (Fernández-Amaya, Hernández-López and Garcés-Conejos Blitvich, 2014; Hernández-López and Fernández-Amaya, under review), in which deference and affiliation seem to be equally important, this study shows that, while both ends are present, they are not always balanced.

#### ***Quoting ordinary people in Prime Minister's questions*** (Contribution to *Constructing Ordinarity across Media Genres*, organized by Weizman Elda [et al.]

Prime Minister's Questions (PMQs) is the central British parliamentary institution and its highest profile parliamentary event. Every week in the House of Commons, Members of Parliament have the opportunity for half an hour to pose questions to the Prime Minister (PM) on any topic of their choice, frequently utilizing quotations from various sources, e.g. allies from the quoter's political party, political opponents, experts, or ordinary people. The focus of this contribution is on interchanges between the Prime Minister (PM) and the Leader of the Opposition (LO) and their use of references to ordinary people, in particular quoting them. The data comprise 240 question-response sequences in total: 20 exchanges between David Cameron (former PM and Leader of the Conservative Party) and Ed Miliband (former LO and Leader of the Labour Party), and 20 exchanges between David Cameron and Jeremy Corbyn (current LO and Leader of the Labour Party, since 16 September, 2015).

In the PMQs sequences analysed, quotations made up 9.21% of the total word count for Cameron-Miliband and 10.99% for Cameron-Corbyn. Notably, however, in the Cameron-Corbyn data set 37.11% of the quotations were from ordinary people, used almost exclusively by Corbyn; this contrasted with only 2.53% of quotations in the Cameron-Miliband data set (principally from Cameron).

The discursive contextualization of quoting ordinary people displays interesting patterns. Corbyn presents them not as singled out individuals but rather as first names, e.g. "*Paul*, for example, asks this very heartfelt question: 'Why is the government taking tax credits away from families? ...'", sometimes furnished with their role in society, e.g., "I have a question from *Steven*, *who works for a housing association*. He says that the cut in rents will mean ...", and sometimes also as generic representatives of a relevant group, such as nurses or teachers. In his response, the PM recycles the referring expressions and responds in a descriptive manner, e.g. "Let me now answer, very directly, Marie's question", formatted as a hypothetical quotation, e.g. "What I would say to Steven, and to all those who are working in housing associations and doing a good job, is that for years in our country there was something of a merry-go-round."

Corbyn's systematic use of quotations from ordinary people was novel in the context of PMQs, foregrounding their political issues and assigning them the status of an object of discourse in the media rather than scoring points at the expense of one another as has been the case with quotations from other sources.

### **Carolina Figueras Bates & Natividad Braceras**

#### ***The interplay between evaluation, evidentiality and argumentation: Stancetaking strategies in the National Court's decision for the Madrid bombings of 2004*** (Contribution to *The Interrelation between Evidentiality, Mitigation and Appraisal across Genres*, organized by Figueras Bates Carolina [et al.]

Evaluation is pervasive in all types of discourse, even in the ones traditionally considered as more centered on the ideational component of language, or more domain-specific, impersonal, objective and neutral, such as judicial decisions (Szczzyrbak 2014). In fact, as some researchers have pointed out, justices routinely resort to affective and evaluative language in their rulings (cfr. Almeida 2015). Articulating evaluative meanings constitutes an essential component of judicial argumentation, since judges' rulings are the result of a complex process of assessing the evidence in the case. In solving a conflict according to the law, "the same set of evidence can be interpreted in various different ways" (Salmi-Tolonen 2005: 60). Deliberation and interpretation then become necessary operations in reaching a judicial decision, and so do the different procedures to evaluate the evidence.

Evidential decision-making is also based on the stories (the narratives) presented during the trial. As Bex (2009) points out, the *sources of evidence* (such as witness testimonies, forensics reports, and so forth) are connected to these stories via defeasible arguments. Studying the narrative incorporated in the judicial decision sheds light on the ways judges organize, evaluate and make sense of the evidence made available to him/her when stating the history of the proved facts in the case (Bex 2009; Bennett & Feldman 1981). Likewise, evidentiality plays a fundamental role in the section of *arguing the case*, or presenting the *legal grounds* for the decision. The main evidential source for this discursive move is referred, second hand evidence, and, hence, the main strategies are reporting verbs that signal evaluation and interaction of other voices in the text (Mazzi 2007). In fact, the legal facts actualized in the judicial decision are the product of reasoning against the backdrop of the specialized texts referenced in the ruling.

In this framework, the aim of the present study is to explore the interplay between evaluation, evidentiality and argumentation in judicial discourse by examining the decision rendered in October 31, 2007 by Spain's National Court for the Madrid bombings of March 11 2004. Specifically, we are concerned with the linguistic mechanisms deployed by the justice in the National Court's ruling to construct stance and stancetaking when evaluating the legal arguments, evidence sources and evidential data presented to him by the parts, and when the judge proceeds to argue the case, adducing the legal grounds for the decision. As Szczyrbak (2014) reasons, the concepts of stance, and stancetaking (cfr. Biber 2006; Biber D. et al. 1999; Biber & Finegan 1988; Du Bois 2007; Johnstone 2009) are instrumental to analyze the argumentative and rhetorical strategies of the judicial discourse from the perspective of the interpersonal dimension of communication. By studying the stancetaking strategies articulated in the National Court's ruling we seek to uncover the multifaceted interactions between emotion, attitudes and ideology, evidential evaluation, and judicial decision-making in a particularly controversial judicial case.

#### ***Responsible and irresponsible ways to talk about migration in German mass media***

(Contribution to *Responsibility, migration, and integration*, organized by Östman Jan-Ola [et al.]

This study analyzes the interplay of responsibility and migration on the basis of the current mass media discourse in Germany dedicated to the latest wave of migration caused by the conflict in Syria. It is clear that mass media play an important role in forming and shaping our knowledge and attitudes towards any social, cultural, economic and/or political changes. The process of knowledge formation is strongly supported by language: with the usage of certain types of vocabulary, patterns, structures and topoi a particular type of “linguistic reality” is created (Felder 2013; Warnke 2009; Wengeler 2003). Some discourses are even highly determined by selection of specific linguistic means that can be considered typical for these discourses (Busse & Teubert 2013). The goal of the study is to analyze such specific linguistic means in the German migration discourse and to project the results onto the general questions of the panel. First preliminary results (Filatkina 2015) show that concepts like trust, mistrust and fear are connected with mass media reports about migration, the latter concept often being verbalized with the help of the German word *Angst/Zukunftsangst*. Though this concept is not restricted to the migration discourse (Filatkina 2015), it can be considered one of its “key words”. As *Angst/Zukunftsangst* eludes precise semantic-pragmatic descriptions in German and poses difficulties for translation into other languages, the basic pragmatic question is what this word actually means and what functions it really has in German. The study gives insights into an ongoing collaborative research network that consists of linguists, sociologists, anthropologists, historians, and scholars working in the field of education. In a “work-in-progress”-modus, I shall present a text corpus that is currently under construction at Trier University and includes the six most popular online mass media in Germany. The data from this corpus will be analyzed qualitatively and quantitatively with the help of various linguistic discourse analyses methods. My goal is to

contribute to what the call for papers for the panel refers to as “(a) the notion of “responsibility” in sociolinguistic analyses, in discourse analyses and in pragmatic analyses” and “(b) a deeper understanding of the challenges that integration (or rather, “contegration”) faces linguistically and pragmatically.”

***Facilitating global transitions in health care: The role of genre analysis*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

The nursing workforce around the world has, for the last twenty years, undergone significant internationalisation with increasing migrant waves of nurses crossing borders to undertake jobs in the healthcare sector. In New Zealand alone, it is estimated that 36,9 percent of the registered nurse (RN) workforce comes from overseas and that this number will continue to rise due to an increasing demand for health services as a result of population growth (Nursing Council of New Zealand, 2013). Very interestingly, these nurses are believed to represent approximately 95 different ethnicities (New Zealand Nurses' Organization, 2009).

However, while this phenomenon has helped to alleviate healthcare staffing crises in a number of countries, it does potentially create issues for nurses in relation to adaptation, particularly for those attempting to adapt to professional practices in their new host country. Adapting to a new workplace culture requires a complex and multi-layered effort as nurses need to adjust to the new cultural norms of how to conduct frontstage work, i.e. how to interact with patients and patients' families, and backstage work, such as handover meetings. Knowing how to navigate these interactional contexts will possibly influence how successful nurses are in the new country, which, in turn, may have an obvious impact on staff satisfaction and retention.

Genre analysis provides a potentially useful way of developing an understanding of the knowledge needed by nurses to navigate the interactional contexts of their profession. Genres have been construed of as cultural resources whereby the cultural constraints and expectations regarding social behaviour in a given genre can be mined from linguistic and communicative patterns. In this presentation, we report on a study that analysed the nursing handover meeting in a New Zealand context from a genre perspective. We illustrate the types and layers of knowledge a genre analysis can provide for facilitating transition of nurses to a New Zealand context, focusing on both macro levels (i.e. social purpose and structural knowledge) and micro levels (i.e. patterns regarding interactional management). We end with some discussion of the limitations of this approach and potential ways the research community can attempt to address these limitations.

#### Anna Filipi

***Capturing the interactional properties of early storytelling: An exploratory study***

(Contribution to *Storytelling in adult-child and children's peer interactions*, organized by Burdelski Matthew [et al.]

This study is an exploratory study of two interactions between a parent and her child aged 23 months. The interactions provide examples of tellings that begin to emerge when the child moves from talk that is highly dependent on the objects or activities in the physical space to talk about events that have occurred in a recent past and are not part of the immediate context. Such talk involves extended, multi-unit sequences. In the child

language literature these interactions are reported to emerge from the age of two, typically at the age of 2;6 (Miller & Sperry, 1988). Using the micro-analytic methods of conversation analysis where the focus is on interaction as the outcome of the joint, collaborative actions of both parent and child, and how they make visible to each other how they have understood the action in the previous turn, the analysis will focus on two stories. One is initiated by the parent and invites the child to tell the researcher what she had for lunch. The other is a 'second story' that is triggered by a picture-book story that has just been read. The data were collected in Australia, and the two samples to be analysed are extracted from two 30 minute sessions of a larger sample of 50 hours. Analysis will use a set of features extrapolated from the research on adult story-telling to determine in what ways these two interactional tellings might be construed as stories. They include what triggers the telling, how speakers resolve the interactional problem of creating a multi-unit turn, how the telling is conducted collaboratively, what its purpose is and who it is for, and how it is oriented to as being newsworthy.

### **Rita Finkbeiner**

***Pragmatics and constructions: Approaches and challenges*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

Constructionist approaches to grammar usually do not incorporate a theoretical explication of the status of general pragmatic principles, e.g., conversational maxims (Levinson 2000), w.r.t. constructions (Goldberg 2013). At the same time, in recent contextualist approaches to the semantics/pragmatics interface (Carston 2002, Recanati 2010), the typical grammatical unit referred to is the sentence, whereas sub-sentential constructions such as, for example, 'Really intriguing, this paper' (Paul/Stainton 2006), are rather neglected. However, it seems that not only sentences, but also (sub-sentential) constructions are in systematic interaction with pragmatic processes and principles. For instance, while constructions may be conventionally associated with a certain speech act force (Morgan 1978, Kay 2004), speech act theory is built on the insight that the actual speech act of an utterance is ultimately constituted in context (Searle 1969, 1979). In this talk, I sketch the basic approaches and challenges at the interface between pragmatics and constructions. Drawing on examples from German, it is argued that construction grammar must systematically account for inferential-pragmatic effects, and that contextualist approaches must systematically account for constructions.

### **Giuliana Fiorentino**

***E-Word-of-Mouth vs. online reputation management on TripAdvisor: 'Who are you speaking to?'*** (Contribution to *Analyzing Online Prosumer Discourses: Consumer Reviews, Customer Feedback, and other modes of eWOM*, organized by Vasquez Camilla [et al.]

Web 2.0 encourages the production of (online) consumer reviews for several types of goods and services in different commercial areas. Among this typology of online texts, which have been defined as 'electronic' word-of-mouth (e-WoM), I will focus on travel online reviews, and in particular I will focus on hotel reviews because they represent a very specific type of online consumer reviews. The reason for this uniqueness resides on the fact that in the tradition of the hotel and of their communication to customers, the hotel review is not a novelty.

In fact, there existed the customer satisfaction surveys that the hotel staff, especially in luxury hotels, distributed to customers on their arrival. They were anonymous questionnaires rating both the hotel as a structure and the facilities or the staff members. In some way, the hotel online reviews can be seen as an evolution of the customer satisfaction surveys. Moving to the travel web sites the customer satisfaction surveys become something very different. In fact, they engage a sort of ‘triangle’ whose participants are the customer and the hotel director (or whoever among the customer service staff is involved in managing with the evaluations and complaints), as in the traditional customer satisfaction surveys, but there is also a third relevant ‘element’, the readers (also potential customers) who are visiting the web site and reading through the online reviews. On the web both the traveler and the business man know that there is a public ‘arena’ where their discourses collocate, and they are highly sensitive to it. The fact that travel reviews discourse is intended for different audiences emerges both in consumer reviews and in business replies. Online travel reviews are clearly built for two audiences: from one side they address other travelers, and from the other side they address the customer service as in the traditional customer satisfaction surveys. Readers are directly addressed when the reviewer recommend or not the hotel; the staff and or the hotel are (in)directly addressed especially in complaints (see Vásquez 2014, Compagnone & Fiorentino forthcoming; Fiorentino & Compagnone forthcoming). Business replies are built for two audiences too. Hotel representatives reply to reviews directly addressing each single reviewer, sometimes naming him/her in the first line of the text (a text built as a traditional business letter). At the same time their reply is clearly built indirectly addressing the wider audience of new potential customers or old ones. The strategies and moves that business adopt in order to respond to online complaints have been already studied for Chinese in a genre/move analysis (Zhang & Vásquez 2014). I will take this study as a starting point for my analysis which include also responses to positive reviews. In this paper I analyze the online discourse practices between customers and businesses of some 4-stars / 5-stars hotels in Italy. A corpus of 100 online reviews (from TripAdvisor) followed by the businesses replies will be extensively considered with a ‘light’ quantitative approach and a more detailed qualitative approach. My focus will be a) describing how participants manage with the ‘public arena’ they find themselves involved when writing on the web; and at the same time b) analyzing how do writers on the web keep on producing a one-to-one conversation, considering that especially the business response is meant to reply to a specific review / a specific customer.

#### Kerstin Fischer

***Relationships between (construction) grammar, grammars and genre: Evidence from an analysis of Instagram strategies*** (Contribution to *Multiplicity in Grammar: Modes, Genres and Speaker’s Knowledge*, organized by Iwasaki Shoichi [et al.]

The question concerning the upper limits of the kinds of structures describable in a grammar has been discussed for decades (e.g. Petőfi 1971) and receives new attention with every new definition of grammar; correspondingly, also with the rise of construction grammar, the role of discourse in grammar is being addressed again (e.g. Östman 2005; Fried & Östman 2005; Matsumoto 2010; Andronopoulou and Nikiforidou 2011; Fischer & Nikiforidou 2015 (eds.), to mention just a few). Construction grammar principally allows the definition of constructions beyond clause level and embraces many types of meaning including discourse-functional meanings (e.g. Fillmore et al. 1988; Kay & Michaelis 2012), and it generally claims that linguistic knowledge can be exhaustively described by means of constructions, i.e. constructions all the way up (e.g. Goldberg 2006). These features suggest a re-evaluation of the limits of grammatical description. In the current talk, I will explore these limits using the example of Instagram posts, a text-type that is clearly restricted by technological constraints. Basing the discussion on Aarestrup’s (2016) multimodal analysis of Danish and US department stores’ Instagram strategies, I argue that Instagram posts constitute clearly identifiable form-meaning pairs such that a multimodal document can be easily identified as Instagram post due to its clear formal restrictions, but that beyond that considerable variation in the realization of Instagram posts can be observed. Nevertheless, the immediate and objective feedback available for social media posts supports the establishment of particular practices, which seem to be attended to and exploited by experts, yet which are completely functionally motivated, transparent and compositional for non-experts. Such patterns could be described in a

grammatical representation, incorporating genre into grammar. However, the patterns identified do not constitute a shared inventory of grammatical knowledge since they are not part of the readers' linguistic knowledge, just what experts have come to agree upon. While different grammars for experts (professional producers of Instagram posts) and non-experts (the consumers) could be assumed, these do not account for the fact that both concern the same products, the same Instagram posts, just from an encoding and a decoding perspective. In contrast, as experts speak of strategies themselves, understanding the patterns observable as pragmatic strategies accounts for the observable regularities.

#### Susan Fitzmaurice

***Performing epistolary sincerity for the public: An eighteenth century English literary correspondence*** (Contribution to *Sincerity and Epistolarity*, organized by Fitzmaurice Susan [et al.])

In this paper, I examine the ways in which two eighteenth-century English letter writers construct and perform epistolary sincerity in several distinct communicative contexts. Alexander Pope and Lady Mary Wortley Montagu were friends and correspondents; he wrote between 50 and 60 letters to her before they became enemies and exchanged barbed rhyming couplets in public instead of letters in private. Interestingly, both authors drew upon the ostensibly private letters that they exchanged with each other as raw material for letters that each published separately for public consumption. The letter serves as a source for the construction of different kinds of interaction in the eighteenth century. Specifically, we see in these cases, letters ostensibly addressed and sent to specific, particular individuals. Of course, they could have been circulated and shared among friends by the named individual. However, at some point, they were separated from both writer and addressee and situated in a different frame for public consumption. As these letters are offered for scrutiny to different audiences at different times and in different contexts, they arguably invite a different kind of reading in each of their lives. Separated from the personal epistolary context, they have the capacity/potential to become fictional objects, polemical political objects or indeed objects that participate in a kind of narrative designed for ends quite different from those originally intended. I focus on the pragmatic work undertaken by which each author in the process of making the letter both a literary and public talisman of the writer's epistolary self. The task of persuading a (public) audience that the letter serves as a direct and trustworthy representation of the writer, I argue, entails the necessary transformation of the writer's relationship with the reader from a unique, authentic and sincere exchange to a generalized yet recognizably genuine gesture towards correspondence. I will examine metalinguistic, discursive and pragmatic levels in my analysis of the distance between these personal and literary letters in order to interrogate the ways in which the context of production may condition the reading of sincerity.

#### Natalie Flint, Michael Haugh & Andrew John Merrison

***Accounting for disaffiliation in initial interactions amongst British and Australian***

**speakers of English** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

While much research on ‘affiliative work’ has focused on doing (dis)affiliation (Stivers 2008; Clift 2016), this paper explores remedial work *following* disaffiliations, investigating initial interactions using a conversation analytic methodology to further explore linguistic (im)politeness and the socio-pragmatics of getting acquainted. While previous research (e.g. Stokoe 2010) has investigated initial interactions in speed-dates, this study explores ‘doing getting acquainted’ in a non-romantic setting (Svennevig 1999; Haugh 2015, 2016; Haugh & Carbaugh 2015). Here, we analyse how disaffiliations are accomplished in British–British and Australian–Australian dyads focusing on the use of subsequent extended remedial accounts (Goffman 1971). Additionally, not only are these disaffiliations accounted for, more specifically, they are ‘justified’, as opposed to being ‘excused’. In examining these data, then, we begin to offer a more nuanced account of ways in which speakers of different varieties of English do remedial work when disaffiliating. These remedial accounts enable participants to reposition a prior disaffiliative stance as affiliative. In our data, these accounts are typically followed by some degree of stance ‘movement’. It appears in initial interactions, then, that remedial accounts play an important role in modulating troubles in affiliating. It is proposed that the considerable interactional work undertaken by these participants to modulate such troubles reflects a general preference for agreeability in initial interactions, at least amongst (Australian and British) speakers of English.

**Nydia Flores-Ferran**

**‘You people’: An examination of person deixis and verbs in Trump’s ‘political’ speeches**  
(Contribution to *The Trump Factor: Analyzing the Communicative Practices of Donald Trump Across Broadcast Settings*, organized by Montiegel Kristella [et al.]

In political discourse analyses, the use of pronominals has been found to represent one of the ways in which politicians make reference to self and interact and address their audience. For example, *I* is considered proximal in that it marks the zero point of a speaker’s position with respect to hearers; *you* and *they* and lexical forms such as *those people* are considered distal. Thus, a politician’s use of pronominals affects the way of arguing and how an audience is won. In addition, the choice of deictic expressions may serve to reveal a speaker’s attitudinal orientation. Verbs, on the other hand, denote action and event verbs have been found characteristic of the speech of effective leaders while mental verbs have been reported in high frequencies in political discourse. One of the research questions this study address is how does Trump employ deixis to persuade his audience? The presentation will focus on ten of Trump’s public presentations and will discuss how Trump ‘does’ politics. In using a Critical Discourse Analysis and mixed methods approach, the presentation will show how proximal *I* was attested in utterances related to a positive aspect of Trump’s own performance such as being ‘*on top*’, ‘*winning*’, etc. We will also show how he characterized his opponents with expressions such as *that guy*, immigrants or terrorists with *those people*, and his opponents with *these people*. Finally, the presentation will discuss how Trump issued deictic expressions to persuade and polarize his audiences.

## Lyn Wright Fogle

### ***How single parents talk about their children: "Us" vs. "them" in interviews about bilingual family language policy*** (Contribution to *Discourse, interaction, new families and contemporary kinship processes*, organized by Poveda David [et al.]

As research in family language policy (FLP) moves to consider intergenerational language practices in more diverse family configurations, including transnational, single parent, and adoptive families, new understandings of family interaction and children's agency in FLP have emerged (Fogle, 2012a; Gallo, 2014; King, 2013). This study contributes to this area of research by focusing on how single parents construct their children as joint decision makers in bilingual parenting processes in research interviews. Through a close analysis of pronominal reference (i.e. "we" vs. "they" in relation to family members) by single vs. partnered parents in interviews, this study examines how family configurations and contemporary kinship processes connect with FLP as ideologies of parenting and family roles intersect with language practices. The current paper draws on interview data from two studies of language ideologies and family language policy, the first with adoptive parents (Fogle, 2012b) and the second with Russian-speaking mothers in the U.S. (Wright, in progress). Following Schiffrin (2000) the interviews were analyzed quantitatively and qualitatively for the occurrence of referring terms "we" and "they" and the topical entity (i.e., children, parents, whole family, or others) of the pronouns. Results from the single parents in the data set were compared to those from partnered parents to examine differences in referring to children and parents or the family unit as a whole. Preliminary findings suggest that single parents discursively constructed their children as equal partners in decision-making processes about language and education while partnered participants were more likely to talk about their children as recipients of FLP. This difference points to the ways in which family configurations potentially shape FLP processes and has implications for

understanding the collaborative role of children in family language socialization (Luykx, 2003). In conclusion, studies in FLP require a more contextualized approach that capture family internal and external processes simultaneously in order to examine how migration trajectories, kinship processes, and children's experiences outside of the home influence FLP.

### Josep M. Fontana

#### *A minimalist approach to constructions as inference-restricting devices* (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

A minimalist approach to constructions as inference-restricting devices. I argue that constructions evolve to maintain an acceptable degree of entropy in language as a communicative system: A system requiring too much inferencing is costly; having a single form for every possible meaning, however, is unwieldy, perhaps unlearnable. How constructions (indeed, grammar in general) achieve this is evident in the following example. If I say broak while you and I are observing an unfamiliar entity doing something unfamiliar, it may be entirely unclear what I mean. If I say the broak, the possibilities are importantly reduced. The reduction in possible interpretations requires no assumptions about whether broak is a noun or verb; it is enough to know that the is used for entity reference. Viewing constructions as inference restrictors contrasts with a tendency (prevalent in generativism, but also present in some lexicalist/projectionist approaches to construction grammar, e.g. Boas 2003, Kay 2005; see van Trijp 2015) to treat languages as communication systems that ideally drastically minimize interpretive work by language users. I develop my argument using the constructions in (1)-(6) and their counterparts in Spanish.

- (1) a. The drawer was closed (for three weeks) b. The drawer was big.
- (2) a. The drawer was closed (by your mother). b. The child was found unconscious.
- (3) I have found the child
- (4) Yesterday I had the car parked (by my son, today I parked it myself).
- (5) I had the car parked (all night in an expensive parking lot.)
- (6) a. I have a car b. I have a car behind me. c. I have a party every other week.
- 

Linguists typically posit lexical ambiguities in the highlighted expressions: adjectival participles in (1) and (5) vs. verbal passive participles in (2), and verbal perfect participles in (3) and perhaps also (4); copular BE in (1) vs. passive auxiliary BE in (2); “lexical” (possessive) HAVE or some extension of it in (6) and possibly also (5) vs. perfect auxiliary HAVE in (3), and another “causative” HAVE for (4). The hypothesis of lexically distinct participles and HAVES is reinforced by the common assumption that the perfect has emerged from grammaticalization in which possessive HAVE and adjectival participles were reanalyzed. Under this view, at least some interpretive differences in (1)-(6) are attributable to lexical differences. Crucially, lexical differences imply constructional differences. Thus, on a lexicalist/projectionist approach, we have at least 6 different constructions. If constructions are simply inference restrictors and language change is an inherently gradient process, a simpler theory of how constructions and lexical meaning work together in interpretation becomes possible, on which instead of 6 or more constructions for (1)-(6), there are only 3. Support comes from synchronic data as well as diachronic data of the kind illustrated in (7)-(9).

- (7) He wæs ða dead þurh þa iudeiscen (“He was then dead by the Jews”) ÆLS:310, in Petré 2010
- (8) Las cabras que ovieron las orejas tajadas de pequeñas más leche an.” (“The goats that had the ears cut when young have more milk”) GE1

- (9) ... quae habeat cottidianum familiae coctum (“...who have every day’s food cooked for the household”) Plautus, Mercator 396–398.

I will show that all the interpretations in (1)-(6) were already available in Latin and the earliest English; there is actually no evidence for reanalysis of adjectival participles into perfect participles, or of lexical HAVE into an auxiliary; and there is no reason to distinguish copular and passive BE. There is evidence for gradual specialization of different constructions (understood here as surface-distinct forms) for different interpretations, the perfect being the limiting case of specialization to one interpretation. If there have been no lexical changes, there can be fewer constructions involving BE and HAVE in English (as well as in other languages) than is usually assumed. More importantly, we can conclude that what has changed through time is not the lexical items but rather just the specific range of interpretations associated to each construction (consistent with Traugott and Trousdale 2013 views on constructional change). If so, there is more (pragmatic) inferencing involved in the interpretation of these constructions than lexicalist/projectionist approaches hypothesize.

#### *The affordances and constraints of genre: Words and images in unusual "traffic signs."*

(Contribution to *Going viral: The socio-pragmatics of iconic communication in a shared world*, organized by Cantero-Exojo Monica [et al.]

The key idea of relevance theory (RT) is that communication is governed by the awareness, shared by a message’s sender and addressee, that the former tries to be optimally relevant to the latter (e.g., Sperber and Wilson 1995, Wilson and Sperber 2012, Clark 2013). Mass-communicative visuals are generally considered to be rich in information, but also to be open to many different interpretations. In this paper it is argued that relevance in such visuals is achieved to a considerable extent by the fact that they are understood as belonging to a specific genre (e.g., Fisher 1980, Paltridge 1995, Benoit 2000, Frow 2006, Forceville 2005, 2014). Correct genre attribution, in turn, is partly governed by discourse-internal factors and partly by pragmatic factors

utinsoftLocal.ByteClass specifically by when and where one comes across the discourse. The genre of emoticons is a case in point (Yus 2014). The genre of traffic signs is another one. The heavily coded nature of such signs enables at least partial comprehension even of unfamiliar instances of this genre. That being said, users must not only be familiar with the visual and verbal codes deployed in the traffic signs, but also be able to recognize the objects and people they contain. Complete understanding for a given user thus depends on a combination of knowing the code and recognizing phenomena from everyday life. :0 Keywords: genre, traffic signs, multimodality, relevance theory, creativity.

***Feminine forms: Friend or foe in a gender(ed) social re-ordering?*** (Contribution to *Language, Gender and Cognition*, organized by Alvanoudi Angeliki [et al.]

Italian women are legitimizing their roles through usages of grammatically correct but disputed feminine forms in traditionally male-inhabited working environments – e.g. politics. The use of these forms, often replaced by masculine generics, foreground the relation between grammatical gender (morphological inflections, e.g. *-a* ending for feminine and *-o* ending for masculine nouns, Hellinger and Bussmann, 2002) and social gender (cultural categorizations and cognitive models of women and men, see Alvanoudi, 2016). Regardless of grammatical gender rules, some speakers state that feminine forms “do not sound good” or “do not exist” seemingly questioning the re-positioning of women within the social and cultural gender(ed) order (Formato, 2016a). Similarly, both media and politicians tend to use masculine forms, used as generics, to refer to or address female politicians in their role as Ministers (root of the word: *Ministr-*, fem. *Ministra*, masc. *Ministro*, Formato, forthcoming) and in the various roles within the *Camera dei Deputati* (Lower Chamber, Formato, 2014), e.g. Speaker, deputies. In this paper, I first discuss how feminine forms are perceived by (some) speakers (Formato, 2016a, forthcoming); I then conduct a corpus linguistic investigation of the feminine form *sindaca* (mayor, feminine) in the media in order to discuss semantic derogation (Mills, 2008) based on cultural and social schemas. More specifically, I show that while for language activists the use of this feminine form contributes to a change in speakers’ perception of women’s roles in the public sphere (from negative to positive), media often use this form to emphasise female politicians’ wrongdoings, undermining this change. The dataset includes articles appeared in 2016 in the widely-sold newspapers *Il Corriere della Sera* (politically moderate), *Il Resto del Carlino* (right-leaning) and *La Stampa* (left-leaning), selected in relation to specific political circumstances (e.g. female candidates and elected female mayors). The research question addressed is the following: does the use of feminine forms in the media exclusively promote a speakers’ positive re-conceptualization of women in the male-oriented public sphere? The present study contributes to our understanding sexist language and linguistic constructions of conceptual categories of social gender in grammatical gender languages.

***Dubbing insults as cross-cultural mediation*** (Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

The linguistic codification of impoliteness is one aspect of social interactions that has recently attracted the attention of researchers interested in describing the dual nature of impoliteness expressions used to offend the interlocutor as well as to create and affirm solidarity (Bousfield 2008; Culpeper 2011; Haugh/Bousfield 2012). Among the conventionalised impoliteness formulae a prominent role is played by insults, which are however problematic to investigate for their infrequency in interactions both within individual cultures and cross-culturally (cf. Culpeper et al. 2014:77). Conversely, there is greater availability of insults in films (Formentelli 2014), due to the relevance of antagonism, conflict and challenge in plot development. Hence, films and film translation can be a privileged source of data, as insults used on screen offer a representation of such forms in interactions and the culture-specific expressive modes, while also carrying meanings that are peculiar to film as a genre.

Although a few studies have been carried out on taboo words in audiovisual dialogue (Azzaro 2005; Bruti 2009; Valdeón 2015), we know little of how much the cultural pragmatics of insults in the source language is conveyed to foreign audiences through dubbing. To this aim, we argue that a comparison between original and

translated texts is not sufficient, but needs to be complemented with the analysis of comparable texts originally conceived in the target language.

The study focuses on English and Italian films and addresses the following research questions: 1) How and to what extent are insults used on screen to express: (a) negative, offensive stance; and (b) social bonding and solidarity? 2) Is dubbing of insults in line with the domesticating tendency frequently reported for this audiovisual translation mode, or does it rather serve as cross-cultural mediation of the source language and culture? Data are drawn from the Pavia Corpus of Film Dialogue, a parallel and comparable corpus now including 24 American and British films in the original and dubbed Italian versions, and 24 Italian original films. For ease of identification, this study only considers personalized negative vocatives (Culpeper 2011: 135), such as *you stupid flipping cow*, *disgusting little shite*.

Results show that the frequency of offensive insults in original English and Italian films is comparable, while it is much lower in dubbing, where some of the original vocatives are omitted or replaced with personalized negative assertions (e.g. *you stupid bastard* > *Tu sei uno stupido deficiente* 'you are a stupid idiot'; *you idiot* > *che idiota* 'what an idiot'). Conversely, solidarity insults are less frequent in both original and dubbed Italian films than in English films. Similarly, more limited is the variety of offensive and solidarity insults in the Italian texts. Finally, the repertoires of forms in original and dubbed Italian films display diverging features. Original films mostly include single-word insults (e.g. *bastardo* 'bastard') and regional variants (e.g. *schifús* 'yucky'), whereas dubbed films show complex strings of vocatives that are modelled both on the original English forms (e.g. *you big ugly git* > *grosso brutto e coglione* 'big ugly and asshole') and on target language patterns (e.g. *you lazy git* > *pigrone che non sei altro* 'you are nothing but a lazybones'). Hence, dubbing of insults can be posited as a case of cross-cultural mediation that relies on both foreignization and domestication strategies. The findings will be discussed in terms of their implications for foreign audiences' perception of source linguacultural impoliteness.

*Variation in action formation* (Contribution to *Linguistic structures and actions: does function follow form?*, organized by Seuren Lucas [et al.]

In this paper we explore one of the central questions raised in the proposal for this panel: "why is it that a single language can have multiple linguistic forms that are co-opted to perform what participants treat as 'the same' action?" As part of our larger exploration of requests at local businesses, we have examined the levels and types of morpho-syntactic variation in a collection of approximately 200 requests from a shoe repair shop in North America to understand a) the kinds of linguistic categories that can vary linguistically in a request and b) the subtle interactional work these 'calibrations' can achieve. With regard to variety in linguistic categories, we have investigated variation in the overall syntactic frame (i.e., declarative, interrogative, embedded question, or paratactic formation), as well as variation in the initial verb (e.g., *need*, *want*, *can*, *wonder*), in the tense-aspect of that verb (e.g., *wonder*, *wondered*, *am/was wondering*), in the subject (e.g., first-person, second-person and third-person), in the direct object (specific versus non-specific reference), in the subordinator (e.g., *if*, *whether*, *about*), and in the subject of the embedded question. In our investigations we have found that each of these small calibrations is associated with important shifts in interactional work accomplished by the request. In the current report we focus on calibrations involving the verb *wonder*. Tense-aspect changes on the verb *wonder* are used to construct whether the request is the reason for the visit (past tense) or has emerged in the course of the interaction (present tense). *Wonder about* requests are used when the customer is building a request which they are unsure of pursuing to completion, a feature not shared with *wonder if* requests. *Wonder if* with second-

person embedded subject (*wonder if you could*) orients to a request that the customer believes the staff might not be able to grant, while *wonder if* with first-person embedded subject (*wonder if I could*) is used when the customer is at the counter but the staff member has not yet arrived to their position at the counter, and the paratactic *wonder* + interrogative form is used when the request is positioned after some extended talk but is constructed to be the reason for the visit rather than emerging from the contingencies of that talk. Thus the answer to the question of ‘why all this variation?’ appears to be that speakers make use of subtle morpho-syntactic variation to construct requests that differ in subtle ways.

***Why yesterday’s story isn’t today’s story: Exploring how shifting deictic centers influence news stories*** (Contribution to *Beyond the myth of journalistic storytelling. Why a narrative approach to journalism falls short*, organized by Zampa Marta [et al.])

All stories have to view reality from some particular point of view – just like somebody walking into a room has to view it from a particular point. The story can’t be everywhere at once (Davies 2009, p. 111). When academics talk about journalists’ point of views and how they shape their stories it is never long before the concept of frames (and framing) show(s) up. According to Goffman (1974, pp. 10-11) frames are the “principles of organization which govern events—at least social ones—and our subjective involvement in them”. In Goffman’s view a frame is a metacommunicative message, a psychological state which governs interaction and which participants have to share in order for communication to be successful. ‘Play’ and ‘ritual’ are two such frames of interpretation. News is another one – one which was further explored by Gaye Tuchman in her 1978 book. Critical media scholars often cite Goffman and Tuchman when writing about frames (mostly in a cursory way), but the media frames they write about are quite different from the frames of interpretation described above. What critical media scholars call frames are not psychological states of mind, but narrative strategies which essentially involve “selection and salience” (Entman 1993, p. 52). To unearth the (hidden) ideologies and knowledge structures which creep into news stories because of these narrative strategies, critical media scholars tend to focus on linguistic evidence that gives coherence to news stories (e.g. lexical choice, references to specific people). In this talk I will argue that this focus is insufficient for explaining how journalists shape their stories, especially when they are translating existing coverage, and even more so when they are translating yesterday’s stories. I have chosen several examples to illustrate this claim from a larger research corpus which is made up of several iterations of different news stories that have gone through the process of translation, i.e. news wire stories which were translated into newspaper stories and/or online news stories for a Dutch speaking Belgian audience. One example is a case in which one particular news site ([www.deredactie.be](http://www.deredactie.be)) published an article about a traffic accident the day after it was originally made available by the press agency (*Belga*) that originally covered the story. This meant the information on traffic being obstructed in the original story had become obsolete by the time of publication, and the editor was forced to make a choice between adapting the information to the new deictic center (for instance by altering verb tenses) or omitting the information altogether. The editor in question chose the latter. As the example shows, shifts in the context of situation associated with the publication of a text can influence the meaning trajectory of news stories. As such, it proves fruitful to not only look for linguistic evidence which gives coherence to the story, but also for evidence which makes media texts cohesive (e.g. deictic expressions), as well as the larger frame of interpretation.

### **Farina Freigang & Stefan Kopp**

***An analysis of modal (pragmatic) functions of gesture*** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.])

When humans communicate naturally, a lot more is transferred than just the semantic content. The meaning of an utterance is enhanced by verbal pragmatic markers but also by gestural and other non-verbal signals in order to classify the semantic content of the utterances (Wharton, 2009). Senders want to communicate their convictions, viewpoints, knowledge, attitudes, among others. These signals are not discourse related, they merely support the recipient to arrive at the correct interpretation that was intended by the sender. Recipients perceive those signals overlaid to the semantic content and integrate everything into a congruent message. We define such signals as *modal (pragmatic) functions*<sup>1</sup>, a sub-category of pragmatic functions. This notion is related to Kendon’s (2004) modal functions which “seem to operate on a given unit of verbal discourse and show how it is to be interpreted” (p. 225) as, e.g., to “indicate what units are ‘focal’ for their arguments” (Kendon, 1995, p. 276). Aside from individual articles, a recent summary of gestures that take up pragmatic functions by Payrat o and Teßendorf (2013) mentions various gestures with certain recurrent form features/gesture families

and the corresponding pragmatic functions, e.g., away gestures (Bressemer & Müller, 2014, p. 1599) "to mark arguments, ideas, and actions as uninteresting and void".

Our focus is particularly on how gestures realise the functions and, thus, highlight, downplay or quantify a unit of an utterance. We advocate a full account of modal (pragmatic) functions tackled in an empirical approach and with the necessary amount of detail, partly carried out in our previous work (Freigang & Kopp, 2015, 2016). The scope of the *modal markers* can be identified by co-occurring prosodical cues, since there are also modal and affective tones in prosody (Lu, Aubergé, & Rilliard, 2012) and nuclear accents align with gesture strokes (Ebert, Evert, & Wilmes, 2011). However, "no clear notion of pragmatic gesture is available, neither in the area of (linguistic) pragmatics nor in gesture studies" (Payrató & Teßendorf, 2013, p. 1536) and discussing the mappings between modal (pragmatic) functions in gesture and existing linguistic frameworks is even a step further. In gesture research, terms such as speech acts (illocutionary markers in particular), communicative intend and interpersonal markers are employed, however, they cannot be related to gestures as strongly as on a lexical, grammatical or speech level. Mello and Raso (2011) studied the linguistic categories illocution, modality (epistemic, deontic, etc., for more details cf. e.g. Petukhova and Bunt (2010)) and attitude with special attention to the pragmatics-prosody interface. In an experiment, they tested the effects of changed prosodic markers and found that only prosodic markers for illocution and attitude are salient in prosody. The linguistic categories are central objects of analyses since they are discussed by pragmaticians dealing with modal utterances (e.g., Coates (1990)).

In this talk, we present an analysis of the modal pragmatics-gesture interface. We were interested in whether similar gestures are produced when a sender tries to express a certain illocutionary speech act, modality or attitude. Inspired by the Petukhova and Bunt experiment, and as a first approach to this phenomenon, we asked a naive participant to utter a particular sentence also making use of body language. Two types of sentences were presented: one with spacial configurations (*Das Haus hat ein spitzes Dach./The house has a peaked roof.*) and one sentence with metaphorical meaning (*Jemand holt die Kuh vom Eis./Someone takes the cow off the ice. – meaning someone solves a problem*). The sentences either had several underlying functions or were intended to be uttered with a certain attitude. Surprisingly, we found similar gestures compared to the MF which we analysed in corpus of natural interaction data. (1) Abstract deictic gestures were used for directives (illocutionary speech act), (2) beat gestures were produced with an utterance of modality and with sentences with authority, and (3) for sentences expressing obviousness and indifference, Palm Up Open Hand gestures, brushing and shrugs were used. This suggests that there may be some recurrent pragmatic gestures independent of the study design (in natural and artificial interaction).

1= We use this terms instead of the previously adopted term "modifying functions" (MF), which refers to modifications on a grammatical level, e.g. adjectives modifying noun phrases (Smith, 2010). The term "modal" function fits our approach more intuitively since it implies a modification on a semantic-pragmatic level.

***Gestures and technological innovation: Metaphorical concepts and empractical speaking as basis for constructing human-machine interfaces*** (Contribution to *Empractical speaking and knowledge construction*, organized by Hauser Stefan [et al.]

This talk will present first results of the research project “Hands and Objects in Language, Culture and Technology: Manual Actions at Workplaces between Robotics, Gesture and Product Design (MANUACT)”. Taking an interdisciplinary approach, the following questions will be addressed (AUTHOR): How are descriptions of object handling, tool usage, and machine operation expressed in multimodal utterances? To what extent are the forms of accompanying hand movements conventionalized? What concepts of handling and object use are culturally anchored and how? How do these concepts in turn affect the fields of product design and robotics and drive technological innovation processes? Furthermore, how do the resulting products then influence our cultural and linguistic concepts? The role of the hand is of central importance to technological innovation processes and to describing material culture. Objects and hands mutually influence each other as they develop. Functions of the hand are extended by tools or replaced by mechanical production processes. Reciprocally, objects are specifically designed to be easily usable (e.g., touchscreens). Moreover, speakers handle ideas, notions and abstract concepts as if they were manipulable objects (Lakoff/Johnson 1980). In our presentation, we will, firstly, give examples of the family of interpersonal AWAY gestures (AUTHOR) that support a praxeological understanding of gesture (Streeck 2013). Secondly, we will present a pilot study that focuses on the ergonomic testing of the manual steering of a virtual globe by using the ergonomic method ‘Thinking aloud’ which is a particular kind of empractical speaking (Bühler 1934). The family of Away Gestures is semantically motivated by a common effect of actions of removing or keeping away annoying or unwanted things from the body. Through these gestures, the body space is cleared off or held free from annoying or otherwise unwanted objects. Sweeping Away gestures, one member of AWAY family, are metaphorically used to reject and exclude topics of talk, they negate manually. The operation of touch screens with sweeping away movements shows that characteristics of the mundane actions are also applied to technological devices, that they share the same schema of action with the family of AWAY gestures and are motivated by analogous metaphorical concepts. Another study focuses on the ergonomic testing of the manual steering of a virtual globe (Google Earth) with Leap Motion by using the genuinely empractical method ‘Thinking aloud’ (AUTHOR et al.). In this study, the most successful informant used a flat hand representing an airplane for steering the virtual globe. Analyses of multimodal interaction sequences in several German talk shows revealed that the moving flat hand representing a flying airplane is a very frequent gesture and may be part of a repertoire of at nearly lexicalized hand movements.

Examples like these show that human-machine interfaces can be improved by using metaphorical concepts grounded in mundane actions and embodied in the speaker's hands (AUTHOR) and, therefore, support the hypothesis, that technological innovation is also driven by metaphorical thinking (Fauconnier/Turner 2002). Secondly, they also illustrate the technological applicability of empractical and multimodal speaking in ergonomic settings.

### ***An innovative use of the quotative TO construction in Japanese: Context-driven constructional variation*** (Contribution to *Multiplicity in Grammar: Modes, Genres and Speaker's Knowledge*, organized by Iwasaki Shoichi [et al.]

This paper presents genre-specific syntactic patterns that have recently emerged as an innovative use of the quotative TO construction in Japanese. Context-driven linguistic variation has been documented largely in sociolinguistic studies (such as ones based on Labovian variation theory), which focus attention on socially meaningful factors such as regional, generational and gender-based differences. Constructional approaches, similarly taking up the issue of linguistic variation, have started to examine contextual effects on the availability, forms, meanings, and uses of constructions (Fried 2010, Östman 2005, Fischer 2010, Matsumoto 2010, 2014, Nikiforidou 2010, Ruppenhofer and Michaelis 2010). Building on these latter insights, my study looks to Fillmore's insights on constructional variations in contexts (Fillmore 1981, etc.) and 'interactional frames', as opposed to 'cognitive frames' (Fillmore 1982, etc.).

The Japanese TO-marked clause most typically functions as a syntactic complement of the main verb — typically one of communication (*yuu* 'say'), cogitation (*omou* 'think'), or emotion verb (*yorokobu* 'feel happy'). TO-clauses, however, are often not syntactic complements, but are semantically motivated by frame-evoking elements in the main clause, including nouns. Moreover, quotative TO-clauses have clause-external adverbial uses (e.g., (1) and (2)).

To lay the preliminaries, this paper first reports on a corpus-based analysis of the clause-external adverbial uses. Having examined 187,307 tokens of the quotative TO construction, drawn from the Balanced Corpus of Contemporary Written Japanese (BCCWJ), it shows that there exists significant genre-based variation in the frequency of this adverbial use of the construction ( $\chi^2=71.076$ ,  $df=7$ ,  $p<.01$ ). For example, in the government report genre, the clause-external adverbial use is extremely rare ( $p<.01$ : adjusted standardized residuals  $=\pm 7.1$ ).

Syntactic and semantic analysis of all 604 clause-external adverbial uses (in different genres of BCCWJ), nonetheless, has revealed shared characteristics: (i) the cognizer/speaker of the TO-quotative clause corresponds to the agent of the main clause, regardless its grammatical role; (ii) the TO-marked constituent conveys the psychological state of the main-clause agent while in the main-clause event. This is the case in ordinary spoken discourse as well, as found in a similar analysis of the Corpus of Spoken Japanese (lectures and conversations). The spoken narrative discourse of recent TV news reporting on sports events, however, has started to use clause-external adverbial TO-clauses in a way that violates this generalization. As illustrated in (3) and (4) and schematized in (5), the main clause reports a specific event (during a sports game or performance), while the quoted TO-clause represents what the sports player said about his/her own play after the event (typically at a post-game interview).

(5) (speaker/player) [post-event comment <past tense> ]-TO\_quotative, [ event <past tense> ].

Notice that the TO-clause refers to the player's retrospective comment, and is in the past tense. This non-prototypical constructional scheme is not in the BCCWJ or ordinary spoken discourse, and has a genre- and context-specific interpretation: the narrator speaks on past events while reporting on the player's retrospective comments. The highly-specified genre and discourse context provides an interactional frame where the activities of those involved are more predictable, allowing proficient listeners to associate the elements of the construction to the elements of the frame.

Through this analysis, this paper argues that such genre-specific contextual knowledge of grammatical constructions should be modeled by means of frames, including interactional frames that represent

grammatically relevant ‘sociocultural, discursal, and pragmatic dimensions’ (Matsumoto 2010).

### Examples

*Pragmatics of ba: A cross-linguistic study of task-based interaction in Japanese, Korean,*

***Thai, Chinese and American English*** (Contribution to *Emancipatory Pragmatics: Approaching Language and Interaction from the Perspective of Ba*, organized by Saft Scott [et al.]

This study presents culturally determined principles for interaction in which mutual consent is established in Japanese, Korean, Thai, Chinese and American English, especially focusing on the differences and similarities of linguistic behavior in proposing ideas and co-constructing stories. Then, based on the results obtained, this study proposes *ba* as a key cultural concept indigenous to some languages—especially Japanese, Korean and Thai. *Ba* aids in understanding interaction in these languages and cultures; thus, providing a better pragmatic appreciation of how language works in interaction by complementing pre-existing western pragmatic theories. The concept of *ba* provides important principles to explicate the relation between self and other in interaction. Fujii (2012) illustrates that Americans situate themselves separately from others in interaction, where a oneself-vs.-the-other relationship can be observed. On the other hand, Japanese participants situate themselves as if the self and other are merged into one mind. The American self can be understood through the assumption of an independent and rational self and other whereas the Japanese self can be viewed from the different perspective of an interdependent and non-separable/merging relation between self and other.

This study builds on previous research (Fujii 2012 and Fujii and Kim 2014) not only by focusing on Japanese, Korean, and English but also by exploring corresponding linguistic behavior in Thai and Chinese. I present cross-linguistic results of the five languages concerning how the participants establish mutual consent in the task interaction. The data used in this study is generated by the problem-solving tasks in the ‘Mister O Corpus’, a cross-linguistic and cross-cultural video corpus collected for the purposes of: (1) obtaining a cross-linguistically and cross-culturally comparative and interactional database from American English to languages in Japanese, Korean, Libyan Arabic, Thai, and Chinese, and (2) comparing them in their cultural and social practices.

The results show that in proposing ideas the Chinese speakers’ interaction is the most direct and straightforward followed by the American speakers whereas the Japanese and the Korean speakers are indirect/subtle, interaction-based, and hearer-oriented. In co-constructing stories, the Japanese, Korean, and Thai speakers show interdependent and mind-sharing interaction by using frequent collaborative linguistic behaviors. The Thai speakers’ interaction illustrates an interesting phenomenon; they show a more direct way of proposing ideas than the Japanese and Korean speakers, however, they are very collaborative and interdependent when they are co-constructing stories. Thus, the Japanese, Korean and Thai speakers situate themselves as if they are entraining themselves and resonating each other in interaction. On the other hand, the American English and Chinese speakers interaction show independent, distinguishable selves and others through a oneself-vs.-the-other relationship.

The wide divergence shown in the data from the five languages suggests that existing basic assumptions about human interaction mainly from western theories, where two independent rational conversationalists share the goal of information exchange, does not presuppose the non-separable and merging self and other relationship observed in the Japanese, Korean and Thai speakers’ interaction. Instead, pragmatics of *ba* provides a dynamic field in which interaction emerges, where the participants as well as the surrounding environment stand as components that are indistinguishable and non-separable from one another. Therefore, this study proposes the pragmatics of *ba* to enrich pragmatic views on language practices and to complement pre-existing western pragmatic theories in a way that can account for cross-linguistic diversity.

**Takafumi Fujiwara**

***A comparison of the perspectives of English and Japanese speakers: A case study on English and Japanese causative expressions*** (Contribution to *Linguistic Expressions and Devices that Yield the Implicature of Cause and Effect*, organized by Hanazaki Miki [et al.]

Takekuro *et al.* (2015) point out that English causative verbs, *make*, *let* and *have* are used when the conceptualizer (or the speaker) see a gap between the real world and its mental world. This means that, in causative sentences, causative verbs would be inserted into the slot of causative device in the relation between the cause of an event and the result of the event through the interpretation of the speaker on the real world. Also, Fujiwara (2015) claims that the three causative verbs should have a “habitat segregation” (Hanazaki, 2007) and the habitat segregation can be determined by the focus points of the conceptualizer. Namely, when the conceptualizer puts focus on the agent of a sentence, causative *make* would be used, when on the patient, causative *let* and causative *have* has no specific focus point, which enables causative *have* to be used as both causative and passive. In addition to the explanation of causative *have*, Fujiwara (2015) points out that the translations of causative *have* into Japanese require additional devices to distinguish the differences between causative and passive. According to Ikegami (1981), this phenomenon derives from the difference of the nature

of English and Japanese. That is, English is a do-language and Japanese is a become-language. This study argues that the way of expressions of a cause-result relation differs according to the mother tongue, background knowledge and cultural features of speakers. To examine these differences, an experiment is conducted with participants who are native speakers of English and those of Japanese. The participants describe the relation of the cause of an event and the result in pictures. This study claims that, in a specific condition, native speakers of English tend to use causative verbs to express a cause-result event, while native speakers of Japanese would use causative expression in less frequencies. This difference may arise from the difference between the different perspectives of both English speakers, who look at an event from birds' eye and Japanese speakers, who perceive the world as if they are on stage.

### Chie Fukuda

***What constitutes 'foreignness'? : 'Foreign wives' in an unmoderated roundtable talk on a Japanese TV show*** (Contribution to *Producing 'Foreigners' in TV Entertainment Shows: Sequence, Categorization, and Multisemiotic Practices*, organized by Kasper Gabriele [et al.]

This study examines an unmoderated roundtable talk in a Japanese TV variety show among 'foreign' wives who are married to 'Japanese' men. The participants are competent L2 speakers of Japanese and were recruited under the agenda of 'foreign' wives complaining about their 'Japanese' husbands, which is explicitly stated in the introduction part of the show. While the recruitment category becomes salient in the talk, it is neither fixed nor omni-relevant but dynamically shifts as the talk unfolds. The participants not only treat themselves and each other as 'foreigners' based on the contrastive categorial pair of 'Japanese' and 'foreigner' but also make other categories relevant, including 'woman,' 'wife,' 'mother,' and 'resident of Japan'. Using multimodal Conversation Analysis (Mondada, 2014) and Membership Categorization Analysis (Sacks, 1972; Fitzgerald & Housley, 2015), the analysis centers on describing how the participants constitute the category of 'foreigner' vis->0-vis that of 'Japanese' and how they use these categories to accomplish social actions. Focus is given to interactional sequences in which the participants construct themselves as foreign by using verbal resources as well as embodied action. For example, when one participant talks about trouble with her husband over a visa application and conveys irritation about the incident, the other participants show that they recognize the dually category-bound trouble and affiliate with the teller's affective stance through verbalized empathy, facial expressions, and nods (Couper-Kuhlen, 2012). Through the social action of displaying solidarity, the story recipients mobilize shared experience and treat that experience as categorially bound to their co-incumbency in the 'foreigner' category. The participants' shared category memberships also become salient when they ascribe their husbands' conduct to 'Japanese' cultural practices and compare these practices to their own. In this context, the husbands are categorized as 'Japanese' rather than treated as particular individuals. Likewise, the participants identify themselves as incumbents of the 'foreigner' category vis->0-vis 'Japanese.' On such occasions, the participants frequently partition themselves into members of specific ethno-national groups and construct themselves as the group's cultural representatives (e.g., as a Russian, a Brazilian, and so forth). For the TV audience, such generalization "provides an instruction for understanding the identity of the generalized-from person or people" (Hauser, 2011: 186) and emphasizes the contrasts between Japanese practices and those of the participants' community of origin.

In addition to examining the interaction among the participants in the talk, the study also analyzes post-production techniques such as the use of telops, still-images, music, repetition of scenes, and the overall organization and presentation of the show (Maree, 2013). These techniques play a crucial role in orienting the audience to the categorizations that the TV broadcasters intend to convey. Thus, the study illuminates the process of constructing the 'foreigner' category at a micro level and considers the possible impact of such categorizations on the audience and Japanese society at a macro-level.

**Nami Fukutome Polly Szatrowski**

***Comparative study of Japanese expressions used for individual versus group sensory evaluation of dairy foods and drinks*** (Contribution to *Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German*, organized by Szatrowski Polly [et al.]

In this paper we will show how Japanese subjects describe differences between pairs of different types of milk, yogurt and ice cream, respectively, using Food Science methods for sensory evaluation based on the five senses. We used three different types of milk (non-homogenized pasteurized, hereafter “whole”, skim and soy milk), yogurt (plain, yogurt with agar, and soy yogurt), and ice cream (two types of vanilla ice cream and lacto ice). The subjects tasted and evaluated the different types in pairs, indicating which one they preferred and which characteristics (appearance, smell, taste, texture, sound) affected their overall preference.

In the milk evaluations, overall deliciousness was influenced by taste, smell, texture and appearance, in that order. The significant differences were as follows. For taste of the whole and skim milk, *amami* ‘sweetness’, *koku* ‘thickness and rich taste’, *maroyaka* ‘smooth and mild’, and real milk taste promoted positive evaluations, and for soy milk, *kusami ga aru* ‘having a smell’, tasting like soy milk caused negative evaluation. For smell, while the whole and skim milk had a weak smell, for soy milk many subjects gave expressions related to the smell of the beans and having the smell of soy milk for negative evaluation. For texture, many of the subjects who did not prefer the soy milk used the expressions *mottari*, *dorotto*, *kotteri*, *nurutto*, *zaratto* (variations related to thickness), while the subjects who preferred whole and skim milk used the expressions *saratto*, *sappari* ‘refreshing’, *sarasara site iru* ‘smooth’. Regarding differences in appearance, for milk versus soy milk, the fact that the milk was white, while the soy milk was yellow influenced negative evaluation of the soy milk, for skim versus whole milk, the transparency and thinness of the skim milk and the deep white color of the whole milk influenced positive evaluation of the latter.

Comparison of the expressions used in the group Dairy Taster Brunch conversations with those used for individual sensory evaluation showed that more texture expressions were used in the latter. Hayakawa et al. (2006, 2011, 2012) have shown that Japanese has many texture terms (at least 445), including many onomatopoeia, and classified them into groups of terms with similar meaning, and according to their use with particular foods. The fact that subjects described the state of the milk as *koku ga aru* for positive evaluation and *mottari*, *dorotto* for negative evaluation suggests that these words (roughly equivalent to English “thick”) can be divided according to type of evaluation. In this paper we will demonstrate that results for eating characteristics for the milk, yogurt, and ice cream can be classified according to positive versus negative evaluation. By elucidating which eating characteristics are associated with human preference and how this can be shown using a lexical/semantic analysis, this research contributes to the study of how people use words to express their food preferences and adds to our understanding of the relation between language and food.

**Péter Furkó**

***The role of discourse markers in literary discourse: Authentication, representation and explicitation*** (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

It is a well-documented feature of discourse markers (DMs) that they display type ambiguity as well as token ambiguity (cf. e.g. Lenk 2003): individual DMs have a wide range of (sometimes indeterminate) functions across different contexts and registers, while a single instance of a DM can also display a variety of discourse relational, rhetorical, interpersonal and attitudinal functions in a given host unit. At the same time, DMs in literary discourse have an additional function: they serve as authentication strategies whereby the author either signals to the reader that there is a world larger and more complex than the one presented in the text (as in the case of e.g. fantasy literature), or s/he might lend additional verisimilitude to the fictional dialogue by using DMs for stylizing the speech of particular communities or individuals. The present paper will focus on the use of evidential markers (EMs) in fictional dialogues with a view to identifying EMs’ most frequent and salient functions. A second aim of the paper will be to consider the implications of the research for the theory and practice of literary translation. Since there is only partial overlap between DMs’ functions even in typologically related languages (cf. e.g. Zufferey-Cartoni 2012: 232), it is impossible for the translator to make all of the functions of a given source language DM explicit in the target text. Therefore, translators have to make a choice in terms of salience: they highlight the function(s) they consider the most relevant to be represented in the target

language. Since the variation analysis of discourse-pragmatic features poses a large number of methodological challenges (cf. Pichler 2013: 9), throughout the paper, a combination of quantitative and qualitative methods will be adopted. In both the monolingual and bilingual data, individual DMs have been tagged according to formal properties (lexical co-occurrence patterns, position in utterance, turn and conversational structure) as well as functional features (speech act of host unit/preceding unit, speaker roles, implicit/explicit coherence relations). Additionally, in the parallel corpus, tokens have been tagged according to translation strategies (types of lexical items, syntactic structure, information structure, focus etc.) and the explicitation of particular DM functions in the host unit as well as in adjacent utterances. The findings suggest that the most frequent translation strategy in connection with evidential markers is implicitation, the second most frequent strategy is explicitation with stylistic features / propositional items other than DMs. The paper will argue that this means that speech idiosyncrasies associated with individual protagonists as well as particular communities of practice in the fictional world are lost in translation.

#### Anne Furlong

*The invisible hand: The director as communicator* (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

Texts written to be performed do not constitute “source works” per se: rather, they furnish performers with the basis for action. Every performance thus constitutes an adaptation from which the audience infers the playwright’s intended interpretation. Because playgoers see and hear the actors, and can consult the texts used by the performers, they often overlook the intermediary who determines the interpretation presented on stage: the director. Audiences who attend a performance of a well known play (such as *Romeo and Juliet*) will construct their interpretation in a rich context including their familiarity with the text, previous productions, and film versions. Audiences for obscure plays (such as George Ryga’s *Captives of the Faceless Drummer*) develop their interpretation in a relatively impoverished context. They must work out the text as the play progresses, and for that reason are critically dependent on the evidence provided by the performers and the mise-en-scène. In either case, audiences rarely focus on the contributions of the director, even if they could distinguish these from the actors’. However, it is the director who determines the adaptation of the text that performance communicates. I contend that whether she has full autonomy (auteur) or is realising the vision of a producer or previous director (associate), the director is the de facto communicator; the production conveys the evidence for the interpretation she intends the audience to recognise or construct. I have been observing a director at work and have conducted structured interviews with him on his views of the relationship between director and audience. Dr Greg Doran has created productions of the Shakespeare and Ryga plays as part of his Theatre Studies program at UPEI. Since his actors are largely untrained students or community members, the rehearsals function in part as discovery process. As the cast members become more adept, they also come to share (and often expand) the director’s interpretation of the text. In this paper, I will describe and discuss my observations of Dr Doran’s process to support my views on performance as adaptation, and on the director as communicator.

#### Toshiaki Furukawa

*Non-recollection and moral assessment in the public hearings of the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission* (Contribution to *How to construct “memory”: stories of the nuclear events from Hiroshima to Fukushima*, organized by Hata Kaori [et al.]

Conversation Analysis (e.g., Drew & Heritage, 1992; Clayman & Heritage, 2002) has shown many ways that mundane talk is constrained in institutional settings such as workplaces, news interviews, doctor-patient interactions, and public hearings. Among these, public hearings can have particularly high stakes, which at times leads participants to resort to acts such as criticizing, denying, and apologizing to manage their interests (Potter, 1996). When Bogen and Lynch (1989) analyzed data from the 1987 Iran-Contra hearings on one of the most well-known political scandals of the United States, they showed how participants displayed the recall and non-

recall of past events by referring to certain bureaucratic documents. Bogen and Lynch argued that the unavailability of the documents led to plausible deniability (i.e., a justifiable claim by a witness about her/his non-recall). Reanalyzing the same data, Lynch and Bogen (2005) examined the interactional construction of memory and showed how a witness's recollections are "bound up with the procedures and moral assessments of an interrogative investigation" (p. 239). This kind of analysis of institutional talk can be applied to other, non-English public hearings. Following Lynch and Bogen (2005), the study discussed in this presentation takes a discursive psychological approach to the topic of memory. It analyzes how participants constructed memory in hearings held by the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission (NAIIC), whose goal was to investigate the causes of the Tokyo Electric Power Company (TEPCO) nuclear power plant accident that occurred on March 11, 2011, following the Great East Japan Earthquake. Although the transcripts and video recordings of these hearings have been available to the public on the internet since 2012, there has been little scholarly analysis of what actually happened in the hearings' moment-by-moment development of interaction. In order to fill this gap, the study explores interactions in fifteen hearings in which commission members interviewed nineteen witnesses who held positions in the government, TEPCO, and nuclear regulatory organizations at the time of the accident. In the approximately forty hours of video recordings of these fifteen meetings, the lexical item *kioku* (i.e., 'recollect' or 'recollections') occurs 257 times in the speech of both witnesses and investigators. A preliminary analysis of the data observes that the participants' recollections are intertwined with moral assessment, especially when some witnesses try to claim non-recall when they respond to investigators' questions regarding crucial defects in past nuclear power policies and planning.

#### Gavin Furukawa

***Degrees of foreign-ness: The construction of foreign and Japanese identity in variety shows*** (Contribution to *Producing 'Foreigners' in TV Entertainment Shows: Sequence, Categorization, and Multisemiotic Practices*, organized by Kasper Gabriele [et al.]

*Gaikokujin* ('foreigners') are increasingly the focus of many television variety shows in Japan. These foreigners are often sought after for their opinions and insights into Japan's place in an increasingly globalized world. In this way foreigners become a cultural and interactional resource for the discursive establishment of Japanese identity. As such, these programs, their complex construction of foreign-ness, and reflexive construction of Japanese-ness are an excellent resource for studying culture in action (Hester & Eglin, 1997). In the course of producing these shows, the foreign-ness of these individuals must be established to lend credibility to their accounts; at the same time, they cannot be constructed as so foreign as to interfere with the establishment of intersubjectivity between themselves and the Japanese viewing audience. Data from a late night TV show focused on interaction between Japanese hosts and foreigner studio audience members is used in this presentation to examine the discursive construction of these cultural concepts. This presentation will utilize both sequential and category analysis (Stokoe & Attenborough, 2015) to show how category-bound predicates interact with both categories and their collections. This presentation will analyze how the category of foreigner on these types of television programs is constructed through the resources of social interaction between various individuals, institutional norms, and the use of *telop* (O'Hagan, 2010), images and text which appear on screen during the program and are an increasingly common feature in East Asian television programs. Analysis of the data will show multiple ways in which the category of foreigner is constructed as both single category and a collection of other categories that has a standardized relationship with the non-foreigner/Japanese category. In particular, analysis of the *telop* text will show how visual formatting and linguistic register are used to give authority to the categorization and attribution of category predicates by the show's producers. Finally, the analysis will also show how there are frequent shifts between taxonomic levels of the foreigner category that are used in giving and contesting accounts. The discussion will then connect the issues of identity shown in the data to the current political discourses of the Japanese government towards both the Japanese public and the larger international community.

***'Have you read Helen Oyeyemi?' The resolution of metonymy clashes at the semantics-pragmatics interface in her Book of Short Stories*** (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.]

There has been a growing interest in the notion of 'clashes' in the last two decades as a consequence of the studies of 'coercion phenomena' (Pylkkänen, 2008; Swart, 1998, 2003, 2011). 'Mismatches' are conflicts and incompatibilities between the meanings of two linguistic items, or between the meaning of a linguistic item and the context where it is inserted (Escandell Vidal & Leonetti, 2011).

This paper explores feature mismatches in metonymy and the interpretive processes by which such clashes are resolved within Relevance Theory (Sperber & Wilson, 1995; Wilson & Sperber, 2012). Such interesting cases are those in which the combination of clashing features leads to systematic and predictable changes, whose explanation requires a notion of composition that can account for these changes without abandoning the principle of compositionality. The aim of this paper is to establish generalizations related to the reinterpretation processes, their overarching properties and the consequences that can be derived from all these elements for linguistic theory and for the grammar-semantics/ pragmatics interface.

The research questions are as follows: 1. What are the conditions that allow the combination of clashing features in metonymy? With which units and at which levels do these mismatches occur? How are they detected? 2. What is the status and the consequences of the operations that resolve mismatches? What are the limitations that bind these processes? 3. What are the implications and consequences for linguistic theory in general, and for the semantics/pragmatics interface? What do they entail regarding the management and representation of meaning in the human mind? How do they affect our understanding of literary texts? A combination of qualitative and quantitative methods that include the methodology of Corpus Linguistics will shed light on our research.

***What does the use of discourse markers reveal about age and educational background? A comparative account between French Sign Language (LSFB) and Catalan Sign***

**Language (LSC)** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

The study of discourse in sign languages (SLs) is still in its infancy. Before the advent of SL corpora in the 2000s, linguistic research was mostly focused on micro-aspects of the language such as phonology and morpho-syntax that mainly concerned one or few signers. The availability of large datasets containing different types of signers (from different ages, gender, educational backgrounds and linguistic profiles) and genres (argumentations, narratives, free conversations, etc.) widens the perspective of SL research and allows for applied linguistic studies.

This paper aims to contribute to the field of discourse in SLs from a cross-linguistic and a cross-generational point of view by studying how argumentative productions are structured through the use of three discourse markers (DMs), here defined as “a grammatically heterogeneous, multifunctional type of pragmatic markers, hence syntactically optional and non-truth-conditional, constraining the inferential mechanisms of interpretation processes” [1]. DMs possibly exist in all natural languages and SLs, as such, are no exception. So far, the number of studies (all of them descriptive) is scarce and restricted to one DM, to one informant and/or to one genre [2], [3], [4] and [5].

Two SLs for which a referential corpus has been collected will be studied: French Belgian SL (LSFB) [6] and Catalan SL (LSC) [7]. The three DMs are common to these two SLs: list buoys (numeral signs held in the weak hand and used to make associations with from one to five entities [8]), palm-ups (fingers loosely extended performing an outward movement with the palm in upward position and having various discourse functions in different SLs [9]), and the sign SAME (the indexes of both hands are extended and get in contact with an inward movement, meaning resemblance or similarity). For each SL, we will investigate the distribution of the three DMs across signers, their functions and their position in signed discourse. The results extracted from LSFB and LSC data will be compared in order to point out the differences and similarities in the use of DMs related to the language and to the age of signers.

Our sample includes 12 signers, 6 from the LSFB Corpus [6] and 6 from the LSC Corpus [7]. There will be a balance in terms of age (2 signers from each SL belonging to one of the following age groups: 18 – 29, 30 – 49 and 50 – 85) and gender (3 men and 3 women per SL). The task chosen is an argumentation on “deaf issues”. The function of DMs will be annotated following [1] and productions will be segmented using the principles of [10] and [11] adapted to the specificities of SLs with the ELAN software.

The main underlying hypothesis is that palm-ups will be more frequent in old signers because palm-ups come from gesture, are empty of meaning and allow the integration of a spoken word to convey meaning. The oralist model of education (not including SL courses) and the difficulty for the deaf to access higher education may have favoured the use of this device to the detriment of list buoys and the sign SAME. The contrary is expected for younger signers as some have already benefited from a bilingual educational model and have gone to university.

The main applications of the present study to the real world are twofold. On the one hand, the different functions found for these three DMs will enrich the materials (limited at present) for SL courses and will allow to improve the pragmatic competence of both deaf and hearing signers. On the other hand, the analysis of argumentative productions (a genre that requires formal training to master it and a higher cognitive effort to reason and to present arguments) will cast light on what is education-related and what is age-related in the use of DMs.

***Ironic humor in the context-collapsed Web as a social segregation tool*** (Contribution to *Laughing at the 'other': Critical pragmatic insights into the humorous construction of opposing groups*, organized by Chovanec Jan [et al.]

This paper explores acts of social segregation executed through Facebook-based ironic texts, in the context of a recent political conflict in Israel. In a qualitative critical discourse analysis of 205 posts, I examine participants' use of ironic humor in the construction of collective boundaries (Kotthoff, 2003; Kuipers, 2009). Focusing the textual dimensions of genre (ironic humor), medium (social network sites), and content (social divides), and based on key humor scholarship (Attardo, 2002; Lynch, 2002; Moraell, 2009), I explore participants' use of textual incongruencies in the attempt to relieve social tensions and construct superiority in relation to the other. In my analysis I focus on preoccupation with gender and ethnicity (Boyarin, 1997), and point at the self-positioning of the cultural elite as the weak party, based on these social divides. This group uses the indirect discursive means of online ironic humor to cope with the physical threat posed by the politically dominant group, while positioning the latter as physically superior, but morally and intellectually inferior. Alongside content, participants utilize the polysemic potential incorporated in ironic texts, SNS-based in particular, to demonstrate these cleavages. The analysis demonstrates how the combination of genre, medium, and content, is utilized to construct a new overarching social divide I term *the intellect-physicality divide*. In terms of *genre*, the choice of ironic humor as the dominant stance creates potential for misinterpretation of the message, resulting in the lampooning of the failed addressee. The choice of *medium* - the de-contextualized disembodied sphere of SNS - enhances the potential for misinterpretations, and thus their affect. In terms of *content*, analysis reveals the discursive construction of a social division, between a civilized, effeminate, Europe-originated, dovish in-group; and a savage, violent, masculine Arab-originated hawkish other. These divisions, intertwined with choices of genre and medium, serve as the basis for an overarching one between physical and intellectual strengths. Thus, participants' choice of genre, medium, and content in this corpus serves in the demarcation of collective boundaries. The initiation of a "failed" interaction is utilized to construct the division between the in-group and the other, as contrasting interpretive (and ideological) communities. This maneuver results, among other things, in the performative positioning of the addressors (and by virtue the addressees) not only as intellectually and morally superior to their opponents, but also as the "natives" of the online sphere (as opposed to their weakened position in the offline sphere). To conclude, I assess the broader implications of the emerging intellect-physicality divide to our understanding of the social role of SNS-based irony in the consolidation of collective boundaries. This paper joins a growing corpus of scholarly work dealing with the pragmatics of humorous interactions as a means for social segregation and collectivization. It points at the significance of the combination of genre, medium, and content in these processes. Its main contribution deals with the utilization of failed interpretations, rather than what is usually perceived as successful interactions, as a central tool within these practices.

***The physical examination of amputees : Manipulating and touching the patient's body***

(Contribution to *Touching-the-body in interaction*, organized by Greco Luca [et al.]

The contribution proposes the analysis of the physical examination of the patients' body during specialized visits at a centre for prosthesis construction and application. The analysis aims at showing how the physical examination, and particularly the touching of the patient's injured limb(s), is introduced, and how touch and visual inspection are intertwined. The analysis will investigate the relationship between two types of diagnostic touch: the *visual diagnostic touch*, which is mainly in the service of the doctors' inspection, and the *tactile diagnostic touch*, which aims at soliciting the patient local and momentarily experience in terms of pain and/or discomfort. The analysis will focus on the structure - form and duration - of the two types of touching and on how doctors and patients manage the transition from one to the other. The consequences of the two types of touching for the patients' participation will also be investigated.

***'It is much better here': Students' expectations concerning disciplinary knowledge as***

***shaped by former Erasmus students and researchers*** (Contribution to *High hopes for mobilities? Researchers' and researchees' discursive co-constructions of expectations for mobility experiences*, organized by Sabaté Dalmau [et al.]

From a critical sociolinguistic approach to language in social life, this paper explores the discursive construction of Study Abroad (SA) experiences by 3 groups of Science and Humanities students in a public university in Catalonia, a Catalan/Spanish bilingual Southern region of the European Higher Education Area (EHEA) which underwent internationalization relatively recently. The participants carried out their stay in three European countries with very contrasting sociolinguistic situations (Denmark, Italy and the UK) in connection with the degree of stabilization of English as a general language of communication. More specifically, we focus on the interplay between the former and prospective Erasmus students' discursive constructions of disciplinary knowledge both in their home and host universities, mobilized in situated narrative encounters mediated by a team of 4 researchers, and gathered through 6 focus-group interviews complemented with long-term ethnographic observations (the full research project is available at [www.cla.udl.cat](http://www.cla.udl.cat)). We ask whether a (self)-reflexive, informant-oriented approach to outgoing students' expectations on their future courses with regard to (1) content, (2) teaching pedagogies and (3) languages of instruction may provide a window into how these get dialogically negotiated, transformed and mutually shaped by the all agents at play (former Erasmus students, prospective Erasmus students and researchers). In the analysis, we show that, indeed, the prospective students' beliefs, imaginations and hopes which emanate from, and materialize in, the audio-recorded narrative interviews circulate social constructions of disciplinary knowledge in "international" courses as being "worse" (i.e. same or lower level) and "more difficult" (i.e. more demanding, more student-centered) than home courses. These, at the same time, though, are envisioned as "definitely worth-taking" to feel the "international experience", meet other international students who also come from middling class youth with similar cosmopolitan life styles) and, above all, enhance one's communicative practices in English as an elite lingua franca and to obtain credentialized proof of their multilingualism. Overall, we argue that this particular approach to the co-constructed nature of mobility experiences and expectations may provide a more comprehensive, non-essentializing approach to some of the myriad Erasmus- and SA-related phenomena within the fields of critical discourse analysis, narrative inquiry and linguistic anthropology.

***So- and But-prefaced interviewer questions in Chinese TV Nnws interviews: A***

***conversation analytic approach*** (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

Taking the approach of Conversation Analysis (Sacks, 1995; Sacks, Schegloff & Jefferson, 1974), this study presents a study of the form, the role and function of interviewer question (IQ) prefaced by connectives '所以'

(*so*) and ‘但是’ (*but*) as a prominent feature of IQ design in Chinese TV news interview. The analysis is based on 10 Chinese TV news interviews which were randomly collected, video-recorded, face-to-face interactions with a total time of 4 hours and 16 minutes, with detailed quantitative and qualitative analysis of the two types of connective-prefaced IQs---‘所以’ (*so*)-IQ and ‘但是’ (*but*)-IQ--- in terms of their frequency of occurrence, turn design, sequential organization, and interactive function. Altogether 6 ‘所以’ (*so*)-IQs and 10 ‘但是’ (*but*)-IQs were found, taking up 4.76% and 7.94% of the total 126 IQs. Our data indicates that the use of connective form is closely related to question type and turn position of IQ and leads to different interactional functions. The ‘所以’ (*so*)-IQ introduces either a tag question or a declarative question, both with strong speaker presumption in semantics, and occurs in single-TCU turn by taking up the whole turn or in turn-initial position, which means this IQ design is used to directly follow the prior interviewee’s (IE’s) turn. While tag questions and declarative questions, by displaying IR’s understanding of what the interviewee (IE) has just said, serve to elicit a confirmation from IE in themselves, a ‘所以’ (*so*)-prefaced one is more likely to lead to interactional overlaps. The other connective ‘但是’ (*but*) is mainly used to preface two other question types, the wh-question and the alternative questions, and the question appears only after other TCU(s), which clearly indicates that it does not show up in turn transition position or express disagreement to or contradiction of the IE’s opinion; instead, it functions only to mark the upcoming question as a contrastive or simply another point of consideration as against the preceding statement or background report. The analysis of the adjacent answering turn shows that if IR’s presupposition in the ‘但是’ (*but*)-IQ is confirmed by IE, IR directly initiates a new topic after the question-answer sequence; if not, IR attempts to reformulate IE’s point and seek further clarification. The distributional features and interactional functions of these two types of connective-prefaced IQs converge to reflect the alignment of IR and IE in Chinese TV news interviews.

### **Maria Marta Garcia Negroni**

***El enfoque dialógico de la argumentación y la polifonía enunciativa. Acerca de los puntos de vista alusivos.*** (Contribution to *About subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.]

Como es sabido, las teorías pragmático-cognitivas de origen anglosajón disocian el estudio del significado en contenido proposicional/conceptual (de carácter objetivo) y fuerza ilocucionaria/contenido procedimental (de carácter subjetivo). Al mismo tiempo, presuponen como parte de la descripción semántica la existencia de un sujeto hablante único, cuyas intenciones comunicativas, siempre conscientes y voluntarias, se reflejarían en el sentido, el que, por su parte, sería recuperado transparentemente por el interpretante. A diferencia de estas perspectivas, y a partir de las teorías fundacionales de la polifonía y de la argumentación en la lengua (Ducrot, 1986, 2004), del dialogismo (Bajtín, 1982) y de las heterogeneidades enunciativas (Authier, 1995), el *Enfoque Dialógico de la Argumentación y de la Polifonía Enunciativa*, que junto con el equipo de investigación que dirijo vengo desarrollando desde hace unos años (García Negroni, 2009, 2016a y b; García Negroni y Libenson, 2015; García Negroni, Libenson y Montero, 2013), busca profundizar en la construcción de una semántica-pragmática no veritativista y no referencialista de la significación ( *i.e.*, no existe elemento de la significación cuyo carácter sea puramente objetivo), no unicista ni intencionalista del sujeto (*i.e.*, los puntos de vista subjetivos vehiculizados por el enunciado no necesariamente deben ser atribuidos a la misma figura discursiva) y centrada en el funcionamiento de las unidades lingüísticas en la lengua y en el discurso. Con el fin de avanzar en esta línea investigativa, aquí me ocuparé de los diferentes tipos de *puntos de vista* que pueden manifestarse en la enunciación. Además de los ya descritos por la teoría polifónica (Ducrot, 1984), que introducen una cierta representación argumentativa de la situación de la que se habla (tal el caso de aquellos vehiculizados en la aserción simple, la presuposición y la negación polémica, por ejemplo), propondré la existencia de **puntos de vista evidenciales** y de **puntos de vista alusivos**. Si bien ambos permiten poner de manifiesto el carácter dialógico de toda enunciación, la presencia de unos y otros determina modos distintos de inscripción del enunciado en la cadena discursiva, lo que a su vez repercute en la construcción del sentido y de la (inter)subjetividad. En efecto, mientras que los evidenciales exigen la identificación de un marco de discurso previo o prefigurado que se muestra como la causa de la enunciación y frente al cual queda constituido el posicionamiento subjetivo de respuesta manifestado en el enunciado (García Negroni, 2016a; García Negroni y Libenson, 2015), los puntos de vista alusivos evocan discursos “otros” que deben ser recuperados en el interdiscurso como parte de la “memoria discursiva” (Courtine, 1981) y, al hacerlo, no solo indican un cierto posicionamiento subjetivo sino que además permiten entretejer lazos de complicidad intersubjetiva. Para poder avanzar en la caracterización de los puntos de vista alusivos, en esta presentación, me detendré en los diferentes tipos de procedimientos (paralelismo morfológico y sintáctico, reformulación, repetición, silenciamiento) que permiten identificarlos.

***Rethinking communicative competence: Intersectionality and social fields of inequality in interactional assessments of competence*** (Contribution to *Critical Perspectives On Language Socialization Processes and Trajectories in (Bi-) Multilingual Contexts*, organized by Relaño Pastor Ana Maria [et al.]

Communicative competence has been a key analytic construct in micro-interactional, ethnographic accounts of language and culture development. Language socialization has always taken a multifaceted view of communicative competence, transcending the pragmatic developmental focus in Hymes’s (1972) original formulation of the concept. Yet, the general trend in language socialization studies has often been to treat communicative competence as knowledge that resides within social actors and that can be-performed relatively unproblematically. Some scholars, however, have argued that the development and performance of communicative competence in communities of practice is far from a neutral, value-free process. For example, Garrett and Baquedano-Lopez (2002) have called for “a notion of competence that takes into account the inherent heterogeneity of culture and the cross-cutting dimensions of power and identity that partially structure and organize that heterogeneity” (p. 346). Drawing on recent developments in raciolinguistics (Alim, Rickford, and Ball 2016), raciolinguistic ideologies (Flores and Rosa, 2015), and intersectionality (Crenshaw, 1991; Collins, 2000), this paper proposes a critical reformulation of communicative competence. We examine competence as an emergent product of everyday practice in politically fraught and contested contexts. In analyzing how differential assessments of competence are interactionally produced and situated in social fields of inequality, we draw from our two linguistic ethnographic projects in the US and Spain. From our work in the first comic store owned by an African-American woman in the US Northeast, we analyze the narratives of a Black female who reflects on her participation in white male dominated “comic book nerd” and “gaming geek” communities. We focus on her metapragmatic awareness describing encounters in which her competence was challenged or denied. This analysis is elaborated on by our investigation of how Moroccan immigrant children in Spain are rendered linguistically and socioculturally (in-)competent across institutional contexts. We highlight how variable participation affordances and forms of social organization can impact whether children can contest these assessments and redefine their own competence. In both examples, we emphasize the role that ethnoracial, gendered, and national/immigrant identities play in how competence and knowledge are differentially ascribed in everyday and institutional encounters. We conclude by suggesting the central role that assessments of communicative competence play in perpetuating the racialization and the sociopolitical inequality of non-dominant and minority groups.

***Mitigating informativeness and claiming previous access: Formal signs of disagreement in agreement sequences*** (Contribution to *The Interrelation between Evidentiality, Mitigation and Appraisal across Genres*, organized by Figueras Bates Carolina [et al.]

Studies on epistemics and interaction have suggested that, in assessment sequences, first assessments carry with them an implicit claim to epistemic primacy over the matter at hand. For this reason, speakers tend to downgrade claims in first position and upgrade claims in second position. Upgrading claims in second position is sometimes related to claiming previous epistemic access. This presentation explores a type of reactive move in conversation where a speaker shows agreement with the content of the previous turn while displaying linguistic signs of disagreement. It is argued that this is used by the second speaker to minimize the informativeness of the claim proposed by the first speaker and, therefore, minimize the role of the first speaker in the construction of the sequence. In this way, speakers negotiate epistemic primacy by negotiating the source of information.

***Humor in conversations with and among bilinguals: Constructing 'otherness'*** (Contribution to *Laughing at the 'other': Critical pragmatic insights into the humorous construction of opposing groups*, organized by Chovanec Jan [et al.]

In this study, we analyze conversations recorded during ethnographic research in bilingual communities on the island of Rhodes, Greece. We examine the bilingual in: (a) the Greek and Turkish Muslim community of Rhodes (Georgalidou et al. 2010, 2013) and (b) the Greek-American community of repatriated emigrant families of Rhodian origin (Kazoulli 2016). In particular, combining conversation analytic (Auer 1995) and critical (van Dijk 2008) frameworks, we examine the pragmatics of humor in conversations with and among bilinguals. We scrutinize aspects of the overall and sequential organization of talk as well as instances of humor produced by speakers of different ethnic origin, generation and social groups. We focus on the construction of 'otherness', which reflects the dynamic interplay between the micro-level of then and there conversational practices and the macro-level of discourse involving contrasting identities pertaining to differently orientated ethnic and social groups. Our data is comprised of recordings of humorous everyday talk-in-interaction during family and friendly gatherings. Bilingual speakers tease and humorously attack interlocutors or participants in narrated incidents constructing discreet identities for perceived 'others' (Georgalidou & Kaili in print). Narratives involving jokes and stylized interlanguage talk as an insulated fun-code (Deppermann 2007; Georgakopoulou & Finniss 2009) elaborate distinctions among different origins and generations and demonstrate relationships of ambivalence as to the *we/they codes* compatible with a dynamic process of change within both communities under scrutiny. Moreover, Rhodian Muslims and Rhodians of Greek-American origin make use of humorous code-switchings. These are seen both as *discourse related* alternations connected to pragmatic parameters of the organisation of talk-in-interaction and as *participant related* alternations strategically used for the construction of aspects of the bilingual identity as well as dynamic alignments among participants (Auer 1998, 2005). Based on the analysis, we will show a) how humorous targeting orients in-groups versus out-groups, and b) mediates the dynamic process of constructing the identity of speakers who, being members of minority linguistic communities, represent 'otherness' by definition.

#### ***Stranger in a strange land: Emotions in Greek neomigrants’ social media discourse***

(Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

Since the onset of the Greek economic crisis in 2010, thousands of highly educated young Greeks have migrated abroad in search of better career prospects and living standards. This form of neomigration phenomenon is also known as ‘brain drain’ and has attracted increased media and social media attention. The lives of these neomigrants are characterised by a range of conflicting emotions: sense of uprootedness, loss of belonging, abandonment and renewal of attachments, irritation at Greek policies and mentalities, distant suffering (Chouliaraki 2006) for the family who remains in Greece facing the crisis, hopes of new beginnings in a new country, potential for new opportunities, and an alternative path to fulfilling one’s goals (Skrbiš 2008). Having as a point of departure the transformative impact of social media on the lives and experiences of migrants (Madianou and Miller 2012), I look at how a Greek neomigrant, settled in the UK, conveys across social media his emotions and assessments towards specific events and characters both in Greece and the host country. Theoretically, the study draws on Du Bois’s (2007) and Martin and White’s (2005) frameworks on stance and appraisal respectively; methodologically, it adopts a discourse-centred online ethnographic approach (Androutsopoulos 2008). The data comprise postings (verbal, visual and audio material, links) which this neomigrant made on his blog as well as his Facebook, Twitter and Instagram accounts during September 2011 – September 2016, extracts from an online interview he has given me and field notes from systematic observation of his social media activities. In my analysis I focus on emotional disclosures through evaluative lexis, pronouns, rhetorical questions, irony, metaphor, entextualisation and resemiotisation (Leppänen et al. 2014). The findings showcase social media’s vital role in allowing, mobilising and sharing affective expression. In doing so, they also provide a strong link between brain drain migration and emotions, shedding light on the broader discursive, socio-cultural and psychological aspects of the phenomenon.

### **Cornelia Gerhardt**

**'Showing', not 'pointing': Why people in embodied activities choose to pick up an object when referring to it** (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.]

In everyday life in mundane interaction, activities are usually constituted by participants orienting to an overall goal and the overall organisation with their actions. This paper focuses on a specific gesture 'showing' in its vocal, verbal, sequential and multimodal gestalt, as a means to shape a specific activity as well as local roles and moral obligations. Against the backdrop of the activity of "cleaning a room", this paper raises the question why participants choose to pick up an object rather than simply point at it. In contrast to pointing (e.g. Kita 2003, Streeck 2009), the gesture 'showing' involves picking up the object referred to and moving it into the projected site of vision of the addressee to establish mutual orientation and, potentially, a joint activity space. It is accompanied by a shift in body position, gaze redirection (from object to addressee), and other (verbal) means such as summons, locatives or demonstratives. In the main, 'showing', as (part of) a first pair part of an adjacency pair, appears to be a powerful means of increasing the relevance of a response. While the difference between 'pointing' and 'showing' may be partly based on exogenous criteria, like nature of object or proximity to speaker, the choice between the two is also relevant for the trajectory of the interaction. First, showing allows for manipulations of the object (e.g. 'exploratory procedures' Streeck 2009). Also, because of the greater effort it requires and the ensuing closer proximity between speaker and object, it represents a display of greater commitment, closer association or contiguity (cf. also Clark (in Kita 2003) for 'directing to' vs 'placing for'). The gesture 'showing' is always only interpretable against the backdrop of the current activity, shaping or constituting it at the same time. In the main, this paper will concentrate on the specific case of a German father-daughter dyad cleaning the girl's room and sorting things out, an activity they refer to as 'aufräumen'. Dad uses an array of prosodic, verbal, and multimodal resources to engage the girl in the activity (e.g. terms of address, questions, positioning of the body, and gaze). 'Showing' the object under discussion does not only make a response from her immediately relevant, also it represents a first step in the practical activity of sorting the room (i.e. moving objects from one place to another). Hence, with the help of this gestures, dad manages to engage the girl in the activity, constructing it as a common endeavour of the two in which she has a moral obligation to join. In conclusion, I will compare this specific use of 'showing' to instances in other activities, i.a. sales activities or teaching, to illustrate the intrinsic connection between activity, roles and gesture, highlighting some of the specific meanings the gesture 'showing' can take on because of this interplay.

### **Jan Gerwinski**

**The role of spatial environment, shared institutional knowledge and empractical speech at the workplace** (Contribution to *Empractical speaking and knowledge construction*, organized by Hauser Stefan [et al.]

In my speak I want to show which (shared) institutional knowledge (e.g. "wir gEhn nach der rEchtsregel vor.", *we go forward by using the rule to turn right*) and which (perceived) spatial environment (e.g. "zwEltes o ge über den treppenraum vor.", *to the second floor via the stairwell*) play a (communicative) role for firefighters in indoor firefighting operations. Because of the practice-driven interaction (see Fiehler 1993, 343) of fireworkers, their communication is best described as "empractical speech" (Bühler 1934/1978). What is extraordinary within the firefighter data is the participants' perceptual limitation. Under different working conditions workers can, e.g., point to something and (in combination with their institutional knowledge and common experience) make use of minimal phrases or single words (or no utterance at all) to realize (more or less) complex speech acts. Firefighters in firefighting operations, however, have only limited opportunity to point at something nonverbally. To compensate for the lack of perceptual limitation new media are developed to support firefighters in orientating and navigating. Of course this has an impact on the communication (for example an utterances like "blAU gesetzt.", *switched to blue* refers to the light of a technical device and indicates that the firefighters had decided to go right this way). I want to show in what way communication is influenced by these different factors. Based on this example, I want to broaden the scope and discuss how knowledge is constructed

interactively (see also Deppermann 2008 and 2015) between different participants in institutional contexts in which communication is not the main goal (unlike in meetings etc.; see Gerwinski forthcoming). I also want to ask which linguistic patterns can be analyzed in such kinds of empractical speech (see also O'Connell/Kowal 2012 and Baldauf 2002) and how these can be explored methodologically (see also Gerwinski 2015).

**“Is it OK?”: Discussion on women subordinates’ Non-use of honorifics in Japanese workplace discourse** (Contribution to *Exploring roles of ideology in Japanese workplace discourse*, organized by Minegishi Cook Haruko [et al.]

This study examines entries in online discussion-boards concerning non-canonical or problematic non-usages of honorifics by women subordinates in Japanese workplace discourse, and shows the ways in which the discussion-board participants’ linguistic ideologies are displayed and negotiated. In Japanese, the use and non-use of honorifics are key characteristics constituting stylistic variations. Traditionally, under the rigid hierarchical structure at Japanese workplace, the non-reciprocal use of honorifics (e.g., the subordinate is obliged to use honorifics while the boss is not) has been considered the “norm.” Also, researchers have shown that women tend to speak more politely at work, and women in positions of authority utilize polite forms rather than using the less polite or masculine forms to get things done at workplace (e.g., Sunaoshi 1994, Takano 2005). However, after the economic bubble burst in Japan in the late 1980s, the Japanese cooperate culture has undergone considerable changes. Because of the decline of the seniority wage system and the rise of the merit system, more and more companies value employee ability rather than seniority. Moreover, a form of non-regular labor force called *Haken* (dispatch), or a contract worker, has become increasingly popular. These changes have an impact on the Japanese institutional hierarchical order and on the Japanese employees’ linguistic ideology regarding the use and non-use of honorifics at workplace. For instance, the decline of lifetime employment system has created a number of “younger” bosses and “older” subordinates, to whom the old hierarchical norm may not work. Thus workers these days sometimes have to negotiate their own “appropriateness” on the spot. Researchers in pragmatics have also realized the discursive nature of appropriateness and pragmatic norms (Kramsch & Whiteside, 2007). Eelen (2001) claims that one of the ways to investigate appropriateness as a discursive phenomenon is to closely examine the process in which people discuss precisely on this topic: whether a certain interaction is appropriate or not. Adopting this view of appropriateness, this study explores how norms about the use and non-use of honorifics are discursively displayed and negotiated. The non-use of honorifics is frequently categorized as *tame-guchi* (it can be translated to ‘buddy talk’) in online discussions. Utilizing qualitative discourse analysis, it examines 80 entries in online discussion-boards concerning non-canonical or problematic *tame-guchi* usage (i.e., non-usage of honorifics) during workplace interactions. The paper first introduces the concept and common usages of the term *tame-guchi* in mass media and online discussions. Then it shows how discussion-board participants display and negotiate their linguistic ideology concerning workplace *tame-guchi* usage. Especially, this paper focuses on how the discussion-board members penalize and legitimize the *tame-guchi* usage by female subordinates. Various reasons for the participants’ approval and disapproval of *tame-guchi* usage as well as their linguistic framing of the *tame-guchi* usage and its users show the existence of competing and changing ideologies of gender and honorifics.

***Temporal adverbs and cyclicity: From Latin temporal adverb ILLA HORA to Italian discourse marker allora*** (Contribution to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.])

This contribution describes the pragmatic cycle that led to the development of the Contemporary Italian discourse marker *allora*. Its semantic values and pragmatic functions developed from a semantic core which can be identified in the corresponding temporal adverb *allora* ‘at that time, then’. Synchronically, pragmatic uses of *allora* have been analyzed for Contemporary and Old Italian (Bazzanella and Borreguero 2011, Bosco and Bazzanella 2005). These studies show that today the marker is highly polyfunctional with functions ranging from discourse organization to management of interpersonal relations. Its prototypical functions index discourse construction, in particular discourse coherence and cohesion. In Old Italian *allora* already shows a few of these functions alongside its distal temporal uses. (Bazzanella *et alii* 2007). Diachronically, the development of *allora* has more rarely been described. The studies illustrate that the development of its polyfunctionality can be described as a prototypically organized category whose diachronic change has to do with various types of uses shifting from the periphery to the center and reverse (Bazzanella and Miecznikowski 2009). Yet the semasiological semantic-pragmatic cycle (Hansen 2015) that characterizes the evolution of *allora* has still to be analyzed. In particular, the pragmatic processes involved in the routinization of Latin temporal adverb *illa hora* lit. ‘at that hour’ into Old Italian *allora*, as well as a description, informed by quantitative data, of the role played by contexts of use and textual genres in the shifts of meaning that characterize this rather persistent form (cf. Detges and Waltereit 2016 on the notion of routinization). This study aims at filling these gaps. The system of coherence and cohesion relations in Latin shows, as unmarked markers, other forms (e.g. *tum* and *tunc*, Rosén 2009), derived from corresponding temporal adverbs. However, already in Latin operate formal and semantic changes in the system of temporal deixis which have their ultimate outcome in Romance languages. One of these implies the introduction in Vulgar Latin of popular innovations alongside more classical terms, as is the case of the temporal phrase *illa hora* (Lüdke 2015: 543). This expression, which has several morphosyntactic variants (without or with prepositions), gradually routinizes also in written varieties already in Late Latin, probably as a substandard, analytic variant in paradigmatic relationship with synthetic adverbs. The result is that in Old Italian *allora* is already a routinized temporal adverb and discourse marker, which is also attested in a number of old vernaculars (Flor. *allotta*, OPdm. *antlor*, OGen. *laor*, OLumb. *lora/enlora/inlora* Ledgeway 2015: 97). Basing our analysis on a selection of dialogic texts, as narratives and comedies, and letters gathered at regular intervals of time from Late Latin to Contemporary Italian, we aim at describing how (a) the deictic component of the Latin demonstrative (*illa*) and the prepositions from which *allora* derives are at the origin of its routinization; (b) subsequent pragmatic developments of the adverb can again be connected with its intrinsic deictic value; (c) the polyfunctionality of the marker is the result of push chains through which *allora* has gradually taken over functions that characterized the ‘territories’ of other discourse markers (e.g. *dunque*).

***Pragmatic questions as alignment and disalignment strategies in original and dubbed film dialogue*** (Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

Recent research has shown the high frequency of direct questions in original and dubbed film dialogue (Ghia 2014). In addition to their narrative role, questions are used to represent interpersonal relationships on screen and correlate with highly recurring genre-specific frames depicting conflictual exchanges among characters or characters' encounters and/or introduction (cf. Taylor 2006; Pavesi 2011). In these sequences, pragmatic questions often appear as devices to mark alignment or disalignment among interactants, respectively expressed through affiliative and disaffiliative interrogatives (Koshik 2003; Steensig, Drew 2008). Based on the exploration of the *Pavia Corpus of Film Dialogue*, a parallel and comparable corpus of English and Italian original and dubbed film dialogue (Pavesi 2014), the current study aims at investigating the ways in which affiliative and disaffiliative questions are constructed in original English filmic speech and its dubbed translation into Italian. The source and target languages show rather high similarity in the ratio of pragmatic questions and in their expression of alignment and disalignment – with a notable prevalence of disaffiliative interrogatives carrying conflict-initiating role. However, different strategies are privileged in the two languages as far as the linguistic expression of stance is concerned. The English source text does not rely on a single and specific pattern to signal alignment, while it marks disaffiliation through inserts, emotionally-loaded chunks (Freddi 2009; Bednarek 2012) and non-canonical word order in the interrogative. Conversely, dubbed Italian appears to resort to independent means, frequently drawing on weak connectors (cf. Voghera 1992; Bazzanella 1994) and other question openers to express disalignment and preferring different types of syntactically marked structures (i.e. dislocations and clefted questions) in the construction of affiliation. Findings thus suggest that, despite matching questions with similar affiliative or disaffiliative frames, dubbed dialogue distances itself from the source text in the selection of specific linguistic markers to transfer and 're-portray' interpersonal relationships in the target linguaculture. Some of these markers align with target language usage (Voghera 1992; Berretta 1996), showing an effort to comply with target audience needs and to recreate the suspension of disbelief at the level of interpersonal stance.

***Mediatizing death and suffering: Stance-taking and affect in the (re)scripting of the***

**refugee crisis** (Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

In the context of the mediatization of the *refugee crisis* - a term used to highlight the pressures and challenges resulting from the dramatic increase of the number of migrants and refugees crossing the Mediterranean - images of migrants' life and death trajectories have been circulating widely in mainstream news and social media. In September 2015, the image of the lifeless body of Aylan Kurdi, a 3-year-old child lying on a Turkish shore, created ripples of shock in public opinion and arguably marked the transformation of the refugee crisis into a political crisis (Blommaert, 2015). About a year later (August 2016), the image of another child, wounded 5-year-old Omran Daqneesh from Aleppo, became again the object of viral sharing both in the mainstream press and on social media. Despite a considerable body of critical work on discursive constructions of migrants as the 'other' (e.g. Wodak, 2015), there is still scant attention paid to the affective stances and positions projected through the visual (re)storying of refugees' life and death trajectories.

This presentation provides a small story lens into the mediatization of the refugee crisis focusing on the (social) media sharing of emblematic images. Drawing on small stories heuristics (Georgakopoulou 2015) and social semiotics (Kress and van Leeuwen 2006), we examine how key aspects of the 'refugee crisis story' (i.e. characters, time and place) are represented, visually arranged, and emplotted in the (narrative) space of the two emblematic images of Aylan and Omran. After identifying such portrayals in the focal images, we explore how these key aspects are further reworked in subsequent story recontextualizations and rescriptings in news headlines and popular memes.

We argue that the visual emblemization of children as innocent victims of suffering relies on iterative, intertextual and portable narrative plottings of characters, time and place. Such narrative plots place networked publics in positions of distant witnessing and index particular moral and affective stances. It is suggested that this mode of stancetaking orients more towards phatic communion, rather than radical political action. The presentation contributes a visual-semiotic narrative perspective to the understanding of mediatized suffering of migrants and the texturing of affective publics (Papacharissi, 2015).

**"A cancer in your breast is not gonna kill ya": Addressing the risk of death in surgical consultations for early-stage breast cancer** (Contribution to *Talking about dying*, organized by Pino Marco [et al.]

Recent conversation analytic research on death and dying in medical contexts has focused on conversations between physicians and terminally ill patients, revealing how death is topicalized and how end-of-life considerations emerge in these conversations (e.g., Maynard, Cortez, and Campbell 2016; Pino *et al.* 2016). Death and dying may also be broached in conversations between physicians and patients who are not dealing with terminal illness but who have a condition that, if left untreated, is likely to result in death. One such condition is early-stage breast cancer, which has the potential to spread beyond the breast into other organs of the body such as the bones, liver, lungs, and brain. How and when is the possibility of death addressed in consultations between surgeons and early-stage breast cancer patients? To address this question, I draw on a corpus of recordings of surgical consultations for early-stage breast cancer collected in two clinics in the U.S. I use conversation analysis to analyze sequences where surgeons broach patients' risk of dying from breast cancer, focusing on the local sequential environments within which this occurs, what is being accomplished in and through these sequences, and how they figure in the broader activities and tasks of the consultation. In the phase

of the visit where surgeons are presenting patients with their treatment options, surgeons present the survival rates associated with these options, relying on patients to infer the risk of death should they elect one option over another. However, surgeons may explicitly address the risk of death when working to advance particular treatment recommendations, when countering patients' arguments, and when orienting to and working to correct misconceptions about breast cancer. In various ways, the risk of death is marshalled as a persuasive resource in these consultations. I discuss the implications for informed and shared decision making in the surgical consultation for breast cancer.

***Affirmative sarcasm and negative sarcasm: Which is easier to process? Which is more entertaining?*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

Given equally strong contexts, supportive of a sarcastic interpretation, will Affirmative Sarcasm (*He is the most restrained person possible*) and Negative Sarcasm (*He is not the most restrained person possible*) differ in terms of processing costs? Will they differ in terms of pleasing effects? According to the Defaultness Hypothesis (Giora et al., 2015), it is only degree of Defaultness that matters. Consequently, once degree of Defaultness is established (see Giora et al., 2015, Exp. 1), **default** interpretations will be processed faster than **nondefault** counterparts, irrespective of degree of contextual support, degree of negation, degree of novelty, or degree of nonliteralness. Results indeed show that **default** Negative Sarcasm was processed directly, faster than **nondefault** Affirmative Sarcasm (*He is the most restrained person possible*), which further involved **default** Affirmative Literalness in the process; it was also processed faster than Negative Literalness (*He is not the most restrained person possible*, said of someone who is restrained but not the most restrained), which also involved **default** Negative Sarcasm in the process (see Giora et al., 2015, Exp. 2).

However, according to the revised version of the Optimal Innovation Hypothesis (Giora et al., 2017), following from the Defaultness Hypothesis, it is stimuli's **nondefault** responses, involving **default** yet *retainable* responses in the process, that determines degree of pleasurability. Such **nondefault** responses (e.g., Affirmative Sarcasm) qualify for Optimal Innovativeness (Giora et al., 2017). They will therefore be pleasing, more pleasing than **default** (e.g., Negative Sarcasm) and **nondefault** counterparts not qualifying for Optimal Innovation (e.g., Negative Literalness).

Results of 2 experiments support the revised Optimal Innovation Hypothesis, while further corroborating the Defaultness Hypothesis. They show that **nondefault** Affirmative Sarcasm is more pleasing than **default** and **nondefault** counterparts, regardless of whether the context is linguistic or pictorial. Although Affirmative Sarcasm is more difficult to derive than Negative Sarcasm, it benefits from the involvement of a **default** interpretation in the process (i.e., Affirmative Literalness), which renders this interaction gratifying.

And if we accept that constructions, such as Negative Sarcasm, may convey **default** yet noncoded, constructed interpretations, then the results reported here can be viewed as supportive of Construction Grammar (e.g., Goldberg, 1995) or better even, of Ariel's (2008) concept of "salient discourse profiles", the latter demonstrating a strong, though not necessarily coded, form/function association.

***Emergent clause-combining in French talk-in-interaction: The [main clause + relative clause] pattern*** (Contribution to *The Emergent Grammar of Complex Clausal Structures in Interaction*, organized by Keevallik Leelo [et al.]

This paper investigates the use of relative clauses (RCs) in French talk-in-interaction. RCs are traditionally defined as subordinate clauses introduced by a relative pronoun (in French: *qui, que, quoi, dont, où, lequel*). From a semantic standpoint, they maintain a referential relationship with a noun phrase – called *head* of the RC

– stated in the main clause (MC) (Riegel et al. 2009). As such, RCs together with their MCs represent a typical case of clause-combing.

While French literature abounds in studies focusing on the syntactic and semantic functions of RCs in written data as well as in oral utterances (see Gapany 2004 for an overview), in this paper we propose a reanalysis of these constructions as part of “grammar for talk implementing action” (Schegloff 1996: 113). This contribution sets out to analyze how participants in talk-in-interaction use RCs as resources for accomplishing different interactional purposes. The data for this study comprises 6 hours of French video-recorded interactions between students during their coffee breaks. The data has been transcribed according to conversation analytic transcription conventions.

Based on detailed sequential analyses, this paper shows that:

- a) Speakers sometimes use RCs in order to perform specific referent-based actions, such as: (1) repairing a problem of referential identification, or (2) co-constructing a list of referential characteristics;
- b) These referential actions occur *in response to* particular interactional contingencies, such as: (1) recipient's verbal or non-verbal display of trouble with referent identification, or (2) recipient's display of a certain body conduct oriented to verbally by the speaker.

The following excerpt provides an illustration of the first phenomenon (1):

Ex. ‘Qui joue dans the die hard’ [Corpus Pauscaf (Pause 18) – 02m39-02m51]

```

01 GEB:  [c'est une histoire géniale.
          `it's a great story'
02 DAV:  [°ok°
03       (0.7)
04 GEB:  Statham c'est,
          `Statham it's'
05       * (1.5)
          geb *smiling and looking down, playing with the coffee cream capsule
          dav *smiles and takes the plastic stick out of this mouth
06 GEB:  [*c-
          geb *raises head and looks at dav
07 DAV:  [c'est le nouveau comment il s'appelle l'autre chauve?
          `it's the new how is he called the other bald (guy)'
08       * (1.1)
          geb *displays quick middle-distance look to his left and then looks at dav
09 DAV:  *eu[:h
          dav *hits table with a plastic stick
10 GEB:  [*°l'autre chau[ve°?
          `the other bald (guy)'
          geb *questioning look addressed to dav
11 DAV:  [qui joue dans the die hard?
          `who plays in the die hard'
12       * (0.7)
          geb *displays quick middle-distance look to his left
13 GEB:  *ah Bruce Willis?=
          geb *looks at dav, smiling, gently raising eyebrows and head
14 DAV:  *=Bruce Willis.
          dav *nods approval

```

Sequential analyses of this excerpt, as well as of others akin to this, show that the RC (in this case, at line 11) is used by speakers as a resource to accomplish referential identification repair in reaction to co-participant's verbal and/or non-verbal display of trouble with referent recognition (see lines 8 and 10 in this excerpt).

The findings show that the clause-combination MC + RC emerges in talk as a product of interactional contingencies, either occurring as a solution to a problem displayed by a recipient or being occasioned by recipient multimodal, behavior, emphasizing thus recipient-designing and joint construction of talk. We thus argue that an accurate linguistic description of the actual use of different clause-combinations, such as MC + RC, in naturally occurring talk-in-interaction, should integrate in its analysis, in addition to language, all other semiotic resources composing interaction, such as gaze, gesture and body conduct.

This paper contributes thus to recent discussions on the interactional functions of RCs in English (Clift 2007), Hebrew (Maschler 2011) and Finnish (Laury & Helasvuo 2015). This study is also a contribution to the growing

body of research on the emergent character of grammar (Deppermann & Günthner 2015, Pekarek et al. 2015) and on its understanding as closely related to embodied semiotic resources (Keevallik 2013, 2015).

***Grammatical constructions and discourse units: Mental state verbs as markers of dialogicity*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Borderia Salvador [et al.]

Following recent constructionally-oriented work on supra-clausal patterns (Fried and Östman 2005, Östman 2005, Linell 2009, Fischer 2010, Nikiforidou et al, 2014, Nikiforidou 2016, etc.), this paper explores the substantive constructions *think again* and *mind you* in authentic discourse; we forward the hypothesis that they indeed form discourse constructions that systematically correlate with features of the surrounding context. Aiming to test the conventionality of such uses (hence their degree of grammaticalisation) we investigate their appearance both in dialogic and in monologic contexts (Diewald 2015). Adopting a corpus-based methodology and systematically tagging the contextual environment (including their discourse position) we show that they indeed serve to impose a dialogic construal on monologic text types of expository discourse (e.g. articles, brochures, narrative parts of novels etc.), in this sense perspectivising preceding or following utterances (Traugott 2008), as in the following example coming from the narrative, monologic part of a novel.

(1) “Well now, if that’s your little game, you can bloody well **think again!**” J. Cox, *Don’t cry alone*, novel, BNC, Sketch Engine

While inheriting the conventional semantics of the mental state verbs and the directive speech act force of the morphological imperative or other modal markers, these patterns qualify as constructions because of idiosyncratic properties pertaining to syntax (primarily their appearance in formally definable contexts), semantics, and pragmatics. They further appear to delimit *discourse units* typically including *an initial* (explicit or inferred) *proposition* (construed as disputable, challengeable or in need of revision) that is followed by *an amendment*, which either modifies completely the content of the preceding proposition or partially alters it for emphatic or other purposes, e.g.:

(2) “A place more authentic, where we’ll finally be free to turn into ourselves, use our innate powers to create. Not a new Eden, **mind you**, but a new and better Adam.”  
MAG: *New Republic*, COCA

We further explore the status of these expressions as discourse-markers with intersubjective functions and their use in extended, non-prototypical contexts in terms of conventionalization of inferences and possible lexicalisation (Traugott 2012, 2014).

***The pragmatics of lingua franca vs. native language settings through the learner lens: Students’ perceptions during study abroad*** (Contribution to *Student mobility and pragmatic competence*, organized by Barron Anne [et al.]

Interlanguage pragmatic (ILP) development during study abroad has usually been analyzed with regard to host countries in which the target language is spoken as a native language, thereby ignoring the growing number of study abroad contexts in which the target language is used as a lingua franca. To address this research gap, this paper presents a case study of the pragmatic perceptions of advanced English learners during study abroad, comparing a group of students who spent their sojourn abroad in a native language setting ( $n=9$ ) to their peers who went to a lingua franca environment ( $n=10$ ). The data consists of reflective essays which the learners composed during a study abroad semester following explicit pragmatic instruction and which cover the learners’ perceptions of the instruction’s relevance and usefulness (‘Usefulness’), its applicability in real-life encounters during the stay abroad (‘Applicability’), the learners’ gains in pragmatic awareness (‘Awareness’), and their views on including pragmatics in their English language teaching curriculum (‘Curriculum’). The results suggest that there are clear differences between the two learning environments with regard to pragmatic learning. Most prominently, it was found that the lingua franca setting offered fewer opportunities than the native language setting to apply concrete pragmalinguistic strategies taught in the classroom; at the same time, this culturally diverse environment provided more room to apply sociopragmatic awareness and pragmatic negotiation skills. Accordingly, the two groups perceived different components of the pragmatic instruction as relevant during their stay abroad. The resulting implications for ILP development during study abroad and for pragmatic instruction preparing for and/or accompanying study abroad are discussed.

***Pragmatic effects of question-answer sequences of politicians in Italian courtroom examinations and in TV interviews*** (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

“Face” model (Bull, 2003, 2008; Bull & Mayer, 1993), equivocation (Bavelas, 2009) and politeness (Brown and Levinson, 2009) theory applied to political interviews, communication accommodation theory applied to legal contexts (Giles, Willemyns, Gallois & Anderson, 2007; Gnisci, 2005; Gnisci & Bakeman, 2007; Gnisci, Soliz & Giles, 2016) are the integrated theoretical approaches that lead the present contribution. When studying dialogical exchanges of the same politicians in two different contexts - examinations in courtroom and interviews in TV broadcasts -, we will implement these theories with a sequential approach to interaction (Bakeman & Quera, 2011; Bakeman & Gnisci, 2005). Sequential analysis is a set of quantitative methods for collecting and analyzing interaction data. The aims of the present study are: a) comparing the questions posed to politicians in the two contexts; and b) their answers; c) understanding how the sequential associations ‘question-answer’, and then d) ‘answer-question’, differ in the two contexts. We sampled the audio and video-recordings from different sources, mainly from archives in Internet (e.g., the website of Radio Radicale: Creative Commons: Attribution 2.5 License) with a particular technique of matching: a) we looked first for examinations with politicians in courtroom because they are more uncommon than TV interviews; b) once found, we looked for the same politicians but interviewed in a TV broadcast, possibly in a similar period and trying to reach the same duration. Finally, we selected 19 courtroom examinations (total duration of 20h 48m for N\_CT = 1802 question—answer exchanges) involving 11 famous politicians who had represented various parties in different phases of recent Italian history (1970--2010); then we were able to match the same politicians in 48 TV interviews (16h 30m for N\_TV = 955 exchanges). The study presents data reliably coded by two independent observers of the same politicians interviewed/examined in the two contexts. However, before the coding, the two independent coders collected information from newspapers and magazines and freely observed all the available video- and audio-taped material, making ethnographic notes to familiarize themselves with the contents, events and context of TV interviews and courtroom examinations. Meanwhile, they transcribed a considerable portion of the material (approximately half of both the interviews and examinations). The ‘question-answer’ and ‘answer-question’ sequential associations (Ilie, 2015) were studied by a sequential analysis method. This means, first, identifying the real contingencies between types of questions and types of answers (therefore not using a simple correlational approach); second, checking if their frequencies and their sequential associations vary according to the context by statistical analysis. Non parametric analysis will be used to analyze data (e.g., log-linear). The differences among politicians interviewed in TV and examined in courtroom will be discussed at the light of the theories above presented and of the level of coercion that each context have on the persons involved in it.

**'Country', 'land', 'nation': Key Anglo English words for talking and thinking about people in places** (Contribution to *The Pragmatics of Place: Colonial and Postcolonial Perspective*, organized by Levisen Carsten [et al.]

This is a corpus-assisted semantic study of the polysemic English words 'country', 'land' and 'nation', using the NSM technique of paraphrase in terms of simple, cross-translatable words (Goddard and Wierzbicka 2015). It builds on Anna Wierzbicka's (1997) seminal study of "homeland" and related concepts in European languages, as well as more recent NSM works (e.g. Stecconi 2010, Bromhead 2011, Roberts in press) that have explored ways in which discursively powerful words encapsulate historically and culturally contingent assumptions about relationships between people and places. The importance of the words "country", "land" and "nation", and their derivatives, in public and political discourses is obvious. Indeed, it would be no exaggeration to say that, without the support of words like these, discourses of nationalism, patriotism, immigration, international affairs, land rights, and post/anti-colonialism would be literally impossible. The primary focus is on conceptual analysis, lexical polysemy, phraseology and discursive formation in mainstream Anglo English, but the study also touches some specifically Australian phenomena. One is the use of the word 'country' in a distinctively Australian sense which originated in Aboriginal English, e.g. in expressions like 'my grandfather's country' and 'looking after country' (cf. Rose 1996), but which is now widely heard in general Australian English, including in institutionalised contexts, such as the 'Welcome to Country' ceremony performed at various official functions (cf. wikipedia entry cited below). Another is the colossal role of expressions and descriptions based on 'land' and 'landscape' in the perennial debates and discourses about Australian national identity (cf. Arthur 2003). Some brief cross-linguistic perspectives are also offered concerning how 'nation' and 'country', in particular, may differ in meaning and usage from their counterparts in other European languages.

### Betty Goguikian

**Building a triadic therapeutic alliance in interpreter-mediated mental health consultations : Temporal patterns of verbal and nonverbal communication** (Contribution to *The interpreter's role in healthcare conversations: A multimodal analysis of a multimodal reality*, organized by Van Vaerenbergh Leona [et al.]

Appropriately assessing and treating mental health problems among immigrants poses a challenge because of differences in language and culture. Clinicians must avoid an authoritarian attitude and try to recognize and explore patient's views of illness, treatment expectations, and specific needs in order to build a good therapeutic alliance (supportive atmosphere and trustful bond). In this perspective, it has been suggested that the interpreter's role during a triadic consultation is not only to translate all what is said, but also contribute to « bridge the cultural gap » : highlight possible misunderstandings, shed light on cultural modes of reasoning, facilitate the flow of emotions and help co-constructing « interculturality », i.e. shared meanings and representations during the psychotherapy (Goguikian Ratcliff, 2010). Hence, the interpreter is considered as a part of the therapeutic system. However, moving from a dyadic to a triadic relationship considerably complexifies the therapeutic process and it is necessary to better understand the specific dynamics allowing the achievement of a triadic therapeutic alliance. Following Fivaz-Depeursinge & Corboz-Warnery (1999) who

empirically assessed family triadic alliance, we propose that the triadic therapeutic alliance is facilitated when triadic interaction is coordinated and compromised when it is not coordinated. As an important goal of dialogue in mental health consultation is to create a pleasant and trustful feeling of communion between participants, the coordination of their verbal and non-verbal behaviors becomes critical. The quality of coordination (or triadic therapeutic alliance) is an emergent characteristic of the triadic unit and is not a reflection of individual attributes or dyadic features. This clinical case-study presentation will describe observed pattern interactions and highlight the complexity of the ongoing processes: not only do they involve multiple modalities —verbal and nonverbal; lower and upper body, head orientation, eye contact; emotional and facial expression; distance; tone of voice, speech— but they are coordinated both simultaneously and sequentially. We will address the following research questions: (1) What is the respective contribution of the Patient-Interpreter and Clinician-Interpreter dyads to the development of the Patient-Clinician therapeutic alliance? (2) Is there a specific temporal pattern of the development of the triadic alliance across time?

**“Who is to blame for the missing cat?”: Identity deconstruction in conflictive digital communication** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.]

This study explores an intriguing phenomenon of identity deconstruction in a case of conflictive digital communication, where language usages as (im)politeness are adopted for various communicative purposes. Identity under the scope of pragmatics is understood as dynamically emerged, displayed, negotiated or constructed during interaction. A majority of studies have concentrated on identity as an instrument, serving the needs of communication. This supports that identity research has its unique place in pragmatics. Pragmatics practitioners have examined a broad range of issues in relation to identity, such as discursive strategies of identity construction of various types (Schnurr, 2009) , social factors that influence how identity is discursively constructed (Garcés-Conejos Blitvich, Bou-Franch, & Lorenzo-Dus, 2013) , and identity construction in different situations (Locher & Bolander, 2015) . These studies tend to stress the process of identity construction in interaction. But, a related yet quite different process of identity deconstruction is under investigation. Questions as what is identity deconstruction, how is the process of identity deconstruction unfolded, what factors influence this process and what is the role of context in the process of identity deconstruction. These questions call for future explorations. Computer-mediated communication (CMC) provides multiple platforms to negotiating identities of various kinds. Apart from daily face-to-face interaction, specific CMC features shape the engaging participants' identities constantly. For instance, because of the anonymity of CMC, identities can be imposed to certain participant(s) without evidence. In that case, relevant respondent may react to such imposition. Considering the nature of imposition, discourse involving identity de/construction is face related in some way. Therefore, the reciprocity constitutes a valuable resource to investigate identity deconstruction and (im)politeness. The current study examines the process of identity deconstruct based on a “Cat Missing Event” of a Chinese conflictive digital communication. Approaching the online interaction between the cat owner, animal protection group as well as relevant insiders of the event in terms of discursive moves, the cat owner is found taken multiple discursive moves to deconstruct any imposing identity casted by other parties. Patterns are also emerged by examine the discursive moves closely. Then, the study summarises the results by addressing recent debated topics as manifesting (im)politeness on CMC from an interpersonal pragmatics perspective.

***Closing sequences in L2 computer-mediated interactions: A conversation analysis***

(Contribution to *CMC Pragmatics of L2 Discourse*, organized by Vandergriff Ilona [et al.]

The management of politeness is clearly an essential component for the maintenance and opportunity for future social relations (Spencer-Oatey, 2000 2005). Among all the possible sequences where politeness is an essential component, conversation closings are frequent and essential in the interaction because they are not only used to terminate conversations, but also to reinforce relationships and support future interactions (Button, 1987; Hartford & Bardovi-Harlig, 1992; Schegloff & Sacks, 1973). However, conversation closings are not common in the language classroom, and when they are employed they are reduced to a few formulae. In addition, for L2 learners (and speakers in general) conversation closings are difficult and complex sequences since they must consider not just language choices but also additional elements such as contextual norms, sociopragmatic and pragmalinguistic conventions, and fundamental cultural values. In L2 learning contexts that lack opportunities to engage in these speech act with competent users of the language, computer-mediated communication (CMC) offers an excellent alternative to experience conversation closings through interactions with expert speakers within a variety of sociopragmatic contexts. The present study employs Conversation Analysis (CA) to look at longitudinal data of L2 language learners interacting with expert speakers of Spanish via synchronous text:=based CMC. More precisely, the study explores how closing sequences are generated and negotiated in CMC. The results suggest that the learners' closing sequences developed to be more similar to those of the expert speakers in amount of turns, length, and sequential structure within the affordances of the medium. In addition, learners progressively began to initiate the conversation closings themselves, something that was done almost exclusively by the expert speakers at the beginning of their interactions. The study also demonstrates how CA is a suitable tool for the investigation of language learning phenomena when longitudinal data is explored.

***The intertwining of touch, prosody, and voice*** (Contribution to *Touch in Social Interaction: Integrating Haptics into Embodied Interaction Research*, organized by Cekaite Asta [et al.]

While touch and voice are frequently investigated independently from one another, in this paper I examine the important mutual elaboration of these quite distinct semiotic fields in the constitution of relationships of intimacy during interaction between family members. Researchers investigating the importance of the haptic sense in social relations have argued that touch is “the ontogenetic precursor of social communication” (Botero 2016:1). In many nonwestern cultures (Meyer in press) touch is as important as gaze in interaction among infants, providing a critical resource for understanding one’s place in the world, one’s relatedness between people, and for achieving joint engagement. Through skin-to -contact in interpersonal touch social bonding and affiliation occur (Gentsch et al. (2015). Prosody (Couper-Kuhlen and Selting 1996) and voice (Podesva 2007) function as rich phonetic resources through which speakers can display affect and take stances in interaction (Podesva can Callier 2015; Goodwin et al. 2012). Sounds that can be produced with extended duration, such as vowels and nasals, make extended prosodic displays possible; as Selting (1994) has argued, forms of emphatic

speech style make possible the prosodic signaling of heightened emotional involvement in conversation. Touch, voice, and prosody mutually elaborate each other, making distinct and different contributions to an ensemble of emotion and stance. The way in which action is built through the use of diverse materials that mutually elaborate each other enables actors to adapt to local interactive environments by constructing a range of variable displays, and ones that can shift from moment to moment. Interactively structured sequences provide environments where the embodied dialogic organization of emotion can be systematically investigated. Situating my analysis within an ethnographic context, I consider the repertoires of intertwinings of voice and touch that occur within the larger ecology of the daily round as well as moment-to-moment shifts that occur within the arc of activities such as greetings, farewells, or putting a child to bed. Materials for this study are drawn from the extensive video archive of naturally occurring interaction in 32 middle class Los Angeles families who were part of UCLA's Center on Everyday Lives of Families.

***Mobilizing co-participants' sensory experience of co-present objects in scientific practice***

(Contribution to *Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction*, organized by Tuncer Sylvaie [et al.]

The systematic transformation of the natural world into the material and discursive objects that animate scientific discourse is accomplished via the professional and interactional practices that practitioners bring to bear on that task. In scientific practice more so than in other settings, however, practitioners engage not with "objects" in the first instance, but with a dense materiality from which those objects are then fashioned or extracted. In order to understand how then these objects are made available for co-participants for subsequent use, re-use, and transformation, attention must be given to the practices by which objects emerge as "...progressively witnessable and discourseable" in the first instance. In this talk, we present video recorded data from naturally occurring interactions in 1) geochemical laboratory, where senior and novice geochemists collectively monitor the completion of a chemical process, and 2) from geological fieldwork, where senior and novice geologists extract samples from rock outcrops containing different mineral compositions. We approach these data from a conversation analytic perspective (Sacks, Schegloff, & Jefferson, 1974) with priority given to the multimodal, co-operative nature of the actions produced therein (Goodwin, 2000; 2012; Mondada, 2013). In each setting, we observe practitioners engaging not only with the physical and interactive work of handling, inspecting, and exchanging objects, but how those manual operations are coordinated with the discursive constitution of the objects as constellations of distinct features and qualia. This latter task presents a problem for the co-participants: While these features and qualia are in a sense "co-present," they are not always immediately perceivable, especially to the novice, and thus must be built sequentially through co-participants' concerted effort. We find in our analysis that practitioners overcome this problem by selectively mobilizing their co-participants' sensory experience of various aspects of co-present objects (i.e., the "silvery" luster of a perceivable mineral on a rock, the different sounds a hammer makes against different parts of a rock outcrop or the smell or "blackness" that emerges from a chemical reaction) and accomplish this through both a) the continuous (re)formulation of relevant features or qualia of the objects in any given context, as well as b) through their continuous monitoring of how their co-participants, especially novices, experience and assess those co-present features and qualia. In our talk, we will detail how these two projects are accomplished simultaneously. As we will detail in this talk, this develops out of senior and novice practitioners working in activities with a focus not only on the cultivation of objects through professional practice but the socialization into those practices for novice members. It is through these practices that material objects are incrementally revealed in their "unity" as scientific objects through time and through interaction (McCumber, 2014, p. 148) and through which the natural world enters discourse and is (re)constituted as a socially meaningful and consequential world.

*A map task dialogue: Are eyebrow movements a trigger of disalignment?* (Contribution to *Multimodal Turn-Taking*, organized by Zima Elisabeth [et al.]

Talk in interaction displays a co-construction involving all the participants (Sacks et al 1974; Goodwin 1981, among others). In dyad, both the speaker and the recipient collaborate to build a joint activity (Clark 1996) that requires at a first level they both participate in achieving mutual understanding. This mutual understanding is largely dependent of the common ground that reflects—for example the mutual beliefs that participants have to take into account for successful interaction. Feedback items (such as mh, ouais/yeah, nod or eyebrow movements) produced by recipients are the explicit marks of this mutual understanding. As continuer or assessment (Schegloff 1982) they are also appropriate responses whereby recipients show their alignment to the current activity (Stivers 2008). But, feedback items can also help the speaker to identify a problem of understanding. Misunderstanding sequences have been examined through repair sequences (Schegloff et al. 1977). Following Enfield et al (2013) other-initiated repair exhibits a trouble source, a repair initiation and a repair. We investigate here the role of a conversational facial gesture (Bavelas et al 2014), i.e. eyebrow movements as a potential trigger of a repair. Firstly, we wonder about the potential of eyebrow movements to trigger a misunderstanding sequence while giving rise to a *disalignment* sequence. Secondly, we attempt to show that each frowning or raising movements can reveal different functions when they signalize a repair sequence. We use the French Map-Task corpus (Gorisch et al. 2014) including video recordings for both participants individually as they could see each other during the dialogue (see the original MapTask protocol Anderson et al. 1991), where the role of map giver and follower change through the 7 or 8 maps per session. Each map took about 5 minutes to complete. The corpus was annotated at different levels among them communicative functions of feedback (see CoFee project). Up to now, 130 eyebrow movements have been annotated and analyzed for one dyad (involving 8 map-task). We can notice a great interindividual variability (70 raised/6 frowning for A and 27 raised/33 frowning for B). Our preliminary results tend to confirm our first hypothesis concerning the whole eyebrow movements as trigger of misunderstanding and *disalignment*. To the difference of the previous turns marked by a positive feedback, the eyebrow movement occurrence within a turn often signalizes a trouble. At this point, the recipient summarizes the shared knowledge (well established so far) from which the speaker is prompt to elaborate for solving the problem. This repair sequence is concluded by a positive feedback marking understanding and realignment with a gestural feedback such as nods. Furthermore, raising and frowning seem to have different functions: while raising is more likely associate with an unexpected information frowning is associate with a doubtful information which imply different interactional trajectories in the next repair sequences.

*The turn-initial-elements in discourse: Vocatives, parentheticals, particles, and interjections in Russian* (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

The present contribution focuses on different kinds of turn-initial elements such as vocatives, parentheticals, particles, and interjections in Russian and discusses their commonalities and differences. All of these elements are used as pragmatic devices to encode the speaker's relations to the situation of interaction. The linguistic literature often argues that these elements are not syntactically integrated with the rest of the turn. However, many examples demonstrate that these elements build a secondary, "higher-order" syntactic structure at the pragmatic level of discourse deixis.

Besides their turn-initial placement, many of these "objects" can occur in various positions within the sequences of discourse. Thus, vocatives (which are usually used to get the attention of the addressee by identifying the person addressed) can occur in turn-initial, turn-medial, or turn-final positions. The similar function seems to be traced by the use of some parenthetical forms, e.g. the Russian 2<sup>nd</sup>-person verb-form parentheticals *slušaj<sub>2PSglmp</sub>/slušajte<sub>2PPllmp</sub>* 'listen' and *znaeš<sub>2PSgl</sub>/znaete<sub>2PPl</sub>* 'you know', which morphologically signal the hearer in the discourse situation. These forms act as a kind of "address" to the interlocutor, very frequently used

especially in casual discourse situations. In more formal situations (e.g. patient-doctor communication), they lighten the conversation, endowing it with a more relaxed and familiar character, cf. (1).

(1)

- 01 doctor: nu, kaKogo razmera (u vas gematomy byvajut)?  
*Well, what size are your hematomas?*
- 03 (.) s pjaTAK?  
*Like a five-kopeck coin?*
- 03 patient: s pjatak (.) ja (.) na èto vnimanija ne obraščala [byl].  
04 vot otsjuda (.) i vot do samoj (nogi).  
*Like a five-kopeck coin? I wouldn't even notice [if this were the case]. [The hematomas stretch] from here to the end of... [the leg] (patient uses hand to approximate the size of the hematomas)*
- 05 doctor: [SLUšajte, ja, ZNAete, čto podumal], vot my govorim "s pjatak",  
*a ved', naverno, polovina naselenija è (.) rossii uže i ne pomnit, kakim byl pjaTAK-to <<smile>.*  
*Listen, you know, I was just thinking: we are talking about a five-kopeck coin, but it might be that half of the population of Russia doesn't even remember how big that is.*  
*(TV programme "O samom glavnom", 10.10.2016).*

Both Russian parentheticals (*slušaj*<sub>2PSgImp</sub>/*slušajte*<sub>2PPlImp</sub> 'listen' and *znaeš*<sub>2PSg</sub>/*znaete*<sub>2PPl</sub> 'you know') have undergone pragmaticalization, i.e. the development from once-particular grammatical forms to pragmatic markers, and are, thus, "semantically bleached". Thereby, it is interesting to admit that the "rest" of their grammar and semantics seems to occasionally determine their position within turns and sequences of discourse. Thus, being formally an imperative form (which usually prompts someone to do something in the immediate future) the Russian parenthetical *slušaj*<sub>2PSgImp</sub>/*slušajte*<sub>2PPlImp</sub> ('listen') occurs predominantly in turn-*initial* (and never in turn-final) positions, carrying *cataphorical* function of pointing the interlocutor to the following information while simultaneously softening a direct formulation in conversation. The Russian parenthetical *znaeš*<sub>2PSg</sub>/*znaete*<sub>2PPl</sub> ('you know'), which is not a former imperative, does not exhibit such restrictions and can occur in turn-initial, turn-medial, or turn-final positions.

Furthermore, similar restrictions as to their placement in a turn are observable in some Russian particles like *ved'*, *už*, *tak* ('so') and others that also cannot occupy the turn-final position and are frequent at the beginning of a turn. The Russian *tak* ('so') can even build a turn by itself, cf. (2).

(2)

- 06 doctor: otKUda vy?  
*Where are you from?*
- 07 patient: s penzy.  
*From Penza.*
- 08 doctor: s penzy (-).  
*From Penza.*
- 09 patient: s penzy.  
*From Penza.*

- 10 doctor: ČTO doktora v penze govornjat?  
*What did the doctors in Penza say?*
- 11 patient: govornjat, čto lomkost' sosudov.  
*They say that it is due to fragile blood vessels.*
- 12 doctor: °hh /hh° TAK, (.)
- 13 značit, prinesite nam, požalujsta, ém (--) DAnnye.  
*So, then please bring us the data [the results] of the blood test.*

(TV programme "O samom glavnom", 10.10.2016)

One more group of linguistic objects can either occur in a turn-initial position or build a turn by itself: interjections. The current contribution, thus, also touches on some cases of turn-initial uses of interjections and their particular functions in a discourse.

### **Eva-Maria Graf**

***From face-to-face coaching to Online coaching: Exploring virtual psycho-hygiene for clients from a (multimodal) discourse analytic perspective*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

The use of online interventions in the psycho-social sector has increased dramatically over the last few years (Geißler et al. 2014; Künzli & Lohmann (unpublished). To speak with Gods & Boyce (2013: 501), "(v)irtual work, working with those not co-located in the same space and/or, working with technology to engage in communication ... has become nearly ubiquitous". Particularly in the context of helping professions such as consulting, counseling or coaching that view communication as constitutive for their work (Graf & Spranz-Fogasy in press), virtual instead of face-to-face meetings are attractive solutions to restrictions in time and money, while concurrently guaranteeing similar or even increased productivity and knowledge (Hakim 2000; Rossett & Marino 2005). In digital times the transition to digital modes of providing psycho-social support then seems but a logical consequence. While virtual psycho-technologies have become a practical reality, their research lags dramatically behind. E.g. questions whether and/or how such medial transitions are affecting the coaching interaction on the micro-, meso- or macro-level are only slowly emerging in the coaching research community (but see e.g. Künzli & Lohmann unpublished or Geißler & Metz 2012). From a discourse-analytic perspective, too, computer-mediated or virtual coaching is but a very recent object of research. In one of the very few existing studies, Weinzinger (2016) looks into the discursive co-construction of knowledge and trust in work-related online-coaching. The current paper applies a wider perspective and investigates into the particular linguistic and interactive layout of the four basic communicative activities of coaching, i.e. 'defining the situation', 'building the relationship', 'co-constructing change' and 'evaluating the coaching' defined as coaching endemic by Graf (2015). While these communicative and interactive core components are also constitutive for online coaching, their virtual realization entails – as will be discussed in this paper – particular communicative tasks in the context of 'defining the situation' and 'building the relationship'. The data stem from a small pilot study out via the software CAI® Coaching World in the Master's program "Applied Psychology" (modul "Distanzberatung") at the Zurich School of Applied Sciences (ZHAW) in winter term 2015/2016 (cf. Künzli & Lohmann unpublished). While this software offers video, audio and chat communication as well as the use of interactive tools for visualizations, the current analysis focuses exclusively on the chat data. Around 15 virtual coaching processes, each containing up to four online sessions (between 45 to 60 min each) are analyzed with the help of an integrative discourse analysis. As a next research step, yet beyond the scope of this paper, the full potential of coaching via the software CAI® Coaching World will be analyzed applying a digital multimodal discourse perspective as applied in Tan et al. (2015) in the context of leadership discourse.

***Breaking ‘Da Rulez’: Impoliteness as a construct in online gaming*** (Contribution to *The new normal: (Im)politeness, conflict and identity in digital communication*, organized by Beers Fägersten Kristy [et al.]

(Im)politeness is not only a fascinating lens through which to examine human behavior, it is also a hotly debated topic in pragmatic research. Three of the major questions that continue to be debated are 1) how (im)politeness can be identified and defined, 2) how impoliteness intersects with and/or differs from rudeness, aggression, offensiveness, and argumentation, and 3) whether a predictive model of (im)politeness is achievable. This paper attempts to explore these questions through an examination of online gaming, a context where impolite behavior is not only frequent, but in many cases expected. As Maher (2016) observes, Online gamers have a reputation for hostility. In a largely consequence-free environment inhabited mostly by anonymous and competitive young men, the antics can be downright nasty. Players harass one another for not performing well ... Racist, sexist and homophobic language is rampant... (Maher, 2016) Despite the prevalence of online gaming, research on this topic has tended to focus on gaming as a tool in language learning environments. There has been relatively little linguistic research on interactional strategies (including impoliteness and aggression) in gaming (exceptions include Masso's 2009 & 2011 and Ennslin's 2012 examinations of the games *Diablo* and *World of Warcraft*). Attempts to regulate impolite language and behavior in online gaming have resulted in an array of multi-layered guidelines (e.g. FAQs, codes of conduct) at all levels -- from game designers (e.g. Riot Games), broadcast channels (e.g. Twitch.tv, YouTube), and game streamers themselves regarding what types of behavior and language are acceptable in the multimodal environment of game streaming. On Twitch.tv, gamers have two systems in place for regulating behavior in their streams: human moderators (mods) and robot moderators (botmods). Botmods by nature must rely on a predictive framework for impoliteness – they must be programmed ahead of time to recognize posts that break the rules of politeness and delete them. For a botmod to be effective however, someone must write a predictive code that instructs it on how to recognize impolite/offensive/problematic messages. This predictive model is flawed, however, since it would be impossible to anticipate and program a botmod to delete all of the possible manifestations of rule-breaking. Streamers therefore must also rely on human mods to recognize and delete content that could be classified as impolite or offensive. Using a corpus of real-time interactions gamers and the open chats that run concurrent with their streams, this study examines impolite, offensive, conflictual, and aggressive speech in the MOBA (Multiplayer Online Battle Arena) *League of Legends*. Taking a Community of Practice approach, it examines rules and guidelines for behavior distributed by game designers, broadcast platforms, and gamers themselves to examine the intersection of predictive rules and real-time practice as they are regulated in a multimodal environment.

***The discursive construction of ‘an ordinary nation’ in TV interviews with the President of Argentina.*** (Contribution to *Constructing Ordinarity across Media Genres*, organized by Weizman Elda [et al.]

The notion of ordinarity responds to ‘what we might see to be’, to the way in which the individual constructs self in interaction according to how he perceives usualness (Sacks 1984: 414). The work of being ordinary is acted out in the interpretation of daily events which are made ordinary (Paoletti and Cavallaro Johnson 2007: 91). Political interviews, as instances of institutional, public discourses, aimed “(Andone 2013: 103) to preserve a democratic political culture”, constitute a fertile arena for the construction of ordinarity through which politicians present themselves as committed to the different endeavours as public servants. The aim of this work is to show how a sense of ordinarity is achieved and projected in televised political interviews. More specifically, we look at the discursive construction of what constitutes an ordinary nation in the eyes of Mauricio Macri, elected president of Argentina in November 2015. The study is based on a corpus of eight television interviews, amounting to 266 minutes of broadcast material in Spanish conducted by different journalists between November 2015 and October 2016. A qualitative analysis is anchored in sociopragmatics and makes use of both bottom up and top down approaches to the scrutiny of the data, that includes a micro analysis interpreted against the background of the sociopolitical reality of the current government administration. We argue that by foregrounding ordinarity and backgrounding non ordinarity as a recurrent strategy, the president deconstructs the state of ordinarity established by the previous administration and constructs his view of the ordinary nation he envisages. This is achieved by the means of various discourse and linguistic resources used throughout the interviews. In this presentation, we will focus on the employment of terms of address, casual expressions, monoglossic statements and first person plural as the most prominent resources exploited by the president in the construction of an ordinary nation.

***From clause to discourse and back: Cyclicity phenomena in Spanish *a ver si*-constructions*** (Contribution to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.]

This paper addresses the cyclical nature of a particular phenomenon in clause combining: the process whereby formerly dependent clauses become independent and, later, further dependent values appear. This is the case of the Spanish construction <*a ver si* + clause> (lit. ‘to see if’).

Initially, *a ver si* introduces dependent clauses. The subordinate clause introduced by *a ver si* signals the purpose of the main clause (1).

- (1) afeitóse; e estonçes se asomó a casa de la vieja, ***a [ver] si*** avía fallado aquel omne que fuera a buscar

*He groomed himself; and then he dropped by the old woman’s house, to see if she had found that man she had gone to look for.* (1253, Anonymous author, *Sendebarr*, CORDE)

In a second stage, the sequence introduced by *a ver si* is not dependent on a previous syntactic constituent, but is reanalysed as a mark of the speaker’s (modal) stance, i.e., it expresses the speaker’s wish or doubt, in a syntactically independent structure (2):

- (2) Y dame la vihuela en cuanto va Pandulfo, **a ver si** te contenta a ti las comparaciones, y dezirte he un villancico que tengo hecho

*And give me the guitar as soon as Pandulfo is gone, [a ver si] the comparison pleases you, and I will sing a villancico I have written.* (1534, Feliciano de Silva, *Segunda Celestina*, CORDE)

This particular development is compatible with Evans' (2007) hypothesis of insubordination. According to Evans, insubordination can be defined diachronically as a process whereby subordinate clauses become reanalyzed as main clauses that express pragmatic functions, such as indirection, modal stance or various discourse relations. The result of this process is the creation of new grammatical constructions that exhibit two conflicting features: they formally resemble dependent clauses (the sequence *a ver si* can still introduce dependent purpose clauses); but, on the other hand, they behave like main clauses in terms of their illocutionary force, discourse distribution and prosody.

So far, the literature has not pointed out the possibility of an insubordinate construction going back to be used in syntactically subordinate contexts. Furthermore, the impossibility to occur in embedded contexts has been used as a test to determine the insubordinate status of different constructions (Montolío 1999; Schwenter 2001, 2016; Gras 2011, 2016). However, this seems to be the case of (3), where the construction headed by *a ver si* is embedded in a clause depending on a verbum dicendi:

- (3) Isabel no le había visto nunca, dijo **que a ver si** se lo enseñaban.

*Isabel had never seen him before, she said that they should introduce him to her.* →Lit.  
*She said that to see if they showed him to her.* (1958, Carmen Martín Gaité, *Entre visillos*, CORDE)

On the one hand, in (3) the *a ver si*- construction preserves its modal-illocutionary value (expressing a wish) found on insubordinate clauses like (2); on the other hand, however, two major changes took place: (i) the modal value of the *a ver si*- construction does not necessarily coincide with the speaker's stance (it is, in fact, a third person to whom the wish can be attributed, not to the speaker), and (ii) the *a ver si* construction admits being combined with subordinating elements (*que*), which means that *a ver si* does not head an independent clause here.

Through the analysis of historical data extracted from the Diachronic Corpus of the Royal Spanish Academy (CORDE, RAE), the different stages in the aforementioned process are illustrated, and the changes in form and interpretation experienced by the construction are pointed out and accounted for. The question we intend to answer is whether or not this process can be considered a genuine case of cyclicity: Does the dependent construction (1) give rise to the independent one (2) which, in turn, results in a new dependent construction (3)? Or is (3) a direct result from (1)?

***Imagining a new gendered body : Touching the face in drag king workshops*** (Contribution to *Touching-the-body in interaction*, organized by Greco Luca [et al.]

A drag king is generally a female assigned at birth person who performs masculinities through a complex and a

multimodal repertoire (vocal, visual, material, corporeal resources...) for the sake of performance, in pursuing a political agendas, or for a personal self-fulfillment. Drawing from a fieldwork conducted among french speaking drag king community in Brussels (Belgium), and based from a video recording data, I will focus on touching in embodied transformation practices in make up activities. Touching the face constitutes a crucial moment in make up activities especially in interactions between a novice, a person who discovers drag king workshops, and an expert, a leading figure in the workshops who helps incomers to construct a male gendered body. I will focus on two particular moments in touching episodes in make up activities : in the first one, the expert touches zir face as a way through which ze shows to the novice the forms of a possible beard or of possible moustaches, sideburns; in the second one, the leader touches the novice's face to begin the make up activities. The analysis focuses on ways through which grammar, pragmatics are mobilized in the course of these two moments temporally and sequentially organized: directives, instructions, collective and individual pronouns and hypothetical structures are mobilized and are intertwined with participation frameworks. Through an analysis of touching practices in drag king workshops, this paper questions the role of touching in imagining practices and the creative and sensorial dimension of gender.

***Wikipedia as multimodal environment: The role of (multimodal) metaphors in constructing realities on Wikipedia*** (Contribution to *The micro-analysis of online data (MOOD): Using discourse and conversation analytic methods to analyse online interactions*, organized by Meredith Joanne [et al.]

One of the defining features of digital discourses on Wikipedia is the convergence of media and consequently the convergence of various modes such as pictures and text or video and text (Herring 2013: 15). In the process of collaborative text production of the sort that takes place on Wikipedia editors are able to integrate pictures and videos on article pages and discuss their integration on the corresponding talk pages. This study demonstrates that, and how, metaphors occur multimodally, providing an outline how to consider this phenomenon in the microanalysis of online data. Covering innovative as well as conceptual metaphors, and where appropriate evaluating the intercultural factors governing metaphor interpretation, the paper draws an outline of the variety of (multimodal) metaphors (c.f. Forceville/ Urios-Aparisi 2009) on Wikipedia article and talk pages as a transtextual phenomenon in the light of Foucauldian discourse analysis.

This paper contributes to the methodology of a digital conversation analysis (Giles et al. 2015) by investigating digital discourses on Wikipedia. The findings of this paper suggest not only the convergence of media and data but also the convergence of methods: It demonstrates along the lines of the MOOD framework (Microanalysis of Online Data) why Wikipedia should be analyzed also in the light of digital conversation analysis. The study reveals communicative strategies and practices of interaction on article pages and on corresponding talk pages especially considering their multimodal nature.

***Non-truth-conditional meanings and conversational common ground*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

Conversational common ground (Sensu Stalnaker, *Context*, OUP, 2014) is usually modeled as a set of propositions, or, alternatively a set of possible worlds. However, Stalnaker 2014 (as well as Green, "Conversation and Common Ground," *Phil Studies*, 2016) argue that this austere framework needs to be enhanced to allow for a *partitioning* of that set of worlds to account for the result of interlocutors" accepting a question. (Question Q partitions the context-set into a set of subsets, each of which corresponds to one complete answer to Q.) Green 2016 also suggests that expressive behavior (including uses of expressive language, and expressive uses of language) merits accommodation in the common ground framework, and conceptualizes such

cases as types of “manifest event” - events that are perceptually salient to all interlocutors and such that all interlocutors perceive one another registering them. That paper leaves the suggestion undeveloped, however. In this talk, I will motivate this suggestion, and develop it in further detail than I have done thus far. In the course of this discussion I will defend a view of certain expressive behavior as making perceptible the psychological state that is expressed, and argue as well that a conversationally accepted question can be answered by means of such expressive behavior.

**‘Talking about language’: An investigation into language teaching as an activity in interaction** (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.]

Both speech and language therapists and second language teachers aim to improve their respective clients’ and students’ language skills and interpersonal communication. In achieving this goal, the participants have to use language as both the means and the target of interaction. Seedhouse (2004: 64) refers to this phenomenon as the ‘extra dimension’ that distinguishes language teaching discourse from that of other classroom subjects. While interaction in social contexts has routinely been analysed using Conversation Analysis, a socio-linguistic method for investigating how talk functions as a social activity (Sidnell, 2010), it is only during the last two decades that the interactions of language teaching professionals have started to be analysed in detail (e.g. Horton, 2008; Seedhouse, 2004; Waring, 2014; Wilkinson, 2013). This research has been useful in unpacking what is involved in this professional activity but up until now has investigated second language teachers and speech and language therapists separately. From a survey of the literature, it appears that there are similarities, and differences, worth exploring.

The project from which these data are taken uses Conversation Analysis to analyse video recordings of aphasia therapy and second language teaching with the aim of comparing how language is being taught and informally assessed. The data set currently consists of approximately 12 hours of recordings of second language classes in adult education colleges. The overarching social activity under analysis is that of language teaching and its full range of verbal and non-verbal behaviours. In terms of ‘doing teaching’, initiation, response and feedback/evaluation (IRF/IRE) sequences are recognised as key components of any classroom or therapy discourse (Seedhouse, 2004; Kovarsky and Walsh, 2011). Differing from the common adjacency pairs that form actions such as greetings or invitations, these ‘known-answer question’ sequences (Schegloff, 2007: 223) are distinctive in being tripartite, with the third turn being thought to play a vital role in pedagogy (Lee, 2007). What is less researched and what I’ll seek to unpack further, is how these three-part turns are employed in language teaching. While some literature has noted that teachers very rarely use explicit negative formulations in the third turn position following an incorrect response (e.g. Margutti & Drew, 2014), in the data discussed here we will see that language teachers can occasionally employ forms such as ‘no’ and I will discuss in what contexts these are used. Related to this and also emerging from the data, concerns how teachers seem to permit a certain sequence of action that is outside the IRF lockstep before ‘expertly’ guiding the interaction back to a more standard classroom discourse (e.g. Waring, 2014). One interesting aspect is how these shifts back to ‘business of teaching’, essentially an overarching action, are negotiated and managed between the participants, with epistemic authority and control seemingly being reestablished with relative ease. This presentation may be of interest to teachers, therapists and researchers who are currently concerned with language teaching and how its interactional work gets done.

***Initiating and delivering news of the day: Interactional competence as joint-development***

(Contribution to *Interactional competence: CA perspectives on second language development*, organized by Pekarek Doehler Simona [et al.]

One common interactional activity that forms part of the nightly ritual in many family groups involves delivering *news of the day*. Often initiated with formulations such as – “How was your day?”-, co-members of a family or similar group will tell each other stories concerning matters and events that have happened to them during the period they have been apart. On the surface this may seem like mere small talk, but these narratives serve the important social function of creating and maintaining group ties and reinforcing identities and family histories. Sequentially this involves a specific form of topic initiation, a type-suited response and possible post-expansion sequences. This presentation adopts a CA perspective to explore how one family group accustoms a guest L2 speaker of English into their version of this interactional ritual throughout the course of a 3-week visit. Ryo, a 19-year-old undergraduate student from Japan, is home-staying with a Mexican immigrant family in Australia during a short-term study abroad program. The analysis will focus on a dataset of dinner table talk recorded on four separate occasions throughout the stay. In each case a member of the family initiates the news of the day sequence. In the earlier recordings, Ryo's responses are brief assessments and do not contain any significant narrative sequences. This leads the family to initiate post-expansion sequences that prompt Ryo to extend the topic. Over time, Ryo's responses become fuller, smoother and formulated more recognizably as narratives, and by the third week he is initiating follow-up questions during the other family members' news-of-the-day stories. I will argue that this change in the nature of Ryo's participation demonstrates his growing familiarity with the way this sort of talk activity routinely occurs. His changing responses across time show that he eventually views the preferred response to a news-of-the-day initiation as a tellable story of some sort (Sacks, 1970/1992). One of the study's central premises is that the novice L2 speaker alone is not responsible for the development of this interactional competence. Instead it is a co-constructed process through which the family works with him to draw out further news through the sequential practices of their talk. As such, the analysis will also outline changes in the way the expert speakers adapt the way they address the novice as he becomes more familiar with the interactional routines of the dinner table. In addition, it will look at how the family initiates and sustains news-of-the-day talk with the youngest family member, 6-year-old Luis, who himself is still being socialised into this interactional practice, allowing for cross-case comparison of the role maturity can play in shaping interlocutor turn design. The study adds to burgeoning longitudinal CA-SLA research into the development of interactional competence, particularly with respect to the ubiquitous but under-investigated mundane practice of delivering news of the day and the notion of routines and rituals as interactional competence.

***On intentionality, sincerity and the possibility of ethics in discourse*** (Contribution to *On*

*language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

The question of intentionality of the speaker has always been controversial topic in the field of language studies. Even the language conception of the so-called *second* Wittgenstein, the language perspective on which this work lies on, we have that: given the impossibility of predicting all of a certain linguistic expression *uses*, also the speaker himself has no control over his *intention* [meinen]. The issue gets more interesting the more we realize that, although to call something “language” we should have otherness, that is, there must be an interlocutor (here we can remember the Wittgensteinian idea of the impossibility of a private language), we do not have any previous guarantee that to use language in some way we will be *successful* in that (language) practice. More than that: there is no guarantee that the intention of the speaker will be understood by his interlocutor, at least in approximate way to his *intention* [meinen]. It is known that Wittgenstein did not propose a theory of language, given that, for him, that would be a contradiction – how anyone can establish a theory of language use in an *a priori* way that would previous all possible use of some linguistic expression? According to Wittgenstein, that

would be understanding language in a metaphysical way. However, after the seminal thought of Wittgenstein, there were several attempts to formulate a *pragmatic* theory of language - and many of these attempts have also put themselves the task of answering on the speaker's *sincerity*. However, this task always seemed pretty thankless; after all, how can anyone detect the intention of the speaker, or even to circumscribe their sincerity in the materiality of language? One way out was to deal with the problem in terms of the speaker's *responsibility*; thus not necessarily investigate their intention or sincerity, but rate their obligations from the effects of his speech. In this spirit, this work aims to develop and expand the proposed Marie-Anne Paveau by a *philosophy of discourse*, that is, an attempt to include ethics in linguistics. The guiding question of her work, "Can everybody say everything?", the same question I asked myself when, during the impeachment process suffered by the (now former) President Dilma Rousseff in Brazil, Federal Deputy Jair Bolsonaro voted for the removal of the President for "the memory of Col. Carlos Alberto Brilhante Ustra, who terrorized Dilma Rousseff". The tribute rendered by a Federal Deputy for a military responsible for torture during the civil-military dictatorship in Brazil (1964-1985), was the discursive sequence chosen to be analyzed in this work, which is part of an ongoing research on the possibilities to stipulate criteria for an ethics in discourse.

### Helmut Gruber

#### ***Candidates' self presentations as "ordinary people" on Twitter during the 2016 Austrian presidential election campaign*** (Contribution to *Constructing Ordinarity across Media Genres*, organized by Weizman Elda [et al.]

Since Barack Obama's 2008 presidential election campaign, the use of Internet communication technologies in political campaigns has become more and more common in many countries (Chadwick, 2013; Jungherr, 2014). A major role in politicians' internet communication activities play social media platforms like Twitter and Facebook (Larsson & Kalsnes, 2014). Although Twitter is often considered an "elite" communication platform in communication studies (Ausserhofer & Maireder, 2013), linguistic studies of Twitter message streams show that it is often used for sharing evaluative postings and for establishing interpersonal relations between users (Zappavigna, 2011). Twitter thus provides huge communicative potentials for politicians aiming at extending their relations towards their audience from the mere transmission of content towards establishing personal bonds with the general public. This, however, requires that politicians present themselves as "ordinary people" to whom members of the general audience may want to engage in a personal relationship.

In my presentation, I will present the results of a study of the Twitter communication activities of all candidates in the 2016 Austrian presidential campaign. The Austrian president is one of the very few political offices of the republic which is elected by direct vote every 6 years. Communicating directly with the electorate is, therefore, one of the challenges for each candidate. My data comprise all tweets which were sent by each of the five candidates before the first ballot and all tweets which were sent by the remaining two candidates before the second and third ballot. The overall research question of the study concerns the possible ways presidential candidates present themselves as "ordinary people" on Twitter. Politicians' "doing ordinarity" may be performed by employing two different ways of providing information about themselves. With reference to Goffman (1966), these two strategies can be described as "giving information" and "giving off information", where the term "information" refers to the "doing ordinarity project" politicians may engage on a social network site (SNS). When information on a politician's ordinarity is given, the respective information is in the focus (the front stage) of the message, i.e. the message is about the ordinarity of the respective politician; when information on a politician's ordinarity is given off, the politicians' ordinarity is performed by mimicking "ordinary persons'" ways of behaving "ordinary" on an SNS (and the information is on the "directional track of the interaction"). This way, the respective politician's "ordinarity" is not in the focus of the interaction but rather the interaction is shaped by the politician's staged ordinarity. My presentation will focus on these two different information strategies and their linguistic characteristics and it will show how the different candidates made use of them. Possible relations between these strategies and the candidates' electoral success will be discussed.

### **Elke Grundler**

*Argumentative competencies of teachers in classroom interaction* (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.])

For classroom interaction argumentative competencies are supposed to be both the indispensable presupposition for performing successfully at school (Morek & Heller 2012; Feilke 2013) as well as one of the most important communicative skills which have to be supported (Vogt 2002, Grundler 2011). Thus two main context variables of arguing are prominent in classroom interaction: On the one hand arguing is an expression of academic language. Teachers require this competency implicitly from students in order to construct knowledge on the ground of validity claims. On the other hand arguing is an explicit content of teaching in secondary school level. In this context arguing is trained within an artificial setting e.g. role-plays or the analysis of argumentation schemes. Results gained based on both settings have often a lack of relevance in real life oral communication (Deppermann 2006). Due to this discrepancy it seems that teachers do not support their students to learn what the need to become successful at school. In this lecture I am going to discuss if teachers show systematic patterns like “demanding and supporting” in classroom interaction. These patterns are identified to be significantly supportive for developing argumentation competencies in family interaction (Heller & Krahl 2015; Quasthoff et al. 2015; Fürstenau & Lange 2013). Based on data retrieved from 20 audiovisual recorded argumentation lessons I use the conversation analysis to demonstrate that teachers are usually more focused on explicit teaching of argumentation schemes than using the existing opportunities in their all day classroom communication in order to support the development of argumentation competencies of their students. Though procedures of institutional conversation at school can't be equated with those of dyadic conversation in family-discourses it seems to be valuable to discuss whether supportive interactive patterns of family interaction can be implemented at classroom interaction.

*The pragmatactic properties of fiction in 'these [and other] pages'* (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.])

The pages in question are those referred to by Esther Summerson in the opening sentence of Chapter 3 in *Bleak House*: 'I have a great deal of difficulty in beginning to write my portion of these pages, for I know I am

not clever.’ But which pages are they? Pages that are yet to be written by herself, together with pages of which she has knowledge that are yet to be written by authors other than herself? And yet we hold the complete text of the novel in our hands. (And as *ex post facto* readers we may wonder whether these questions might have provoked a subtly different reflection in March 1852 when readers held only the first ‘portion’ of what would turn out to be the 19 parts of the novel in their hands.) The means by which Dickens here invites us to infer that his novel is veracious, besides being a secondary kind of the authorial fiction, is neatly accounted for in Nunberg’s (1993) theory of deferred deictic reference, which distinguishes between the *demonstratum* indexed by the description ‘these pages’ (which is not a fiction) and the *demonstrandum*, the interpretation or ultimate referent of ‘these pages’ (which is a fiction). At the same time, there’s a very striking difference between the pragmatically rich and syntactically bound address of this first sentence of Chapter 3 (and those that immediately follow it) and the three-paragraph-long beginning of the first chapter of the novel consisting of a sequence of nominal ‘sentences’ whose relationship to each other is entirely paratactic and which have no obvious narrative properties. In the kind of standard account that would be widely accepted, Esther Summerson’s use of ‘these’ would be characterized pragmatically (as deictic), whilst the only use of a demonstrative in the three opening paragraphs of Chapter 1 (‘foot passengers .. losing their foot-hold at street corners .. adding new deposits to the crust upon crust of mud sticking at those points tenaciously to the pavement’) would be characterized syntactically (as anaphoric). Drawing on several examples from a range of fiction, I will try to show that a closer study of the deictic and broader indexical properties of writing can help to provide an understanding of the relationship between writer, reader and text in fiction, arguing that so-called anaphoric reference finds an origo in textual antecedents that make the text central and, intriguingly, may also effect deferred reference. In the case of fiction (and perhaps more generally), such reference ought to be regarded as pragmatic, or, to coin a neologism, *pragmatactic*. I hope to show that this approach can usefully supplement the characterization of fictional texts from first-person, free indirect discourse and third person perspectives. Reference Nunberg, G. (1993). Indexicality and deixis. *Linguistics and Philosophy* 16: 1-43.

### Casey Guditus

***“You were resisting the whole time”:* Assumptions of guilt and contrasting frames in police-civilian interactions** (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

Racial profiling has led to prejudiced and often violent treatment of black men by police officers within the United States, marked by unwarranted arrests and unjustified fatalities. Evidence of this behavior has become more readily available with the increasing presence of smartphones and the adoption of body cameras by police departments. Using data from three discrete instances of police violence as recorded through police body cameras, this study uses conversation analysis and critical discourse analysis to examine the evidence for the officers' assumption of guilt of the civilian, manifested through their use of coercive question types, questions containing presuppositions, combative discourse markers, and lack of response to civilian questions. The analysis suggests these types of questions used by the police officers reflect a pre-existing assumption of the civilian's guilt. The police officers use both open and closed question formations, including polar questions, declarative questions, and tag questions (Huddleston & Pullam, 2002). The officers' declarative questions contain presuppositions indexing their assumptions of the guilt of the civilians, as well as re-state information previously given by the civilians prefaced by discourse markers such as “so” in an attempt to evaluate the truth of these previous statements (Johnson, 2002). These questions are coercive in that they preference agreement in the answer. In typical conversation, when respondents need to respond in the negative to this sort of question, they will bury their disagreement lower in the adjacency pair, not disagreeing up front. Sacks shows this phenomenon below:

A: Yuh comin down early?

B: Well, I got a lot of things to do before getting cleared up tomorrow. I don't know. I w- probably won't be too early.

(Sacks, 1987, p. 58).

By using questions containing assumptions of guilt, the police officers force civilians to disagree in their answers. These civilians express their disagreement up front in the turn, in contrast to the way speakers bury and hedge disagreement in everyday conversation (Sacks, 1987). This disagreement leads the policemen to mark the civilians' answers as atypical within the typical confines of a question and answer adjacency pair.

Officer: so look i'm gonna\_ look are you going to have papers or something is that what we're dealing with?

Civilian: no I ain't got no papers that I know of

Officer: come on bro

Civilian: i'm not here to go to jail bro

(88.5 WFDD Public Radio).

The police officers mark this atypical response by attempting to calm down the civilian after the question and answer sequence, interpreting civilian anger concerning these false accusations as “resistance,” an interpretation which allows them to justify their use of force. By answering the officers’ questions, these respondents are performing compliance. However, their anger over the police officers’ assumptions is interpreted as non-compliance, evidence to the fact that the officers and civilians are viewing their shared interaction with conflicting frames- the officers view the interaction as an arrest while the civilians view the interaction as an information exchange. The findings expose the danger these conflicting frames creates, and problematize the lack of standardization in this type of institutional discourse.

## Marie-Noelle Guillot

### *Audiovisual translation as cross-cultural mediation - context, developments, way forward*

(Contribution to *Films in Translation – all is not lost: Pragmatics and Audiovisual*

*Translation as Cross-cultural Mediation*, organized by Guillot Marie-Noelle [et al.]

This paper will provide the contextual framework for the *Pragmatics and Audiovisual Translation as Cross Cultural Mediation* panel, with input from two main sources: an ongoing review of Audiovisual Translation (AVT) research from a pragmatics and cross-cultural pragmatics perspective; and the work of an AHRC-funded international research network set up to promote and coordinate research into the linguistic and cultural representations conveyed through subtitling/dubbing, and into audiences’ responses to these representations (“Tapping the Power of Foreign Films: Audiovisual Translation as Cross-cultural Mediation” [TPPF]<sup>1</sup>). The review will take stock of AVT research with a pragmatics outlook, with an overview of the main aspects involved in engaging with AVT from this perspective, and of the two principal domains in which pragmatics has been represented within it: narrative aspects and characterization, and communicative practices in their interlingual representations. Work in this domain is recent but has been gathering momentum, within AVT and from interdisciplinary perspectives (see e.g. contributions to Diaz Cintas and Neves 2015, Gambier and Ramos Pinto 2016, Locher and Jucker 2017, Pavesi et al. 2014; also Guillot 2016, fc 2017). The TPPF project has been predicated on a series of basic but largely uninspected observations: the circulation of foreign-language films relying on subtitling or dubbing to reach their public has increased immeasurably with digitization and global dissemination; our research understanding of how subtitling and dubbing work as an expressive medium and represent other languages is fragmented; we know barely anything of the impact on audiences of subtitling and dubbing as a medium for cross-cultural exchange, despite films’ global availability. In line with the concerns embedded in these observations, the network’s aim has been to coordinate an international cross-disciplinary platform and research agenda, with two research and one impact interrelated objectives: to collate research on linguistic and cultural representation in AVT, to develop research into AVT-mediated audience responses to FL films from an intercultural perspective, and to raise public and industry awareness of subtitling and dubbing as mediators of the intercultural. Pragmatics and cross-cultural pragmatics are central to this enterprise, and a critical underpinning for it. The review of (cross-cultural) pragmatics research in AVT and synthesis of TPPF project outcomes will double up as an invitation to collaborate in the effort to establish this new domain of enquiry more firmly within pragmatics, with the presentation of a methodological framework set

up as a platform to bring together the work of researchers involved, and to promote its methodological robustness and research dependability.

***What's the issue? Two notions of (non-)at-issueness and their relation to other pragmatic issues*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

In his influential book on conventional implicatures, Potts (2005) introduced the notion of (non-)at-issue content. Since then, the idea that some content may be at-issue while other content is non-at-issue found a lot of applications in linguistic semantics and pragmatics. However, there are (at least) two different uses of that notion that are often conflated.

First, there is a backward-looking notion of at-issueness according to which at-issue content addresses the main theme of the discourse (the *question under discussion*; QUD), while non-at-issue content does not address the QUD (Simons et al. 2010, Tonhauser 2012, Tonhauser et al. 2013). Under this view, at-issueness is relation between a content (i.e., a proposition) and the previous discourse. I call this *Q-at-issuess* (*Q* for *question-based*). Under the second understanding of at-issueness, some content is at-issue if it *becomes* the issue for the following discourse, for instance, because it proposed and has to be negotiated before it enters the common ground. Accordingly, non-at-issue content directly enters the common ground (it imposed) and thus does not become the issue. Under this view, at-issueness is hence a forward-looking property of an utterance to make a negotiable proposal for updating the common ground (CG), thereby becoming the next QUD (AnderBois et al. 2013, Koev 2013, Murray 2014). I call this *P-at-issuess* (*P* for *proposal-based*).

In this talk, I show that while overlapping in many cases, these two notions are not the same and have different consequences. Having established the two notions of at-issueness, I contrast and relate them to other pragmatic notions (like asertoric inertia, secondary assertions, non-truth-conditional content) and argue that we are dealing with a genuine distinction that cannot be traced back to other pragmatic aspects.

***Object transfers in the car and in the lab: Knowing and transforming objects in interaction*** (Contribution to *Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction*, organized by Tuncer Sylvaine [et al.]

Research on language and social interaction has recently turned to objects (Nevile et al., 2014), showing, for example, how clothing items are assessed in a fashion atelier (Fasulo & Monzoni, 2007), how packages can be manipulated and take various semiotic functions during a business negotiation (Streeck, 1996), or how the handling of shoes can project different requests from customers to repairer (Fox & Heinemann, 2015). This study focuses on object transfers. It adds to the few existing studies (Svensson et al, 2007; and in interactions involving children: Scollon, 2001; Wootton, 1994; Lerner & Zimmermann, 2003) by focusing on the multimodal accomplishment of object transfers in object-centered sequences. By this we refer to sequences where participants are involved in a joint activity in the course of which new knowledge about the object is interactionally produced. The data are video-recorded naturally-occurring interactions in cars involving families and friends, and in a chemistry laboratory between collaborators. On the basis of 74 instances, we first set an empirical distinction between giving and taking. Then we show how different ways of giving, embedded in

different activities, can provide the object with new qualities, and how different ways of taking visibly account for the special circumstances in which they occur. Throughout the analysis we show how, through object transfers, the laboratory and the car emerge as two different activity systems (Goodwin, 1997).

*The self and others as seen in academic researchers' positioning practices* (Contribution to *About subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.] )

This paper applies perspectives derived from polyphony, discursive psychology (Edwards and Potter 1992) and positioning theory (Davies and Harré 1999 ;Harré and Van Langenhove 1999) to examine how academic researchers negotiate positioning in spoken interaction. This is done through an analysis of interviews with academic researchers in the fields of linguistics and applied linguistics in UK universities. This paper discusses examples of positioning phenomena and the kinds of linguistic pragmatic resources and moves involved in these positioning practices. The examples illustrate how researchers position themselves amidst expectations about how academic research is to be done and how they are positioned by others, including voices in larger discourses. For instance, one positioning phenomenon that has been observed relates to disciplinary positioning where researchers claim certain positions while resisting others according to how they want to be positioned as belonging (or not belonging) to a particular field or discipline. Some respondents also challenge traditional notions of disciplinarity in academia. These positioning practices are analysed through examples of reported speech, irony and metadiscourse, which could indicate the presence of polyphony. This paper borrows insights from Bakhtin's theoretical ideas of polyphony (Bakhtin 1981 ;Bakhtin 1986) and the linguistic framework SCAndinave de la POlyphonie LINGuistiquE (ScaPoLine) (Nølke 2006 ;Angermuller 2014) to analyse the inherently dialogic nature of utterances.

***English lexical items that yield the implicature of cause and effect and the mechanism for the interlocutors to understand such implicature: Applying theory to practice in TESL / TESOL in Japan*** (Contribution to *Linguistic Expressions and Devices that Yield the Implicature of Cause and Effect*, organized by Hanazaki Miki [et al.])

There are many linguistic devices that invite the interlocutors to interpret the two uttered events as having the relation of cause and effect. One obvious device is to use lexical terms which show such relation, such as *because* as in the sentence *I was in bed because of a cold*. Besides such apparent expressions, other lexical items that do not show cause and effect directly also provoke such interpretation or "implicature" (Grice 1975). Those include lexical items that show simultaneity such as *as, with* and *so on; I was in bed, as I had a cold or I was in bed with a cold*, and others are words that show temporal sequence as *and, after, since* and so on; *He was sick and he stayed at home, He died after the stroke, Since he was sick, he stayed at home*.

This paper aims to classify the lexical items that indirectly show such relationship of cause and effect and tries to compare data cross-linguistically between English and Japanese. In Japanese, words that show the temporal sequence invites the interlocutors to interpret the two uttered events as having cause and effect relationship; *byoki-da-kara ie-ni ita* (sick-be-from, house-at-be-PAST, *Since I was sick, I stayed at home*), however, showing the simultaneity does not always lead the interlocutors to interpret the sentences as having cause and effect relationship; *TE*, a conjunctive particle for showing simultaneity leads the two events as interpreted as having cause and effect; *Byoki-shi-TE, ie-ni i-ta* (sick-do-SIMULTANEITY, stay-at-PAST, *I was sick and I stayed at home*), but *Nagara*, a word that shows simultaneity, does not always yield the interpretation of cause and effect. *Byoki-shi-NAGARA, ie-ni i-ta* (sick-do-NAGARA, house-at be-PAST, literal interpretation would be *being sick, I stayed at home*, however it only shows that two events occur simultaneously, and never implies a cause-and effect relationship)

Through the classification and comparison cross-linguistically, this paper tries to answer the following three questions, namely 1) what kind of expressions and devices are available cross-linguistically to yield the implicature of cause and effect, 2) to explore which devices are universal / culture-specific in making the interlocutors interpret the expressions as having such implications, and 3) what kind of mechanisms are involved in the construal of such interpretation.

Also, as the last remark, this paper tries to apply the theory into practice. English education is on the top agenda of Japanese education lately. However, in spite of all the discussions and trials, Japanese education has not fully achieved the intended goal of producing fluent English speakers. One of the reasons for this failure so far is that Japanese and English seems so different, making the English learning difficult in Japan. And one of the biggest differences between the two languages is that English shows the cause and effect relation clearly with lexical items, while Japanese only describes the events, and does not clearly state the relationship between such events. (cf. Ikegami 2009) Hence, teaching the Japanese EFL students how to show and interpret the cause-and effect relationship should lead to a better English education in Japan. In other words, this paper examines how effective it is to teach ELF students the mechanism of interpreting two events as having cause and effect relationship, i.e., applying the theory to practice.

***Methodological issues in researching child-child argumentation*** (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.])

The paper presents a discussion of core-issues in the methodology of researching argumentation and argumentative competence in pre-school children. The paper is grounded in our joint research project on the establishment of validity through argumentation in authentic child-child communication. The project works with two longitudinal corpora of child-child communication (3.0 – 7.0). The context the children are videographed in is play, either role-play, play with props or building games. Taking up examples from our corpora, we will concentrate on two issues: communicative means and context. First, we argue for a multimodal approach to the study of argumentation among pre-school children with a special focus on vocal and prosodic means. When pushing for communicative goals, especially for smaller children, vocal, paraverbal and bodily ways of

expression stand equal to verbal means (Garvey 1984; Kirsch-Auwärter 1985; J. Klein 1985; Andresen 2002; 2005; Bose 2003; Bose/ Kurtenbach 2014). Our data shows, that the paraverbal and extraverbal analysis is crucial in order to analyse the frame the children use. Especially the change between cooperative and agonal framings as well as fictional and factual framings is reflected in the prosodic, vocal and bodily demeanor. Following from this, our second question will be – in a reframing of Brockriede’s (1975) classic question – where is argumentation? A common observation in the newly sparked interest in child argumentation is that younger children (pre-schoolers) are likely to engage in argumentation when working out a dissensus while at the same time not trusting this instrument to carry them all the way. Hence sequences of argumentation will result in physical force, petering out or calling on adults (see Valtin 1991; Komor 2010; Arendt 2015). We propose that argumentation functions as a means not only to work out dissensus but also to establish validity, thereby exhibiting the epistemological dimension of argumentation (see Krummheuer 1995). This function can be researched best in authentic child-child communication, videographing children in their main activity, play. Here we report of and opt for a conversation-analytic/ ethnographic approach. We argue that in order to make statements about the development of argumentation competence, the epistemological function of argumentation needs to be taken into account as well: a function exhibited often in cooperative frames.

#### Maj-Britt Mosegaard Hansen

***Onomasiological cyclicity in semantic/pragmatic change: The case of Lat. 'nunc', Old French 'or', and Modern French 'maintenant'*** (Contribution to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.]

Hansen (2013, 2014) and (independently) Ghezzi/Molinelli (2014) proposed that pragmatic markers may evolve in a cyclic fashion over time, in a manner which is reminiscent of the by now well-documented morphosyntactic cycles, such as the Jespersen Cycle. Hansen (2015) introduced a distinction between the following basic types of semantic/pragmatic cyclicity:

- Semasiological (or form-focused) cyclicity, in which a linguistic item with a given etymology can be observed to renew its functions in a cyclic fashion across different stages of language evolution, starting each cycle with a similar content-level source meaning/function and subsequently developing context-level extensions that are largely identical to, or at least significantly overlap with, the context-level meanings/functions of its etymon/etyma.
- Onomasiological (or function-focused) cyclicity, in which etymologically different items with similar content-level source meanings/functions can be observed to subsequently develop similar context-level extensions across different stages of language evolution.

Where Hansen (2014) focused on the semasiological case represented by the evolution from Latin iam (‘as of now/already’) through Old French *ja* to Modern French *déjà* (‘already’; < *dès+ja*), this paper will consider in

greater depth a case of onomasiological cyclicity, namely the respective semantic/pragmatic developments of Latin *nunc* and French *or* and *maintenant*, whose content-level source meanings are in all cases equivalent to English *now*. The analysis will pay particular attention to the role of metonymic inference, of so-called bridging contexts, and of the monological or dialogal nature of the discourse. I will argue that cyclicity at the level of semantic/pragmatic evolution takes place because source items that are semantically similar will favor similar types of contextual inferences. At the same time, however, the fact that the range of uses of the items under consideration is not necessarily exactly identical from one cycle to the next supports an instructional view of semantics.

### **Katariina Harjunpää**

***How does translatory talk shape participation in everyday interactions?*** (Contribution to *Linguistic differences, interpreting and institutional re-shaping of non-natives' talk in social encounters*, organized by Traverso Véronique [et al.]

Studies on oral translation (interpreting) have made successful use of Conversation Analysis to investigate the interactional organization of mediated interactions in various institutional contexts (e.g. Bolden 2000, Baraldi & Gavioli 2012). Linguistic mediation has, nevertheless, always occurred outside of professional contexts as well (Pöchhacker & Schlesinger 2002: 2). In the Conversation Analytic approach to social interaction, it is considered that the analysis of everyday interaction feeds into describing also more specialized, institutional forms of talk-in-interaction (e.g. Heritage 1988). Thus there is a methodological motive to explore the relation between institutional and everyday practices of oral translation, and through this juxtaposition shed light on the variety of translatory, interactional processes. The current paper examines one of the issues that cut across types of oral translation, namely, how translatory talk shapes the status and participation of the source speaker in the interaction. This paper thus contributes to the panel on the shaping of migrants' or non-natives' talk from a mundane perspective. It investigates translatory interaction in video recorded everyday encounters between Finnish and Brazilian Portuguese speakers. The ways in which translating speakers portray the source speaker's talk and action are examined in a variety of environments during the multilingual interactions. The environments include the translation of accounts that have been provided for dispreferred action (e.g. rejecting an offer) and other kinds of socially sensitive talk (e.g. disagreements) but also more neutral talk. The paper discusses how the shaping of the source speaker in these environments is linked to the overall interactional motivations for translating in the everyday conversations. In this context, translating happens only occasionally and concerns mostly individual turns. The relevance of translating a given turn does not yet exist at the moment when it is produced, but follows from how the talk is reacted to by other participants – their reactions may indicate a need for facilitating. By the choice of what and how to translate, the translating speaker responds to the needs and situational circumstances of facilitating understanding for these particular recipients. Thus when compared to the institutional shaping of the non-native's talk as a way of conforming to the institution's pre-existing goals and categories (see panel description), in the everyday conversation, the shaping can be understood as a commonplace process of *recipient design* (Sacks, Schegloff, & Jefferson, 1974: 42). The translating speaker takes into consideration what kinds of local, social implications the talk that she now translates has had for the current recipient, and how the latter has already acted in the situation. This may involve accommodating the participants' differing perspectives and making categorizations that somehow explain the past talking, thereby showing orientations to situated social norms (Garfinkel 1967).

***Refugees and public health care in Toronto: New language action patterns*** (Contribution to

*Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.]

While Canada prides itself with the structured way it has been accepting refugees, reality, involving new refugees, often brings unforeseen complexity on all levels and institutions, particularly in health care services. The specific challenge encountered in health care services set up for refugees is that there is an accumulation of difficulties which could be handled in more routine ways if the difficulties were not added on all at once, but rather one by one, for instance in the case of a typical counselling session with additional interpreting. The modification of a routine pattern would be created by the translatory action and can become manageable in the course of time. In a pilot study in a health care centre in Toronto, a discourse analysis of medical communication revealed that, in situations in which patients were struggling with the language, medical terms and concepts, interpreters and possibly trauma all at once, even modified routine doctor-patient communication structures are not successful. New forms of communication are created in order to fulfil the purpose at hand. Much along the lines of Koole & ten Thije (1994), one finds new forms of specifically intercultural discourse. Using Rehbein's concept of cultural apparatus (2006), the analyses show that much critique and linguistic creativity are needed in order to manage to fulfil the original purpose of the medical communication.

*“Memories” in Hiroshima and Fukushima: A case study of recontextualisation by the Japanese mass media* (Contribution to *How to construct “memory”: stories of the nuclear events from Hiroshima to Fukushima*, organized by Hata Kaori [et al.]

Recent years, in the field of narrative studies, it is said that narratives are co-constructed by the author and the other participants in the here-and-now situation and certain elements of the past memory are foregrounded according to the context. Especially, survivors' stories of life threatening memories are one of the most noticeable and significant examples. Analysing the narratives, in this sense, this study aims to reveal how the memories are de/re-contextualised and reconstructed from the original ones in order to become appropriate forms in its sociocultural context.

In this presentation, I deal with two cases; 1) documentary programmes of Hiroshima including the news of Obama's first visit to Hiroshima in 2016; 2) documentary programmes of the Great East Japan Earthquake and the nuclear power plant accident. It can be said that the former one is the reconstruction of collective memory by the mass media, while the latter one is de/re-contextualisation of memory in the personal level but recontextualised again by the mass media.

The documentary programmes I analysed for Hiroshima had been intensively broadcasted at around Obama's visit in May 2016. Among a number of special programmes to recollect the historical event, I analysed two long documentaries that consist of narratives of family of survivors or second/third generations. As for the Great East Japan Earthquake, I analysed the 80 programmes intermittently broadcasted since 2011 by public broadcast stations in Japan (NHK). Especially, I focus on the narratives of the survivors' stories (Labov & Waletzky 1967, Labov 1997), participation framework (Goffman 1974, 1981) of the participants, multiple (verbal/non-verbal) communicative resources (e.g. discourse marker: Shiffrin 1987) used by the participants. As a result, several defining characteristics of the earthquake's survivors' stories in the Japanese mass media have been observed. First, the structure of family story, as a contextual metaphor, is expanded to the story of community. Second, in the programmes, women tend to use direct reported speech in their narratives rather than men. These ways of narrating are synchronized with non-verbal communicative resources. It could be said that this differentiation is the reflection of the social norm or normative consciousness the mass media believe that the audience must have.

By analyse the same category “memory” but about the historical event and newly happened event, this study is able to clarify the process and structure how the “memory” can be ‘renewed’ according to the history, context, culture, and situation. In the presentation, I will show the actual video data and script to illustrate these points above.

### **Ciler Hatipoğlu**

***(Im)politeness functions of SIZ in Turkish*** (Contribution to *Address Forms across Cultures: A Cross-Cultural Comparison of Address Terms in Indo-European, Uralic and Altaic Languages*, organized by Bayyurt Yasemin [et al.]

Turkish, similarly to some of the Indo-European language, has two second-person pronouns that are used to refer to a single interlocutor - SEN and SIZ. The first one is usually defined as the informal non-honorific second person pronoun while the second one is classified/defined as its 'polite' counterpart. Is this always the case, though? A number of studies have already shown that the functions of the second person pronouns can be varied as well as ambiguous (e.g., Belz & Kinginger 2003; Hatipoğlu 2008; Illie 2005). Therefore, a more detailed analysis of the interplay between different contexts, categories of social relationships and functions of pronominal terms of address is needed. The current study focuses on the so-called 'polite second person pronoun' SIZ in Turkish and aims to attain two goals:

- (i) to uncover the contexts where SIZ is most frequently used to manifest politeness versus the contexts where it is specifically employed to express impoliteness;
- (ii) to identify and classify the factors (e.g., age, gender, the perception of interpersonal relationship, kind of offense) that determine/affect the politeness category of SIZ in interactions in Turkish.

The data for this study were collected from undergraduate students attending various universities in Turkey. All of them were native speakers of Turkish and had various social backgrounds. They were also born and raised in different geographical regions in the country. The data collection tools utilized were questionnaires and interviews. The questionnaires, first, asked informants to list contexts where they would use SIZ to address their interlocutors, and, then, they were instructed to explain why they would use SIZ in the listed contexts. After the analysis of the questionnaire data, interviews aiming to provide a more in-depth understanding of the interplay between the various contextual factors and the politeness functions of SIZ were conducted with some of the students. The data coming from the interviews were thematically analyzed.

The results of the study revealed that the second person pronoun SIZ has multiple functions in Turkish. While in some contexts, as predicted by Brown and Levinson (1987), it was used as an honorific form of address to express respect and conventional politeness; in others, it turned from an unmarked politeness maker into a marked pronominal form which fulfilled functions not usually associated with it (e.g., to keep some interlocutors at bay).

***Analysis of LINE chat interaction as part of multi-modal communication*** (Contribution to *Exploring effective ways of group discussions for constructing a democratic society*, organized by Shiraishi Katsutaka [et al.]

We are all participating in the multi-modal communication by using several types of communication tools or Social Networking Services (SNS), such as internet, smart phones, Facebook, Instagram and others. Among these, the users of LINE, an instant communication application, have rapidly increased and its users are over two hundred million in more than 230 countries (Asahi DIGITAL 2015). Especially in Japan, about 96.6% of those who downloaded the app are active users according to LINE performance reporting. However, although the studies on visual communication exist (Kress and Leeuwen 1996 etc.), the studies on LINE communication processes are not yet widely conducted. The goal of our study is to show the process of group discussions for agreement using LINE as an effective on-line tool. In order to achieve this goal, as the first step, this study analyzes the sequences in LINE conversations where ordinary negotiations and discussions take place. By observing the sequences of group discussions using LINE, the similarities and differences of the communication

between face-to-face interaction and LINE conversation could be found. The analysis was based on the study focusing on some functions of stickers (Okamoto 2016, Hattori and Okamoto 2014, Okamoto and Hattori, in print) to see how the stickers were used to negotiate, achieve agreements, or maintain interactional organization (Kushida 2006). The authors looked at some group conversations in Japanese using LINE which had purposes to achieve. The data were collected between 2012-2016. The results show that the stickers are effectively used for completion of subtopics. They are also used as turn-taking devices, which organize visual turn-taking, used as adjacency pairs, as well as contextualization cues for opening and closing. The stickers played roles to express participants' footing in participation framework (Goffman 1981, Schiffrin 1994). In addition, other features of visual communication in LINE conversation were observed. The analysis of online chat such as LINE makes it possible for us to explore the organization of multi-modal communication and dynamics of SNS interaction.

***Revisiting po-faced responses to teases*** (Contribution to *Linguistic structures and actions: does function follow form?*, organized by Seuren Lucas [et al.]

In a seminal paper on tease responses, Drew (1987) claims that “the overwhelming pattern” is for “recipients [to] treat something about the tease, despite its humour, as requiring a serious response: even when they plainly exhibit their understanding that the teasing remark is not meant to be taken seriously” (p.230). This has often been taken in the broader CA literature to mean that teases prefer (in the CA sense) po-faced responses. What is less well acknowledged, however, is that Drew’s analysis was, as he himself admits, primarily focused on characterising a particular form of *responses* to teases, and was not itself intended as a comprehensive study of the range of different social actions that can be accomplished through teasing. In this study, I revisit the question of whether teases, broadly defined by Drew (1987) as “mocking but playful jibes against someone” (p.219), do necessarily occasion serious responses through an analysis of more than 150 instances of teasing sourced from everyday interactions amongst both well acquainted and previously unacquainted Australian and American speakers of English. Close examination of this dataset, drawing from methods and research in conversation analysis, indicates that whether a serious or non-serious response is occasioned depends in large part on the *type* of teasing involved, that is, what social action(s) are being accomplished by those participants through that particular instance of teasing, and the broader sequential activity in which that teasing is situated. It is suggested, in particular, that *design* features (Drew 2013; Lee 2013) of the turn through which the tease is delivered and of the response to that tease are recruited by participants in order to interactionally accomplish the tease as a particular type of teasing. It is concluded that a po-faced response is not necessarily the standard response to a tease, as some analysts have sometimes interpreted (or perhaps misinterpreted) Drew (1987) to have been claiming, but rather is part of what co-constitutes the prior tease as accomplishing a particular form of social action, namely, sanctioning an action prior to the tease as “overdone” or “exaggerated”.

***Upgraded self-repeated gestures in Japanese interaction*** (Contribution to *Upgrading/Downgrading in Interaction*, organized by Prior Matthew [et al.]

Participants in interaction sometimes produce self-repeated gestures, that is, a gesture which can be seen as the same as a gesture produced by the same person slightly earlier in the conversation. Such self-repeated gestures are also sometimes produced so that they can be seen as upgraded versions of the previous gesture. In this presentation, I focus on such upgraded self-repeated gestures as they are produced in Japanese interaction. The data come primarily from approximately six hours of video-recordings of meetings and pre-meeting and post-meeting conversation at a neighborhood organization in Tokyo. Supplemental data are drawn from video-recorded second language English discussions among Japanese university students and an interactional English test at a Japanese university. Detailed sequential analysis is used to reveal how the participants in the interaction use and design self-repeated gestures. The analysis shows that, first, self-repeated gestures can be divided into two groups based on formal features of their design, those that occur before the retraction phase of the first gesture, with or without a hold, and those that occur after the retraction phase and the first gesture is, therefore, complete. Second, the default form for a self-repeated gesture is for it to be attenuated in some way, involving smaller, less energetic, and/or less clearly-defined movements, so that when a self-repeated gesture involves larger, more energetic, and/or more clearly defined movements—when it is upgraded—special work is being done through the upgraded gesture. Third, an upgraded self-repeated gesture is used when there is some problem with the reception of the initial gesture—it is not understood, is not noticed, or does not have the desired effect on the behavior of the recipient. The concept of upgrading has generally been restricted to actions performed through talk. The analysis of this sort of self-repeated gesture shows that the concept can also fruitfully be applied to gesture.

***The meaning and function of the words *takže* and *hele* in the turn-initial position in Czech talk-in-interactions*** (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

The presentation focuses on the meaning and function of the words *takže* [so (that), well] and *hele* [look] in the turn-initial positions in Czech talks-in-interaction. Data come from the DIALOG corpus, which covers approximately one million expressions from TV talk shows. The expressions *takže* and *hele* located in the initial positions of turns-at-talk can have different meanings and functions depending on a) the type of the talk show (a political debate vs. a popular talk show), b) the position of turn in a sequence of talk-in-interaction, in particular, whether it comprises the first part, or the second part of adjacency pairs, c) the personality of the speakers: some speakers use the words *takže* and *hele* in certain positions (e. g. also in the initial position) of turns more or less regularly, or stereotypically. The words *takže* and *hele* located in the turn-initial positions can play the role of a preparatory particle; the word *takže* has a strong summative function (in the sense of: “tedy, jin? =mi slovy” [so, in other words]). The word *hele* can function as a cue for turn-taking, that is for speakers’ change. Both words can also function as empty slot fillers. However, slot fillers are important in spoken communication (unstructured or partially structured communication) - for instance they allow speakers to gain time or continue leading the communication. We also pay attention to the prosodic perspective, namely to lengthening vowels in the second syllable, which can be a part of the idiolect of some speakers, or enable speakers to express uncertainty, gain time, maintain their role in the communication, etc.

***Speakers’ manipulation of emergent conceptual structures to achieve semantic foregrounding: Multiple orientations to list, category, and foreground in conversation*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

The meanings of words in interactions cannot be fully understood unless we take the cognitive dimension into account. This is because when communicating with others, we marshal various cognitive recourses such as comparison, classification, enumeration, and foreground. Studies on the relations between language and cognition based on this view explore the broad variation in the fields. The studies’ approaches largely differ among disciplines, but they can roughly be divided into two groups: theoretical/prescriptive and empirical/descriptive. This study takes the latter approach by incorporating ethnomethodological conversation analytic, occasioned semantic, and interactional perspectives (Bilmes 2010, Kasper and Prior 2015, Hayashi 2016) to examine speakers’ multiple orientations to the cognitive properties: those to list, category, and foreground in conversation, and to investigate how speakers mobilize these elements as constructions in order to

align communicative actions in talk. List has been a subject of formal analysis in previous studies. The works relevant to this study include those in conversation analysis, ethnomethodology, and cognitive linguistics: they identify list's structures in talk (e.g., Jefferson 1990; Lerner 1994, 1995), consider it in relation to categorization (e.g. Jayyusi 1984; Sacks 1995), and analyze its cognitive constraints (Sanches-Ayala 2003). This study explores speakers' orientations to emergent semantic structures of chosen words in the event of list-making and illustrates how they deal with the referential conflict between speakers by orienting to the structures. For example, in the conversation below, the speakers evaluate 'swordfish' using evaluative expressions. However, M and J's evaluations are in conflict in terms of the semantic taxonomy they refer to, because M evaluates the special swordfish she experienced and J evaluates swordfish, a kind of fish, which is abstract, general swordfish. That is, M associates "delicious" with the experienced fish, which foregrounds taste while J associates "favorite" with the general fish, which foregrounds preference. Additionally, at the moment of K's saying "excellent," the semiotic property he is associating with is lucid, because the referent of K's evaluative word, "excellent," foregrounds taste and preference. However, K's list of evaluative words, "fantastic" and "wonderful" at subsequent turns, are associated with general swordfish, the association of which is pre-endorsed ("It's just like eating Porterhouse steak"). As K was referring to the experienced swordfish when he began to talk about the fish, listing these words reveals his referential shift foregrounding the general swordfish from the experienced fish. We can see here his orientation to and deployment of the semantic categorical structure of the word that emerged at the occasion of M and J's evaluations. Because K's use of "excellent" and the following words ("fantastic" and "wonderful") constitute a common list construction---a three-part-list (Jefferson 1990) structure---, we can understand, from his orientation to the structure, that the transition of semantic orientation was grounded in his word, "excellent". The objective of this analytic approach is not to solve semiotic membership or speech act ambiguities of the use of this word but to show how speakers manipulate emergent conceptual structures to achieve semantic foregrounding, and to spot the moment they do so.

Example

- 1M: and um [we've had a]  
 2 J: [fish is so] expensive here  
 3 M: yeah we've had some fish that I I seafood that I don't really like [( )]  
 4 K: [(right)] the last  
 5 time we went to St. Louis we had dinner at uh forget the name of the restaurant in  
 6 McLeogh's [name of the] restaurant we had swordfish  
 7 J: [mm hmm]  
 8 M: [It was *delicious*]  
 9 J: [That's my *favorite*]  
 10 K: *Excellent*  
 11 J: That's my [absolute] favorite  
 12 M: [seriously]  
 13 K: [Baked] swordfish  
 14 E: [mmm]  
 15 K: It's just like eating Porterhouse steak *fantastic*  
 16 E: That's what Jerry says. I haven't tried it yet (chuckle)  
 17 K: Oh yes really it's it's a *wonderful* piece [of (steak)]

***Image co-construction through talk: A categorical analysis of praising in a TV talk show***

(Contribution to *Upgrading/Downgrading in Interaction*, organized by Prior Matthew [et al.])

The study of compliments and compliment responses began in the late 1980s (e.g., Pomerantz 1978, Pomerantz 1984, Wolfson 1984, Holmes 1988) and several studies have been conducted since then from various perspectives (e.g., form, function, object, organization, sociocultural variation). However, very little is known about how they are embedded in talks in an institutional context to fulfill social goals. This study looks into how compliments and compliment responses are systematically, albeit covertly, incorporated into talk-in-interaction in a TV talk show. We discuss how praise is upgraded in relation to categorical features of a guest. The data are taken from a Japanese TV talk show, *Tetsuko no Heya* (Tetsuko's Room), a long-running show featuring a regular host, Tetsuko Kuroyanagi, and celebrity guests from various fields. The show represents an interview show where talk unfolds as a host probes a guest for information (Greatbatch 1998). The goal of this show is to introduce a guest in ways to project a favorable image of the guest as "a nice person". This calls for paired sequences of compliments and compliment responses (Kodama 1996, Tatsuki & Nishizawa 2005). The fundamental question addressed in this paper is how upgrading is integrated into categorical predication in talk. For this purpose, we first looked into its "interactional thematic structure" (Senko 1989). The analysis revealed that the interview talk unfolded basically along derived themes on various episodic actions of the guest (e.g., appearing in a quiz show, playing a difficult role in a drama, negotiating with high school authorities). On the basis of this analysis, we examined how the episodic talk accomplishes the social goal of projecting a favorable image of the guest. Speakers "go categorical" in compliment and compliment response (Song 2013). In this paper, we analyzed how the positive image of the guest as a nice person is projected as the interview talk unfolds thematically. Our main findings are as follows. First, various categorical predications of a nice person that go along with the frame knowledge were elicited by the host. The positive image of the actress was reinforced through several category-resonant features (e.g., serious, hardworking, talented, humble) that were implicated through the thematic progression. Second, praising was executed indirectly; these categorical features were often projected through non-evaluative talk. Third, the category-bound predicates were in large part conceptually projected through the guest's response; they were evoked along the episodic actions of the guest elicited by the host. The findings suggest that in this show praising is practiced by projecting positive categorical features of a person constructively and that the nature of upgrading in such practice is compositional.

***Taking offence as face practice in individual livestream*** (Contribution to *The Pragmatics of “Bonding” in Cross-Cultural Encounters: East Asian Perspectives*, organized by Ide Risako [et al.])

Relational work or relating has been well explored, but evaluating relationship is understudied. Accordingly, the current study probes into how relationships are evaluated in taking offence or constructing prior actions as offence (Haugh, 2015): Offence is specified as threat to relational connection. Face (Arundale, 2010; Haugh, 2013) pinpoints participants’ understandings of relational connection and/or separateness. And it is negotiated in interactions. This study sources data from a computer-mediated communication (CMC) - individual livestream. Interactions in this context are synchronic and multiparty. Like other social networking sites (SNS), the main conversational goal is building relationships (Marwick & boyd, 2011).

In the data, an offence taker evaluates an offence initiator’s comments as offensive. This evaluation is further up-taken and evaluated positively by his or her supporters. Affiliations among the offence taker and supporters emerge in interaction. The offence initiator is merely exploited as a trigger for their bonding. Their understandings of face, namely conceptions of connection and/or separation, is dynamically negotiated along with the emergence of affiliations. The preliminary findings suggest that taking offence bonds an offence taker and his or her supporters and shapes their face understandings. Although evaluation of offence is inherently aggressive, it is constructive rather than destructive to relationality in this context.

***Historicized dialogue in Mozart’s piano concertos KV 456 and 482*** (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.])

Abstract This paper examines the possibility of historicizing the dialogue that takes place in two Mozart piano concerto 1. movements, KV 456 (1784) and KV 482 (1785). In the model dialogue is based on modalities together with musical qualities and it is illustrated through interaction expressed in movement within temporal references. This especially suits the kind of dialogue that is endemic for concerto discourse (cf. Keefe 2001). The historical distance to our own time is traced through the changing relation of qualities of dialogue to the cultural and stylistic context of the period. The study aims to construct temporal and cultural profiles for Mozart’s 1.movement concerto form. The phenomenon in question partly belongs to historical pragmatics in that it studies historical dialogue in two senses, in relation both to its own period i.e. contemporaneous compositions and to the period of the modern critic. Historical study of dialogue in music is thus considered as a parallel phenomenon to historical study of dialogue in language. A linguistic analogy of modals becoming past and/or future oriented expressions is used in bringing temporal reference inside the work at the level of musical actors. The Gricean idea of acceptability serves to form acceptability operator ACC in default semantics to express epistemic commitment of an actor’s mental states to musical features interpreted as eventualities (Jaszczolt 2009). The relation here is a quantitative one, where degrees of commitment correspond to temporal distance. This step turns the dialogue into temporal interaction and amounts to formation of a temporal profile. How is it possible, then, to historicize this dialogue within discourse? Stylistic features are found to have certain combinations of social and individual modalities that are derived from existential semiotic theory (Tarasti 2000, 2015). These are projected from one stylistic patch to another one as well as to different stages of historical reality. As a consequence stylistically peculiar dialogical merger representations (Jaszczolt 2005) move through history. The study examines how social meaning moves through possible paths of historical time and in so doing transmits traces of the past culture of enlightenment to our own day. We ask whether it is possible to reconstruct and revitalize the relation between cultural world and musical style in order to locate possible paths for stylistic traces from the past (cf. Greenblatt 1988, Tarasti 2012). This aims at building a cultural profile for 1.movement

concerto form. The above process could be characterized as realizing new historicist insights through detailed analysis of pragmatic meaning. When set in relation with musical narrative this historical co-narrative consisting of counterfactual events and processes draws the outlines for likely existential semiotic constraints of the stylistic tenor of late classical style. Together the two profiles present a culturally sensitive view of dialogue in Mozart's concerto practice.

***Porteño discourses of identity: An ethnopragmatic approach*** (Contribution to *The Pragmatics of Place: Colonial and Postcolonial Perspective*, organized by Levisen Carsten [et al.] )

Argentina was projected by its founding fathers and 19<sup>th</sup> century elite as a European enclave in Latin America. An urgent Europeanization of Argentina that involved the genocide of indigenous peoples—as in the 1870s *Conquista del Desierto* (Conquest of the Desert)—, the promotion of massive European immigration, economic ties with Europe, and a blind adoption of everything European was implemented with the hope of leaving *barbarie* (barbarism) behind and entering *civilización* (civilization), culture, and progress (Shumway 1991). The idealization of Europe and the discourse of *civilización y/o barbarie* (civilization and/or barbarism) have not only played a central role in Argentine post-colonial political discourse and in the development of the Argentine nation state (Svampa 1994), but also in the construction of the self-identity of *Porteños*, i.e. the inhabitants of the capital city of Buenos Aires (Grimson 2012).

In this paper, I will champion the idea that certain key expressions and cultural scripts which *Porteños* use to think and talk about themselves today, and about their neighbouring countries and Europe, are closely related to the European project that was integral to the formation of the modern Argentine state (Grimson 2012). In particular, I will show how this is true of certain place-related key expressions (e.g. “*Argentines descend from ships*”, “*Buenos Aires is the Paris of the River Plate*”) and associated cultural scripts (e.g. *A Porteño cultural script for thinking about Argentina's trajectory*) (Garguin 2007; Guano 2003, 2004). A closer inspection reveals that these expressions not only concern places, but also incorporate chauvinistic and racist ideas (Gordillo 2016; Grimson 2012; Joseph 2000).

The task at hand is to expose the actual, full meanings at play in such expressions and scripts. To attain this, I will draw on the tools of the Natural Semantic Metalanguage approach and its “sister” theory Ethnopragmatics, which capture the meanings of culture-specific keywords, speech practices and other cultural phenomena using simple, non-ethnocentric, cross-translatable terms (Goddard 2006; Levisen & Waters in press; Wierzbicka 2003).

***Dropping off or picking up? Objects as a resource for determining the purpose of a customer encounter.*** (Contribution to *Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction*, organized by Tuncer Sylvaine [et al.]

To initiate a face-to-face encounter, participants – among other things - rely on spatial-material resources (e.g. Heath, 1986; Llewellyn & Burrow, 2008; Mondada, 2009; Mortensen & Hazel, 2014). In this paper, we demonstrate that participants also rely on spatial-material resources to establish what **kind** of encounter they are about to engage in. Building on more than 130 service encounters in an American shoe repair shop, we focus on how the objects that customers bring into the shop are used by the staff to determine the purpose of each encounter. Customers typically have one of two purposes; they enter the shop to **drop off** an item for repair, or to **pick up** an item that has been repaired. Customers often carry an object with them that clearly indicate their purpose; if dropping off, they bring with them the item that is to be repaired, if picking up they may carry a receipt slip. When either of these items are unambiguously present in a customer's hands, the staff prepare their actions in accordance with the item: if the customer carries a shoe, boot or similar 'repairable' object, the staff typically reach for the receipt pad and a pen, thus preparing to take down the customer's details. If the customer carries a receipt slip, the staff will either reach for the slip before the customer reaches the counter or go directly towards the storage space for pick up items. To demonstrate the systematicity with which the staff uses the objects brought in by customers to determine their purpose, we focus on cases where objects are either ambiguous or absent and specifically on how the staff in such cases seek to determine the – as yet unstated – purpose of the customer. Our analysis will demonstrate how the staff may try to determine whether a bag is large enough to conceal a pair of shoes, whether a purse conceals a receipt slip or could be the object that needs repairing, or whether the customer might be wearing the object that needs repairing. The staff may also produce candidate understandings ('Dropping off stuff?') or request solicitations ('How can I help?'), but there is a clear preference for the staff to visually determine – rather than verbally inquire - the purpose of the encounter by interpreting the objects brought in.

***Displaying and understanding epistemic stances in explaining and arguing*** (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.]

The paper investigates how children with heterogeneous socio-cognitive resources display and understand epistemic stances in explanatory and argumentative activities. Explaining and arguing are discursive practices, i.e. routinized communicative solutions to recurrent communicative problems of a speech community (Luckmann, 1995). The 'problems' that explaining and arguing are designed to overcome both concern the management of knowledge: Whereas explaining presents a procedural solution to the transmission of knowledge to an addressee who has or is assumed to have a particular knowledge deficit (or to the demonstration of

acquired knowledge vis-à-vis a teacher), argumentations provide a solution to the interactive management of divergent validity claims (Quasthoff, Heller & Morek in press). The two discursive practices differ with regard to the management of epistemic stances (Kärkkäinen 2006; Heritage 2013). In contrast to explanations, in which participants display complementary (unknowing/known) stances, argumentations develop from diverging and competing epistemic claims. Being able to display and understand different epistemic stances is therefore fundamental for the participants' mutual understanding of which of the two discursive practices is currently realized. Acquiring explanatory and argumentative competence entails, then, among others, mastering the marking and understanding of different epistemic stances. The question of how children with heterogeneous socio-cognitive resources come to distinguish between different epistemic stances has received only little attention until now (Ward-Lonergan 2010). The present study addresses this gap by investigating the acquisition of explanatory and argumentative stance-taking in children with learning difficulties and their typically developing peers. The sequential analysis draws on video-recordings of explanations of procedural and conceptual relations as well as decision discourses that were elicited in adult-child and peer settings. The children are aged between 7 and 10 years. Findings are discussed with regard to what linguistic and embodied resources children use for marking epistemic stances when establishing themselves as an opponent or 'explainer' and how they respond to epistemic stances taken by their co-participants.

##### ***Interactional competence seen in the experienced practice of augmented reality game players 'in the wild'*** (Contribution to *Interactional competence: CA perspectives on second language development*, organized by Pekarek Doehler Simona [et al.]

This investigation contributes to the questions raised in the areas of interactional competence and 'learning in the wild' (Wagner, 2015). In particular, we study to what degree the practices for interactional competence in a 'learning in the wild' context differ between first language and second language speakers. Our report comes from a project on the contextually-embedded nature of language use and development in an increasingly technologically-mediated and mobile world. We use multimodal conversation analysis methods to uncover the sequential and collaborative interactional practices used by small groups to organize various actions to play an augmented reality (AR) game on a mobile phone. The game has participants find and report on five examples of green technology on their university campus using GPS-enabled maps. Once a destination is found, players are asked to 'make a report' about the green technology. The five consecutive destinations and reports made at those destinations provide a perspicuous setting for studying adaptations made in the interactional practices participants use to accomplish their task at each successive location. The data are 22 hours of video-recorded interactions of speakers of L2 English, L1 and L2 French, L1 Japanese, L1 and L2 German, and L1 and L2 Hungarian playing the AR game developed at the research site (authors, 2015). Two participants wear head-mounted cameras. A third camera captures the entire group's interaction. We report on the complex array of semiotic resources participants use for playing the game while walking across the campus focusing on shifting practices for activity types such as wayfinding (Klein, 1982), introductions to reports, and connecting the 2 dimensional screen to the 3 dimensional environment around them. We trace micro-longitudinal changes and note similarities and differences between such practices for L1 and L2 speakers. Preliminary findings show that although there is a wide range of interactional practices for accomplishing these activities due to the underspecified nature of the task, evidence can be seen in all groups for adaptive, experienced practice (Zemel & Koschmann, 2014) over the course of the game. Similar interactional competences are seen in the L1 and L2 interactions due to the hypercontextualized nature of the interaction: participants using a mobile phone to find physical locations have similar semiotic resources at their disposal and use similar interactional practices, especially deixis, to make those semiotic resources relevant to their interaction, regardless of language expertise.

## Annette Herkenrath

***Child interpreters and parents of child interpreters in German-Turkish health care communication: Looking back*** (Contribution to *Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.]

This paper studies two types of language-biographical experience related to multilingualism in health care settings: having been a child interpreter and having been a parent of a child interpreter. It looks at language-biographical data (some 17 hours of transcribed oral narratives in Turkish and/or German) collected from several generations of Turkish-German multilinguals, using them as a window to the 'background of patients', taking a temporally distanced view. Research on immigrant 'child interpreters' as well as 'child language brokers' (Tse 1996) spans fields such as education, social studies (Katz 2014 for a recent overview) and linguistics (Meyer 2004). Controversies include ethical issues against the exploitation of underage bilinguals (Orellana 2009), the quality of the translations (Meyer, Pawlack & Kliche 2010), boosting effects in cognitive, social and linguistic abilities (Valdés 2003, Orellana 2009), as well as intergenerational and community-level cooperation (Valdés, Chávez & Angelelli 2003; Orellana 2009; Bauer 2010). Particularly in the earlier decades of immigration from Turkey to Germany, medical and translational service offered in Turkish, let alone in other languages of Turkey, was scarce. The needs of the first generation – and of monolingually functioning German institutions – were often addressed by children and adolescents, who, as the earliest competent bilinguals, assumed the role of interpreters. For the Turkish-speaking community in Germany, this situation is gradually becoming a thing of the past; it continues, however, to be a remembered historical reality. Rather than examining *in situ* phenomena (García-Sánchez 2010; Meyer, Pawlack & Kliche 2010), the present paper looks at these narrated subjective memories, taking a language-biographical interest in long-term developments and retrospect reflections (Bauer 2010). What do informants say about their past experience, its language-biographical impact (Franceschini & Miecznikowski 2004), and the continuing situation vis-à-vis medical institutions? What aspects of their reflective insight might be useful for innovations in multilingual policies currently at issue? The data shows that the memory of medical constellations involving child interpreters is a difficult one that, even decades later, does not easily come up in conversation: the topic may hide behind other topics, narrators may impersonalise their experience, listeners may be unable to listen etc. At the same time, speakers of this group of immigrants have an important message for listeners from the 'other' side. With this situation in mind, discourse-analytical questions relate to formal ways in which memories are brought up and verbalised. This includes a closer look at thematic organisation, speaker-hearer interaction, the expression versus non-expression of personality, and linguistic means of emotional evaluation (Akar 2011, Herkenrath 2016a, b). Since the topic of child interpreters was not part of the elicitive design, it emerges alongside and through other language-biographical topics, revealing thematic connections to topics such as school performance, (lack of) governmentally provided multilingual infrastructure, institutional support for community languages, and intergenerational relations. The study qualitatively focuses on four narrative case studies: two each from the younger (now middle-aged) and older (now retired) generation.

### **Ilona Herlin & Marja Etelämäki**

***The Finnish collective person*** (Contribution to *Construal of person in interaction – a cross-linguistic comparison*, organized by Visapää Laura [et al.]

The paper will discuss the use of the Finnish passive, and suggest that it should be counted as one of the personal forms (see also Helasvuo 2006), namely a *collective*. The data comes from audio and video recorded everyday interactions, the methodological and theoretical framework consists of conversation analysis, interactional linguistics and cognitive grammar. Finnish has several passive-like constructions that meet the criteria for passive constructions mentioned in WALS. The paper will focus on the so-called impersonal passive (*syö-dä-än* 'eat-pass-4'), which is the most frequent and widely used Finnish passive constructions. It differs from the passive constructions in, e.g., many European languages in a crucial way; it is always used in contexts where a human or at least an intentional agent is implied. It is used for describing a state of affairs without expressing the identity of the agent or some other salient participant (Hakulinen et al. 2004, 1254). Apart from its 'passive-like' use, this passive construction is generally used also for first person plural references in colloquial Finnish. It is a typical way of expressing first person plural directives (*men-nä-än* 'let's go'), and it has been called an imperative form (see, e.g., Lauranto 2014). In other first person plural uses it is often accompanied by the first person plural pronoun *me* ('we'). In addition to these uses, the Finnish passive can also be used for second person references (*täällä istutaan ja juurutaan* 'here sit-pass-4 and gossip-pass-4'). The paper will focus on the first person plural uses that are not accompanied with the personal pronoun. These uses can be found in directive and in telling sequences; in directives, the use of the passive without an accompanying 1p.pl pronoun is not, however, limited to "imperative" use only; it is used when an action or experience are construed as shared. Furthermore, it is sometimes ambiguous whether the passive is used as a first person plural form or as a "passive". This becomes particularly evident in the internet data. The paper will suggest that there is a common feature in all of the uses of the passive form: they construe a group as a collective subject where the identities of single individuals are faded. The defining feature of the group – or the collective subject – is a joint-action or joint-experience. Enfield (e.g., 2013) describes interaction as a constant fission-fusion process between individuals. In social psychology, the notion of collective emotion has currently been explored. E.g., Walker (2010) argues that experiences of interactive and collective flow involve a loss of consciousness of the "self", and that implies not only a loss of one's public image, but also the merge of the self or "I" with the "We". The evidence from social psychology supports the linguistic findings in the use of the Finnish passive, and the paper will suggest that the type of personal passive that Finnish has is not actually a "passive" but a personal form, that could be named a *collective*.

### **Laura Hidalgo Downing**

***Spanish state universities as sites of inequality and social action: Contested territories in times of political and educational crisis*** (Contribution to *Some Are More Equal: Constitutive and Regulative Rules in Pragmatics Revisited*, organized by Bhaya Nair Rukmini [et al.]

The present paper studies the role of graffiti as instruments for the regulation of inequality and the call to social action in a complex situation of crisis in Spanish Universities during 2014 and 2015; the study compares a corpus of graffiti drawn on the external walls of buildings at the Universidad Complutense, Madrid during 2015, and another corpus of graffiti written on women students' toilet doors in the Faculty of Philology at UCM during 2014 and 2015. Only the graffiti that have to do with the topics related to the crisis and calls to social action are analyzed, namely, the increase of fees and the change of the degrees structure to 3+2, feminism and protest against gender violence, calls to action and strike of various political activist groups (communists, anarchists, antifascists, student struggle) and the 'intrusion' of fascist groups days before the anniversary of Franco's death on November 20th. With regard to the distinction between constitutive and regulative rules, the present paper points at the difficulties in distinguishing between the two types of rules, which seem to overlap when studying social practices. In order to focus on the social function of graffiti as regulators of inequality, it needs to be pointed out that this form of expression is illegal in at an institutional level in Spain. However, as a social practice, graffiti are a form of regulative social behavior which enable people to express and share opinions, feelings and calls to social action in public spaces, even referring to virtual sites of call to action in the social networks. Graffiti, at this level, have socially shared constitutive rules regarding the territorial use of various graffiti crews' tags and bombings in public spaces. They also have regulative rules which allow for the use of spaces as sites of social struggle. Since graffiti are territorial practices, the walls of state university buildings such as those in UCM in Madrid, and the toilet doors in the women's bathrooms, can become two different sites of struggle and recontextualization of different ideological positions. The two types of graffiti are compared regarding the similarities and differences which characterize the practices in the two public spaces, specifically, the characteristics of the spaces and their rules, the characteristics of the messages, the use of figurative language in certain contexts, the recontextualization and negotiation of messages and the multimodal features which accompany them in each context.

### **Yuko Higashiizumi**

***Sequentiality and constructionalization of discourse-pragmatic markers in modern Japanese: The case of nimokakawarazu 'even though'*** (Contribution to *Sequentiality and Constructionalization of Discourse-Pragmatic Markers*, organized by Higashiizumi Yuko [et al.]

This paper examines the development of the clause-final conjunctive connective *nimokakawarazu* 'even though' into the clause-initial adversative marker 'however' in Modern Japanese from a constructionalization perspective (Traugott & Trousdale 2013; Traugott 2016). I will address the main research question of the panel, how sequentiality in discourse affects the diachronic rise of new constructions, based on evidence from the diachronic survey of *nimokakawarazu* from the very early 20th century to present-day Japanese. The construction *nimokakawarazu* comprises "ni (dative particle) + mo (focus particle) + *kakawara* (the irrealis form of the verb meaning 'to concern, to be particular about') + *zu* (negative)". Consistent with the fact that Japanese is a verb-final agglutinative language, it is attached to a noun or a finite clause and functions as the clause-final connective, as in example (1), in present-day Japanese.

- (1) *Boku-wa tokkun-shita-nimokakawarazu ... ichiban yowakat-ta-n-desu-yo.*  
 I-TOP special.training-did-**nimokakawarazu** most weak-PST-NMLZ-COP-FP  
 ‘Even though I received special training, (I) was the weakest (player in the team).’  
 (1999–2001, CSJ: S01M0877)

The construction has developed a new clause-initial use as a conjunction, as in example (2), competing with another construction with the anaphor *sore* ‘so, that’, as in example (3).

- (2) ... *shisutemu-o saikoochikuse-n-eba, shoku-no anshin, anzen-wa*  
 system-ACC rebuild-not-if food-of security, safety-TOP  
*jitsugenshi-uru-hazau-mo-arimasen.*  
 realize-POT-should-FOC-not.POL  
**Nimokakawarazu**, *Nihon-de-wa ... seido-ga miseibi-na-jootai-de...*  
**However** Japan-in-top system-ACC un-development-COP-situation-COP  
 ‘... If (we) don’t rebuild the system, food security and safety should not be realized.  
 However, in Japan, ... the system has been in the situation of un-development...’  
 (2008, *Kokkai Kaigiroku Package*)
- (3) ... *seijishikin-o-meguru giwaku-ga shitekis-arete-orimasu.*  
 political.funds-ACC-concerning allegation-NOM point.out-pass-POL  
**Sore-nimokakawarazu**, *imadani jijitsu-ga kaimeis-are-zu...*  
**So-nimokakawarazu** still fact-NOM find.out-PASS-not  
 ‘... (their) allegation concerning (the misuse of) political funds has been pointed out.  
 Even though (it is) so, the fact is not still found out...’  
 (2007, *Kokkai Kaigiroku Package*)

The results of the corpus survey show that the clause-initial use as in example (2) developed from the clause-final conjunctive connective use via “anaphor + the clause-final conjunctive connective”. The tendency of discourse-pragmatic markers to develop from “right peripheral” to “left peripheral”, in the sense of Traugott (2015), is seen in the development of other discourse-pragmatic markers in Japanese (see Onodera 2014). Another tendency is ellipsis of the anaphor that precedes the connective (Kyogoku and Masui 1973; Matsumoto 1988), e.g. “anaphor + *da* + *ke(re)do(mo)*” ‘anaphor + copula + although’ becomes *dakedo* (Miyachi 2014; Higashiizumi 2015); “anaphor + *dar(o)/desho(o)*” ‘anaphor + the conjectural form of the copula’ becomes *dar(o)/desho(o)* (Higashiizumi 2016). I suggest that constructions with an anaphor are precursors of “left peripheral” discourse-pragmatic markers, and sequential patterns in discourse play an important role in the emergence of such new constructions.

### Jo Hilder, Maria Stubbe & Ann Weatherall

**‘When you’re 85, then I’ll call you old’: Age categorisation as an interactional resource in healthcare consultations** (Contribution to *Stage of life categories: Morality and identity work in talk in interaction*, organized by Weatherall Ann [et al.]

Societal attitudes and practices relating to age and ageing are changing rapidly and will continue to evolve. The transitions in life stage, health and capability that older people experience are also evolving, with ‘active ageing’ now expected well beyond age 65. In the clinical world, constructs around age, ageing and ‘life course’ are also changing, but may have quite different meanings and implications than they do for lay people. Little is known about exactly how clinicians and patients in routine health encounters negotiate the mundane and medical

aspects of age and ageing in this changing environment, or how these interactional practices influence mutual understanding and health outcomes. The work is based on an analysis of recorded medical consultations drawn from the New Zealand ARCH Corpus of Health Interactions (<http://tinyurl.com/ARCH-Group>) in which participants make explicit references to age. A total of 311 recorded consultations were searched for the occurrence of several words that explicitly relate to age (age, ageing, old, young, years), resulting in a set of 113 with explicit mention of 'age'. The data consists of video recordings (or audio recordings in a few cases) of medical consultations from several previous ARCH research projects and features several types of clinicians (general practitioners, specialists, nurses) and adult patients aged 18 and over, of whom a preponderance (about 60%) are aged between 40 and 69. The overall aim of the study is to identify the interactional practices used in routine health care encounters when age and/or ageing are made explicitly relevant. We explore the interactional work being done by age references, descriptions and categorisations in these excerpts. We investigate how these practices contribute to the clinical and 'life world' perspectives or agendas oriented to by the participants, especially at times where categories of age appear to be contested or framed differently according to the perspective of the participant. Our analysis draws on the tools of conversation analysis and membership categorisation to examine the occasions and trajectories of references to age in the encounters and how they function in the medical interactions. We have found the mentions of age can be a source of trouble. On these occasions participants contest the definition or relevance of age to the talk, or resist being categorised with respect to age. For example, in the following excerpt with a nurse in a diabetes consultation, the nurse categorises the 65 year old patient as 'young' in a clinical sense while the patient responds referencing everyday notions of 'young':

NS: .hh so that's just why we take it seriously for young people like you. PT: ((snorts)) ar(h)en't yo(h)u e(h)ver so sw(h)eeet? .hah (.) sixty five .hah= NS: =yeah well when you're eighty five then i'll call you old (.) tch (0.8) how's that for a deal .hh

### Florian Hiss

*Questions about diversity — responding responsibly* (Contribution to *Responsibility, migration, and integration*, organized by Östman Jan-Ola [et al.]

Talking about diversity involves questions of responsibility. This paper views language as means and object of responsible action: Speakers take or refuse responsibility *through* the means of language; linguistic difference is often presented *as* an obstacle to certain responsibilities (e.g., when communicating safety instructions to a linguistically diverse workforce); and speakers take or reject responsibilities *for* language use in particular and linguistic diversity in general. The paper draws on data from a telephone survey on workplace multilingualism in the North of Norway, a region which unites traditional minority languages and various immigrant languages in addition to global English and the Norwegian majority language. The material contains short telephone interviews with 140 representatives of small and medium-sized businesses on topics surrounding work practices, diversity, and multilingualism. While the dataset as a whole gives an overview of the linguistic diversity, practices, policies, and ideologies in regional workplaces, the interview recordings reveal as well a variety of discursive approaches to handle such diversity. The main focus of the paper is on a series of survey responses concerning the role of the region's endangered, traditional minority languages in the workplace and the linguistic integration of immigrants at work. While reporting about facts and experiences, respondents relate their answers to a variety of contexts, beliefs, attitudes, and perceived expectations in order to respond in a responsible way and minimise communicational risks. Disregarding if they are held accountable for some action or not, respondents may feel responsible, wish to evade responsibility, or perceive a need to account for their responses because:

- (a) the interview question involves a topic (language diversity) that is ideologically loaded and has been discussed elsewhere with references to responsibility;
- (b) the question is directed at them within the inter-subjective and structured interactional setting of the telephone interview; and
- (c) the respondent has certain responsibilities related to his/her role as a company representative and as interviewee. (Cf. Solin and Östman's (2016) distinction of three levels of social organisation to which speakers anchor their responsibilities.) There are hardly any fixed form-function relationships that mark responsibility or ideology in language use (Verschuere 2012; Lakoff 2016). In their (typically short) responses, informants manage responsibility both explicitly and implicitly, relating it to practical issues and/or ideology. Relevant linguistic phenomena and strategies include pragmatic markers, voicing, evidentiality, and the marking of proximity and distance.

***Restarting talk: Resources for lapse resolution*** (Contribution to *Entry and re-entry into interaction*, organized by Antaki Charles [et al.]

In this talk I take up a recurrent issue for conversationalists: How to restart talk after a lapse. Lapses emerge when all participants forgo the option to speak (Sacks, Schegloff, & Jefferson, 1974). This can occur at the end of a course of action, where it is a systematic possibility that nothing remains to be done next. In this environment, if all participants refrain from speaking, then a particular kind of sequence organizational problem arises (Hoey, 2015). What do you talk about next is there is apparently nothing relevant to take up, nothing to progress onward to, and no remaining projections to fulfill? 'Lapse resolution' refers to the ways in which participants solve this problem. In this paper I focus on the kinds of resources that participants draw upon for lapse resolution in ordinary conversation. The data come from a collection of 500 lapses identified in naturally occurring interactions in American and British English. They are analyzed in accordance with conversation analytic principles and methods (e.g., Sidnell & Stivers, 2013).

My question is how participants form up some sequentially implicative turn after a lapse such that turn-by-turn talk is restarted. I describe three basic alternatives to where participants can go after a lapse: speakers may move to end the interaction, continue with some prior matter, or start up something new. In selecting from among these options, I argue that participants reveal their understandings of where they are situated in the course of their interactions, they exhibit sensitivity to the completion or incompleteness of prior or latent courses of action, and they introduce as relevant things from 'outside' their interaction, respectively. Participants are shown using resources grounded in the interaction's overall structural organization, in the materials locatable in the interaction-so-far, in the mentionables they bring to interaction, and in the situated environment itself. I argue that lapses in ordinary talk are places for the management of multiple possible courses of action.

***"Trump never says 'God Bless You' like Obama does" – Invoked compliments in partisan Facebook comments*** (Contribution to *Complimenting behaviour in social media*, organized by Das Anupam [et al.]

Much pragmatic research in the last decade has been devoted to the ways users of social media construct and negotiate their identities online (cf. Placencia 2013, Bolander and Locher 2015, Dayter 2016, Locher and Bolander forthcoming). Many of these studies have probed the rich selection of self-presentation strategies on which users rely to eke out their online image. However, the role of compliments as a central affiliation strategy in social media still remains clouded.

This paper explores the instrumental use of a new type of implicit compliments frequently detected in the official Facebook campaign websites of the two main candidates for the last US presidential election, i.e. Hillary Clinton and Donald Trump. The study focusses particularly on the way the proponents of two political camps (democrats and republicans) negotiate their party identity in the Facebook comment sections through heated conflict talk. While some commentators vigorously attack the opposing political candidate, others come to his (or her) verbal defence. While each attack is directed at one political candidate, they likewise invoke a compliment toward the other. On the one hand, the investigation of these invoked compliments surfaces what commentators think both political candidates stand for (and what they believe the politicians should be praised for). On the other hand, they help commentators on political social media sites to (dis-)align with each other by stating, reproducing and negotiating their shared social and political beliefs and values (cf. *ambient affiliation*, Zappavigna 2011).

Implicit compliments of this specific type will be investigated both quantitatively and qualitatively in a broad range of comments in Hillary Clinton's and Donald Trump's Facebook campaign sites, in a short period leading up to the US presidential elections in November 2016. The main classification is based on an adapted, abridged version of Martin and White's Appraisal framework (2005) which I combined with existing pragmatic research on compliment functions as well as on objects of complimentation (Holmes 1988, 1995, Golato 2011, Hoffmann 2012, Placencia and Lower 2013, Taavitsainen and Jucker 2008, Placencia and Lower forthcoming). The main focus of the analysis will be on the nature and type of this specific type of compliment in line with its social function and object of complimentation.

***Laughter, hyperbole and "funny stories" - using humour in positioning Georgia's Greek community*** (Contribution to *From self to culture: Identity construction in humour-related discourses*, organized by Sinkeviciute Valeria [et al.]

Members of Georgia's Greek multilingual community extensively use humour (mostly laughter, "absurd" hyperboles, and "funny" or paradoxical narratives) in interview situations with an outsider when positioning themselves, their in- and various out-groups. As Georgia is a multi-ethnic and -lingual country, they position themselves not only in relation to the Georgian societal majority but also to other minorities. Historically, identification in this community is linked to their migration to the Southern Caucasus from the Southeastern coast of the Black Sea almost 200 years ago, their belonging to the (Greek) Orthodox Church, the perception of being part of a greater Greek diaspora reaching back to the Byzantine Empire (Bruneau 1998; Sideri 2006), and to mass emigration in the past 25 years (initially mainly to Greece and Cyprus). In Georgia, religious affiliation and the historical link to the Byzantine Empire were and in most cases still are considered as "legitimate" links to "Greekness". In Greece, however, while they are officially recognized as Greeks, flawless competence in Standard Modern Greek is seen as paramount for belonging in everyday interactions (Hionidou 2012; Kaurinkoski 2010).

This paper proposes an ethnographically informed conversation analysis (Bucholtz & Hall 2008; Deppermann 2000) of excerpts from 49 semi-structured interviews with members of Georgia's Greek community collected in 2013-14. The aim of the analysis is twofold: it will firstly focus on how humour is used to position interlocutors and to manage relationships during the interview situation, and secondly on how humour is used to establish, negotiate and contest social boundaries between the "groups" interviewees make relevant in our conversations (Holmes & Marra 2002; Roth 2005). Wherever necessary, the larger socio-political context of this conversational meaning making will be explicated (Bucholtz & Hall 2005; de Fina et al. 2006).

### Christiane Hohenstein & Magdalène Lévy-Tödter

#### *On international medical doctors' professional identity in a multilingual environment*

(Contribution to *Increasing mobility in health care and challenges to multilingual health care communication*, organized by Hohenstein Christiane [et al.] )

Our study focuses on 'international doctors', i. e. medical doctors often carrying a foreign or migrant background, who in doctor-patient communication (DPC) either use the patient's tongue as an L2 or a joint Lingua Franca. On one hand, a recent study highlights that patients, even though they adapt to interpreted DPC, may actually prefer bilingual providers of health care to interpreted services (Villalobos et al. 2016). On the other hand, studies on interaction between international doctors and native patients - mainly carried out in the US, Australia, and Canada (cf. Berbyuk Lindström 2008) - indicate an array of communication issues. These may be linked to several factors, including lack of knowledge regarding the host society and their medical procedures, credential issues, inadequate level of medical and surgical knowledge and perceived discrimination or racism. Linguistically, three factors seem to play a major role: (1) different expectations between doctor and patient with regard to the course of the clinical encounter (e. g. patient-centered communication, culturally differing approach, address etc.), (2) interpersonal barriers due to difficulties in providing verbal or non-verbal emotional support (explanations, mitigation, consolation, humour), and (3) comprehension problems due to the use of regional dialects or foreign accents (cf. Berbyuk Lindström 2008). In light of these findings, and building on previous studies that focused on international medical graduates (cf. Cordella/Musgrave 2009, Dorgan et al. 2009, Van de Poel/Brunfaut 2010, Dahm/Yates 2013, Fioramonte 2014), the current study considers effects that medical doctors may experience in their L2 interaction with regard to their professional identities. In order to explore multilingual medical doctors' professional identities, we will take as a point of departure narrative interviews conducted with international and multilingual doctors working as physicians in Germany and Switzerland. A discursive approach to identity analysis (cf. van de Mierop 2015) will be used to determine aspects of professional identity. Parts from our data set of narrative interviews will be analysed using functional pragmatics (cf. Redder 2008), in order to highlight how 'international doctors' describe relevant tasks in medical encounters, how they speak about misunderstandings or resistance of patients, and how they present themselves

verbally in their L2 as medical professionals. Since (lack of) knowledge about the course of the medical interaction and phases within DPC plays a role in interpreted DPC (cf. Albl-Mikasa/ Hohenstein 2017), it is expected to pose a challenge for international doctors as well. The way these challenges are met by communicative strategies international doctors have developed will reveal intersections of social, collective and personal aspects of professional identity. Our study aims to open insights into doctor-patient interaction in a multilingual environment without the help of interpreting, and to contribute to an understanding of possible benefits of and challenges in international doctor-patient interaction.

***Before and after: The professional identity of nurses employed as caregivers*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

The negotiation of professional identity has emerged as an important focus for workplace discourse analysts in recent years (e.g. Schnurr 2009, van De Mierop and Schnurr 2016, Angouri and Marra 2011). The richness of the research agenda flows from the dynamic, ongoing and highly contextualised identity work in which professionals engage in their daily activities. Most recently, attention has turned to the transitions faced by professionals in their working lives, e.g. transitions across countries, across teams, and across discourse activities (see Marra, Holmes and Kidner fc). Aged care has been selected as a site for investigating workplace transitions and the corresponding identity work in which international healthcare workers engage. Many caregivers employed in the New Zealand aged care sector are migrants with nursing qualifications from their home countries. Their jobs in eldercare facilities are often seen as a stepping stone on the journey back to their chosen career, an option which may initially be denied to them in a new national context where their qualifications and previous experience may not be formally recognised. In naturally-occurring interactions recorded in residential eldercare homes we have captured nurses involved in the macro transition of shifting between countries, as well as the meso transition of moving between professions. For our participants, the 'downgraded' role of caregiver is generally seen as temporary; the caregivers are often waiting for recognition of their qualifications or actively pursuing registration in New Zealand. How does this challenge to their professional identity impact upon their work practices and their construction of self? In this paper we draw on

recordings of caregivers in everyday interaction with elderly residents in three different eldercare homes. We explore the ways in which they index their identities as skilled and experienced nurses while working in a related but distinct profession. The findings highlight both a future, imagined self as well as the ways in which the caregivers make use of the capital gained from their pre-migration working lives in their negotiated identity construction.

***Free indirect reported speech in interaction*** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

In this presentation I focus on a collection of instances of what might be termed "free indirect" or "quasi direct" reported speech: in other words, instances of reporting that combine direct and indirect forms. The data are drawn from informal, two-party telephone calls. Analysis of these instances supports exploration of the connections between CA and pragmatics, particularly in considering "facework" and the way criticisms of self are reported. From a conversation analytic perspective sequential analysis allows for exploration of the design and recurrent environments of this device. It reveals that they tend to occur in non-narrative environments, regularly following assessments, providing evidence to support them. Unlike indirect reports they recurrently consist of multiple units. Comparison with the recurrent sequential positions of direct and indirect reported speech reveals why a form that combines them is particularly useful in this environment. They retain the focus on ongoing activities prevalent in IRS, while providing some insight into what was said, recurrent in DRS. From a pragmatics point of view the instances raise interesting questions about issues of face. In selecting to use a form that combines elements of direct and indirect speech participants shift footing to create a "layering of voices" (Günthner, 1999). In so doing they convey both the stance of the reported and the reporting speakers. This is particularly useful here since in a number of instances speakers report critical comments about the current speaker. The design enables speakers to portray what was said while distancing themselves from the stance conveyed in the report.

***From hearing to seeing : Visualization of para-languages on Korean social media***

(Contribution to *Between Graphic and Grapheme: Representation in Writing*, organized by Dickinson Jennifer A. [et al.]

On Korean social media, punctuation marks such as periods, question marks, exclamation marks and swung dashes, etc. are used to express the text writer's emotion and attitude, which is quite different from how they are normally used in writing. This phenomenon is much more prominent on the instant messaging where the people have no choice but to rely on the letters which denote the textual messages only. The symbols mentioned above are very distinguished from the 'emoticon' which portray people's facial gestures, as they represent visualized para-language information such as volume of the voice, accent or nuance, which are originally transmitted through acoustic media. However, it should be noted that this is not about the transcription symbol used for discourse analysis. The Korean people, especially the young generation uses these signs spontaneously to show emotion or attitude more vividly through the text. It means that 'emoticon' is not enough to support people's growing desire. Interestingly, even though the signs are symbolic and the information contained on them is abstract, they can be read very naturally on the text without a manual or instruction as we do on iconic ones. This could be explained by the semantic derivation of punctuation marks. For the close analysis of the role of each signs, I collected year's data consist of 50 people's conversation text using punctuation marks from the very popular free mobile instant messaging application in South Korea, 'Kakao Talk', and categorized them into four levels of different types of the signs. By reading large text files line by line, I found that each sign is sub-categorized based on the detailed emotions. For example, question marks can be used to express different feelings such as 'surprise', 'conscious', or 'puzzled'. And one of the common features is that to express different scale of emotion is possible by controlling the number of the sign.

Strangers in public spaces demonstrate respect for one another through 'civil inattention', which for Goffman (1963: 84) is 'perhaps the slightest of interpersonal rituals ...that constantly regulates the social intercourse of persons in our society'. Mutual observation of the ritual of civil inattention is not guaranteed: it is discarded in rude encounters between strangers. This paper treats rude encounters in urban public spaces as conceptually generative for those interested in the endogenous organization of interaction orders constituted by strangers. Existing research on strangers in public space tends to rely on observation and analysis of naturally occurring encounters. This is a problem, because no encounter is in itself inherently uncivil, rather it must be *interpreted* by one or more consociates as uncivil. Drawing on data from over 200 interviews where participants provided narrative accounts of rude encounters with strangers in urban public spaces, this paper shows how the specificity of ritual infractions opens up opportunities for participants to make claims around selves as moral actors and everyday life as a moral order.

***Systematicity in variation within a grammar: A look into "broken" structure and "deviant" semantics in Japanese conversation*** (Contribution to *Multiplicity in Grammar: Modes, Genres and Speaker's Knowledge*, organized by Iwasaki Shoichi [et al.]

It has been known for a long time that grammatical patterns differ in different communicative activities. However, in recent years there has been studies pointing out the depth and kind of structural differences are such that the variation should be understood to form separate systems. In other words, the grammar of a language does not constitute a single integrated system but consists of multiple grammars that have been shaped differently in response to particular communicative needs of the genres.

This study examines the nature of multiplicity in grammar through comparison of patterns found in conversation and written language in Japanese. Specifically, we will direct our attention to the following phenomena observed in conversation:

(1) Fragmentary expressions: It is rather common to see expressions that are not grammatically complete in the sense that they do not form a self-standing clause. A good example of these is an unattached NP, which is a free-floating NP that is not grammatically integrated in a clause. They are by no means 'mistakes' or 'performance errors' and are much more common and frequent than accidents.

(2) Structurally dependent expressions: Some uses that have developed in conversation include structurally incomplete expressions, such as cases where one starts utterance with a predicate-final auxiliary expression 'desuyone' or with a topic-marking particle 'wa'. Structurally, both 'desuyone' and 'wa' require the main element, a predicate and a nominal, respectively, but in conversation they can be used without the main element at the beginning of a turn.

(3) Insubordination: Structurally subordinate (grammatically incomplete and dependent) clauses can occur a self-standing expression without the 'main clause' on which they are supposed to be grammatically dependent upon.

(4) Non-conjunctive use of conjunctions: Some conjunctions, such as 'dakara' and 'dakedo', have developed non-conjunctive uses in conversation. This development is evident both in their semantics and syntax: they function more like discourse markers, and their syntactic position is not fixed at the beginning of an utterance.

Thus, there are many expressions observed in conversation that are grammatically (structurally) incomplete, fragmentary, and serve non-typical functions. However, linguistic expressions in conversation are hardly uncontrolled or 'broken'. These structurally 'incomplete' expressions or semantically 'deviant' expressions are interactionally functional, meaningful, and 'complete'. This mismatch between structural organization and interactional organization suggests that the structural makeup of a linguistic expression and its interactional functionality do not necessarily match or align. In this paper we argue that the apparent 'broken' structure or 'deviant' function in conversation does not result from the lack of systematicity but is a reflection of the fact that linguistic expressions in conversational environment are oriented toward (i.e., formed and organized around) interactional functionality more strongly than toward grammatical completion and integrity. It is sometimes pointed out that linguistic expressions in conversation has simpler structure than written language. However, the difference between conversation and written language is not a matter of simplicity but of organizational principle. They are oriented toward different kinds of goals and communication activities.

***Self-touching practices as corrective actions in hair salons: The client's head as a locus for displaying expertise*** (Contribution to *Touching-the-body in interaction*, organized by Greco Luca [et al.]

Tactile practices in beauty salon encounters have only marginally been studied as recurrently observable practices – and self-touching practices by the clients even less. However, clients do touch their hair during such encounters, mostly when giving instructions to the hairdressers during the initial phase of the encounter or when requesting a revision at the end of the encounter (Oshima 2009; Oshima & Streeck 2015). My paper focuses on the latter, i.e. when clients orient towards a possible problem with their hairdo. In these cases, what the data shows is that a) clients only touch their hair and identify the problematic area, thereby assigning the agency for correction to the hairdressers (a corrective manipulation *inviting* correction according to De Stefani & Horlacher 2016) or b) they engage in self-correction by displacing problematic strands of hair and by rearranging their hairdo, thereby taking on the responsibility for the correction (a corrective manipulation *as* correction; De Stefani & Horlacher 2016). In both cases clients can be seen to challenge the hairdressers' taken-for-granted authority through such corrective manipulations, as well as their professional expertise and social identity. This is visible in the fact that hairdressers immediately suspend the clients' manual activity and intervene with their own hands on the clients' head, thereby re-establishing the normatively expected division of tasks. By analyzing the tactile practices that both clients and hairdressers carry out during these moments, I shed light on the distribution of rights and obligations that prevail within hair salons. The analysis of such corrective actions will lead to a better understanding of the kind of responsibilities and entitlements participants experience and of some of the ways in which categories, expertise and epistemic authority are negotiated and competed for in this type of workplace (Jacobs-Huey 2006; Horlacher *forthcoming*). More generally, I address complex and delicate issues around dealing with the clients' "body" (here: the head) and how professionals treat and manipulate it in hairdressers/clients encounters (Nizameddin 2016). This paper uses conversation analysis (Sacks, Schegloff & Jefferson 1974) and multimodal interaction analysis (Streeck, Goodwin & LeBaron 2011) as methods of investigation and the analysis is based on video recordings collected in three different hair salons located in the French speaking part of Switzerland (25 clients, 6 hairdressers, 28 hours in total).

***The use of emoji to construct distance-learning student identities on a Facebook Forum***  
(Contribution to *The micro-analysis of online data (MOOD): Using discourse and*

*conversation analytic methods to analyse online interactions*, organized by Meredith Joanne [et al.]

This presentation will examine how students use emoji on a Facebook forum from a micro-analytic, discursive psychological (Edwards and Potter, 1992) perspective. Recently, the use of emoji has accelerated on Facebook forums, with more emojis being added all the time. Emojis differ from emoticons, in that they are a pictorial symbol, rather than a typed symbol, and as a result there may be differences in the ways they are used. There has been research into emoticon usage as a resource - Kaye et al (2016) concluded that people carefully consider their use of emoticons and they are not direct replacements for facial expressions. Similarly, Vandergriff (2013) showed through micro-analysis of the smiley, how it was used for purpose

utisoftLocal.ByteClass to show an appreciation for humour and to 'do' disagreement in a non-aggressive way. There has been little research into emoji from an exclusively discursive perspective. However, emoji has been considered as part of interaction, for example, to inoculate stake in real-time student online discourse (Stokoe et al, 2013). This presentation will build on previous research by examining how students build and do identity work through the use of emoji. Data has been scraped from a first-year student Facebook group, which was set up and managed by students, for the purposes of discussing their module. The students are distance-learning students. The data was gathered after the module was completed so is entirely naturally occurring. The presentation will show that emoji is not simply a reflection of what people are thinking, but a resource people use in internet discourse to construct themselves in particular ways. Initial findings suggest that emoji may be used to inoculate stake; to construct students as 'being helpful' to others; or to manage the dilemma of lower-than-expected grades. The presentation will also discuss the usefulness of applying a talk-based theory to online, emoji analysis.

*Multi-word discourse markers in a cross-linguistic perspective* (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

This paper examines the behaviour of dislocated, left-peripheral multi-word discourse makers in English popular science texts, their translations into German as well as German comparable texts over the space of 25 years. Examples of such discourse markers are the extraposed prepositional phrases: *After all, On the other hand, In addition*. My analysis focusses on the forms, functions, distribution and translation equivalents of such multi-word discourse markers in parallel and comparable text corpora, listing frequencies and examining co-text from a contrastive discourse perspective. Two leading questions will be pursued: 1. Which types of discourse markers are preferred in the tripartite corpus over time and what are the sequential implications? 2. What are the consequences of the choice of particular discourse markers for discourse processing?

Results of the analysis indicate that the use of the type of discourse markers examined here differs substantially in English and German popular science discourse in terms of clear preference of either left peripheral dislocation or syntactic integration. I discuss these preferences with reference to typological differences as well as earlier contrastive work on discourse preferences. Finally, I make some suggestions for developing written language skills in learning and teaching a foreign language.

***Teasing as language socialization in a culturally diverse kindergarten*** (Contribution to *Trickery, Cheating, and Deceit in Language Play*, organized by Bell Nancy [et al.]

An important site for investigating the confluence of deception and play among children is the act of ‘teasing’. The functions of teasing have been extensively examined within interactional and language socialization approaches to children’s linguistic, social, and cultural development, mostly in culturally homogeneous contexts. Defined as “an intentional provocation accompanied by playful off-record markers that together comment on something relevant to the target” (Keltner, et al, 2001, p. 234), to be recognized as such among interlocutors, an instance of teasing requires the skillful interpretation of subtle contextualization cues that key it as playful. Even within their own familiar cultural contexts, it may be difficult for young children to distinguish between playful teasing and serious negative remarks. What happens, then, in a classroom of diverse young children in which not only are children being introduced to the communicative practices of school-aged children, but they also hail from multiple cultural backgrounds in which teasing may be enacted differently? This study investigates young kindergartners’ practices of teasing in a classroom in the Northeastern United States. In particular, a year-long, ethnographic, discourse-analytic study was conducted in which Spanish-speaking children of Mexican immigrant parents were closely shadowed at school and at home at regular intervals. This paper will present a detailed discourse analysis of instances of teasing in the classroom, examining who teases whom, under what circumstances, how the target of the teasing responds or reacts, how others react, and the longer-term effect on students’ social relationships over the course of the year. The findings will be discussed in terms of the practices of teasing that are socialized and produced over the school year through these interactions, and children’s language socialization into these practices within their peer groups, and their language socialization through these practices into particular values, morals and language ideologies.

***Finding voice in silence: A critical examination of the right to silence in American evidentiary interviews*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

Finding voice in silence: A critical examination of the right to silence in American evidentiary interviews Sarah Howard, Diana Boxer and Joseph Radice The American evidentiary interview is coercive by nature. Every element of its design is meant to help the detective (and the institution) elicit a confession from the suspect by removing power from the suspects and placing the detective in as advantageous of a position as possible without infringing on the suspect’s rights. For example, the suspects are removed from any setting where they may feel in control and is placed in a room that is “home turf” for the detective. Removing them from their normal environment is meant to take away things that may empower them and give them more control over the exchange and creates an imbalance of power during the interview (Shuy, 1998). However, in order to avoid coercion and false confessions, the US court system has taken certain precautions. Of particular interest is the right to silence as understood in the Miranda Warnings. Silence is a social taboo and many American English speakers go to great lengths to avoid it in ordinary conversation. However, in the evidentiary interview the suspects are expected successfully employ strategic silence even though all of their experience tells them to avoid it. This paper examines the intertextuality of silence and the issues that suspects have with voice in a context where they are explicitly allowed to employ it. Within the legal system, a speaker needs to fully understand what language is required in order to achieve a desired result, and that acting without that understanding can create various unwanted and unanticipated outcomes (Ainsworth 2008). The ability of speakers to make themselves understood within in the legal system is an issue of voice. Following Blommaert (2004, 2007), this paper examines strategic silence in evidentiary interviews through the lens of intertextuality. We argue that effective use of the strategic silence created by the Miranda Warnings empowers the suspects in the evidentiary interview and it is through silence that the suspects may come to find their voice.

***A constructional approach to clausal modal expressions*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.] )

The analysis of modal particles has long been a challenge for grammarians and linguists. Notable solutions include Halliday's (1985; 1994) metaphor of modality proposal plus Aijmer's (1997) and Traugott's (1995) diachronic perspectives with a focus on particular expressions such as *I think*. The present study develops a new constructional approach to account for the use of clausal expressions instead of modal adjuncts to realize modality, which are termed by systemic functionalists as metaphor of modality.

In this study I draw on a combination of present-day versions of construction-based approaches to grammar, primarily cognitive grammar (Langacker 1987, 2008), Mental Spaces Theory (Fauconnier 1985, 1997) and Verhagen (2005)'s approach to syntactic constructions, and analyze metaphor of modality in line with 'constructions of intersubjectivity'. I claim that clausal modal expressions, such as [*I V<sub>mental</sub> that P*] and [*It is ADJ that P*] in English and [wo (I)-V-S] and [zhe shi X de] (this is X Sub.) in Chinese, can be treated as constructions of Viewpoint management in which the hearer is invited or influenced to entertain the Content P from a certain viewpoint. Rather than offering mere examples by previous studies, this project has generalized from modal particle exemplars in COCA and BCC the schematic constructions, i.e. [*I V<sub>mental</sub> that P*], [*It is ADJ that P*], [Wo -V-S] and [zhe shi X de] constructions.

In order to testify this claim, the present project tries to merge two currents in modern linguistics, constructional approach and corpus methodology. Our English data is mainly drawn from a large corpus representing natural usage, namely, Corpus of Contemporary American English (COCA) by means of the Brigham Young University interface (<http://corpus.byu.edu/coca/>) and our Chinese data is mainly from BLCU Chinese Corpus (BCC, <http://bcc.blcu.edu.cn/>).

Frequency data from COCA and BCC have supported the productivity of these constructions. The schematic slots of [*It is ADJ that P*] construction and [*I V<sub>mental</sub> that P*] construction, are found to be constrained by a set of abstract semantic features, i.e. Epistemic, Affective, Deontic or Evaluative standpoint. Text excerpts containing concordance lines of the constructions from the corpus are used to observe and infer the type of function a speaker or writer intends to fulfil. Through analyzing exemplar constructions in both English and Chinese discourse excerpts, I find they serve the function of putting conceptualizers and their standpoint on stage as well as opening and guiding a Content space. That is, they are constructions used by the speaker to exchange and manage viewpoint, taking the hearer in regard. Besides explicit subjective modality, pragmatic effects including weakening or boosting the force of the claim also play a role in the use of [*I V<sub>mental</sub> that P*] construction in communication. On the other hand, [*It is ADJ that P*] construction is often used to express intersubjective viewpoint, indicating the view may be shared with a wider group of people, including probably the speaker and the hearer.

In addition, we also analyzed the syntagmatic relationship between the modal clause and the complement *that*-clause in an attempt to solve the problems with constituency analysis of their syntactic structures. I hope to show that a constructional approach combined with discourse-functional tradition works out to a systemic and richer account of modality represented by clausal expressions.

***Narrating the journalistic stance through news values: Evidence from Chinese and Korean news reporting on the sinking of "Eastern Star" and "Sewol"*** (Contribution to *Beyond the myth of journalistic storytelling. Why a narrative approach to journalism falls short*, organized by Zampa Marta [et al.] )

This research sets out to investigate the way news values are discursively constructed in disaster news reporting across different, but closely related cultures. Particular attention is paid to how news values are taken as a way of journalistic narration in articulating the journalistic stance. To this end, a case study of Chinese and Korean news reporting of two similar events of are used, namely the sinking of a Chinese ship (The *Eastern Star*) and a Korean ship (The *Sewol*). The discursive approach to news values (Bednarek & Caple 2014) has been adopted, with the assistance of the corpus tool UAM, to code those news values that are constructed in news texts. This research shows that *negativity*, *eliteness*, and *personalisation* occur far more frequently than other news values,

and that *proximity* occurs least frequently. When Chinese and Korean newspapers report shipwreck events from their own country, they tend to foreground *positivity*, *superlativeness*, *impact*, and *personalisation*. However, when they report shipwrecks from a different country (e.g. when the China Daily covers the sinking of the *Sewol*), they tend to highlight such news values as *negativity*, *novelty*, and *eliteness*. A close examination of each discursively constructed news value reveals that they constitute a significant method by which journalistic narration assists journalists in taking up different stances in their production and reproduction of different pragmatic/social values. For instance, news values (e.g. novelty, negativity and eliteness) are employed by journalists to negatively frame another government's dealing with the aftermath of a shipwreck. The immense disparity displayed in Chinese and Korean journalists' deployment of news values are discussed in relation to the social and professional news production contexts that give rise to news reporting.

#### ***Preschoolers' multimodal production of politeness cues in requests*** (Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

In research on the development of children's sensitivity to politeness cues in communication, there has been a major focus on those of a lexical, syntactic and morphological nature (see e.g. Küntay, Nakamura, & Ateş-Şen, 2014). Yet, communication is clearly multimodal and little is known about how children acquire politeness from a multimodal perspective. From a perception point of view, Hübscher, Wagner, and Prieto (2016) found that 3-year-old American English children are clearly able to recognise a polite stance encoded through intonational and facial cues. Taking this further, the present study has the goal of assessing preschool children's sensitivity to intonational patterns and face/body cues in comparison with lexical strategies as politeness cues in production.

A total of sixty 3- to 5-year-old Catalan-dominant children were tested in a request production experiment and twenty adults as a control group. Four different situations were created in which children had to request an object from either a class mate or an unknown experimenter (low/high power) and the objects they were asked to request varied between the cost of the request (low/high). For adults similar request situations were created (but adapted to adults) through the form of an oral Discourse Completion task.

Pilot results show that children display a growing sensitivity to register in the ages investigated and concurrently adapt their use of face and body cues and intonation. We hypothesise that not only are preschool age children sensitive early on to the facial and intonational encoding of politeness cues as demonstrated by Hübscher et al. (2016), but they also start to use these strategies actively as strong indicators of politeness displayed in formal register speech.

#### ***Low-entitlement in appointment solicitations in business-to-business prospecting calls*** (Contribution to *Orientations to Low Entitlements and/or High Contingencies During Request Sequences*, organized by Kent Alexandra [et al.]

In business-to-business sales, meeting in person with prospective clients ('prospects') is crucial for the progress of the sale. Setting up appointments is a difficult task, especially when the sale has been unilaterally initiated by the salesperson. Moreover, when proposed meetings take place at the prospect's office, salespeople have to manage additional contingencies associated with the solicitation to visit a prospect's place of business.

In this paper, we examine a collection of 40 appointment solicitations identified through the scrutiny of 153 business-to-business unsolicited 'prospecting' calls. The calls are initiated by salespeople from three British companies selling office equipment. Prior conversation analytic research has mainly focused on the use of reportings in self-invitation sequences (Drew, 1984). We complement this line of work by documenting the use of requests as 'vehicles' (Schegloff, 2007, p. 73) for appointment solicitations. We document four recurrent features in the design of appointment solicitations: (1) emergence out of prior talk, (2) minimisation of imposition, (3) claims of timeliness, and (4) framing the future meeting as congenial and informal. We illustrate

these features in the extract below, taken from the beginning of a prospecting call. The appointment solicitation is located in lines 13-14 and is accomplished through a low entitlement (Curl & Drew, 2008) request for permission to visit: "U:hm (0.5) an'=I- >I was just wonderin'< is now the time to arrange a visit to come and see you."

(1) Appointment solicitations emerge out of and are linked to prior talk. In this extract, the appointment solicitation is preceded by the salesperson's claim of having had, at some point in the past, an amenable discussion about a potential commercial agreement (lines 10-11). The link between this TCU and the appointment solicitation is established in two ways. First, the speaker holds the floor to produce another TCU (line 12). Second, the conjunction "an'" (line 13), in turn-initial position, frames the appointment solicitation as a continuation of the prior discussion.

(2) Salespeople work to demonstrate their visit would not disrupt the prospect's work schedule. In this extract, S's request indexes time constraints (line 13) and contains a restricted formulation of the scope of the meeting (line 14).

(3) Third, salespeople claim their visit is scheduled at an opportune time for the prospect's company. S formulates the request for a visit by incorporating a time consideration "is now the time to arrange a visit" (lines 13-14). Also, he orients to timeliness in the pursuit of the prospect's commitment to a meeting (lines 18-19) after the latter's hedged response to the visit request.

(4) Finally, the salesperson refers to the meeting as simply "a visit to come and see you" (line 14), which constitutes a vague description of the visit, suggesting it will be a casual, informal meeting with no pre-established agenda.

Overall, in our collection, appointment solicitations were produced with low entitlement, mainly embodied through displays of uncertainty with regard to the meeting taking place, with salespeople orienting to the potential imposition of the meeting and with the visit framed as a casual or even friendly encounter.

***Language regulation in the research writing practices of a multinational research group in the field of computer science*** (Contribution to *Language regulation in professional contexts*, organized by Nissi Riikka [et al.])

The increasing use of English as an academic lingua franca raises questions not only about the ‘choice’ of language for publication (e.g. Anderson 2013), but also what research communities regard as ‘acceptable’, ‘functional’ or ‘good’ English, and what scholars do to achieve such English in their writing (e.g. Li & Flowerdew 2007; Lillis & Curry 2015; Mur-Dueñas 2013). This presentation addresses the latter question by focusing on the mechanisms and practices of regulating the ‘quality’ of English in the English-medium research writing of multilingual scholars in the field of computer science. Focus is laid on both the institutional and disciplinary conditions for writing, as experienced and described by writers, and the actual practices of managing and intervening in language in the process of writing for publication.

I approach writing as situated within particular organisational and disciplinary frames, and thus embedded in evaluation practices that are often regulated institutionally (see Lillis 2013), for instance, by university administration or disciplinary conventions. By adopting the notion of *regime* (see Lillis 2013; cf. Sonntag & Cardinal 2015), I discuss the dynamics between these institutional structures for regulating research writing, and the actual writing and language-regulatory practices of scholars.

The questions addressed in the presentation are: (a) who intervenes or is expected to intervene, why, and in what ways, in the ‘quality’ of English during the process of writing a research paper for publication; (b) what value(s) writers place on language (e.g. in terms of its ‘correctness’), and (c) what kinds of norms of language and writing are produced and reproduced through the regulatory processes?

In the presentation, I draw on multiple data (research interviews with writers, text histories, recordings of writing clinic meetings and document data) collected mainly from multilingual scholars working in the field of computer science in Finland. I discuss my findings particularly in reference to an example case of a co-authored research paper and its trajectory from indicative abstract to a published paper and conference presentation. The data have been collected as part of the *Language Regulation in Academia* research project (see <http://www.helsinki.fi/project/lara>).

***Melting the ice: The rituals of “thin laughter” in first time cross-cultural encounters among Japanese, Koreans and Chinese*** (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.])

One phenomenon that can perplex people engaged in cross-cultural communication is the different ways in which people laugh in conversation. For instance, there is a stereotype that Japanese laugh and smile even when things are not funny or during sad or tragic situations. In previous studies, Hayakawa (2010) revealed that Japanese tend to laugh not only as reactions towards overt funniness (joke-telling, puns, etc.) or as mitigations to speech acts (commands, requests, criticisms, etc.), but often as fillers for silence or to prevent interactional awkwardness. Furthermore, laughter functions as response tokens that indicate agreement or active listenership. Comparing Japanese and British English speakers, Namba (2007) demonstrated that Japanese speakers and listeners had stronger tendencies to laugh simultaneously or initiate laughter than their British counterparts. Murata and Horii (2007) also perceived that Japanese-Chinese pairs produced less laughter towards propositional funniness but more laughter used as backchannels or reactive tokens, compared to Japanese-American pairs.

However, none of these studies discussed the rationale behind these ‘non-funny’, ‘simultaneous’ or ‘listener-oriented’ laughter which are associated with Japanese conversation.

This paper examines the pragmatic functions of subtle, non-funny laughter in conversation which I name “thin laughter.” I examine video-taped interactions of six cross-cultural pairs (Japanese-Korean, Japanese-Chinese) during a first encounter interactional context and analyze the emergence of thin laughter from a micro-ethnographic point of view. An initial study revealed that Japanese-Korean pairs produced more ‘synchronized’ thin laughter with the speaker and listener laughing simultaneously, whereas Japanese-Chinese pairs yielded more ‘independent’ thin laughter with only the listener or the speaker laughing. I also examined how ‘independent’ thin laughter may create grounds for the emergence of simultaneous thin laughter in a stretch of conversation. Explaining how and why simultaneous thin laughter emerge in interaction, I interpret the paralinguistic resonances of simultaneous thin laughter as a bodily ritual based on the notion of self within the theory of *Ba* (Shimizu 1995, 2016, Saft 2014, Hanks 2016). According to the theory of *ba*, *the self is understood as a* “dual-mode of existence”—consisting of the subjective/logical ego-centered domain and the predicative/emotional *basho domain*. I interpret simultaneous thin laughter to be emerging as “entrainment” occurring within the *basho* domain, pre-reflectively and non-strategically inducing the other’s act into one’s own in a non-separate state of the one and the other. I argue that the ritualistic thin laughter ‘melts’ the ice rather than ‘breaks’ the ice in face-to-face interactions.

***How wakimae works: An explanation in terms of ba based thinking*** (Contribution to *Emancipatory pragmatics: Approaching language and interaction from the perspective of Ba*, organized by Saft Scott [et al.]

Based on empirical data, Hill et.al. (1986) and Ide (1989) introduce the concept of *wakimae* as an aspect of linguistic politeness that can complement Linguistic Politeness (LP) à la Brown and Levinson (1978). Thus, although the term *wakimae* has long been recognized as an aspect of LP, thirty years have passed without a clear explanation of how exactly *wakimae* works. This presentation aims to provide that long awaited explanation of just how *wakimae* works. An understanding of the functioning of *wakimae* becomes possible by employing *ba* based thinking, which is a paradigm that complements scientific reductionist thinking. *Wakimae* is a Japanese term that represents the concept of ‘a discernment of what is called for in a situation’ (Hanks 2016). How can you know what is called for when speaking in everyday conversations? It would be difficult to imagine what *wakimae* is if you think of your utterance according to speech act theory, which appears to be the standard view in pragmatics. A speech act is an utterance defined in terms of a speaker’s intention and the effect it has on a listener. From the *wakimae* perspective, it is not sufficient to consider the speaker’s intention: the speaker’s attitude, reflected in indexing with honorifics or modality, must also be considered. Hanks (2016) claims that the ‘term “discernment” is a good approximation, but a bit heavy, since it implies cogitation and the intention to grasp, whereas *wakimae* is pre-reflective and pre-intentional -- similar to Merleau-Ponty’s “*prise de conscience*,” but at the level of a situation, not an individual corporeal schema’. How is it that speakers manage to employ *wakimae*? This presentation deals with the anatomy of pragmatics of LP (honorifics in particular) that is performed by fitting a modal expression to a situation. It will be argued that pragmatics consists of the dual functioning of recognition and perception by a speaker, who is embedded in the *ba*/context as a part of a whole. It will be discussed by employing ‘dual mode thinking’, one of the assumptions of *ba* based thinking.

**Reiko Ikeo**

***Discourse presentation in present-tense narratives*** (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

In recent fiction, the present tense has been more commonly employed, replacing the past tense, which has been regarded as the norm for narrative tense. For example, out of 102 novels which were shortlisted for the Man Booker Prize in the UK between 2000 and 2016, 31 (30.4%) apply the present tense to narration. This paper investigates how characters' discourse (speech, thoughts and writing) is depicted in present-tense narratives in fiction by analysing 3<sup>rd</sup>-person narratives. The paper examines in particular how the boundary between narration and characters' discourse is controlled, whether it is clearly demarcated, contracted or blurred, by the use of linguistic and non-linguistic means. The present tense can limit the narrator's scope of viewpoint because the narrator depicts but usually does not interpret or analyse what is currently happening in the narrative world (Casparis 1975). Linguistically, the verb tenses of narration and a character's discourse are more often the same in present-tense narrative. These two factors can contribute to minimizing the boundary between narration and a character's discourse. More precisely, a shift from narration to a character's discourse may be less noticeable than in past-tense narrative. Such smooth, inconspicuous shifts from a character's discourse presentation to narration or vice versa can lead to blurring the boundary between the external events and the internal state of a character, which Fludernik (1996: 254) points out as one of the effects that present tense narrative has on the reader. Instead of being accompanied by reporting clauses such as 'he says' and 'she thinks', a character's discourse can be introduced by the uses of proper nouns and other lexis which is more associated with the character than the narrator. When verb phrases are omitted from a character's discourse, the distinction between direct and indirect forms can often be blurred. However, the directness of a character's discourse can also be maintained in present-tense narrative by the uses of quotation marks, indentation and occasionally dashes.

***"Vegetables as a chore": Constructing a "picky eater" identity online*** (Contribution to *Food for thought and social action: Constructing ideologies in food-related communication across digital and cultural contexts*, organized by Gordon Cynthia [et al.]

Food and eating practices are loaded with symbolic, moral, and social meanings that are continually enacted and negotiated in everyday interactions. This study uses computer-mediated discourse analysis (Herring 2004) to investigate posts from an online health and weight loss discussion forum where users seek and share advice about improving their diets. We consider how expressing attitudes toward specific food items and eating practices creates a "picky eater" identity.

A "picky eater" is someone, often a child, who rejects familiar or unfamiliar food to a considerable degree (Thompson et al. 2014). To illuminate how this identity is discursively constructed (and constructed as undesirable), our analysis integrates the concept of master narratives (Tannen 2008), or cultural ideologies that shape the themes around which individual accounts of experiences are expressed, and theorizing on stance (Ochs 1993), especially how interlocutors display socially-recognized attitudes toward different foods. In the case of the self-identified picky eaters who seek advice for changing their eating habits, the master narrative is the assumption that a diet that consists predominantly of carbohydrates and other bland foods is a problem that needs to be solved through individual determination and active engagement. We identify two discursive strategies that create the socially meaningful stances that speak to this master narrative. First, by identifying foods they do and do not eat and referring to them in particular ways, posters construct the themes of childish versus adult eating practices, and of a taste-versus-nutrition struggle. For instance, one poster writes that when he and his wife eat out, he tends to "skip the salad" and instead chooses not only rolls and butter, but also "fried chicken tenders and fries with loads of ketchup and bbq sauce." These food preferences and choices index master narratives that connect food and identity; for example, chicken tenders/nuggets are primarily "kids' food" (e.g., Elliott 2011), and this ideology is explicitly realized when the poster notes, "My wife accuses me of eating like a 4 year old." Second, posters produce narratives of, and give and seek advice for, getting used to eating certain food items through conscious effort by making lexical choices that emphasize "food as nutrition and eating as a social and moral obligation" (Ochs and Shohet 2006: 39). The poster above, for instance, indicates that his desire to change his diet is shaped by weight concerns and the process involves hard work in terms of thinking about, finding, preparing, and getting used to healthy foods. For example, he notes, "I eat small salads out of veggies I can tolerate"; in a similar spirit, another picky-eating poster quoted in our abstract

title requests of others, “let me know if you figure out some way of not seeing vegetables as a chore.” The analysis contributes to our understanding of how stances toward food—which are shaped by the master narrative of food as an individual, moral choice—realize themes of struggle (adult/child, nutrition/taste) that construct, and problematize, the “picky eater” identity online.

*A study of shifting in gendered speech styles in Japanese* (Contribution to *Gender, regional and generational varieties in Japan: Re-exploring negotiation of identities*, organized by Nakane Ikuko [et al.]

From a perspective of style shifting, this study examines the ways in which the speakers shift between *genderless* and *gendered* styles in Japanese conversation and explores the sociopragmatic motivation behind such shifting. Due to increasing mobility across social groups, as well as geographic areas, and the development of various types of media, the distinction among regional dialects, for example, has been disappearing gradually in present-day Japanese, especially in the speech of younger generations. This does not necessarily mean the language is going toward the direction of standardization in a traditional sense. Instead, especially in casual conversation, various features once attributed to other varieties are now incorporated in the use of standard variety and vice versa. As a result, the boundary between the varieties has become less distinct. The use of genderlects is no exception. On one hand, in accordance with the change of social structure, intergender differences have been disappearing even in the standard variety as reflected in the recent usage of sentence final particles by younger speakers. On the other, linguistic features which used to be attributed to speakers of a specific gender can be often observed in the speech by the speakers of the opposite gender. This study addresses the latter phenomenon. The data is collected mainly from media interactions in which the individual speakers, regardless of their original gender identity, shift between “genderless” and “gendered” speech styles (even of the opposite gender) while the interlocutors/audience remain consistent. For example, a male speaker who, in the context of non-gendered speech, occasionally uses certain prosodic features, as well as other linguistic features such as first person referents and sentence final particles, stereotypically associated with female speakers. This study discusses such shifting in terms of gender identities and identity shift (Omoyini and White 2006) in relation to the gender stereotypes in the society, addressing the notions of audience design (Bell 1984, 2001), indexicality (Silverstein 2003), stance (Jaffe 2009), or communication accommodation (Giles 2009) as well. Discursive analysis of shifting in intraspeaker variation reveals that, through styling different selves in terms of gender, the speakers are not simply creating rapport with or distancing from the interlocutor(s)/audience of a specific gender. The study argues that the shifting to a gendered style can be motivated by the local topic when it is concerned with certain types of social activities where gender stereotypes prevail in the society. In discussing child-rearing, for example, the speakers may implicate higher expertise by shifting to the style of feminine gender and consequently make their comments sound more persuasive.

*Answering questions and questioning answers: The shifting dynamics of media interviewing practices* (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

Answering questions and questioning answers: The shifting dynamics of media interviewing practices Cornelia Ilie, Zayed University By virtue of its interactive and ritualised nature, the media interview (Montgomery 2007) is multifunctional in that it provides interviewers, on the one hand, and interviewees, on the other, with a public arena where they pursue their respective agendas through a question-answer exchange that is enacted for a multi-layered audience (e.g., members of the studio audience, TV-viewers representing a national and international public). Using skillfully designed questions (often framed as face-threatening acts - Bull et al.1996) and subsequent follow-ups (Ilie 2008), interviewers are actually staging a scrutiny of the interviewees’ answers and controversial viewpoints (Heritage 2002). On examining the question-answer sequences in interviews, a number of studies tend to focus mainly, and sometimes exclusively, on the number or form of questions and answers without carrying out an in-depth analysis of the underlying negotiation of the pros and cons of the issues under discussion, as well as of the institutional, interpersonal and power-based relationship between interviewers as questioners and interviewees as answerers (Ilie 2015). Two essential aspects of media interviews are often overlooked: (i) interviewers often pursue their particular agendas not by straightforward questioning, but rather by calling into question the interviewees and their reactions (Ilie 2011); (ii) interviewers

who are seen to ask challenging questions (e.g. accusatory questions, also called by Clayman and Heritage, 2002 splits, forks and contrasts) can be confronted with interviewees who are calling into question, rather than answering, those very questions. The present analysis focuses on the multiple functions and argumentative potential of interviewers' questions and interviewees' answers, which can be used and misused in unpredictable ways, for a variety of purposes and with far-reaching personal and political outcomes.

#### Matthew Ingram

#### *Stance attribution through mimetic enactments political rallies* (Contribution to *Stance-Taking in Interaction*, organized by Imo Wolfgang [et al.]

Stance, a discourse-analytic and socio-culturally informed concept, provides us with a unique rhetorical device we can use to understand the densely-textured means by which individuals position, evaluate, affiliate or disaffiliate with others in their social worlds (Bucholtz & Hall, 2010; DuBois, 2007; Englebretson, 2007; Jaffe, 2009). In this article, I explore how Donald Trump and Hillary Clinton used embodied impersonations (Hall, Goldstein, & Ingram, 2016), mimetic enactments (Streeck, 2002), or demonstrates (Clark, 1996) as this phenomenon has been called in the literature, to superimpose evaluative characterizations onto their (political) opponents. I argue that that during 2015-2016 American political campaign cycle, political candidates used stance attributions in not so subtle ways as a form of stylistic weaponry meant to damage each other's reputations in the fight to become the next American President. Although mimetic enactments can be commonly found in everyday interaction, there is a great deal of scholarly work still needed to be done from an interaction-based perspective that attends to the stancetaking forms of visuo-kinesthetic persuasion that appeals public audiences.

Scholars (Hall, Goldstein & Ingram, 2016) have started this discussion through the examination of Donald Trump's gestural impersonations during the Republican primaries. Hall et al. (2016) demonstrate that Trump's embodied impersonations, combined with his nicknaming practices, created a comedic weapon he used to create entertaining spectacles that denigrated his political opponents. In the same realm, Bucholtz and Hall (2016) have also suggested that the body (voice, gesture, space, etc.) has become a stylistic locus for managing ideological concerns and social values, particularly, as the voice and body are susceptible to ideological semiotic processes. Therefore, this analysis contributes to this emerging scholarship by analyzing some of the political theatrics created through mimetic enactments and how audiences respond or even encourage such productions. I explore the way mimetic enactments function as a type of political weaponry, as Clinton and Trump create experiential spectacles of each other and other opponents for the benefit of their audiences. In doing so, Clinton and Trump prompt audiences to share in the damaging stances or attitudes that are mapped onto their depicted characters. The understanding of mimetic enactments I put forth in this article is that they operate as rhetorically powerful type of ideological transfer (Coupland & Coupland, 2009) meant to prompt audiences to make harmful socio-indexical inferences and contrasts between their political candidate and others. In turn, mimetic enactments operate as rhetorically-charged visuo-kinesthetic line of argumentation that is meant to create identifications with the stances of a given political candidate/party. This, part of a larger project, raises questions about mimetic skillfulness as we look at some interactional segments that showcase some differences between two very different stylistic personas: a canonical politician and a reality television-turned American president.

***Managing topics in L2 Japanese: Identifying ‘development’ of interactional competences***  
(Contribution to *Interactional competence: CA perspectives on second language development*, organized by Pekarek Doehler Simona [et al.]

A growing number of CA-based studies have documented the development of L2 speakers’ interactional competences in various settings such as L2 classrooms (e.g., Hellermann, 2008) and beyond (e.g., Hall, Hellermann, & Pekarek Doehler, 2011; Pekarek Doehler & Berger, 2016). However, given that interactional competences are co-constructed, CA-SLA researchers need to overcome the conundrum of how to identify *development*. With the aim of tackling this conundrum, the present CA study analyzes different sets of video-recorded conversations in which Steve, an intermediate L2 speaker of Japanese, participated with different interlocutors during a period of 16 months. One set of conversations, collected at his university in the U.S. before and after he studied abroad in Japan, are both first-encounter conversations in which he interacted with an L1 Japanese speaker who he had never met before. Another set of data, collected during his study abroad, consists of nine conversations in which he interacted with his L1-Japanese friends. They are casual conversations and tutoring sessions.

By focusing on Steve’s actions in topic shifts (Jefferson, 1984; Maynard, 1980; Svennevig, 1999), the analysis documents his interactional competence in contributing to topic development and topic changes. The comparison of the two first-encounter conversations shows that, while there were frequent *disjunctive topic transitions* (Holt & Drew, 2005) in his pre-study-abroad conversation, the post-study-abroad conversation had only occasional disjunctive ones. Steve contributed greatly to *stepwise topic transitions* (Holt & Drew, 2005) in the latter and his use of linguistic resources for navigating the topics had greater variations. Such higher competences are also found in conversational encounters recorded during his study abroad, and this finding suggests the transportability of interactional competence. The present study also identifies practices that are found only in a particular conversational encounter, namely tutoring sessions, and thus points to the co-constructed nature of interactional competence that are highly local. This paper contributes to the research on *development* of interactional competences by exemplifying identification of what is transportable across situations and time, and what may not.

***Negotiating agency in educational sites: A narrative study of multilingual socialization of a language teacher*** (Contribution to *Critical Perspectives On Language Socialization Processes and Trajectories in (Bi-) Multilingual Contexts*, organized by Relaño Pastor Ana Maria [et al.]

This paper responds to the panel organizers’ call for research in language socialization in multilingual communities by focusing on the life trajectories of an Italian language teacher as she grew up bilingually in Europe and was gradually socialized multilingually into a range of educational sites more globally as her life unfolded primarily in greater Europe and North America. Although (language) learners’ socialization has been researched rigorously in various educational contexts (e.g., Bayley & Schechter, 2003; Duff et al., 2002; Ishihara & Takamiya, 2014; Kanagy, 1999; Kinginger, 2012; Li, 2013), development of second language teachers’ multilingual socialization and their negotiation of agentive identity have scarcely been highlighted. Rather, language teachers are often assumed to grow up monolingually (Menard-Warwick, Masters, & Orque, under

review; Palmer & Martinez, 2013). While it is true that some language teachers rely on their experience of primary language socialization, others do capitalize on their bi/multilingualism in their social and educational sites. Therefore, it is vital to investigate their language socialization to understand how their participation in the community shapes their membership and expertise as well as how these teachers in turn negotiate their multilingual agency in their efforts to instigate some educational changes. Drawing on Kayi-Aydar (2015) and Varghese (2012) in which the process of (language) socialization and discursive construction of identities were investigated through narratives, the study used life-history interviews as the major data source. The research data is based on a larger set of life-history interviews of 25 language teachers. While most of the teachers recounted their language socialization in a monolingual community, several were situated in bi/multilingual sites such as India, Haiti, Tanzania, the Philippines, the U.K., and the U.S. Among these, one of the teachers' narratives showed the breadth and fluidity of global mobility as well as the depth of language socialization in a most striking and complex manner, which has become the main focus of this study. Preliminary analysis has been conducted through deductive coding (Patton, 2002) based on themes including identity, agency, resources, expertise, power, positioning, resistance, and inclusion/exclusion. The narratives will be further analyzed in terms of what linguistic and interactional resources she resorted to in order to negotiate legitimate membership in a Spanish bilingual school community she entered as a minority parent, along with how her linguistic and professional expertise assisted her in exerting power enforcing bilingualism in the parents' meetings and thereby resisting the monolingual English dominance in that bilingual institution. Her pedagogy will also be investigated in terms of how she attempted to socialize her students into a rather simplified Italian cultural practice as well as how her students somewhat resisted the simplification. The class discussion in fact ended up with successful co-construction of a nuanced understanding of that particular cultural practice. The findings of this study assists in the collective understanding of language socialization in multilingual communities and educational institutions in which teacher agency leads to reproduction or reformulation (Garrett & Baquedano-Lopez, 2002) of education at local or macro level.

### **Johanna Isosävi**

***Perceptions of the use of address forms in Finland by the French and in France by the Finns*** (Contribution to *Address Forms across Cultures: A Cross-Cultural Comparison of Address Terms in Indo-European, Uralic and Altaic Languages*, organized by Bayyurt Yasemin [et al.]

In the study of address forms, the term “politeness” can hardly be avoided. Laymen often compare different languages: which language is the most polite? It is often said that the Polish are very polite, they use titles; in the United States, everyone uses first names and salespeople call their clients *honey/buddy*, and people are very informal (Braun 1988: 46). Finnish has been regarded in the media as a “clumsy” language – in comparison with English and French – which lacks established terms for calling a waiter (Isosävi 2010: 184). This study is a part of a larger post doc project with the purpose of comparing Finnish and French politeness. In this paper, I aim to examine perceptions of the use of address forms by people who come from a different culture. I will focus on two groups: firstly, French people living in Finland, and their perceptions of the use of address forms in Finland, and, secondly, Finns who are living or have been living in France, and their perceptions of the use of address forms in France. According to previous studies, there are differences in the use of forms of address: in Finnish, the informal pronoun of address *sinä* (*tu*, T-form) is much more used than the more formal *te* (*vous*, V-form), while nominal forms of address (such as *herra/Monsieur*) are less used than in French or other European languages (Isosävi & Lappalainen 2015). The corpus was collected through focus groups, which have the advantage of providing data on shared and contrasted conceptions (Dervin 2015). The data includes audio and video recordings of three French focus groups (13 participants), and two Finnish focus groups (9 participants). The questions asked were related to politeness: e.g. what the participants think is considered polite/impolite in Finland/France, what they appreciate in the Finnish/French politeness and what causes them problems. Even though forms of address were not explicitly mentioned in the questions, most groups talked about them. If the theme “forms of address” was not raised in a particular focus group, the researcher asked an open question on the subject in the end of the discussion. According to the preliminary results, the French participants, perhaps surprisingly, do not seem to be disturbed by the dominant use of T-forms in Finland, but they are more surprised by the wide use of first name or last name alone in formal contexts. The Finnish participants, especially students who returned from Erasmus exchange, emphasized the use of V-forms and nominal forms of address in France. Living between two cultures also raised a special question for French teachers living in Finland: should a teacher use the T- or the V-form when addressing a student? On the basis of different views expressed by the participants, the choice between these forms does not seem to be only a pedagogical question, but also a way to establish rapport with students.

***Teach me about liberalism: Construction of a social elite through English in the Japanese TV drama, Massan*** (Contribution to *Nationalism, Courtship, Elitism, and Enemy Language: Linguistic Ideologies in the Japanese TV Show "Massan"*, organized by Suzuki Satoko [et al.]

While the ability to speak English is a crucial social currency in the globalized society, the majority of Japanese lack such skills. For example, despite various proposals (e.g., English as a second official language by then-prime minister Obuchi in 2000 and *Action Plan* by MEXT in 2003), the Japanese still rank very low in standardized English tests such as TOEFL compared to other Asian counterparts (e.g. Hiramoto 2013:234; Seargeant 2009). Most Japanese have developed a "love and hate relationship with English" (McVeigh 2004) through their education and employment. Much recent scholarship examines ideologies of English in Japan in educational settings (Houghton and Rivers 2013; Kubota 1998; Seargeant 2009, 2011; Yamaguchi and Tollefson 2011) and the construction of English ideologies in the media (Furukawa 2014, 2015; Jackson and Kennett 2013). This paper intends to contribute to such dialogues by examining *Massan*, the first NHK drama featuring a foreigner as a main character. Aside from the story itself, English language has been a part of the audience's fascination from the beginning. This paper focuses on how a social elite was constructed and reinforced through the range of English used by various characters. In addition to *Massan* and Ellie, the two bilingual main characters, many supporting characters speak English. While some English usage is highly symbolic and triggers emotional reactions from both the characters and the audience, in more mundane episodes, ideologies of English is manifested through various means: highly conventionalized "English conversation," hyper-Japanized pronunciation, the content/context of the characters' speech, and metalinguistic comments. For example, while several well-educated characters use English with Ellie, their words are limited to greetings and set phrases. Another character uses hyper-Japanized pronunciation, especially with addressing other mono-lingual Japanese characters. Moreover, although *Massan*'s and Ellie's speech obviously represent competence in English, its role as a social currency is most highlighted in a subordinate character, Eiichiro, a university student whose father owns the company that *Massan* works for. Unlike other characters who are only capable of "conversational English," thus representing the Japanese as poor English learners, Eiichiro never greets anyone in English—which leads *Massan* and Ellie (and viewers alike) to believe that he cannot speak English. However, he surprises *Massan* and Ellie by requesting Ellie to teach him about European "liberalism" when he is making an arrangement with Ellie to begin English lessons. Neither *Massan* nor Ellie seem able to discuss such matters—highlighting Eiichiro's ability to express complex idea in the episode. Combined with his demeanor and skills in cooking, Ellie describes him as "smart and a gentleman," and others praise him as a "handsome boy who can speak English and cook." Eiichiro is clearly depicted in a strikingly different manner from not only other ordinary mono-lingual Japanese characters but also the two bilingual main characters who learned a second language in an immersion setting. His educational and financial background combined with his gender clearly marks his elite status. Such representation remarkably parallels the current discourse of elites (e.g., Jaworski and Thurlow 2009; Yamaguchi and Tollefson 2011).

### Shoichi Iwasaki

#### *Construction transportability across modes and genres* (Contribution to *Multiplicity in Grammar: Modes, Genres and Speaker's Knowledge*, organized by Iwasaki Shoichi [et al.]

Recent research in language use in different modes and genres has provided us with a cognitively based understanding of genre. The two strands of research tradition we present in this panel are the Multiple Grammar (MG) model and Construction Grammar (CxG). Based on the rich tradition of spoken and written language research (e.g. Chafe and Tannen 1987; Tannen 1982; Biber 1988, 1989; Miller and Weinert 2009 among others), Iwasaki (2015) proposes a cognitive model for speakers who use language in different modes. He shows that the same speaker demonstrates his ability to assemble different sets of linguistic resources in an informal conversation and an academic written text. Researchers in Construction Grammar, on the other hand, have noted that the grammatical resources (i.e. constructions) are not tied directly to a specific genre. Focusing on the "Stand-alone Noun Modification" construction in Japanese, Matsumoto (2015) shows that this construction appears in several unrelated genres (e.g. stage direction, blogs, non-academic essay etc.), and argues that it is its 'invocatory' function that the writers use to achieve a goal in these genres. Fischer (2015) also notes that several linguistic resources such as high pitch and shorter mean length of utterance (MLU) appear characteristically in child directed speech (CDS), but their employment is not dictated by this genre per se, but rather by speakers' awareness of the situation. Thus, when a speaker approaches a similar, but innovative, situation (e.g. talking to a humanoid robot), he may transport some CDS features. These findings highlight the importance of the language producer's perspective in creating a flexible genre rather than the static, probabilistic understanding of genres. In this paper, I will further extend this approach to cross-modal construction transportability through an analysis of a political debate in Japanese. Politicians in political debate usually employ resources they have acquired from written language, that is, they speak like they write, but occasionally they shift to a colloquial conversational mode when they directly involve the opponent. It will be concluded that while genre in spoken or written mode may be a useful heuristic approach, examination of actual linguistic activities reveals speakers are flexible enough to cope with the local demand. This view can be also applied to any conversational interaction where speakers attend different local demands by using varied linguistics resources, suggesting that a speaker/writer enters into a language activity with an initial understanding of the frame, but adjusts his speech/writing as specific needs arise. I suggest this approach will lead us to a sounder, cognitive based understanding of genres.

***Storytelling as social and cultural practice: The degree of audience participation and co-telling and collaboration in English and Japanese first-encounter conversations***

(Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

Ritual practices have a broad interface with (im)politeness and play a key role in daily interpersonal interactions. People perform ritual behavior not only in ceremonies but also in daily exchanges, therefore, it is a tool for communities to maintain their interaction norms (Kádár, 2013; 2016). The following study investigates how people tell and co-tell stories in English and Japanese first-encounter conversations, and how ritual manifests itself in their storytelling.

Since storytelling is a joint venture of the interlocutors, the analysis focuses on both speakers' and listeners' roles. In this study, forty 30-minute conversations between three males were collected in Japan, the United Kingdom, the United States, and Australia (ten conversations in each country) and analyzed in order to examine the pragmatic usage of the speakers.

There are three primary findings. First, the analysis reveals that English and Japanese participants tell stories in different ways. English speakers tend to tell stories *with* the other participants while the Japanese tend to tell stories *to* the other participants. In English conversations, not only speakers but also listeners are actively involved in storytelling. The listeners co-construct and elaborate stories with a speaker (teller) in an interactive style. They display involvement in a telling of the story such as asking questions to elicit further information, making predicting or assessment comments and telling stories related to the speaker's topic during the storytelling. In addition, the listeners give a second story to show understanding of the point of the story upon story completion (Sacks, [1970], 1992). The findings support earlier research which found that listeners become co-authors of the stories (Duranti, 1986; De Fina & Georgakopoulou, 2012).

Second, in contrast to the patterns uncovered in the conversations held in English, the analysis shows that storytelling in Japanese conversations tends to be monologic and that the listeners rarely interfere in any way with the telling or participation in the evaluation. The listeners encourage speakers to tell stories by back channeling. They seldom ask information-seeking questions or make predicting or assessment comments, nor do they tell any related stories. In other words, speakers are the main tellers and listeners encourage them to tell a story by being a "good" listener. Only in this sense do Japanese interlocutors co-narrate stories.

Third, in contrast to previous research, it was found that toward the end of longer story-telling sequences, Japanese speakers begin to take a more active role. For example, the listeners start to ask questions, make predicting comments and guess what the speaker would have said in the story. The listeners in Japanese conversations co-narrate the story with the speaker in an interactive way, too, but not at the beginning of the conversation. This may be due to the interlocutors feeling more at ease toward the end of a longer turn and more confident about what they can contribute to the co-storytelling. This finding is significant because it has implications for the teaching of appropriate pragmatic usage in both English and in Japanese as a foreign language.

***Shedding light on the relationship between indirect evidentiality and mitigation: A reanalysis of the so-called markers of general or unspecified indirect evidence***

(Contribution to *The Interrelation between Evidentiality, Mitigation and Appraisal across Genres*, organized by Figueras Bates Carolina [et al.]

The most influential classifications of evidentials include a broad area called *indirect* or *non-firsthand evidentiality* wherein three main subtypes of evidentials are usually located under different terms: (a) hearsay, reportative or reported evidence, (b) inferential or inferring/inferred evidence, and (c) assumptive, presumptive or assumed evidence (Anderson 1986; Chafe 1986; Willett 1988; Aikhenvald 2004: 63-64; Plungian 2010). Most of the linguistic items and constructions analysed as evidentials in European languages and, especially, in Spanish, are mainly considered to be indirect or non-firsthand evidentials. When their semantics and pragmatics are studied, many of these items are not assigned to any specific subtype of indirect evidentiality (be it reportative, inferential or assumptive), but are semantically described as markers of general or unspecified

indirect evidentiality. This means that contextually they can be used not only when the evidence is reported, but also when it is inferred or assumed: see, for example, De Haan (2005: 314), on Dutch *moeten* ('must'), Bermúdez (2005: 27) on Spanish *parece* ('it seems') or Wiemer (2010: 104-105) on similar parentheticals in different languages (French *paraît-il*, Italian *a quanto pare*, etc.). Among the items that are often analysed as markers of unspecified indirect evidence in Spanish are found adverbs and adverbials such as *al parecer*, *por lo visto*, *supuestamente*, *presuntamente* or *aparentemente* (González Ramos 2005: 225; Hennemann 2013: 143-145; Martín Zorraquino 2013: 117-118; Rodríguez Ramalle 2013: 184; Estellés & Albelda 2014: 34; Cornillie & Gras 2015: 12; Kotwica 2015: 157; Torner 2016).

These expressions are frequently used in different journalistic and media genres as recurrent mitigating strategies, since they allow speakers to avoid full commitment regarding the states of affairs that are being communicated. In fact, many of these items have also usually been included in the inventories of mitigating strategies (see Albelda 2010, 2016, Albelda & Cesteros 2011, Albelda et al. 2014, Briz 2011, Briz & Albelda 2013). Thus, the prevalence of indirect evidentials in the descriptive studies on evidentiality applied to European languages favours the explicit or implicit connection between evidentiality and mitigation.

The aim of this contribution is to suggest and show that *general* or *unspecified indirect evidentials* do not actually exist, and that the items which are analysed under this category are actually specialised in (a) the marking of a specific type of indirect evidentiality (reportative, inferential or assumptive) or (b) the expression of non-commitment towards the content communicated, which are sometimes labelled *médiatifs* in the French-speaking literature (Guentchéva 1996, 2014; Lazard 1999, 2000) and are prototypical mitigating devices. This hypothesis will be justified with different arguments and will serve as the grounds of a reanalysis of the relationship between (indirect) evidentiality and mitigation.

#### ***A technical analysis of scaling in rehabilitation team talk*** (Contribution to *Upgrading/Downgrading in Interaction*, organized by Prior Matthew [et al.])

Based on an analysis of audiovisual data from multidisciplinary rehabilitation team meetings in Japan, this paper investigates how rehabilitation team members comprised of a physician, nurses, therapists, a medical social worker, and a dietician collaboratively negotiate dietary prescriptions when treating stroke patients suffering from dysphagia (or difficulty in eating and swallowing). Dysphagia can be scaled by the level of patients' swallowing capacity; the lower the level, the more elaborate food modification is required. The paper first conducts componential analysis to uncover semantic arrangements among dysphagia diets comprising 5 diet categories (i.e., regular diet, soft diet, bite-sized diet, minced diet, and puree diet). Next, the paper draws on occasioned semantics to systematically illustrate how such semantic backgrounds are realized in actual talk. Analysis focuses on two scalar phenomena in oppositional sequences: (1) justifying claims by upgrading semantic strength; and (2) negotiating medical decisions by regrading semantic strength between two scalar relations. Analysis reveals that team members use the semantic setup of dysphagia diets as the basis for evaluating the level of patients' dysphagia, creating semantic relations in the midst of conversation. Moreover, analysis shows that the use of scaling diagrams is helpful in explicating scalar relations co-constructed in actual interactive talk and understanding the mechanism of sense making practices. The paper shifts analytic attention to conversational uses of scales by integrating ethnographic dimensions of medical diagnostics and scaled criteria into the analysis of scaling practices. In so doing, the paper explores the interplay between a culturally shared, scaled semantic system and actual talk.

#### ***Regularity outside argument structure: Sequential ordering in final position*** (Contribution to *Sequentiality and Constructionalization of Discourse-Pragmatic Markers*, organized by Higashiizumi Yuko [et al.])

A growing interest in naturally occurring conversations has led linguists to posit two distinct categories of grammar, such as "thetical grammar and sentence grammar" (Kaltenböck et al. 2011) and "macrogrammar and microgrammar" (Haselow 2016). Although formal identification criteria differ, both thetical and macro grammars pertain to elements that are "shaped primarily by the situation of discourse" (Kaltenböck et al. 2011: 874, also see Haselow 2016: 81), such as discourse organization, speaker-addressee interaction, and discourse context. They are not governed by "canonical rules of syntax" (Kaltenböck et al. 2011: 858) or "morphosyntactic dependency relations" (Haselow 2016: 82). Since thetical/macro grammar concerns linguistic elements which occur "'outside' core grammar" (Haselow

2016: 78) or clausal structure, the linguistic elements that belong to these grammars are often characterized by their “resilience” (Kaltenböck et al. 2011: 877) or “plasticity” (Haselow 2016: 79). However, such a flexible nature is somewhat incongruent with the classical notion of grammar. It leaves us a question: what kind of regularity or structural patterns are supposed to be attested in the phenomena dealt with in these grammars. Our study argues that sentence- and utterance-final pragmatic markers in Japanese are regulated in a varying degree by the same ordering principle: more addressee-oriented markers follow less addressee-oriented ones in the linear production of utterances (cf. Saji 2001: 8). Final particles, a type of pragmatic marker, are strictly regulated by this principle as in (1). The particle *-ne* ‘right,’ used for soliciting an addressee’s agreement or confirmation, always comes after *-yo* ‘I tell you,’ a marker of information giving. The reversed order *-ne-yo* yields an ungrammatical sentence.

(1) *Tukareru-yo-ne-ne-yo*. ‘It’s tiresome, (I tell you), right?’

A similar sequential ordering is operative, though less rigorously, in the elements that occur outside a clause as in (2), where *desho* ‘isn’t it,’ an agreement-seeking marker, is more likely to follow *demo* ‘though,’ a pragmatic marker of concession. The reversed order *desho, demo* results in an awkward utterance.

(2) *Tukareru-yo-ne demo, desho/desho, demo*. ‘It’s tiresome though, isn’t it?’

These examples illustrate that the same ordering principle applies to the sequence of pragmatic markers at the extra-clausal as well as intra-clausal level, implicating that a dichotomy between thetical/macro grammar and sentence/micro grammar can hardly be maintained as it stands. In agglutinative languages like Japanese, final particles as in (1), which may be functionally viewed as elements of thetical/macro grammar, percolate into clausal structures governed by the morpho-syntax of the language.

Moreover, we would like to suggest that this ordering principle is not necessarily language-specific or typologically unique. Our brief survey of the Santa Barbara Corpus finds similar patterns concerning the ordering of final pragmatic markers in American English. For example, question tags follow the concessive marker *though* in all their combinations found in the corpus. From a processing perspective, the ordering pattern discussed in this study reflects a natural sequence of information packaging: from a clause denoting a proposition, through markers indicating a speaker’s manipulation of the proposition, and then to elements inviting an addressee’s reaction to the proposition (cf. Minami 1993, Shinzato 2007).

#### *Giving back to professionals: Formulating recommendations as a venue for co-creation*

(Contribution to *Research versus Practice: Towards a Stronger Partnership between Academia and the Real World in the Study of Institutional Discourse*, organized by Vandendaele Astrid [et al.]

An important aspect of the researcher-practitioner gap is the difficulty that researchers experience in reporting back their findings to the practitioners. Due to differences in time dimensions, communication practices, rigor, relevance, frameworks and methods of inquiry (Bartunek & Rynes 2014), academics and practitioners do not always manage to find a middle ground where research is translated in recommendations that respect the academic framework (i.e. in terms of generalizability, nuance and complexity), while still being clear, concrete and relevant for the practitioner. Although some researchers have reflected on their experience with reporting back to practitioners (Roberts & Sarangi 2003), or, more generally, informants (Stewart & Draper 2009), this aspect of doing research has largely remained unexplored. In this paper, we reflect on our experience with reporting back to practitioners, drawing from our fieldwork experience at a pharmaceutical company. The fieldwork focused on the production processes underlying health news, as part of a bigger, transdisciplinary project on the stakeholder interaction in and production, content, interpretation of health news. We analyse an

audio-recorded follow-up meeting, during which we presented the findings of fieldwork, as well as more general findings of the transdisciplinary research effort. We presented these findings to two practitioners: the gatekeeper and the main informant. By analysing the audio-recording, we want to gain insight in: (1) Whether and how new knowledge is co-created in the process of reporting back to these practitioners, (2) Which mechanisms and strategies we can identify to improve the clarity and usefulness of the reported findings for the practitioners, as well as venues for co-creation. We invited one of the practitioners, also the third author of this paper, to participate in this reflection, and to comment on the meeting in general, and our discursive analysis of the meeting. During this meeting, we discussed elements of health news production that were relevant for the practitioners in terms of communication and PR, including stakeholder interactions, topics and themes, journalistic practices and production processes and lay audience interpretation strategies, as well as the company's identity building and representation towards the outside world and in the press. By analysing this meeting as newly co-created data, we aim to address a few particular challenges in reporting back to practitioners, like the differences in academic and professional register, formulating recommendations as non-professionals for the already experienced and expert practitioner, and translating the gist of the academic papers on the fieldwork to concrete recommendations. With our study, we want to demonstrate that how our academic view and rigour can become a tool for new insights for the practitioner, rather than create a gap, and how academics and practitioners can find a middle ground for co-creating knowledge and co-interpreting results, rather than unidirectionally reporting these from the researcher to the practitioner.

#### Marco Jacquemet

***The transidiomatic subject: Credibility and intentionality in the asylum court.*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

The experience of linguistic globalization, and the sociolinguistic disorder it entails, requires a serious retooling of basic units of sociolinguistic analysis—foremost among them the concept of the speaking subject. The randomness and indeterminacy of contemporary flows of people, languages, and knowledge across social and geographical space are affecting both the linguistic boundaries of membership and the way people make sense of each other's intentions. In particular, we can no longer assume that people involved in a transidiomatic interaction (i.e. an interaction taking place over multiple languages enhanced by various digital communication technologies) share a common understanding of appropriate discourse strategies. Using ethnographic evidence from asylum hearings in various European states (Italy, Belgium, the United Kingdom, and Albania), this paper explores the problematic nature of determining credibility in these multilingual, intercultural, and digitally enhanced contexts (Jacquemet 2011, 2015). This paper argues that scholars must go beyond an idealized notion of the subject to examine communicative subjectivities shaped by a linguistics of xenoglossic becoming, transidiomatic mixing, and communicative recombinations.

#### Jérôme Jacquin

***Multimodal politeness resources in New Zealand English management meetings***  
(Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

Previous studies suggest that New Zealand English speakers tend to strongly mitigate or even avoid the direct expression of disagreement (e.g. Holmes, 1995; Holmes & Marra, 2004; Marra, 2012). In other words, they display a strong preference for agreement, implicitness and softening strategies such as tag questions, hedges, gambits and hesitations. Adopting a multimodal perspective, Stadler (2006, p. ii) notes that “New Zealanders’ non-verbal behaviour in disagreements differs little from their behaviour in neutral speech”, which consists, for example, of looking at the recipient less directly than in other cultures (e.g. in Germany). However, Stadler’s analysis is purely quantitative and no attention is paid to the situated coordination of verbal and non-verbal resources.

Drawing on a descriptive and language oriented approach to argumentation (Doury, 1997, 2012; Jacquin, 2014;

Jacquín & Micheli, 2012; Plantin, 1996, 2012), this paper explores the multimodal dimension of argumentation in talk-in-interaction by looking at the various resources that are used by the speaker to “disagree without being disagreeable” (Marra, 2012). Data are taken from a video-recorded corpus of management meetings held in 2005 in New Zealand and recorded by the Language in the Workplace Project (e.g. Holmes, Marra, & Vine, 2011).

Linguistic, sequential, and multimodal analysis of various extracts shows the crucial importance – for the expression and accountability of the disagreement – of polyphonic negations combined with shifts in gaze direction and/or pointing gestures. While verbal negative formulations allow the speakers to uncover (and contest) contextually relevant points of view without having to attribute them to other participants in an explicit way (e.g. Ducrot, 1984; Nølke, 1992), shifts in gaze direction and/or pointing gestures are used to refer to participants who actually or potentially endorse such contested points of view. These complex multimodal resources appear as a politeness strategy to indirectly refer to the origin of the disagreement and therefore to counterbalance the New Zealand preference for mitigation.

This combination of resources taken from different semiotic repertoires in salient, sequential points of turn-at-talk – i.e. what Stukenbrock (2015) calls “Multimodaler Verdichtungsräume” [Multimodal Compaction Zones] – suggest the relevance of potential “Multimodal Gestalts” (Mondada, 2014) whose identification and description consist of interesting theoretical and analytical challenges for Politeness Theory and for Pragmatics in general.

### Sabine Jautz

***The initiation of change: Evidence from coaching sessions and debriefings*** (Contribution to *The Pragmatics of Change in Therapy and Related Formats*, organized by Graf Eva-Maria [et al.])

Asking different kinds of questions or listening actively are but two of many tools (cf. Albrecht/ Perrin 2013, Klein 2001, Menzel 2008) which coaches have at their disposal to initiate and co-construct changes of perspective with their clients (cf. Graf 2015, Habscheid 2003, 2015, Nothdurft 1984, Spranz-Fogasy 2014) so that the latter are able to achieve a specific personal or professional goal (cf. Nazarkiewicz/ Krämer 2012). There are different indicators as to what initiates change using such tools: Keywords or specific episodes in

clients" narrations may be taken up by coaches in their questions, which, in turn, may lead clients to elaborate on them and thereby develop a new perspective on a specific matter; or clients may discover a keyword in what a coach says and use that in order to develop a new perspective. Such initiators of change and how they are employed can be detected in careful analyses of transcripts of coaching sessions. What proves additionally helpful is clients" as well as coaches" reflections (and assessments) of such sessions in general and the use of specific interventions in particular. In this paper it shall be attempted to compare what is mentioned in debriefings to what is said in coaching sessions: Transcriptions of audio-recordings of training sessions for coaches as well as debriefings in which coaches, clients and observers comment on how they have experienced the coaching session serve as data to qualitatively investigate and illustrate what initiates change. Analyses combine insights from conversation analysis, ethnomethodology, critical discourse analysis as well as from sociolinguistic and pragmatic approaches (cf. Graf/ Aksu/ Rettinger 2010, Kallmeyer 2000). Pieces of evidence for the initiation of change from coaching sessions comprise repetitions of key terms by coaches and clients alike, or issues suggested by coaches taken up and elaborated on by clients (verbally or in terms of contents) which ultimately leads to an advance of the conversation towards establishing a different perspective on the issue under discussion (cf. Buchholz/ Reich 2015, Günthner 2002, Scarvaglieri 2015). Debriefings comprise concrete assessments as to which interventions clients consider helpful and why, and reflections by coaches which interventions they have taken into consideration and why they have decided for or against them. Data is taken from training sessions which serve to practise different kinds of interventions in different interactional formats (especially regarding the degree of involvement of the coach) and form part of a further education programme for coaches and advisors in university/ college contexts. Knowing more about how it actually shows in conversations that interventions prove helpful to initiate change may not only help clients in their current situation, but it may also help to improve training programmes (cf. Graf 2011): Here the focus may not only be on teaching certain interventions and how they can be realized linguistically, but an additional focus can be to learn to pay attention to indicators of change right from the start and to tailor subsequent interventions accordingly by examining transcripts.

***Fillers and their interactional function. On the contribution of speakers' eye gaze and gesture to the turn management function of fillers.*** (Contribution to *Multimodal Turn-Taking*, organized by Zima Elisabeth [et al.]

Although fillers have been studied extensively from different perspectives, there still remains some confusion about which function they fulfill at which specific moment in interaction (Clark & Fox Tree 2002). Studies on the formal variation between fillers on different levels of expression have tried to offer an explanation for this functional difference. On the verbal level, a difference between 'uh' and 'um' has been described (Clark & Fox Tree 2002). On the para-verbal level, a difference was found in the length of the pauses surrounding the filler (Swerts 1998). On the non-verbal level, different gestures during fillers are related to their function (Navarretta 2015).

In the present study, formal differences between fillers are mapped onto their functions as a turn management cue in interaction: a filler can function as a turn holding, a turn taking, or a turn eliciting cue (Maclay & Osgood 1959, Beattie 1983, Goodwin & Goodwin 1986). We analyzed fillers together with the accompanying eye gaze and gestures to offer a truly multimodal account. In particular, our study focuses on the kind of gesture and gaze pattern co-occurring with fillers, as well as on the precise timing of the gaze shifts accompanying fillers. For this purpose, we analyzed three unscripted triadic conversations of approximately 15 minutes in Dutch between acquainted students. We used mobile eye tracking glasses to get an accurate overview of speakers' eye gaze during fillers. The conversations were transcribed and annotated for the exact linguistic form, surrounding pauses, gestures and eye gaze. Our analysis reveals that fillers with a different interactional function indeed manifest formal differences. When a filler is used in turn-final position, it is more likely to be longer, to have the vocalic-nasal form 'euhm' and to be surrounded by pauses. Also on the non-verbal level, striking differences were found: speakers tend to avert their gaze more often during a turn-final filler, and gesture less than during a turn-medial filler. These results demonstrate that a multimodal analysis of fillers is very useful to distinguish their different interactional functions. Moreover, the interplay of the co-occurring verbal and non-verbal elements feeds our understanding of an interactional mechanism such as turn management.

***Affective stances in the #jesuisCharlie Twitter discussion*** (Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

The terrorist attack at the editorial offices of the French satirical magazine *Charlie Hebdo* in January 2015 was a major news event that was followed by media coverage across the world. On social media, it was one of the most tweeted news events in the history of Twitter, with several million tweets, creating global digital interaction. The main hashtag in this discussion was based on the logo *Je suis Charlie (I am Charlie)*, created by Joachim Roncin, accompanied by other supporting or opposing hashtags. Even though Twitter users are networking participants, the audience remain fragmented and divided (Marwick and boyd 2011; Androutsopoulos 2014). This can be seen in tweets that were sent in English: they shared information about the event and expressed solidarity and sorrow but also adopted ironic and parodic stances (Johansson et al. 2015).

In this paper, we examine affective stances with the hashtag #jesuisCharlie. We look at tweets that construct discursive meaning through emotional expression about the event. Emotions are cognitive and subjective because they are evaluative expressions of internally represented knowledge (Schwarz-Friesel 2015: 161). In addition, they are embodied, interpersonal, and culture-bound (e.g., Wierzbicka 1999). In socially shared situations, they can enhance solidarity and create bonds within an imagined collectivity (Anderson 1983), but they can also be used to delegitimize collective affectivity and emotions (Papacharissi 2015: 89). Our objectives are to study 1) the kinds of affective stance found in this Twitter feed and their mode of expression (DuBois

2007) and 2) the differences between them in different languages. Our hypothesis is that the affective stances of solidarity and sorrow are shared across different cultural contexts that are reflected in tweets in different languages, but that the opposing stances differ among them. The data for this study consist of the tweets with the hashtag #jesuisCharlie posted between January 7 and 14, 2015. Altogether, the multilingual data include nearly 1,200,000 tweets, of which we analyze the English, French, and Finnish ones, that is, 1,023,043 tweets (991,471 after excluding retweets). Our methodological approach is composed of both language technology methods that allow the linguistic study of large datasets and qualitative digital discourse analysis. First, to explore the variations in tweets in terms of topics and expression of stance, we apply *clustering* with the *word2vec* algorithm (Mikolov et al. 2013), a machine learning technique that enables the grouping of topically similar tweets into the same clusters. This presents the global anatomy of the tweets and permits the analysis of the distribution of different tweets in the three languages. Second, we focus on the clusters that typically include different expressions of affective stance, and we take a closer, qualitative look at the linguistic contexts in which they emerge and what the tweets' function is within them.

***Pivot questions: Lawyer strategies in first cross-examination questions in 19th century Old Bailey criminal trials*** (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

The first questions put to witnesses in cross-examination are pragmatically important, being the pivots on which narrative accounts turn. Witness examination structure (examination-in-chief^cross-examination^ re-examination) presents the cross-examiner with a context for "strategic" pragmatic work (Woodbury 1984). Just like the sonnet's *volta*, or turn, which comes just over midway through, invoking a transformative moment, cross-examination has the potential for "springing a naughty surprise" (Fussell 1979: 118) on the witness and bringing about a sudden change in the jury's perspective. I have called these first cross-examination questions 'pivot questions' because of their pivotal and transformational role in the witness appearance, where examination gives way to cross-examination. Although the prosecution voice withdraws and a new defence voice enters, the witness stays the same; nevertheless the witness voice is as much transformed as the lawyer's, as s/he responds to a range of lawyer strategies, including irony and mockery, which produce diverse, damaging effects. Drawing on previous studies on questioning and courtroom questioning (e.g. Atkinson and Drew 1979; Ilie 1995, 2015; Luchjenbroers 1997) and using a combined corpus-based discourse-pragmatic approach to the professional discourse of forensic courtroom questioning (Coulthard, Johnson and Wright 2016), this paper considers the first cross-examination questions of a single barrister, Mr Horry, in a corpus of 1,007 trials from his 38-year career (1837-1875) at the Old Bailey courthouse, where he appeared mostly for the defence. Compiled from the Old Bailey Proceedings Online (Emsley et al. 2016), the corpus allows for the examination of Horry's defence voice (e.g. evaluating, doubting, mocking). This "voicing contrast" (Agha 2005: 39) is concerned with the production effects (Matoesian 2001: 133) of advocacy, which re-shape meaning through institutional practices and *repertoires* (Lave and Wenger 1991). The changing advocate voice not only alters the

tone of questioning, but also brings about a change in the witness voice, so that prosecution testimony, which invites commiseration, is supplanted with testimony that is self-protective, potentially turning juries' affective responses from alignment to disapproval and disalignment. Pivot questions and their answers reconfigure the witness story as these questions launch the narrative into another direction, undoing the carefully painted prosecution picture and turning prosecution events from crime narrative to doubtful tale, caricature and even entertainment.

***Politeness in eighteenth-century England: Literary evidence*** (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

The eighteenth century in England was the age of politeness. Politeness was an ideology which the higher social classes used to distinguish themselves from the lower social classes and which the lower social classes tried to use as a stepping stone to give them access to social advancement. The century is rich in didactic literature, from grammar books and dictionaries to conduct books, educational literature and didactic works of fiction. Particularly noteworthy in this respect are educational plays and epistolary novels. In a previous study I analysed Richard Steele's sentimental comedy "The Conscious Lovers" (1722) and George Lillo's domestic tragedy "The London Merchant, or the History of George Barnwell" (1731) (Jucker 2016), both of which had a very clear didactic purpose. Through the actions of the characters, the author tried explicitly (as can be seen in the prefaces to these plays) to have a positive influence on their audience. In this contribution I want to extend the analysis to epistolary novels, such as Samuel Richardson's *Pamela* (1740) and *Clarissa* (1747/48) and Frances Burney's *Evelina* (1778), which have an equally strong didactic goal. They aimed to entertain as well as to instruct and improve their readers in a world of intricate social complexities where only moral virtues and sensibilities could guarantee an appropriate social place for both the fictional protagonists and their readers. The analysis uses an ethnographic approach that focuses on discursive negotiations of proper behaviour and politeness both in the prefatorial interactions between author and reader and in the fictional interactions between the letter writers and the other characters of these novels.

***Rejecting 'foreignness' in Korean reality TV show with multi-national participants***

(Contribution to *Producing 'Foreigners' in TV Entertainment Shows: Sequence, Categorization, and Multisemiotic Practices*, organized by Kasper Gabriele [et al.]

Categorization and construction of “foreignness” is an often utilized concept in Korean reality television shows. Real-time discussion on various topics by participants from diverse international origins have constituted a popular sector in Korean television (i.e., *Misuda* “The beauties’ chatterbox”; *Bijeongsanghoedam* “Non-Summit”) with the participants’ varying levels of Korean language proficiency as well as their display of “foreignness” ranking up the entertainment factor. This study examines another similar yet different TV show, *Babel 250*, in which such “foreignness” is not only occasionally invoked, but rather constitutes the very core of the production theme. Using Conversation Analysis and Membership Categorization Analysis (Fitzgerald & Housley, 2015), this study aims to examine how participants use multimodal resources (Mondada, 2014) to reject the categorization of ‘foreignness,’ while constructing their individual identity void of language and culture specific assumptions.

The main concept of *Babel 250* is to construct a self-supported community with a new language system that embodies the characteristics of each of the six participants’ individual language and culture. The participants, all new to Korea with the exception of one Korean participant, are required to only speak their language—neither Korean nor English—as they attempt to build a community in a rural area of South Korea. Consequently, telops (Television Opaque Projector; images, captions and sound superimposed on the screen in postproduction) expand beyond their original use as commenting devices, and are fully utilized as the main source of communication between the participants and the TV audience. Moreover, to obtain provisions for survival, participants take part in errands for local farmers—who only speak Korean, thus creating instances in which one or more of the participants are constructed as “foreigner” who needs to learn (or be taught) Korean language and culture, despite the rules of the show. This study examines a collection of sequences in which such categorization is rejected by the participants. In one example, the Brazilian participant, Mattheus, interacts with a local while resting after farm work. The local Korean woman offers him *saecham* (meals provided between farm work) and instructs him to sit down and eat. Seeing that Mattheus has difficulty sitting on the floor, she initiates an instruction of the different ways of sitting, utilizing Korean-culture relevant categorization, “appa-dari (daddy legs)” and “emma-dari (mommy legs).” By doing so, she immediately constructs Mattheus as a “foreigner” who does not know how to sit like a Korean. A few attempts show that indeed he is not able to sit in either of the instructed positions, confirming the apropos categorization. However, instead of accepting the implied and verified categorization, Mattheus shifts into another posture that he labels with a non-categorical description “Mattheus-dari (Mattheus’ legs),” thus rejecting the categorization, and insisting on his uniqueness as an individual.

Based on such examples, this presentation will illustrate the distinct practices and interactional consequences of ‘foreign’ participants’ construction and rejection as category incumbents. The possible impact that such categorization has on the audience and their understanding of ‘foreignness’ will be discussed. (word count: 493)

#### Konstanze Jungbluth

*Bueno doncs, a: Ve(u)re ‘well, then, let’s see’*. (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

*Bueno doncs, a: ve(u)re ‘well, then, let’s see’*.

Selection and temporal sequence of turn initial pragmatic markers in Catalan used by L1 and L2 speakers. Participating in formal and informal conversations among interlocutors of different L1 in Barcelona, Catalonia, one may observe that the speakers accommodate to each other by using pragmatic markers of Catalan when speaking Spanish, so called Catalan Spanish (Sinner 2004; Jungbluth 2007). However, in a reciprocal manner they may use Spanish pragmatic markers when talking Catalan or even may pile up markers of both languages as shown in the title of this abstract. Here the combination of Spanish *bueno* ‘well’ with Catalan *doncs* ‘then’ and Catalan *a veure* ‘let’s see’ introduces a turn in Catalan (‘starter’ cf. Heritage 2013). Most of the other turns forming part of the same corpus (*Corpus audiovisual plurilingüe*, Payrató/Fitó 2008) show only one or two of the same pragmatic markers in turn-initial position, some speakers use other markers among them Catalan *bé* ‘well’. The informants observed in the corpus are students of the UB (Universitat de Barcelona, mainly of the faculty of Economics) and the data is elicited by professors or co-fellows of them representing a formal spoken register. Every informant performs 5 text genres: narrative, descriptive, argumentative, explication and

instruction twice. The one set is experimental using fotos and drawings as stimuli, the other one is based on experience simply requested for. The aim of my contribution is to show the different choices, their frequency and the context, taking into account not only the immediately following words of the utterance (microcontext), the syntactical integration of the observed markers and the text genres, but also the participants of the ongoing dialogue. Beside of the function to show the interpersonal relationships of the participants the pragmatic markers encode the relation of the propositional part of the turn initiated to the foregoing turn and sometimes the speaker's stance, attitude, emotional state towards it. The also turn-initially used Catalan pragmatic marker *va*: 'great' used among interlocutors of Catalan Spanish is known to function as identity marker used by Catalans who express themselves in this regional Spanish variety (Jungbluth 2007: 94). However, so far there is no research on the use of pragmatic markers used by L1 Spanish speakers expressing themselves in Catalan.

##### *Whose crisis? Intentionality in European attitudes on the refugee crisis* (Contribution to *Responsibility, migration, and integration*, organized by Östman Jan-Ola [et al.]

Refugee-crisis discourse in EU Member States has taken fundamentally different perspectives. More than anything else, it reflects the deep moral and cultural dissonance in the EU, disregarding the human crisis at its borders. Perspectives on the refugee crisis present different attitudes, such as acceptance of responsibility (Merkel), mitigation, and avoidance of responsibility and blame. Consequently, there is no support for a dedicated contribution to relieve the suffering. To find answers to why the EU is failing to pull together on the issue in a positive way, we need to know the geopolitical frame in which the concept of 'the EU refugee crisis' is constructed. Metaphors such as 'tsunami' and 'swarms' are indicative as they suggest that 'they' are an inevitable threat to 'our' world, but there are of course alternative ways of framing the situation.

The purpose of this case study is to reveal cultural variation in worldview perception to get a deeper understanding of European failure to act collectively on the refugee crisis. The method is based on discourse-space theory (Chilton 2014; Hart 2014; Kaal 2015) and its pragmatic-cognitive approach to text- and discourse-world construction. In practice, the spatial "ground floor" of human reasoning shapes (collective) intentionality and volition for action (Duranti 2015, Kaal 2017, Searle 2010). The analysis focuses on the basic cognitive coordinates of worldview construction, Space, Time and Attitude (STA), involving point-of-view, layered attention frames and directions-of-fit.

The corpus includes relevant sections from the Lisbon Treaty, the European Convention on Human Rights, and election manifestos. STA-analysis of EU refugee-crisis discourse scrutinizes the texts for variation in spatial grounding. For example, whereas the crisis is foremost the refugees', as they are victims of their own country, for EU Member States the threat from outside that causes an internal crisis for the EU, resulting in mitigating actions (building fences and financing solutions outside Europe). Then whose crisis is it?

'The' refugee crisis is a typical case of conflicting worldview orientation because it is a geopolitical problem that is epistemically grounded in geographic as well as social and moral space. However, an awareness of

differences in grounding the issue may stimulate alternative perspectives toward intentions for effective cooperation and taking responsibility.

***Of necessity or not - Implicature and preference organization in students' negotiation of obligation in L2 classroom interaction*** (Contribution to *The Pragmatics-Conversation Analysis Interface*, organized by Clift Rebecca [et al.]

This paper both contributes to and adds to the growing body of work on the interface between pragmatics and conversation analysis. It does this by exploring the pragmatic concept of implicature by analyzing the preference organization of students' yes/no interrogatives with conversation analysis. In doing this, it draws on recent studies on pragmatics and different kinds of social actions (e.g. Kent & Kendrick, 2016; Rossi & Zinken, forth. 2016).

Specifically, the paper explores the use of two modal auxiliaries – 'have to' and 'need to' – in students' yes/no interrogatives (e.g. 'do we need to write it somewhere') that initiate repair to request for clarification of or confirmation for task instructions during L2 classroom interaction. While accomplishing classroom tasks, students often try to parley what they need to do and what is not necessary in order for them to successfully bring off a task. This implies that students treat the task instructions and thereby the steps involved in accomplishing the task as a negotiable matter.

The analysis shows that, on the surface, the use of the two deontic modals implies students' orientation to the obliged nature of the action indicated in the question (e.g. Palmer, 1986). It also indicates how students orient to teachers' institutionally inscribed deontic authority and rights to tell them how tasks are accomplished (e.g. Stevanovic & Peräkylä 2012). The polar question format, on the other hand, manifests a preference for an answer that frees students from the obligation (e.g. Raymond 2003). The analysis elucidates that while this is true for some of the repair initiations, others are not as straightforwardly categorized. Therefore, a detailed analysis of the larger activity sequence and the sequential position of the repair initiation is needed to see how they are used as vehicles to perform other actions (e.g. Kendrick 2015), for example, to feign surprise and how this might potentially have an effect on the question's implicature and preference organization. The data originates from a classroom corpus of video-recorded secondary school lessons, including biology, physics, chemistry, history and English, taught in English in Finland. To date, a collection of 31 yes/no interrogatives have been identified from the physics and history lessons of the corpus.

***Solution-oriented requests*** (Contribution to *The Pragmatics of Change in Therapy and Related Formats*, organized by Graf Eva-Maria [et al.]

This paper investigates how participants in psychodiagnostic and psychotherapeutic interactions negotiate an adequate and realistic solution for the patient, one grounded on the interactively re-constructed knowledge and the individual resources of the help-seeking patient (cf. Scarvaglieri 2013, Konerding 2015). As part of a larger research project on understanding change in helping professions we particularly analyze therapists' solution-oriented requests (Mack et al. i.pr.) and their interactional and in particular their sequential contribution to clients' change (Peräkylä et al. 2008, Voutilainen et al. 2011). Solution-oriented requests of therapists in psychodiagnostic and psychotherapeutic interactions invite the patients to participate actively in seeking possibilities of change and thus also support the patients' ability for self-help. With that the direction of the conversation changes from a retrospective past-oriented to a prospective future-oriented one. Furthermore, in patients' responses to solution-oriented requests, therapists can test whether patients see possibilities of change at and where they may lie. Solution-oriented requests emerge in typical interactional contexts, e.g., at the tentative conclusion of a problem-oriented negotiation or in contexts in which the therapist recognizes a patient's inability or refusal to explore alternative ways of thinking about their own agency and future. In these contexts, solution-oriented requests initiate a process in which patients themselves can formulate – in a hypothetical but protected space („therapeutic conditions“, see Sachse 1999) – future life plans, or otherwise display distorted and impeding perceptions that can then be the subject of reflexion and change in the ongoing interaction. Solution-oriented requests thus help patients cope with fears and problems inside and outside the context of the treatment session. The paper analyses the particular design of solution-oriented requests, their presuppositions and contextual conditions, and their sequential organization as a means to initiate therapeutic processes and change (cf. Schegloff 2007, MacMartin 2008, Voutilainen et al. 2011). The data comprises 16 videotaped first interviews following the manual of the Operationalized Psychodynamic Diagnostics (OPD Task Force 2008). It was collected in cooperation with the Clinic for General Internal Medicine and Psychosomatics at the University Clinic of Heidelberg.

#### Daniel Z. Kádár

***Ritual, pragmatics, and the moral order of things - an overview*** (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

In this talk I provide an overview of the scope of ritual and ritualisation within the field of pragmatics. As I have argued in Kádár (2017), while ritual is popularly associated with ceremonies, in real life, it plays a much more important role: by means of ritual people reinforce what they perceive as the appropriate moral order of things, or challenge what they perceive as the inappropriate flow of events. Thus, ritual is a social action, which people expect to happen - even though there are many rituals that would be not defined as "ritual" in a popular sense - and failure to perform rituals tend to be sanctioned. Unlike conventional practices, by means of which people passively uphold perceived moral orders, rituals play an active role in the maintenance of moral orders (see Terkourafi and Kádár, in press).

In spite of the importance of ritual phenomena in interpersonal interaction, research on ritual has been relatively left behind in the field of pragmatics, and the aim of this panel is to address this knowledge gap. In this talk, after providing a definition for the notions of "ritual" and the "moral order", I identify 2:0areas that should be prioritised in ritual research, and provide theoretical frameworks for their analysis; these areas include the

following:

1. The broad interface exists between ritual, and politeness and impoliteness: due to their importance in people's lives, rituals tend to be strongly associated with (im)politeness/trigger (im)polite inferences, and also (im)politeness recurs in the metapragmatics of ritual actions.
2. The process of ritualisation: while there has been a large volume of research dedicated to conventionalisation, we know relatively little about ritualisation, i.e. the ways in which ritual practices come into existence.

***Schmoozing in the business domain: Small talk as a tactic for mitigating rejection in Uruguayan service encounters*** (Contribution to *Service Encounters in the Spanish-Speaking World from a Variational Pragmatics Perspective*, organized by Placencia Maria E. [et al.]

The focus of this study is the communicative behavior of Uruguayan women in service encounters (SE), using natural data from spontaneously occurring interactions in various “domains”: spheres of life in which certain socio-cultural norms and expectations guide both verbal and non-verbal interaction (Fishman 1972; Boxer 2002). Whereas “schmoozing” or small talk is a common way to initiate conversation, especially with strangers and often in an attempt to ease the awkwardness of a situation (Malinowski 1923; Schneider 1988; Boxer 2011), in these data, the participants frequently engaged in small talk following a dispreferred response (i.e., refusal or rejection) (cf. Raevaara 2011; Félix-Brasdefer 2015). This finding from the business domain contrasts with the use of post-rejection small talk in the domestic domain, which was significantly less frequent. This study contributes to the establishment of baseline native speaker pragmatic norms that can be compared with those of other speech communities and SE settings (e.g., online). Based on Locher and Watts’ (2005) theoretical framework for relational work, it is assumed that what speakers of a given community do most (and without evidence of reprisal) may be deemed politic or appropriate behavior for that community. Small talk following a dispreferred response proved to be an important politic strategy for mitigating rejection and restoring equilibrium to the exchange. Conversely, participants who did not engage in this type of talk ran the risk of being perceived as unfriendly or even rude. The situations under analysis emanate from an 80 hour corpus of audio recordings, derived from the interactions of ten women participants as they went about their daily lives in Rosario, Uruguay. Results are discussed in comparison with other mitigating strategies (e.g., apologies) and in terms of participant age, participant socioeconomic status, addressee sex and social distance (i.e., whether the participant and the addressee were intimates, acquaintances or strangers). This research not only sheds light on the use of small talk from a variational pragmatics perspective, but also raises further questions regarding the future of interpersonal communication, as automated and online technologies are increasingly imposed upon the Rosarian population and, at the same time, actively pursued by the younger generations.

### Argyro Kantara

***Laughter as rhetorical device in political interviews*** (Contribution to *Political humor as*

*social action: verbal-visual attitudes towards politicians in late modernity*, organized by Van Hout Tom [et al.]

Previous conversation analytic work on the use and function of laughter in broadcast political interactions has mostly focused on its *affiliative* use as audience behavior (Hopper 1995, Anderson 1999, Montgomery 2000, Ekström 2009, Eriksson 2009, Eriksson 2010), as a response to something the participants had constructed as humorous. Fewer studies have focused on its *disaffiliative* use as a response to something that has **not** been constructed as humorous; Clayman (1992) has investigated the use of laughter as a disaffiliative response from the audience in presidential debates, while Romaniuk (2009, 2013a, 2013b) has investigated its use by politicians in the context of televised news interviews. In particular, she has examined two dimensions of politicians' laughter; firstly its *retrospective* dimension, arguing that laughter acts as an implicit commentary on the interviewer's questions, undermining them and secondly its *prospective* dimension, projecting a disaffiliative verbal response. Adding to the latter line of research, in this talk I investigate a specific politician's (Alexis Tsipras) use of laughter at interview openings. More specifically I examine his use of laughter as a response to the first question asked by the journalist, this being either a policy issue or a promise soliciting question, in three out of four one-on-one pre-election interviews he gave during the 2012 double Greek general elections campaigns. By examining both the retrospective and prospective dimensions of Alexis Tsipras' laughter, I will argue that his laughter is not only disaffiliative, undermining the journalists' questions and projecting either an evasive answer or a counterchallenge, but it also establishes a 'cool but aggressive' persona for the ears of the overhearing electorate.

### **Mariko Karatsu**

***Emergence and co-construction of the identity “fresh cream lover” through stories in talk-in-interaction*** (Contribution to *Food description and assessment in individual sensory evaluation, focus groups, and spontaneous face-to-face and SKYPE conversations in English, ELF, Japanese and German*, organized by Szatrowski Polly [et al.]

In this study, I explore how food and eating trigger the memory of past experiences and serve as a resource for the participants' co-construction of a particular identity, focusing on the emergence of one of the conversational participants' identity as a “fresh cream lover.” The data for this study come from a seven-minute spontaneous Japanese conversation among three female Japanese graduate students (Ikuko, Kayo, and Yae) at a university cafeteria. Building on previous research, I demonstrate how the participants' experiences and knowledge about food, i.e., different kinds of sweets and uses of fresh cream, enable the emergence of Yae's identity, and how participants orient to this identity through their moment-by-moment developing conversational interaction. いか。しない。ng Previous sociolinguistic research on the construction of identity has demonstrated that identity emerges through conversational interaction (De Fina, Schiffrin, and Bamberg, 2006) and researchers can distill the participants' presentation of self and identities as well as group memberships by examining conversational stories and their surrounding talk (Georgakopoulou, 2007; Karatsu, 2011, 2012; Norrick, 2005; Schiffrin, 1996, 2006). Lakoff (2006) suggested that food provides a discourse domain where people exercise their minor identities. In contrast to a “major identity” such as gender and race, a “minor identity,” e.g., a preference for food or music, refers to a “significant part of who we are and how we think of ourselves, and our selves” (Lakoff, 2006, p. 143). My analysis focuses on stories that occur in the beginning of a sixty-five minute conversation, where each participant serves herself a cake by choosing one of three small cakes in a box that the researcher gave the participants, and begins eating it. In the conversational interaction, the activity of serving oneself a cake triggers talk about the participants' attachment (*syuutyaku*) to sweets (*amai mono*) in the past and present, and Yae suggests her expertise in the domain of sweets and fresh cream, by revealing that she “likes” (*suki*) fresh cream. Soon afterwards, Kayo categorizes and identifies Yae as a person who is highly dependent (*syuutyaku no ooi hito*) on fresh cream. Subsequently, Yae's like of fresh cream (to the extent that she “loves” it) is gradually revealed and confirmed through the participants' interaction. Specifically, Ikuko and Kayo's questions about Yae's taste and assessment of particular sweets and fresh cream, give Yae opportunities to tell stories that show her love for fresh cream. I demonstrate how Yae effectively communicates her emotional stance toward sweets and fresh cream using hand gestures, facial expression, distinguished prosody, and quoting her inner thoughts. These verbal and nonverbal resources enable her to depict her stance vividly by locating her in imaginary scenes, and involving other participants in the scenes. By showing how food triggers the co-construction of identity, this study furthers sociolinguistic research on identities in conversations about food, which is an important and ubiquitous part of Japanese society.

***Fabricating foreigners: Telop as a categorization device in a Korean TV show***

(Contribution to *Producing 'Foreigners' in TV Entertainment Shows: Sequence, Categorization, and Multisemiotic Practices*, organized by Kasper Gabriele [et al.]

With the steady increase of foreign residents in South Korea, public curiosity in cross-cultural comparison is on the rise. Media outlets capitalize on and fuel such popular interest. One key example is the highly successful TV talk show *비정상회담 Bijeongsanghoedam* ("Non-Summit"), a panel of young foreign men who live in Korea, speak Korean fluently, and discuss various social and cultural topics under the management of three Korean hosts. A recurrent thread is the panelists' perspectives on "Korean culture, through the eyes of a foreigner" (Wikipedia).

The show is aired with extensive amplification through telop (Television Opaque Projector), that is text, images and sound superimposed on the screen in post-production. These artful semiotic devices provide a running commentary on the unfolding interaction, direct the viewers' attention and emotional response, and substantially enhance the show's entertainment value (Furukawa 2015; Sasamoto, 2014). Telop can be seen to serve as externally generated contextualization devices (Gumperz 1982) or stance markers (Jaffe 2009): they communicate to the audience how to understand and in particular what to feel about the indexed character or scene. Previous research has classified telop according to their forms and functions (O'Hagan 2010), but little is known about precisely what "work" telop do at particular moments in the show.

This study uses conversation analysis (CA), membership categorization analysis (MCA; (Fitzgerald & Housley, 2015; Hester & Eglin, 1997; Sacks 1992), and multisemiotic analysis (Ventola & Guijarro, 2009) to examine (1) how participants are positioned to speak as members of their nation of origin, (2) how that membership is used as a resource, by them and the hosts, for crosscultural comparison, and (3) what responses such comparison engenders from the participants. Particular attention will be given to the ways in which telop are used to enhance all three actions for the audience.

For example, in an episode about the attractiveness of Ukrainian women, Andriy, the panelist from Ukraine, ranks Ukrainian women higher than Korean women, which gets a reprimand from host Hyun-Moon. The reprimand is reinforced for the audience with an overlaid beeping sound and two images attached to HM, a smaller bubble representing a vocalization of 'exasperation' and a larger cartoon-style spiky bubble with a quote of HM's utterance representing 'aggression' or 'anger'. The images and sound effect represent different semiotic resources to upgrade HM's reprimand for the viewer and thus create heightened dramatic tension. HM's reprimand generates laughter from Andriy and the entire panel. Simultaneously with the onset of Andriy's laughter a 'swishing' sound together with a punching fist attached to Andriy appear. Now visible on the screen together, the aggressive stance indexed by the fist icon and the spiky bubble contrast with the shared laughter and intensify the humor of the sequence for the audience.

**Yasuhiro Katagiri & Yusuke Mochizuki**

***Static and Dynamic manifestations of "Ba" in agreement-seeking dialogues*** (Contribution to *Emancipatory Pragmatics: Approaching Language and Interaction from the Perspective of Ba*, organized by Saft Scott [et al.]

Seeking agreement is ubiquitous in conversation, from scheduling a meeting between colleagues to negotiating on treaties between nation states. Establishment of agreements is an essential prerequisite for cooperative joint actions. On top of the sharing of factual information and joint action plans based on them, agreement making involves shared commitments and concomitant responsibilities among participants, e.g., a shared inclinations/expectations/promises to certain courses of actions to be taken toward a shared goals and outcomes. We propose in this paper a conception of agreement seeking processes underlying actual practices of dialogue interactions, based on the notion of 'Ba.' 'Ba' is a situation/place in which dialogue takes place. Dialogue interactions presuppose co-presence of participants, both physical and social. In a prototypical face-to-face interaction, participants are both spatially and temporally co-present. By entering 'Ba' of dialogue interaction, participants commit themselves to act in such a way as to maintain and develop this 'Ba' together with other participants. Dialogue participants behave in accordance with Wakimae (discernment) of 'Ba.' Maintenance of 'Ba' is equally significant as the content of agreement. This shared orientation toward 'Ba' provides a solid foundation for shared commitments to the outcome of agreements. We analyze task dialogues in Mr. O corpus, which has been collected in several languages, including Japanese, English, Chinese and Arabic. We focus on the way participants request confirmation from their partners while they engage in joint story constructions. Expressions such as tag questions in English, sentence-final particle 'よね (yone)' in Japanese, '是吧 (shiba)' in

Chinese and utterance-final 'Sah' in Arabic are used primarily by respective language speakers to request for confirmation from hearers on the content of information provided in the preceding utterances. But, their uses are also often sensitive to speech situations ('Ba'). We observe that speaker behaviors manifest their cultural Wakimae-patterns in static asymmetry based on status differences among participants, as well as its deviations sanctioned by dynamically constructed demands of problem solving.

### **Kuniyoshi Kataoka**

***Ba-oriented management of institutional discourse: A case of a radio program recording***  
(Contribution to *Emancipatory Pragmatics: Approaching Language and Interaction from the Perspective of Ba*, organized by Saft Scott [et al.]

Despite long-standing insistence that nonverbal elements in language use deserve analytic attention (Hymes, 1972), focused work on the multimodal aspects of interaction had to wait until recently (e.g., Goodwin, 1994; Ochs et al., 1996; Heath and Luff, 2000). Following in the footsteps of this more recent work and incorporating a theoretical framework of *Ba* 'place/frame/field' defined by Ide (2016) and Hanks (to appear), I will examine institutional discourse conducted in a recording studio at a Japanese broadcasting cooperation. *Ba* concepts were originally based on physical *ba* 'place' but are now theoretically expanded to incorporate psychological and philosophical milieus for elucidating social interaction in general (Fujii 2016). Depending on Hanks' model which postulates three layers of *Ba* (Hanks to appear), I will focus on the second and third orders of *Ba* in order to examine how participation in the institutional setting can be managed in terms of the *Ba* sense of "being there." Toward that end, I focus on the intersection of "participation framework" (Goffman 1981) and *Ba* concepts with special attention to the conduct of/by "cognitive artifacts" in the studio which serve as surrogates for human actors. Specifically, the site of data collection was recording sessions for a German-as-a-foreign-language program. The session was conducted in team, with the main director (MD: "center or coordination") supervising the progress and quality of performances in collaboration with the sub-director (SD) and the audio engineer (AE), as well as with various recording apparatuses. In that "community of practice" (Wenger 1998), the tasks were meticulously scripted, but the procedures were managed with practical slickness comparable to bricolage. However, not everything was explicit. As is the case with other indigenous communities, certain procedural knowledge was assumed for intersubjective coordination. For example, it appears that what is called a "script" or a "scenario" was the key to understanding the interaction under discussion, but such terms fail to fully explain some actions conducted by SD and AE, especially when we consider their nonverbal and unvocalized achievements of the task. In addition, secluded in a recording cubicle, the performers (i.e., instructor/narrator on the radio program) are expected to act mainly as an "animator" based on the script, but occasionally as "author/principal" in conversations with directors, alternating multiple participation statuses on the spot. Here I will look into such ongoing management of what I call "frame hopping," which was made possible through implicit *Ba* awareness shared among the participants.

### **Istvan Kecskes & Monika Kirner-Ludwig**

***Combining conversational and discourse analytic approaches to identify 'odd structures' and referential repair strategies in intercultural discourse segments*** (Contribution to *Current issues in intercultural pragmatics*, organized by Kecskes Istvan [et al.]

This paper proposes a bidirectional analytic approach to what the authors will be defining and referring as 'odd structures', i.e. such utterances that put forth contradictory or frame-breaking information during a dialogue. For instance:

Participants: a Polish woman and a man from Hong Kong

HKM: - Errh...Are your husband American or...?

PAF: - **Errh...Actually he is...he is Polish. He is American but... (Odd structure)**

HKM: - OK.

PAF: - ...because he came into the United States when he was a child.

HKM: - Hmm.

PAF: - He was something like twelve.

HKM: - All right.

While we do not wish to principally deny that the perception of a structure as 'odd' is inherently subjective and

will be influenced by a number of extra-linguistic complexities that cannot be defined in any straightforward manner, we propose the classification of a structure as ‘odd’, if it interrupts or derails the topical linearity of the dialogue by causing a confusion (not necessarily misunderstanding):

- breaking the topical or situational frame of the conversation, thus creating immediate incoherence;
- putting forth contradictory information (as above);
- posing a violation of grammatical cohesion;
- posing a violation of lexical cohesion.

The analysis of an odd structure utterance (OS) should focus on the discourse sequence that follows it. The OS will potentially put the smoothness of a conversation to risk, triggering off one of two probable threads in the conversation, depending on whether it causes an understanding problem or not: either the linearity of the conversation will not be affected due to the interlocutors not acknowledging or reacting to the OS at all, or the recipient will launch strategies to establish common ground with the utterer of the OS and seek to bridge the gap caused by it in order to continue the dialogue rendered intact. While it has been claimed before (cf. Kecskes 2012; Kecskes 2013) that a meaningful and reliable analysis of intercultural communication discourse scenarios must take into conjoint consideration that discourse is both a process as well as an entity, there have so far not been any noteworthy approaches that would extensively pick this idea up and propose facilitating methods for such a holistic analysis. Claiming that single utterances are reflections of individual human cognition, while a span of utterances within a discourse segment reflects socio-cultural factors (cf. e.g. Grosz & Sidner 1986; Mann & Thompson 1988; Moore & Paris 1993; Passonneau & Litman 1997; Taboada & Habel 2013), we argue that an approach connecting both a bottom-up as well as a top-down analysis is needed so as to systematically dismantle discourse-internal dynamics and principles underlying any kind of interaction. This paper will focus on OSs within intercultural communication as linguistic springboards in order to demonstrate the added value of a systematic bidirectional (or double) analytic approach to interlocutors’ coping (problem-solving) strategies.

***Palpating cheese: A form of ‘professional touch’*** (Contribution to *Touch in Social Interaction: Integrating Haptics into Embodied Interaction Research*, organized by Cekaite Asta [et al.]

This paper is interested in the social organization of touching products as exhibiting expertise in professional and service encounters - with a particular focus on practices for palpating cheese as part of the professional work of the cheese seller. Recently, an interest for the sense of touch has been emerging within interactional studies: some pioneering research has dealt with touching the other in ordinary interactions (Goodwin in press, Cekaite 2015) as well as in professional encounters (Heath 1986, Nishizaka, 2007, Nishizaka & Sunaga 2015). While most of the interactional literature focuses on people touching other people, this paper offers a complementary view on touch, rather focusing on objects. *Touching objects* (in the sense of feeling them, palpating them vs. just manipulating them) is a set of practices that characterize several settings, and that constitutes a form of professional touch. Gastronomy is a setting in which touching food is a recurrent practice: this is observable in cooking (Mondada, 2014) but also in buying products in supermarkets (De Stefani, 2010) and in specialized food shops (Mondada, 2016); in institutional settings, it can be achieved in such a way that exhibits know-how, expertise and knowledge. The paper addresses this “professional touch” by focusing on a large video data set of service encounters in cheese shops recorded in Europe. Within the ongoing transaction, the seller often engages in touching a piece of cheese, in such a way to display and evaluate the features of the product (ripeness, softness, maturing [fr. *affinage*]). This touch is done in a delicately exhibited way, both manifesting the expertise of the seller and demonstrating the quality of the cheese. Although the customer does

generally not touch the product, touching is organized as an intersubjective practice, involving not only private feelings but publicly visible gestures and expressions. Moreover, in the data set, some cheese sellers invite the customer to touch too, sharing the feeling and not only the result of the examination.

##### ***The Herculean task of re-entry into conversation while shovelling (and noticing) dung***

(Contribution to *Entry and re-entry into interaction*, organized by Antaki Charles [et al.]

The study is based on a recording of a single whole-day event where eleven young people had to manually clean a sheep stable of dung. They are all ignorant of the job. Even though long silences witness of the physically heavy labor, the participants regularly marvel at the materials they are working on. This study looks at how comments on the environment, in particular the depth and textures of materials and their gradual transformation, might work to re-start conversations that have lapsed. These noticings, defined as a formulation of some matter in the environment by Schegloff (1988), occur in the form of assessments and assertions. These actions potentially engender more talk but are nevertheless only weakly response-relevant, especially in case the addressee is not selected (Stivers and Rossano 2010). In the current context, noticings of materials are furthermore less response-relevant than, e.g., noticings about tools, which are often treated as important for the immediate work progress and accordingly receive embodied responses. Noticings about the materials, also those coming off as complaints about the hopeless job, can easily be ignored. It thus seems to be especially difficult to initiate a conversation with a noticing. However, composure may increase the chances.

The paper compares the noticings that work as re-starts and those that do not, illustrating the role of the speaker's body posture, speech volume, and gaze in attracting a verbal or embodied response. The analysis shows that comments treated as self-talk are typically uttered low, often while the speaker is poking the dung and hunching over it, with his/her gaze on the tools or the ground. Within some trajectories of action, these utterances may attract a gaze towards the commented object or a minimal receipt, mostly by closely placed co-workers. Comments that succeed in initiating a conversational sequence are often spoken out loud, with the head upright and the whole body oriented towards the center of the stable or moving through the space. They are thus as if done for the "center-stage". However, even in the latter case conversational nextness can be accomplished across extended silences, as a feature of this particular physical workplace where the auditory space is almost always open for talk but the bodies are (presented as) preoccupied. A re-entry into conversation in this co-present setting is a true achievement that furthermore has moral implications: talking may constitute an evidence that you are not currently digging, lifting, or rolling the heavy wheelbarrow.

##### ***A corpus linguistic analysis of reference and identity in online reader comments***

(Contribution to *Knowing me and knowing you – reference and identity markers in public discourse*, organized by Nevala Minna [et al.]

In this paper we use corpus linguistic techniques to analyse reference and identity markers in reader comments appearing at the bottom of articles on the website of the UK newspaper *The Guardian* (<http://www.theguardian.com/>). This is a public forum with over 9 million unique visitors worldwide on a daily basis yet, as we demonstrate, it is an online space where people are able to build distinct sub-communities and

get to know one another on an individual basis without necessarily knowing the true identity of the person with whom they are interacting.

Commenting was first enabled on *The Guardian* website in March 2006 with the launch of ‘Comment is Free’ blog section. A fortnight later, *The Guardian* began to allow comments on conventional news articles too, and Hermida & Thurman (2008: 6) report that five other UK newspaper websites allowed comments on news articles by the end of 2006. Our research is based on a corpus covering the period 2007 to 2010, which includes all 6.2 million comments made on over 500,000 articles published on *The Guardian* website during that time. In a previous study (Kehoe & Gee forthcoming) we applied our WebCorp software (<http://www.webcorp.org.uk/>) to the analysis of this corpus, identifying the sections, writers, and topics attracting most comments. In that study, we found that although less than half of *Guardian* articles allow commenting, 85% of those articles have at least one comment and in some sections, such as Comment is Free and Sport, more than half of articles have over 40 comments.

In this paper we explore in depth the behaviour of individual commenters and the frequency of interaction between them. We begin with an analysis of top commenters, the key finding of which is that, although there are over 470,000 people actively commenting from 2007-2010, 120 of these people are responsible for 10% of all 6.2 million comments in the corpus and 1000 people are responsible for a third of all comments. Particular individuals are extremely active with, for example, the user ‘MartynInEurope’ making 15,233 comments on 4874 articles. Five further users are responsible for more than 10,000 comments each, with many others in the thousands. Several of the most prolific commenters appear to have become minor celebrities in the *Guardian* community, with their own online profiles where, whilst remaining anonymous, they detail their interests and which other commenters they admire.

We go on to show how there appear to be distinct sub-communities forming around specific sections of *The Guardian*, each with their own regular contributors who are well known to one another by their chosen usernames. For instance, the user ‘CunningStunt’ makes 11,500 comments overall, but 98% of these are in the ‘Chatterbox’ video games section. As we illustrate, members of this sub-community are frequently referred to by username, e.g. in (1) where CunningStunt has advised LazyBones during a previous discussion:

(1) *LazyBones*: Morning all. Played Chrono-Trigger a bit last night, and that's about it. I laid Cyrus's tormented ghost to rest (thanks **CunningStunt**) and then tried to find the "sun stone".

We carry out a collocational analysis of the top usernames to examine the contexts in which they appear and the words most commonly associated with particular users. We find many examples of thanking, as in (1), but also of congratulating, empathising, disagreeing, etc. We then extend our analysis to the articles themselves (using a separate *Guardian* corpus) and find an increasing trend for well-known commenters to be mentioned here too. For instance, (2) and (3) come from a weekly ‘best of’ article by a *Guardian* journalist summarising recent discussions between Chatterbox commenters.

(2) One of our regulars - who shall remain nameless - asked the ""box for some advice: "Where is a good place to meet women other than at work or when totally p\*\*\*ed?" Whilst Dear Deidre isn't in any trouble yet, we had a few sensible suggestions. Salsa or dance classes (thank you **Cunningstunt**), friends of friends (well done **cameroon95**) and dizzyisanegg's suggestion of accepting any social invitation, whatever it is, were all good.

(3) Congratulations to **Sorbicol** and **makar27**, who are both getting married this week. Presumably to other people.

We make a significant contribution to the growing field of corpus pragmatics by carrying out the first large-scale corpus-based analysis of reader comments. In doing so, we demonstrate how people commenting under anonymous usernames are able to build rapport and interact regularly, often on a daily basis.

*Identifying and assessing edible objects: Sharing finds in foraging activities* (Contribution to *Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction*, organized by Tuncer Sylvaine [et al.]

Building on recent work in multimodality in social interaction, which has drawn attention to the sensorial experience as a collective intersubjective engagement (Mondada, 2016), the presentation considers how participants of different foraging activities identify and assess their finds. Methodologically, we draw on conversation analysis, which makes possible a close examination of interaction as it unfolds action by action. The data consist of video recordings of families with children or participants on an instructed excursion picking wild berries or mushrooms. The data are in Finnish and English.

Foraging is essentially an object-centered activity in which participants engage in searching and picking wild produce, such as berries or mushrooms, outdoors. Foraging is further characterized by a particular temporal, future-oriented aspect in that wild produce may be stowed and stored for later, rather than immediate, consumption. Nevertheless, it is relevant for foragers to consider and determine whether or not a find is edible

- and worth picking and keeping - while they are still engaged in the activity. The presentation focuses on sequences within foraging activities where participants share their finds by jointly identifying, categorizing, describing and assessing them. To do so, participants in the data may draw on visual cues alone or, additionally, on a range of haptic, olfactory, gustatory and perhaps even auditory cues. The presentation discusses how less and more experienced foragers display their understandings of whether the find that they are handling is edible or not by orienting to the different physical features of it. In so doing, the foragers may display their knowledge and expertise both through vocal means, e.g. via naming the find, and through bodily means, e.g. via handling the find in recognizably specific ways (see Fox & Heinemann, 2015). For example, in determining whether a particular mushroom represents a poisonous species or not, a more experienced forager may identify it from a distance on the basis of visual evidence (e.g. *seitikki, seitikki, laittakaa pois* ‘webcap, webcap, put those away’) or hold it in their hands gingerly so as not to destroy its identifying characteristics. In general, it seems that the features of the wild produce, and the particular ways in which it may be picked, have an influence on how the sharing of a find is organized socially as well as on the kinds of means participants employ to pursue a common understanding.

#### Barbara Kelly

*Noun-phrase and gesture use in Murrinhpatha* (Contribution to *The Pragmatics of the ‘Noun Phrase’ across Languages: an Emergent Unit in Interaction*, organized by Thompson Sandra [et al.]

This paper examines the gestural communications co-occurring with the noun phrase in Murrinhpatha, a polysynthetic Indigenous language of Australia. It seeks to determine the extent to which gestures and nouns might form a communicative unit.

Words and gestures in isolating and synthetic languages typically co-occur in temporal synchrony (Church, Kelly, Holcombe 2014) with nominals and gestures often forming a unified communication unit. Speakers may slow their speech to coincide temporally with gestures and this synchrony has been shown to be communicatively salient for learners in conversation (Kelly 2014). Despite the importance of words and affiliated gestures, we know little about how they are used together in more synthetic or fusional languages. The current paper addresses this issue by investigating the use of gestures and nouns in adult speech to young Murrinhpatha speakers.

Murrinhpatha is one of Australia’s most morphosyntactically complex languages, being highly polysynthetic, with complex verbal predicates which are formed with discontinuous elements in the verbal word, many of which are non-compositional semantically. For example, the Murrinhpatha word *WURDAMnginthaDHAWIWEPERLwardagathu* means “then the two non-siblings, at least one of whom was female, spoke out in unison”, with the two italicized elements jointly providing the predicate ‘speak out in unison’. Such complex predicates may occur with embedded nominal information and with identifiably separate nouns. This paper investigates the gestures that words co-occur with in spontaneous speech. It addresses the following research question: What gesture types occur with nominals and are they temporally synchronous? It is hypothesised that gestures occurring with nominals might tell us about the notion of a noun phrase and its possible boundaries in Murrinhpatha.

Data for the study come from a corpus of 40 hours of adult-to-child speech collected during the Language Acquisition in Murrinhpatha project (2012-2016). After initial pilot coding of visible bodily actions, data were coded for manual gestures that occur with nouns.

Results indicate that gesture use co-occurs with a range of different words and word parts. When they co-occur with nominals that are not part of the Murrinhpatha verbal complex, gestures include: deictics (pointing at an object to draw attention to or request it, using an extended index finger or hand) and iconics (hand gestures that represent a meaning closely linked to the speech segments they accompany, such as outstretched fingers and oppositional thumb moving in an opening and closing action in synchrony with the word *karaku* ‘crocodile’) (McNeill 1992). While deictics are typically not synchronous with speech, iconic gestures are typically synchronous with co-occurring words, contra Schegloff (1984) who suggests that iconics tend to occur preceding lexical affiliates. When words are used together with iconic gestures, the gestures occur with variable speed suggesting speakers may delay the gesture to temporally coincide with the spoken word. By investigating the nexus between gestures and words we can nuance our understanding of what communicative features may be relevant to the noun phrase as a unit.

#### Kobin Kendrick

*The preference for self-remediation over assistance in interaction* (Contribution to *The recruitment of assistance in interaction*, organized by Kendrick Kobin [et al.]

The question of why people on some occasions withhold assistance from those in need has been central to research on altruism and prosocial behavior at least since Latanés and Darley's (1970) classic studies of the bystander effect. This line of research has been largely experimental and focused on interactions between strangers (such as a confederate who feigns distress and subject who finds herself in a position to help, or not). Naturalistic observation of everyday situations in which people help one another has only recently begun, emerging out of linguistic research on offers and requests in conversation. Kendrick and Drew (2016) examined a continuum of methods - from explicit requests, to practices that elicit offers, to anticipations of need - that participants in everyday interaction use to manage and resolve the generally minor troubles that threaten practical courses of action. We observed that although assistance can be given immediately upon the recognition of a trouble, or even in anticipation of it, it can also be withheld: the Other (i.e., the one who gives or offers assistance) may monitor the management of the trouble by Self (i.e., the one to whom assistance is given) before he or she intervenes. Such observations suggested to us that “the organization of assistance includes principles, which await description, that constrain the assistance of Other” (p. 16). This paper will present initial evidence for one such principle, a preference for self-remediation (i.e., the independent resolution of a trouble by Self) over assistance (i.e., the offer or provision of assistance by Other). The evidence, amassed from a collection of over 400 cases drawn from video-recorded interactions among family, friends, and colleagues in the U.S. and U.K., points to a number of generalizations. (1) The practices that Self employs for trouble resolution are ordered such that requests for assistance occur after self-remediation has failed. (2) The practices that Other employs are ordered in a complementary manner. When a trouble manifest, Other routinely, but not invariably, withholds assistance as he or she approaches, stands by, and/or monitors the trouble. (3) The set of situations in which immediate and anticipatory assistance occur appears to be circumscribed, including where self-remediation is not possible, where Self cannot foresee an imminent trouble, and where immediate assistance is critical. (4) Requests for assistance by Self are sanctionable if self-remediation was possible, for example, if Self requests an object that is within his or her own reach. (5) While self-remediation is direct and immediate, other-assistance is often contingent on acceptance by Self (i.e., offered rather than given directly). The paper will examine specific cases that support these generalizations, weigh the evidence for a preference for self-remediation, and discusses obvious analogies and disanalogies with the preference for self-correction (Schegloff, Jefferson, & Sacks, 1977). It will be suggested that the preference for self-remediation arises from a basic tension between the autonomy of Self and the solicitousness of Other in social interaction.

### Alexandra Kent & Alexa Hepburn

#### *Wondering and hoping: Indexing specific contingencies during request sequences* (Contribution to *Orientations to Low Entitlements and/or High Contingencies During Request Sequences*, organized by Kent Alexandra [et al.]

In this paper we explore how speakers can index different types of contingencies through the design of their requests. We are building on recent work suggesting that the choice of request format displays the strength of the speaker's claims of entitlement to have the request granted and their orientation to potential contingencies that might prevent its granting (e.g., Heinemann, 2006; Curl & Drew, 2008; Craven & Potter, 2010). In particular we are interested in how the discursive reporting of 'my side' avowals (e.g., wondering, hoping) can be used to orient to specific contingencies during low-entitlement request sequences.

Our data are recordings of approximately 300 calls made by members of the public to either the UK police on emergency (999) and non-emergency numbers (101) or the National Society for the Prevention of Cruelty to Children (NSPCC). The data were analysed using conversation analysis within a Discursive Psychology framework (Edwards and Potter, 1992).

Consistent with previous work on service calls, our analysis of the call openings reveals a wide range of formats that are available to callers when choosing how to formulate their reason for calling (c.f., Drew & Walker, 2010; Larsen, 2013; Raymond & Zimmerman, 2016). These include overt requests (displaying a range of entitlements and contingencies around the likelihood of the request being granted), problem presentations without explicit request formats (c.f., Robinson & Heritage, 2005), and combinations of the two. Our analysis focused on calls in which the caller uses a wondering or hoping formulation to request assistance from the institution. For example:

Extract 1: P029

1 Caller: Hiya mate, >I was hopin you cun< 'el:p me. .hh I'm lookin  
2 >t find the name< of a >poli:ce officer< that's dealin  
3 with an on:goin case.

Extract 2: P188

1 Caller: m- Yeah hi: dhuck, Er (0.5) °e- >I'm I'm°< jus wondering if  
2 a- (0.2) i:f yuh got cha:nce to mho:ve shomebody out of me  
3 'ou:se,

In this paper we will first address the types of contingencies alluded to, or made interactionally relevant, through the use of wondering and hoping formulations. Preliminary analysis suggests that both constructions project potential difficulties with the granting of the request. However, whereas wonderings may orient specifically to the potential that the requested action might lie outside of the institution's legitimate remit of operations, hoping formulations occur in environments where speakers display increased entitlement to request assistance, while indexing doubt about the recipient's ability or willingness to help.

Our analysis includes a consideration of the sequential position in which the wondering / hoping formulation occurs; preliminary findings suggest that the action of the wondering / hoping turn varies depending on whether it is appended to the greeting sequence during call openings or constructed as a part of the request sequence. We conclude with a discussion of when and how these subtle shades of psychological avowal can have different consequences for recipients.

### Friederike Kern

#### *Interactional and multimodal resources in children's game explanations* (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.]

While there is a rich body on research on children's development in story-telling [1, 2, 3] showing, e.g., how adults systematically support children in accomplishing narratives, considerably less studies have focussed on

children's explanations. Like narratives, explanations can be realized as multi-unit turns, or "big packages" [4], and may therefore require local as well as global construction of cohesive meaning. Additionally, explanations can function as constructing knowledge devices and then primarily serve the mediation and distribution of knowledge in both mundane conversations and institutional contexts. Their production is then strongly linked to the underlying goal of a stepwise transition of knowledge, which is reflected in their global construction as well as in the recipients' response activities, such as the production of change-of-state tokens or clarification request [5, 6]. Little is known about the acquisition of explanations as multi-unit turns in young children. It is therefore the paper's objective to shed light on how young children use multi-modal resources to construct game explanations as "big packages", and how they exploit adults' interactive support. Drawing on a rich corpus of children's game explanations, the paper will present results from an empirical study with 4-year old children (n=20) who were asked to explain a board game they had played earlier with the researcher to their caretaker. Two main research questions are addressed: (1) How do the caretakers, as not-knowing recipients, support the children's management of explaining a game and thus the transmission of knowledge by specific response activities, and (2) how do young children use multimodal resources, especially gesture and prosody, to accomplish game explanations. Special focus will be on if and how the two aspects of explanatory discourse are observably linked in situated talk. With regard to the first research question, analysis will concentrate on the adults' activities to help and support the children, such as clarification requests, repair or modelling that can each function as a scaffolding device to enhance children's productions of game explanations. It will be of particular interest whether adults employ representational gestures in their respective activities, and whether those are picked up by the children, or vice versa. With regard to the second research question, focus will be on the use of representational gestures as local and global meaning-producing devices and resources in game explanations, and on their temporal and spatial organization with speech. Concerning prosody, it is so far an open question whether young children use it as local coherence devices to build compound turns, and to check understanding, such as first graders already do [6]. The results will be discussed in relation to game explanations' underlying function of stepwise knowledge transition, and with regard to developmental issues concerning the use of multimodal resources in situated talk.

***Using mobile eye-trackers to explore the social construction of shared visual attention in interaction*** (Contribution to *Mobile Eye-Tracking in Interaction*, organized by Stukenbrock Anja [et al.]

Gaze in interaction has been studied from a number of different disciplinary perspectives, e.g. Context Analysis (Kendon 1967) or Conversation Analysis (Goodwin 1980, Rossano 2013). Studies on gaze within these strands of research have explored the role of gaze in turn-taking or in the organization of larger action sequences while focusing primarily on *mutual* gaze. Over the last few years, there has been a growing interest in studying the way people co-ordinate their gazes when focusing on a *common object* in their spatial environment, especially in research on computer- or video-mediated co-operation (Jermann/Nüssli 2012). The studies in this field of research are based on eye-tracking data, which are collected in controlled experiments. In these studies, "joint visual attention" is understood as the temporary meeting of two individual gazes on the same spot on the target object at the same time. In our presentation, we will argue that this concept of joint visual attention needs to be revised in order to achieve a more accurate understanding of the interactive nature of its construction. The data our presentation is based on is a corpus consisting of (so far) 20 recordings of unguided visits to a museum of natural history and a science centre in Switzerland. For our recordings, we asked pairs of authentic visitors (either two adults or one adult and one child) whether they would allow us to document about 30 minutes of their visit with video cameras and mobile eye-tracking devices. Based on our corpus and a methodology inspired by multimodal CA, we want to reconstruct how exactly individual gazes contribute to the interactive construction of shared visual attention (on exhibits or museum showcases). In an exemplary analysis of a short

extract of two visitors watching a showcase together, we will first explore the role of gaze in the construction of shared attention based on the synchronized *eye-tracking data* of the two recorded individuals. Then, we will turn to the *video recording* of the same extract and will reconstruct how gaze contributes to the construction of shared visual attention and how it is related to other embodied resources (for this step, we will use CA work on the interactive construction of joint perception as a point of departure, e.g. Heath and Vom Lehn 2004). In contrasting these two analytical approaches, we will demonstrate that joint attention cannot be conceived of as the mere intersection of two individuals' gazes on the same target object (which is generally taken for granted in eye-tracking studies). As we will show, joint attention is primarily constructed based on other embodied communicative resources, which transform specific areas of the visitors' spatial environment into meaningful targets for individual gazes. On the other hand, while eye-tracking does not give us direct access to areas of joint attention, adding eye-tracking devices to CA analyses of the interactive co-construction of shared perception can give us new, fine-grained insights into the temporal structure of visual attention in interaction.

### Fazia Khaled

#### *Verbal and nonverbal emotional markers as part of communicational strategies*

(Contribution to *Interactional routines in caregiver-child and peer interactions*, organized by Nomikou Iris [et al.]

Much of the research on emotions and language acquisition has focused on the process by which children learn to recognize the lexical items, facial expressions and vocal cues pertaining to emotions (Taumoepeau, Ruffman, 2006, Russel, Widen 2002, Sauter, 2012). Research has also shown that in face-to-face interactions, facial expressions and gestures can be seen as nonverbal signals that are integrated to the verbal modality and which both speakers and co-speakers employ to reduce ambiguity (Bavelas, Chovil, 2000). We propose to analyze the pragmatic use that children make of expressing specific emotions and to measure how adults receive this emotional expression in natural face-to-face interactions.

This research provides a multimodal analysis of the expression of three emotions, happiness, sadness, and anger, in two monolingual American children. We have used a longitudinal corpus of 26 videos from the CHILDES database, in the Providence corpus (Demuth et al., 2006). Our methodology combines quantitative and qualitative methods to investigate each child's verbal and nonverbal behavior when expressing emotions.

Results from this corpus showed that occurrences in which the children expressed happiness rarely had an illocutionary force, whereas occurrences of sadness and anger often had a pragmatic dimension with which the children attempted to incite their parents to perform certain actions. Thus, occurrences of sadness and anger were often produced by the children as part of specific communicational strategies. When using markers of sadness and anger, the children relied on their parents' abilities to make inferences in order to modify their environment. On the contrary, the occurrences in which children used markers of happiness while making explicit or implicit requests did not appear to be efficient in their impact as communicational strategies, as parents dismissed the children's needs or desires in these instances. Our results suggest that emotions which have a negative appraisal in the literature are used in a positive and dynamic manner by children to command attention and initiate parental inferences.

***Language maintenance in a transnational immigrant family in Sweden: Children as socializing agents in shaping family language policies*** (Contribution to *Discourse, interaction, new families and contemporary kinship processes*, organized by Poveda David [et al.]

The present study explores family language policies and the processes of language maintenance and shift as they are constructed, negotiated and instantiated in multiparty family interactions. The study explores language socialization patterns in a transnational immigrant Persian-Kurdish family in Sweden (Persian-speaking mother and Kurdish-speaking father). The data consist of video-recordings, interviews and observations of family interactions, primarily family dinner and sibling activities. Detailed interactional analysis is employed to investigate parental heritage language maintenance efforts and the children's orientation to such practices in relation to new kinship processes and new family dynamics. In line with parental language ideologies, the parents employed explicit and implicit language maintenance strategies, aiming to maintain both parental languages in parent-child interactions. For instance, they cooperatively encouraged the use of both languages while predominantly employing the one-parent one-language policy. The analyses, however, show that parental language ideologies and the actual family language practices are not necessarily similar at all times. Children's language practices resembled the ideologies dominating the macro society. The younger child occasionally resisted the parental heritage language maintenance efforts by predominantly using Swedish. The present study broadens the focus of FLP studies and adds to the under-researched area of family bilingualism by closely analyzing family language practices rather than solely parents' experiences and their views on family language planning and language use. Thus, the study argues that an examination of children's roles in negotiating and shaping family language policies is significant for the understanding of the processes of language maintenance and shift. Moreover, taking into consideration the status of the heritage language(s) in the society and educational settings in diasporic context sheds light on the significant role of family as children's primary - and often only - contact with the heritage language(s).

### **Velda Khoo**

***The role of Singlish humor in the rise of the opposition politician in Singapore*** (Contribution to *Political humor as social action: verbal-visual attitudes towards politicians in late modernity*, organized by Van Hout Tom [et al.]

The People's Action Party (PAP) have won every election in Singapore since 1959 when the city-state was first granted self-governance. Over the years, its regime has been described as authoritarian by political observers (Rodan 2004; Tan 2012), the subjugation of the media (Seow, 1998) a commonly brought-up example of the party's ability to shut down contrasting political views. With media laws that dictate the freedom of the press and protect the PAP's interests, opposition parties have found it difficult to break their stronghold on the nation-state, and there has been no real political contestation in the general elections. Since 2011 however, the PAP, amidst social pressure to "keep up with the times", have cautiously lifted the total ban on online campaigning and as a result, Singapore politics have undergone rapid mediatization. This has led to two major changes in the local political arena. Firstly, the shift in symbiotic relationships between the mainstream media, political organizations and the electorate in Singapore, has encouraged the paralleled rise of "newly competitive" opposition parties able to capitalize on newer, non-traditional spaces of communication to question the ruling legitimacy of the PAP (Ortmann, 2011). In order to brand themselves as alternative voices to an elite PAP, their public performances have appealed to growing populism, and tap on Singlish, an ideologically valuable linguistic resource, to do so. This paper analyzes the creative, patterned use of Singlish, indexically tied to "the common Singaporean" (Leimgruber, 2013), by opposition politicians in rallies to humorously attack PAP candidates and ideas. I argue that such linked uses of humor to language allow for opposition politicians to simultaneously position themselves as fellow lay members of the Singaporean community, and reinforce their own political stances through the deriding of the ruling party. Secondly, the rise of social media and alternative new media on the Internet have created an increasingly sophisticated citizenry (cf. Mazzoleni & Schulz, 1999)

that exhibit greater degrees of “open political dissent” (Ortmann, 2011) and scrutinize political actors closer than before. This paper tracks online Singlish memes in which Singaporean netizens mock the PAP’s ‘inauthentic’ expressions of Singaporeanness and legitimize opposition politicians’ use of the language. As such, an alternative linguistic marketplace (Bourdieu, 1977) emerges in which Singlish humor is a symbol of populist resistance and solidarity. Through the analysis of these metalinguistic commentaries, I make a case for the commodification of Singlish as an ideological resource through which Singaporeans construct intersubjectivity and discuss how the nation-state is aligned with certain ways of using language.

***Emotions in humour - A study of emotive satirical news reporting*** (Contribution to *Political humor as social action: verbal-visual attitudes towards politicians in late modernity*, organized by Van Hout Tom [et al.]

In the competitive news environment, emotional story-telling has become a driving force behind award-winning journalism which aims to capture the attention of fragmented media audiences. But long-standing practices of objectivity create parameters for journalists whereby the expression of emotionality is carefully policed and routinized (Wahl-Jorgensen 2013: 141) so that coverage remains impartial. Late night satirists, on the other hand, are not restricted by the norms of conventions of journalistic storytelling, thus they have the freedom to incorporate emotive and passionate displays when covering stories in their nightly comedic monologues. Emotionality in journalism or popular communication has been criticized as propagandist and a representation of a decline in journalistic standards (Pantti 2010). However, the emotive work of satirists such as Jon Stewart, John Oliver and Sam Bee have been praised by scholars because they act as citizen surrogates (Jones 2010), working on behalf of the citizens by articulating their concerns within the wider public sphere. Furthermore, the combination of humour and contextual information on news events can act as a ‘gateway’ (Baum 2003), making politics and current affairs more accessible to viewers and thus promote further attention to these topics. For this study, I intend to use critical discourse analysis (CDA) to decode the emotive monologues used by late night satirists in their reporting of specific news events. Using this methodological approach will demonstrate how satirical news reporting can push beyond the parameters of emotional story telling found in traditional news reporting. In addition, it will consider the types of emotive story telling used and the possible implications of this mode of communication.

***“A friendly voice (~), a big smiley face (^\_\_^), and a heart (♥)”: The role of CMC cues in the multimodal perception of impoliteness in Korean*** (Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

A number of recent studies have shown that computer-mediated communication (CMC) cues depict not only emotions, but also function as an illocutionary force (e.g., to mitigate face threat or to heighten communicative intent). However, and in keeping with the tendency for politeness research to focus on the intentions of the speaker, previous research has tended to focus on the producers of CMC communications. This study considers the other side of the equation. Here the focus is on the relevance of Korean CMC cues to the perception of the hearer during on-going textual interactions, and the role that CMC cues play in negotiating impoliteness. The analysis draws from a sequence of posts found on a personal blog in South Korea. The study finds that CMC cues are not only ‘tools’ to convey communicative intent, but that they also influence and intensify hearer perception of speaker impoliteness. Moreover, I find that including other cues such as non-use of emoticons, chronemics (i.e., frequency of messages), among others, are as important as emoticons when investigating the relevance of CMC cues in ‘relational work’. In summary, this study demonstrates the importance of various CMC cues in the multimodal landscape of CMC.

***Formulation-question in Korean TV talk shows: Mundane probe as shaping consensual grounds for upgrading assessment activities*** (Contribution to *Questioning-answering practices across contexts and cultures*, organized by Ilie Cornelia [et al.]

From the perspective of conversation analysis (Sacks 1992), we examine the host-guest interactions in Korean

TV talk shows with special reference to the host's formulation turn. Preceded by an 'information-oriented' question-answer sequence, the host's formulation, as a *de facto* question, is produced to mark the gist or import of the guest's answer for the benefit of the TV-watching audiences (Heritage & Watson 1979). Often mundane in character, it tends to embody a relatively flat epistemic gradient (Heritage 2013), e.g. by way of being constructed as a negative interrogative or a declarative marked with sentence-ending suffixes (SEs) like the committal *-ci* ('isn't it.'), which strongly favors confirmation over disconfirmation. At the same time, the host's formulation question is often 'trouble-premonitory' (Jefferson 1980), in the sense of conveying the host's stance that treats aspects of the guest's answer as a matter to be further pursued (Ilie 1999, Thornborrow 2007). It is designed to shape the consensus for soliciting the guest's confirmation as 'challengeable' (Reynolds 2011) or otherwise 'notable' (e.g. 'tease-able' or 'praise-able'). This ambivalent character of the host's formulation is evidenced by the frequent occurrence therein of SEs with which the host, even when addressing the 'obvious' aspects of the guest's answer, indexes uncertainty expressed in the form of self-inquiry (*-inka* 'I wonder?'), registers the guest's answer as 'noticeable' (*-ney* 'I've just noticed' or *-kwun* 'I've just inferred'), or ascribes intentions through quotation (*-tako* '(you) said/mean?') (Clift 2006). Organized as mundane, but 'loaded', confirmation request, the host's formulation-question has the sequential import of projecting affectively-upgraded assessment activities, embodying the 'fingerprint' practice of the entertainment-oriented TV talk-show (Heritage & Clayman 2010, Ilie 2001) geared to formulating the 'extraordinary' out of the 'ordinary' (Jefferson 1985, Sacks 1992). For instance, the formulation sequence (e.g. the host's formulation question followed by the guest's confirmation) often serves as a pivot bridging the information- and affectively-oriented phases of the host-guest interactions. It mediates between the 'informationally-oriented' base-sequence of question-answer that precedes it and the 'affectively-oriented' assessment sequence that follows it, which may be organized as a new follow-up sequence, post-expansion, or post-completion musings (Schegloff 2007). The 'post-formulation-sequence' phase furnishes the (normally multiple) hosts with the consensual basis for upgrading their assessment activities, often meta-pragmatically, by exchanging evaluative *post hoc* commentaries 'among themselves' *vis->0-vis* the guest. The host's displayed orientation towards securing the guest's confirmation is accounted for as a sequence-organizationally motivated project to bring off the whole master sequence (e.g. 'a sequence of sequences' (Schegloff 2007)) in a way that is consensually managed and cathartically executed through upgraded assessment activities. The import of the host's formulation-question as such is demonstrably oriented to, and sometimes resisted, by the guest, who may have his/her own 'master narrative' to bring forth. The guest may abort further expansion of the sequence by responding with a mitigated confirmation, disconfirmation, or an alternative formulation competing with the host's (Kim & Suh 2015), thereby resisting the terms on which he/she is subsequently to be positioned as the 'safe butt' of the host's assessment.

### **Ditte Kimps & Gerard O'Grady**

***Early responses during tag questions*** (Contribution to *Early responses*, organized by Deppermann Arnulf [et al.]

Kimps (2016), a corpus study of British spontaneous dialogues, examined the conversational properties of English variable tag questions (henceforth TQ), e.g. *that's nice though, isn't it*, and found that in the majority of cases they elicit a verbal response. 18% of which may be categorised as an early response. The aim of this research is to investigate why speakers respond prior to the completion of a TQ. Based on a dataset of 120 instances from the LLC and ICE-GB corpora with audio files which can be investigated with Praat, we aim to identify the different syntactic, prosodic and pragmatic aspects enabling and predicting an early, and generally non-turn-competitive response.

The first aspect we consider is the placement of the early response in relation to the transition relevance point (TRP) of the first pair part (FPP). Early responses (transcribed with \* in LLC) may either have a transitional (1) or interjacent onset (2) (Jefferson 1983). The majority of early responses are transitional and they start around the TRP, which is the space between the TRP-projecting accent of the current turn and the onset of the next turn (Wells & MacFarlane 1998). A smaller set starts well before the TRP and seems to be primarily backchannels, as in (2) (Levinson & Torreira 2015).

The second dimension we analyse is the type of speech function TQs as FPP perform in spontaneous conversations. Besides requesting information (1), TQs are used to express commands and offers, or they may even be used as a response (SPP) to a question or statement (3), see Kimps et al (2014). Depending on the speech function of the TQ, the presence of an early response is more or less acceptable. At the same time, the pragmatic contents of the early responses will be identified, i.e. whether the responses are agreements or not and whether they are turn-competitive or not.

The third aspect we investigate is how syntax and information structure influence the level of projectability of the SPP (Auer 2005). For instance, the absence or presence of negation and modals in the anchor of the TQ may signal the orientation of the expected response, while the position of new or focused information early in the

FPP facilitates the occurrence of an early response (4). Alternatively, early responses may occur during expansions (5), which are produced after a possible TRP and often carry additional information. Furthermore, the frequent presence of turn-initial particles, such as “and”, “well” and “but” as in (4) may contribute to early projections enabling the productions of early responses.

The last, and important, aspect we study is the prosodic properties of the FPP and SPP. We will look into the tone movements, tempo, rhythm and volume to see if any of these properties can predict or add to the projectability of the SPP. For instance, in example (4), the prosodic prominence is on the word ‘read’, signaling a potential TRP, even though the anchor of the TQ is not completed yet.

*Muy Ylustras Señoras: Address and reference in 18th century Spanish Louisiana business letters* (Contribution to *Knowing me and knowing you – reference and identity markers in public discourse*, organized by Nevala Minna [et al.]

In recent years, the field of (socio)pragmatics has seen an increasing amount of study of speech acts to explore diverse questions related to linguistic behavior in the Spanish language. In spite of the burgeoning of this area of study, the category of commissive speech acts has been all but ignored in scholarship (Márquez Reiter & Placencia 2005: 74). Only a small number of studies (among them Rall 1993; Hardin 2001; Chodorowska-Pilch 2002) focus exclusively, or partially, on this class of speech acts in Spanish, and even fewer studies deal with the expression of commissive intent in written registers of the language. Directive speech acts in Spanish, on the other hand, have received much attention in the literature, but have sparsely been examined in terms of their

supportive moves (Márquez Reiter 2003). In spite of its importance in the history of the American continent, colonial Louisiana has received scarce attention in scholarly work, particularly in the linguistics literature. Although Spanish was the *de facto* legal language of government interactions in Louisiana for much of the 18<sup>th</sup> century (Smith 2014), there is a dearth of work dedicated to the language of this period. During the 40 years of Spanish rule in Louisiana, many business letters were circulated both within the different settlements in the colony as well as from the different settlements to the government seat in New Orleans. These letters reflect a number of different aims: descriptions of local situations, petitions to government officials, offers of goods and services, and adjudications of legal matters. As these documents are replete with directives and commissives, they provide an ideal context for the study of the supportive moves that accompany these speech acts. The corpus for the current study consists of 200 business letters stemming from three different settlements of the Louisiana territory: New Orleans, Natchitoches, and Galveztown. The supportive moves and alerters accompanying commissive and directive speech acts were analyzed in terms of their role in aggravating or mitigating the force of these speech acts (Blum-Kulka et al. 1989). Specifically, forms of address and reference were noted for their conformity to, or deviation from, accepted norms of the time. Formulaic address terms such as *Muy Ylustre X* ‘Most Distinguished + noun’ and mitigation devices such as *con el debido respeto* ‘with all due respect’, when absent, call attention to the intention of a letter writer to defy pragmatic norms. Likewise, terms of self-reference (such as the mention of one’s governmental position, surely well-known to any potential audience of the time) were examined in order to ascertain letter writers’ strategies for the inclusion of such elements. The type and quantity of mitigation devices employed typically correlated with the level of institutional power held by the letter writer. In several cases in the corpus, however, this generalization did not hold; in these cases, writers’ breaking with politic behavior (Watts 2003) signals the expression of annoyance, impatience, anger, or even to challenge the addressee’s power.

*Pragmatics as a cultural filter in translating literary texts* (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

Translation of texts relating to erotic discourse has always been a challenge for the Russian translator who has had to find a reasonable compromise between the necessity to accurately reconstruct the pragmasemantic content of the original and the necessity to make pragmalinguistic adaptations in accordance with traditional tastes of the Russian reading public. Erotica as a system of images symbolizing and structuring sexuality is an integral part of the sexual culture of any ethnos. In reality even most primitive folk cultures embody a complicated system of views that reflect people’s understanding of the human body as a functional instrument of reproduction. In civilized cultures coarse naturalism gets gradually refined into ethically and esthetically graceful models which consequentially become criteria and standards of the individual’s perception, self-esteem and behavior. In the Russian cultural mentality, the clear distinction between the flesh and the spirit has always been appreciated and the conflict between the naturalistic earthliness of the ‘primitive’ folk culture and the idealistic spirituality of its ‘sophisticated’ counterpart has been more acute and lasting than in West-European cultures. These two poles have given rise two different cultural traditions which have intermittently intersected but never coincided. The antagonism between the ‘primitive’ and the ‘sophisticated’ in culture has had a strong impact on the Russian literary tradition because up to the beginning of 20<sup>th</sup> century books had undergone a scrupulous monitoring by the Orthodox church, and later on by the severe Soviet censorship. As a result the

obscene language has confined itself in the domain of invectives while the literary word has further developed what can be termed as ‘linguistic sexophobia’. Russian translators have always had to take into account not only the official censorship, which in practice did not differentiate between pornography and erotica, but also their ‘inner’ censors, i.e. the restrictions imposed by the national mentality, the Russian cultural tradition, and a high esteem of the printed word in general. Even nowadays, when texts are translated and published unabridged, professional translators still face the familiar dilemma of how to maintain adherence to the Russian literary tradition and remain loyal to the original. The analysis of theoretical literature shows that the question pertains to the field of translation criticism (with regard to its objective criteria) and has more practical rather than theoretical implications. Dealing with erotic discourse, Russian translators have to find an artistic balance between sexual explicitness and literary elevation. The general translation strategy can be called evasive and even modern translators avoid using unvarnished vocabulary and have to make pragmalinguistic adaptations to play down the aggressiveness (bigger or lesser) of the obscene language to sound ‘more decent’ and socially acceptable to the Russian ear. Technically the problem is solved through total or partial elimination of the obscene vocabulary, an upgrading shift in the stylistic register and a change of imagery evoking more neutral or elevated associations.

***The linguistic landscape as conceptualization? Bringing corpus linguistics and cognitive linguistics to bear on LL studies*** (Contribution to *Postcolonial linguistic landscapes: Reading globalisation in the margins*, organized by Juffermans Kasper [et al.]

The field of Linguistic Landscape (LL) offers a promising strand of research for the analysis of language in urban environments. This presentation proposes to bring the tools and techniques of corpus linguistics and socio-cognitive linguistics to bear on the study of the linguistic landscape. In particular, the presentation expands the remit of LL analysis to processes of ‘spatialization’ in texts that are typically not the objects of study in LL investigation such as novels, newspaper discourse, interview transcripts, policy documents, tourist brochures, etc. The proposed methodology is showcased through an examination of the discursive construction of two Johannesburg neighbourhoods, Hillbrow and Sandton in a 141 million-word corpus of South African newspaper articles published between 2008-2014. More specifically, we examine the collocates - words that habitually co-occur - of the two place-names in order to scrutinize the cognitive representations of the two neighbourhoods. The proposed method can answer the following questions relevant to LL studies: Can the linguistic landscape be imagined/simulated in texts and are these representations of space a valid area of study for LL studies? How are the neighbourhoods of Hillbrow and Sandton socially constructed (spatialized) in the corpus?

### **Wendy Klein**

***Bilingual socialization on the autism spectrum: Language use and recipient design in family interactions*** (Contribution to *Critical Perspectives On Language Socialization Processes and Trajectories in (Bi-) Multilingual Contexts*, organized by Relaño Pastor Ana Maria [et al.]

Bilingual parents with children diagnosed on the autism spectrum in the United States are often advised to use one language in the home due to language processing difficulties associated with autism (Jegatheesan 2011; Yu 2011). The recommendation to limit children’s exposure to English has created a quandary for immigrant parents who routinely use their native language in family interactions and would like their children to acquire their home language along with English. Recent clinical studies indicate that bilingual exposure is not detrimental to the language development of children with autism (Hambly & Fombonne 2012; Ohashi et al. 2012), yet this new information is only just beginning to inform protocol among clinicians and educators in the U.S., and many professionals still recommend limiting communication to English due to the dearth of resources available in other languages (Park 2014). This study examines language use in three bilingual (Japanese-English) families who employ different language socialization practices while raising their children with autism. One set of parents have followed the recommendation to speak only English with their child, while the other two sets of parents have exposed their children to two languages despite the professional advice they received. Drawing from Conversation Analytic perspectives on language alternation (Auer 2009; Wei 2005), this inquiry examines family interactions and analyzes features of recipient design in ongoing talk (C. Goodwin 1979; Schegloff 1972). The analysis reveals that bilingual youth on the autism spectrum display sensitivity to the

linguistic knowledge of specific interlocutors and demonstrate an understanding of how language choice is linked to sequential and sociocultural contexts. These families' bilingual practices create an environment in which different degrees of fluency, typicality and atypicality are managed through the reliance on a range of linguistic and nonverbal resources. This research has implications for perspectives on intersubjectivity in autism and for parents and professionals making decisions about bilingual socialization in therapeutic and home settings.

### **Arisa Koba**

#### ***Multilayered frames and sexuality perspectives: Mixed use of katakana and English pronunciation by L2 speakers of Japanese*** (Contribution to *The Pragmatics of "Bonding" in Cross-Cultural Encounters: East Asian Perspectives*, organized by Ide Risako [et al.]

The purpose of this presentation is to reveal how a multilayered interpretation of sexuality is elicited in speech through narrative analysis. In current affairs concerning sexual minorities, understanding and knowledge about sexual minorities are diffused as well as each notion of sexuality (like "lesbian", "gay", "bisexual", "transgender" and so on). However, when we mention any notion or idea of sexuality, it must be told with different voices (Bakhtin 1981). Thus in this presentation, I will verify the difference of each idea relating to sexuality, focusing on the cross-cultural pronunciation of sexual notions. Since many sexual notions are imported from Western countries, many loanwords about sexuality are used in Japanese. We usually render them in *katakana*, a form of Japanese characters and once they are rendered into *katakana*, their pronunciations are modified. Here I call it "*katakana* pronunciation". In this presentation, I will illustrate how they use *katakana* / English pronunciation for different purposes and how their frames (Tannen and Wallerstein 1987) are shifted.

There is little literature on Japanese sexual minorities which focuses on qualitative narratives (Maree 2007, Moriyama 2012). However, neither of them focused on the frame shifting caused by cross-culture. Besides, most of the cases in Japanese literature, issues of sexual minorities and ethnic minorities are studied separately. Thus, the cross-cultural problems which occur amongst sexual minorities in daily interaction has not been focused upon. *Katakana* for multinational students is discussed in the field of pedagogy (Mochizuki 2012, Ikeya and Kutsuki 2014), but the acquisition of the Japanese language is the only concern and there is no focusing on identity.

I conducted interviews with 4 people who are sexual minorities and learning Japanese, and from diverse nations and cultures. Their acquisition level of Japanese is also diverse. Some of them behaved differently to the same word indicating a specific sexual identity. All of them can pronounce *katakana*, but there is some tendency that a specific word is pronounced with the *katakana* / English pronunciation depending on the situation. One informant, who is L1 speaker of English and a so-called "haafu" (which is the *katakana* pronunciation of "half" and means biracial) American and Japanese, tended to pronounce words first with the English pronunciation but later rephrased them with the *katakana* pronunciation. This shift is represented the expert-novice (Young 2008) relationship elicited by their English speaking ability. In this case the interview frame shifted between L1 and L2 English speakers' conversation and the power of the interviewer (a Japanese) was lessened while that of the interviewee (an English native speaker) was strengthened. As in this case, behind the *katakana* usage there is multiple frame shifting and the negotiation / revelation of identity.

Through this presentation, I would like to examine how seemingly clear-cut images of sexuality are actually diverse and partially constructed in the dynamics of conversation. Besides, I would like to prove the importance of investigating sexual minority issues from multilayered viewpoints, including ethnicity.

### **Almut Koester**

#### ***"Oh be careful!" - Turn-initial positions in care home interactions*** (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

The turn-taking structure of interactions in care homes is strongly constrained by the nature of the work, where care workers interact with residents and other co-workers as they do their rounds. These interactions are typically brief and are characterized by short turns and by language that frequently accompanies actions, such as administering medication, or feeding, dressing and washing residents. Studying turn-initial elements can provide valuable insights into the ways in which care workers discursively construct their work and navigate the dual goals of performing their care duties and engaging interpersonally with residents. The study draws on over 70

hours of audio-recorded naturally-occurring data in a care home in England gathered over a period of three weeks. Turn-initial elements are investigated in two types of interactions that form part of a care worker's routine: 1) talk with residents and 2) conversations with co-workers. These elements are identified and studied using corpus linguistic methods (e.g. concordancing) as well as micro-analytic methods examining turn and sequence construction. The turn initiators identified fall into a range of types, including pragmatic markers (e.g. *okay, right, just*), vocatives, greetings (e.g. *hello*) and expressives (e.g. *sorry*). As turns are typically short, such syntactically separate turn initiators are not always used. Many turns begin with syntactically integrated turn-initial items, such as imperatives or question-initial *wh*-words (e.g. *what*) or auxiliaries (e.g. *did*). It is hypothesized that there will be differences in the turn-initiators used by care worker in their interactions with co-workers and residents respectively due to the differing role relationships and goals in these two types of interactions. Preliminary analysis does indeed show some differences in the turn-initiators used in the two contexts. For example, elements introducing longer turns, such as *I think* and *because*, are found mainly in conversations between co-workers, while vocatives are frequent turn-initiators in interactions between care workers and residents. The overall aim of the study is to show how such turn-initiators index specific discursive practices within these different micro-contexts of interaction (Handford 2010: 118--149) and ultimately within the macro-context of the community of practice (Wenger 1989).

*At-issueness does not predict projection* (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

The notion of PROJECTION was introduced in Langendoen & Savin (1971) and has since been employed to describe the ability of certain implications to survive embedding under entailment-canceling operators, such as negation or modals. The term has traditionally been applied to presupposed inferences (Karttunen 1973; 1974; Heim 1983; van der Sandt 1992; Geurts 1999; Beaver 2001; Schlenker 2007; a.o.) and has only recently been discussed in the context of non-presupposed projective content, including inferences triggered by appositives, expressives, and evidentials (Potts 2005; Koev 2013; 2016; Murray 2014; AnderBois et al. 2015). In turn, Potts (2005) introduced the term AT-ISSUE content to describe implications that are part of the main assertion of the sentence. In a series of recent papers, David Beaver, Craige Roberts, Mandy Simons, and Judith Tonhauser (henceforth BRST) made the influential proposal that projection can be explained in terms of at-issueness. More specifically, BRST proposed that there is a perfect correlation between these two categories, in the sense that semantic content projects if and only if it is not at-issue (see in particular Simons et al. 2010 and Beaver et al. 2017). I will critically evaluate BRST's account of projection and raise several methodological, diagnostic, and empirical issues. I argue that although projection and at-issueness appear to be strongly correlated, there is no perfect overlap in the way envisaged by BRST. In particular, semantic content may project and be at-issue, and it may not project but be not at-issue.

#### Julia Kolkmann

*Nominal interpretation at the semantics/pragmatics interface* (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

The English language boasts a number of NP constructions which express a relationship between two entities, such as pre- and postnominal possessives (*Mary's children*, *the father of John*) and various kinds of compound constructions (e.g. *bread knife*, *the Obama government*). From a semantic and pragmatic of view, these constructions have in common that they are linguistically underspecified: the precise relation which holds between the two entities has to be inferred on an utterance-by-utterance basis (cf. the more recent Weiskopf 2007, Finkbeiner 2014, Kolkmann 2016, Collins *forthcoming*). For ease of reference, I will refer to this process as 'nominal interpretation'.

While the above insight is not new, the precise ingredients for a holistic pragmatic account of nominal interpretation seem more elusive than ever. This is largely due to the fact that existing procedural accounts which seek to explain the semantics-pragmatics workshare involved in this process are extremely varied. For example, Langacker (1991, 1993, 1995) suggests that possessive and compound constructions should be regarded, on the semantic side, as so-called *reference-point constructions* which, on the pragmatic side, rely on

the addressee's subjective construal of the nominal relation. In a similar vein, cognitive-pragmatic accounts (e.g. Bach 1994; Carston 2002, 2009; Sperber & Wilson 1986/1995; Recanati 2004) are committed to a notion of a pragmatically enriched *what is said* (or *explicature/implicature*), arrived at via a linguistically mandated process of pragmatic saturation (Recanati) or completion (Bach), as the underlying source for the addressee's recovery of these NPs' truth-evaluable content. Yet other accounts (notably Levinson 2000) describe the interpretation process in terms of default *implicatures* arrived at by means of 'preferred interpretations', i.e. the matching of a particular linguistic form (e.g. *Mary's children*) with a particular interpretation (e.g. 'the children to whom Mary is a parent'). Clearly, the divergence in theoretical treatment reflects the complexity of the matter whilst simultaneously inviting a fresh look at the issue.

In this talk, I wish to highlight the pertinence of nominal interpretation for issues at the semantics/pragmatics interface. In an attempt to evaluate the merits of the above accounts, I will discuss numerous empirical examples of prenominal possessives as a case study. On the theoretical side, I will suggest that nominal interpretation is better viewed as an instance of *explicature* rather than *implicature*. On the empirical side, and *pace* e.g. Carston and Recanati, I will suggest that the currently dominant view of saturation as constituting an obligatory, i.e. truth-conditionally relevant pragmatic process, is in need of rethinking. I will argue that full propositionality may at times not be necessary for the addressee to understand the descriptive content of a possessive NP (cf. Korta & Perry *forthcoming*). Instead, a 'semantic' interpretation along the lines of 'the N2 that stands in some salient relation to N1', which all possessive constructions have in common, may be sufficient for the purpose of utterance comprehension. Although more tentatively, I will draw parallels here to compound expressions.

Ultimately, my suggestion for a uniform theory of nominal interpretation will highlight the importance of both semantic and pragmatic token-level interpretations of construction types. While the latter may elude a principled characterisation, the former allow for an account which captures the similarities across numerous configurationally different NP constructions. Above this, my discussion will stress that more empirical work is needed to inform what has hitherto been investigated by largely theoretical means.

*Some aspects of a president's question in group discussion* (Contribution to *Exploring effective ways of group discussions for constructing a democratic society*, organized by Shiraishi Katsutaka [et al.]

We can list the conditions of a "good" group discussion with no difficulty: participants' active engagement in giving or hearing opinions, the president fairly distributing the opportunity to speak, etc. However, we also know that actual discussion does not fall into place so easily even when all the participants make their best effort to have a "good" discussion. Thus, we have a reason to explore the kinds of obstacle to a good discussion not in the minds of participants but in the conversational structures of a group discussion. In this presentation, we will examine the problem of a "participant's negativity toward speaking," which is generally regarded as a

"problem" by participants themselves. In order to investigate this problem, we will focus on the structural aspects of the "presider's question," because participants mainly take their turns after the presider's question in the turn-taking system of group discussion. From the analysis of video recordings of different types of group discussions, including deliberations in mock trials, regular meetings of a volunteer group, etc., we will show two structural aspects of a presider's question, as follows: (1) Addressee of the presider's question: the presider of a group discussion frequently produces a question that is addressed to all participants, "Does anyone have any opinions?," for example. Because such a question does not select the next speaker, addressees of the question not only have a chance to take the next turn through self-selection but also have to decide who will be next. Our data show that relatively long silences often follow such questions. We will examine the relationship between the turn-taking structure of the question that is addressed all participants and the reason for silence after the question. (2) Activities to which the presider's question belongs: actual group discussions consist of many types of activities that sometimes conflict. For example, regular meetings of a volunteer group that we record are the opportunity not only for the exchange of opinions, but also for the education of new members. Thus, the presider sometimes produces a question not for asking opinions but for testing participant's knowledge concerning the agenda of discussion. In this situation, participants face the task of finding out the meaning of the question, "What is your opinion?" or "What is the correct answer?" We will point out that the difficulty of such a task might be another reason for the silence after the presider's question. Through these considerations, we will discuss effective ways to facilitate group discussions.

#### ***Stance taking with "laughter" particles in WhatsApp dialogues*** (Contribution to *Stance-Taking in Interaction*, organized by Imo Wolfgang [et al.]

Drawing on Du Bois' seminal work on stance (cf. Du Bois 2007), scholars generally acknowledge the dialogic nature of stance taking: Stance is not simply expressed by a single speaker, but it is essentially embedded in the interaction with others (cf. Kärkkäinen 2006). However, stance taking is not restricted to spoken communication but also plays a vital role in written interactions (such as chat or message board communication, cf. Bedijs et al. 2014). While several studies deal with the varying functions of emojis or emoticons in computer-mediated communication (cf. Albert 2015, Dresner/Herring 2010, Imo 2015), hardly any research has been done on the use of "laughter" particles such as "haha" or "hihi" (but see Taylor 2009). Taking an interactional approach to stance taking in CMC, the paper analyses the use of laughter particles in German WhatsApp interaction. Based on a corpus of 38 private WhatsApp interactions (group chats as well as dialogues with 7.987 individual messages) the paper will address the following research questions:

- Which sequential patterns in the use of "laughter" particles can be described? In spoken interaction, speakers can use laughter paraverbally; in written interactions, however, laughter particles constitute clearly delineated entities. In which positions (sequential position in an individual message, sequential position in the overall interaction) do laughter particles occur?
- Which emotional or evaluative stances do the users take on with "laughter" particles? Which actions do they accomplish? Which next actions do they make relevant? Do users differentiate between "laughing at" and "laughing with" (cf. Glenn 1995)?
- How are "laughter" particles and emojis related? Do they occur in the same sequential position? Are they used to express comparable or different stances?

The paper adds to studies about humour and contextualization in CMC (cf. Vandergriff 2010) and draws the attention to the use of hitherto neglected stance markers in written interaction.

### **Carmen Konzett-Firth**

#### ***Some evidence of the mutual interdependence of L2 interactional competence and lexico-grammatical development*** (Contribution to *Interactional competence: CA perspectives on second language development*, organized by Pekarek Doehler Simona [et al.]

This paper shows how a language teacher and her students observably recalibrate their interactional behaviour over time. The participants’ turn designs indicate that they are contingent upon 1) the local interactional context; 2) the students’ changing lexico-grammatical and interactional competence; 3) the teacher’s evolving pedagogical goals.

Co-adaptation and socialization processes have been found to be constitutive for the development of interactional competence, both in dyadic student talk (e.g. Hellermann, 2007) and teacher-student talk (e.g. Cekaite, 2007; Young & Miller, 2004). This study adds a further element to these findings by focusing on the relationship between the participants’ co-adaptive conduct and the level of lexico-grammatical competence displayed by students and perceived by teachers. It examines this phenomenon in one recurring discursive practice in the classroom, namely oral collective reconstructions of reading or listening texts in plenary teacher-student talk. The data is taken from a longitudinal corpus of 60 hours of video-recorded naturally-occurring classroom interaction, distributed over 5 years of instructed L3 French, from beginner to intermediate.

The analysis focuses on the way the teacher’s questions, the students’ responses and the teacher’s subsequent third turns are formatted with regard to the use of prefabricated lexico-grammatical chunks. First results show that in the beginner/pre-intermediate data, the teacher invites the use of prefabricated elements 1) by organizing her questions in a highly structured way that closely follows the order of the reading/listening text and 2) by using utterance formats that induce very specific conditional relevances such as wh-questions or designedly incomplete utterances (Koshik, 2002). Expectably, the students’ answer turns are characterised by frequent afforded repetitions (Eskildsen, 2008), appropriating the teacher’s utterance and/or making use of multi-word expressions (Eskildsen, 2014) taken from the reading/listening text. Students render their turns more “context-sensitive” (Pekarek Doehler & Pochon-Berger, 2015) by shaping the prosody of their utterances appropriately (Hellermann, 2003) and by reverting to “make-do solutions” (Larsen-Freeman, 2012), including code switching. In her third turns, the teacher continues to firmly guide the students in closely following the content and sequential order of the reading/listening text while reinforcing the use of and focus on lexico-grammatical chunks.

At the intermediate level, the teacher’s pedagogical agenda evolves to invite more global reconstructions of the reading/listening texts. Her question design allows for increased learner space and learner agency (Waring, 2009, 2011; Young & Miller, 2004) within the interactions, regarding both the content and formatting of the students’ turns. Concurrently, the prefabricated elements in the students’ turns become less evidently afforded, as they increasingly adapt them in view of the local sequential requirements of the interaction. Moreover, intermediate level students frequently make use of paraphrases indicative of their expanding lexico-grammatical repertoire. Meanwhile, the teacher’s third turns display an increasing emphasis on synonymous expressions and alternative formulations.

*The front stage and the back stage – the Wikipedia community’s treatment of ‘Je suis Charlie’* (Contribution to *Mediatizing emotion in reactions to global events and crises*, organized by Giaxoglou Korina [et al.]

This study examines Wikipedia’s encyclopaedic representation of the slogan ‘Je suis Charlie’, how it has changed over time and how Wikipedia editors have negotiated the meaning of the slogan on the Wikipedia discussion page associated with the slogan.

Although one of the most visited sites on the internet (Alexa, 2016), Wikipedia has not been subject to in-depth linguistic research attention. So far scholarly work on the website has mostly focused on e.g. issues connected to the idea of Neutral Point of View (NPOV) in Wikipedia articles different aspects of Wikipedia authorship and collaboration and conflict resolution on Wikipedia (e.g. Borra et al., 2015; Emigh & Herring, 2005; Greenstein & Zhu, 2012). Furthermore, KhosraviNik discusses the more general point of social media in linguistic research and, in the course of this discussion, classifies Wikipedia as one example of a social media platform (KhosraviNik, 2016).

Still, contrary to other social media, Wikipedia has a definitive common goal, namely the creation of an encyclopaedia that attempts to present the Neutral Point Of View (NPOV) on issues in Wikipedia *articles*, Goffman’s front stage (Goffman, 1959; Tannen & Trester, 2013). In order to facilitate the collaborative creation of a comprehensive and NPOV encyclopaedia, each article page is accompanied by a *Talk Page* (TP), the back stage (Goffman, 1959; Tannen & Trester, 2013), which allows Wikipedians to discuss editing and content decisions regarding the article in question. Additionally, the website allows almost real-time creation of new articles and permits site visitors to access past versions of an article to observe change over time.

Thus, and more so than traditional encyclopaedias, Wikipedia permits an examination of how a current topic – the slogan Je suis Charlie (JSC) – is treated and how this treatment might have changed over time. Specifically, the site allows an insight into a) what the Wikipedia community considers/has considered the NPOV representation of JSC as well as b) which aspects of JSC are controversial enough to warrant debate on Wikipedia discussion pages and which attitudes Wikipedians express regarding these controversial aspects. To shed light on these issues, this project takes a corpus-assisted approach (Baker, 2006; Mautner, 2009) and examines the TP and article page separately to arrive at an understanding of the different representations of JSC on the TP versus the article page. Additionally, to understand how the representation of JSC might have changed over time, article versions from different points in time are examined.

Findings are that, on the article page, the approximately 270 unique editors increasingly stress the slogan’s usage across countries, religions and cultures and, seemingly, there is a clear unified understanding concerning JSC’s meaning. The TP data present a very different picture of JSC – in heated discussions, Wikipedians express a range of opinions and positions concerning the slogan, some of them in direct opposition to the article page’s representation of JSC.

### **Monika Kopytowska Łukasz Grabowski**

***In time, on-site and on alert: Media proximization approach and conflict*** (Contribution to *Conflict, public sphere and mediated experience: perspectives on proximization*, organized by Kopytowska Monika [et al.]

The goal of this paper is to present a media-oriented model of proximization theory (Kopytowska 2013, 2014, 2015a, 2015b, 2015c, Kopytowska & Grabowski forth.) and explain the role media play in the construction of social reality, especially (though not only) in times of crisis and conflict. The model draws on Searle's theory of social ontology (1995, 2006, 2010) and proximization theory as developed by Chilton (2005, 2010, 2014) and Cap (2006, 2010, 2013). More precisely, we aim to test the validity of the Media Proximization Approach (MPA), drawing on the insights from Critical Discourse Studies, cognitive linguistics and corpus linguistics. To that end, using corpus-based approach to study word co-occurrence patterns, that is, collocations and colligations, we explore discursive representation of refugees and immigrants in the Polish right-wing press. Hence, the analysis, of both quantitative and qualitative nature, focuses on lexical associations of two nouns, *uchodźca* 'refugee' and *imigrant* 'immigrant', and their role as epistemic, axiological, and emotional proximization triggers in the process of mediated construction of crisis and European security. Generally speaking, the following questions will be addressed here: how is it possible that certain phenomena, events, groups or individuals acquire their axiologically and emotionally imbued representations, often with real life implications, within the sphere of collective consciousness? How are they entrusted with quasi-status functions and deontic powers, which, at least in the case of a certain collectivity of people, including both the perceivers and the perceived, reconfigure relations and bring about material consequences? We propose here that this process of construction of mediated experience, and thus of mediated social reality, is contingent upon journalistic/media manipulation of distance (mental and physical distance between the members of the audience and the elements of presented objective reality to which they have no direct access) in several different dimensions. Whether it is about news discourse or other forms of mediated communication, entities from this reality (events, groups, individuals, phenomena, both abstract and material) are selected and brought closer to the media users, thus influencing their cognitive-affective involvement and, as a result, perceptions, judgements and actions.

[This research is part of the project C.O.N.T.A.C.T. *Creating On-line Network, Monitoring Team and Phone App to Counter Hate Crime Tactics* 2015-2017 (reportinghate.eu), co-financed by the EU Commission (grant no. JUST/2014/RRAC/AG/HATE/6706)].

### **Junko Kosaki & Lala Takeda**

***Pragmatic rules as an enhancement of students' intercultural competence: A study based on a functional analysis of overlaps in task-based dialogues*** (Contribution to *The interfaces between Pragmatics and Language Education*, organized by Lee Cynthia [et al.]

This study investigates overlaps in student interactions in English and Japanese task-based dialogues in order to elucidate differences in the functions of overlaps from the perspective of intimacy. The aim is to help students learn how to communicate effectively with others across first and second languages, and also to help teachers understand how to most effectively instruct students in communication depending on their level of intimacy and

roles-in-interaction. Adopting a metacommunicative approach (Bateson 1972), we conduct quantitative and qualitative analyses of how functional differences in overlaps in task-based dialogues can contribute to the teaching of English or Japanese conversation in particular: who should speak and when, depending on the intimacy level. Data were obtained from a cross-linguistic video corpus of recordings made under experimental conditions. We examined 11 English and 11 Japanese interactions in task-based dialogues between female university students who were intimates. The recordings and their transcripts were analyzed; the results for both languages showed that, the interlocutors overlapped to bring their viewpoints together as a sign of confirmation that they both agreed on a common understanding of the current topic. In the English interactions, however, they overlapped to express clear agreement and acceptance of the suggested ideas in order to show coexistence with each other as individuals. In the Japanese interactions, on the other hand, they overlapped to show shared understanding or commonality through the content of overlaps in order to show a unification between each other as collaborators in the interactions. Moreover, when expressing different points of view, the English interlocutors overlapped to clarify the difference in opinions, but at the same time, they sometimes used mitigating overlaps with a slight pause to show a certain understanding of and respect toward the suggested ideas as well. The Japanese interlocutors, on the other hand, mitigated the negative and assertive nuances of the content of the specific overlaps with frequent use of a pause to show some consideration to each other. Based on these findings, this study proposes the necessity of explicitly introducing into conversation instruction some pragmatic rules tailored to particular genres and intimacy levels—not only the rules tailored to particular languages suggested by Murata (2015)—and of decreasing the hindrances to communication by applying given pragmatic rules to specific genres or languages according to the level of intimacy. Doing so will help educators teach students to identify similarities and differences between overlaps in their first language and those in their second language for a given genre and/or intimacy level in order to enhance their intercultural competence (based on the developmental model of intercultural sensitivity (Bennett 1998; Yamashita 2013)), helping improve their second language conversation skills.

### Peter Kosta

*Initiating conversation with jé - The short, but important life of turn initiating elements in everyday conversation of literary texts (examples from Czech German-Russian-Polish-Serbo-Croatian-French and Italian parallel corpora)* (Contribution to *Creating worlds from the inside: Turn-initial positions as Creators of Discourses and Worlds*, organized by Kosta Peter [et al.]

**Motto:** jít s tebou? Ne! Musíš na konci roku pronést řeč na rozloučenou . Peggy Sue , počkej ! Dnes jsem nebyl v obchodě a zkoušel jsem tu píseň. Na začátečnici není špatná. Změnil jsem všechna " jé " na " ó ", ale poslouchej ...

The goal of my contribution is to examine minimal introductory elements of a turn (cf. Heritage 2013) with regard to their syntactic position, conversation style, speech make-up and communication purpose, in order to examine the main hypothesis of the panel into what extent already minimal sequences at the beginning of a turn represent the overall characteristic and make-up of a conversation or register/style, and what is it that makes them to “creators of worlds from the inside”, that is to say, in which way they determine and predict the macrostructure of a talk. Furthermore, some general conclusions will be drawn from a natural-data-based everyday conversation which we take from the Urban Voices University of Potsdam Data Base<sup>6</sup>.

We first investigate the particles 'jé' typically found in colloquial Czech at the beginning of a turn and compare these with German, English and Russian translations or potential equivalents. A quantitative evaluation will also play a role. When entering the stimulus, the following distributions between Czech and German result in the ČNK (Czech National Corpus): Of a total of 52 entered Czech token, jé correspond in the German parallel text to 0.23 of the German *oh* in the sentence initial position (examples are taken from "intercorp\_v8\_cs")

At the rate ARF, the number varies between react-text: 36 to react-text: 37, which results in the quantitative distribution of / react-text 14.92. The second most frequent translation equivalent appears in place of Czech jé – as German *je*, but equally frequent is zero as equivalent of the Czech turn initial particle *jé*.

In our CA analysis, we give a brief overview of some text occurrences and equivalents in which the Czech turn-initiating particle *jé* occurs with German, English, Russian, Polish, Serbian/Croatian/Bosnian, French and Italian parallel texts. We then want to look into the register and conversation style specificity of this Pragma-Lexem or discursive particle. Since there is no general meaning on the level of intensional semantics, it remains rather underspecified from the viewpoint of semantics proper; the bigger part of the semantics is built by pragmatic contexts and implicatures (cf. scalar, conversational and conventional implicatures in Kosta, 2011).

Thus, the procedural meaning of the token is mostly determined by external pragmatic factors such as illocution, pragmatic situation and style/register, sometimes also by the goal of communication, rather than by lexical semantics proper (i.e. by its intensional or referential meaning or its truth values). This observation roughly corresponds to the well known division of labor between intensional semantics (Frege's *Sinn*), reference (Frege's *Bedeutung*) and third factor relevance, attributing the biggest share to conversational implicatures and indirect speech acts (cf. Kosta 2011, 2015b) of these turn initiating elements. The underspecified or better fuzzy or even vague intensional meaning of these elements is predicted by their function in everyday conversation. The following study is based on a parallel corpus of spoken Czech and spoken German, Russian and English in literary texts of different origin. The source text of entry is Czech token, taken from the [InterCorp v8 - Czech](#) (Český Národní Korpus/ČNK).

Within the monolingual oral discourse, the particle *jé* can be classified with respect to its syntactic collocation as follows:

- 1: Absolute "sentential" position (without any adjacent elements)
- 2: Thematic position- Introducing a new statement
- 3: Second Position (preceded by another introductory expression)
- 4: Special position (Inversion, Parenthesis or Extraposition)
- 5: Final Position (at the end of a turn)
- 6: Other phenomena (excluded, mostly part of an homonymous element, e.g. in abbreviations: JZD etc.)
- 7: TRP /Turn-taking contexts (Initiating or triggering turn-taking in conflictary contexts of dispute (accompanied by special prosody and intonation))
8. Thematic deviation (incoherence)

In the statistic, the frequency of these collocations are very significant. Thus, it seems that syntax at least partly determines a part of the procedural meaning of discourse particles in oral speech.

Table 1: Colloquial (Oral) National Corpus of Czech: Statistics of different collocations of the initiating discourse "particle" *jé* in Colloquial Czech

Table 2: Statistics and quantitative analysis of different collocations of the initiating discourse "particle" *jé* in Colloquial Czech

***Partners in joy and sorrow: Interpersonal aspects of Tehrani marriage and mourning Rituals*** (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

The paper's starting point is Kádár's view that social ritual practices embody and reinforce the moral order of communities (2013, 2016). It explores how some social ritual practices, especially those connected with marriage and death/mourning, are still seen by participants and observers as relating to moral order, even in the face of changed everyday realities. Although a number of informants and observers recognize and meta-comment on the status of a ritual as being purely "customary" and "superficial", or even profess complete lack of understanding of such practices, none reports willingness and intention to depart from the external form.

On the basis of an extensive body of ethnographic data (participant observation, post-event and ethnographic interviews) collected in Tehran, Iran, the paper sets out to examine the ways in which the "ostensivity" (my term) of such ritual practices relates to participants' and observers' sense of the maintenance of the moral order and "face" (Koutlaki 2009). I hypothesise that in such a collective orientation society (Koutlaki 1997; 2002; 2009) even if participants and observers may not be consciously aware of the function of ritual practices, they experience the employment of such rituals as reinforcement of group bonds and expression of respect to participants' individual and collective face.

In a large metropolis such as Tehran, which has undergone a huge metamorphosis in the last thirty years, this study of ritual reflects the transition that is now underway, as traditional ritual practices are adapted to fit new social realities, while retaining their social and interpersonal functions.

***Financial literacy, pension planning, and investment behavior – A comparative study for Austria and Switzerland*** (Contribution to *Financial literacy – a key to the real world*, organized by Whitehouse Marlies [et al.]

This paper analyzes the impacts of financial literacy on the investment and pension planning behavior in Austria and Switzerland. Based on survey data of 449 individuals from Austria and Switzerland, we first analyze which socio-demographic and country-specific factors determine financial literacy. In a second step, we explain the investment and pension planning behavior by the level of financial literacy as well as other relevant person- and

country-specific characteristics. In particular, we investigate differences between the Austrian and the Swiss with respect to financial literacy and the respective pension system and derive potential impacts on the pension planning and investment behavior of the population. Our results show a higher level of financial literacy in Switzerland compared to Austria, and the difference is even larger for the factual compared to the self-assessed financial literacy. Also women are less financially literate than men. A higher financial literacy has a clear positive impact on the level of pension planning, whereas the effect of the self-assessed financial literacy is stronger than the impact of the factual one. Swiss people seem to care more about pension planning compared to Austrians, and the same holds for elder people compared to the younger persons in our sample. Overall, our results provide some potentially interesting insights on the impacts of institutional differences on pension planning, investment and information behavior.

***The multilingual Online discourse of the European refugee crisis on Twitter*** (Contribution to *CMC Pragmatics of L2 Discourse*, organized by Vandergriff Ilona [et al.]

This study examines the multilingual online discourse of the European refugee crisis on the micro-blogging platform, Twitter. Specifically, the researcher looks at 100 tweets, written in English, German, Spanish, French, or a combination of the aforementioned languages, which include #refugeesnotwelcome and explores how this hashtag is used to express negative feelings, beliefs, and ideologies toward refugees and (im)migrants in Europe. Guided by Critical Discourse Studies (van Dijk, 2009; Wodak, 2015), the study analyzes Twitter users' discursive strategies as well as form and function of semiotic resources, intertextuality, multimodality, and addressivity. The data analysis reveals that Twitter users who include this particular hashtag use a variety of arguments and strategies such as negative characterization, reference to so-called facts and right-wing media sources, and visual intensifications to support their negative other-presentations of refugees and (im)migrants. Moreover, many of these Twitter users employ a rhetoric of inclusion and exclusion to depict refugees as unwanted, criminal outsiders and to create a national or European identity. These tendencies align with current trends in Europe where national-conservative and xenophobic right-wing groups gain power and establish a socially accepted discourse of racism.

***English in Asmara as a changing reflection of globalization*** (Contribution to *Postcolonial linguistic landscapes: Reading globalisation in the margins*, organized by Juffermans Kasper [et al.]

In Eritrea, a small country in East Africa that has been colonized for over a century by Italy, Great Britain and Ethiopia respectively, English plays an important role as a language of instruction in education. Although English has no official status in the country's language policy, it is also used in government offices, international businesses and service institutions like restaurants, hotels etc. and it appears in its written form in the country's linguistic landscape (LL). This paper goes into the use of English in the LL of the capital Asmara. We will use data that have been collected in 2009 (by our MA students) and 2016 (by Yonas Mesfun Asfaha). These datasets provide a - be it timewise rather limited - longitudinal perspective on the uses of English literacy in the streets of Asmara. We try to interpret some of the changes that we observed in the LL over the years in relationship to the way in which Eritrea, in the early years of independence referred to as 'the hope of Africa', developed into a country that because of internal repression of its population became increasingly isolated from at least many countries in the West. As a consequence a diminishing number of foreigners go to Eritrea (negative travel advice) and a growing number of Eritreans are leaving the country as refugees (325.000 in 2015). In our 2009 data, apart from government signs using Tigrinya, Arabic and English, we found English mainly in public places related to visitors from abroad such as hotels, restaurants and in- and export companies and also in internet cafes and computer and electronics shops. The English contained quite some grassroots characteristics and restaurant owners that were interviewed turned out to be not all that positive regarding the

future of English

utinsoft.Local.ByteClass a language they introduced on their menus during the UN peacekeeping mission (2000-2008). A conclusion was easily reached: irrespective of world-wide globalization movements that also affect the world's peripheries and margins, being increasingly cut off from international connections, we observed Eritrea experiencing a diminishing use of English in public space. Our 2016 data however showed a different picture. Administrative and tourist signs using English are still there but they don't seem to be maintained very well and are slowly deteriorating. But there is at the same time another development, i.e. a growing number of mainly handwritten or printed quick notes and ads, attached to shop windows that inform the public on computer and internet stuff. The main ads are still in Tigrinya but the specifics, the cultural accents, addressing a new internet savvy Eritrean public, are more and more in English. As a consequence of geopolitical developments the effects of globalization moved from foreigners visiting the country to Eritreans going online, getting connected, and becoming members of a much larger network society that not only includes Eritreans in Eritrea but also the ever growing number of Eritreans in the diaspora.

### *Eye-tracking in theatre: Coordinating multiple activities during a theatre rehearsal*

(Contribution to *Mobile Eye-Tracking in Interaction*, organized by Stukenbrock Anja [et al.]

The organisation of multiple activities ('multiactivity', Haddington et al. 2014) as a social phenomenon highly depends on the temporal and interactional coordination of interaction ensembles in their specific contextual arrangements. Theatre rehearsals as work place settings consist of many concerted activities, but are rarely a research topic due to limited possibilities to observe and record rehearsals (Krüger 2011; Matzke 2012; McAuley 2012).

While the majority of studies focus on director-actor-interaction, the role of the assistant directors' contribution through his/her organisation of multiple activities such as observing, writing, reading and prompting remains unexplored (Schmidt 2014; Schmitt 2012). Modern theatres' assistant directors often deal with several activities which need to be accomplished at the same time: Keeping the script and cues up to date, reading along the script while observing the actors which eventually leads to prompting when an actor "runs dry" (can't remember a word s/he was supposed to say). In doing so, the assistant deals with the practical problem of when and how to alternate activities or embed separate activities into one multiactivity (Mondada 2011: 207). This paper shows two coordination practices of multiactivity: 1) alternating and 2) embedded multiactivity and the concerted practices with which paused activities are held 'active'.

The data used for this paper consist of 200 hours of video recordings of rehearsals at a professional theatre in Germany, covering 28 rehearsals of a devised theatre play with two actors, the director and his assistant director over the course of six weeks. In addition to camcorders, two mobile eye tracking glasses were worn by the director and his assistant director. This allows an insight in gaze behaviour of primarily visual activities like observing and reading (Holler/Kendrick 2015). Through eye tracking it becomes visible that while some activities such as reading and observing alternate, their timing is closely coordinated with other activities and other participants' actions. Despite having a script to follow, the actors often improvise, skipping text parts or running "dry". The assistant director as an unaddressed participant reacts to that by gazing at the actors at transition relevant places (TRP). In doing so she checks whether she has to become the next speaker by using actors' interactional clues like pauses, particles, finger snapping or verbal expressions ("Script!"). To distinguish a "dry pause" from a dramatic pause, the assistant gazes directly at the actors' faces. If she decides that an actor is "dry" she starts the prompting activity and becomes a self-selected next speaker. In cases where prompting isn't needed, the assistant resumes the paused reading activity. Thereby, she treats reading and observing as one alternating multiactivity. When prompting or writing is needed in addition to the reading-and-observing multiactivity, these activities are intertwined in such a way that the alternating course of reading-and-observing can be maintained, resulting in an embedded multiactivity.

Using two cases of alternating and embedded multiactivity this paper will show how the assistant treats reading-and-observing as one multiactivity and maintains multiactivity behaviour through interactive coordination with actors and the director in order to accomplish two work place tasks at the same time.

*Media activate speakers of dialects to be authentic enough* (Contribution to *Gender, regional and generational varieties in Japan: Re-exploring negotiation of identities*, organized by Nakane Ikuko [et al.]

Sociolinguistic studies on the stigmatized reproduction of minority language including regional dialects have been increasing (Ronkin and Karns(1999), Jaffe(2000), Chun(2004), Meek(2006), Hill(2008), Bucholtz and Lopez(2011), Lippi-Green(2012)). Few papers have been written on Japanese regional dialects in Japanese media (Okamoto and Shibamoto-Smith(2008), Kumagai and Okamoto(2013)). Regional dialects have been commodified since 1990s, and many TV programs have been featuring dialects in Japanese media. Coupland(2007:184) claims “mass media are increasingly active and important in delivering our accent/dialect/variation experience”. This paper demonstrates that Tōhoku dialect (TD, spoken in the northern part of Japan) is still stigmatized with the negative stereotypes (i.e. rural, aged, unfeminine, and vulgar) through the examination of the talk performance by TD native speakers in the entertainment TV program “Himitsu no Kenmin Shōu” (secret show of the people of prefectures) broadcast on December 29, 2011. This study analyzes its talk show “Dai Tōhoku samitto” (Big Tōhoku summit) in terms of guest, content and dialect use to show that guests who are native speakers of TD reproduce stereotyped images of Tōhoku area, the people of Tōhoku, and TD linguistically and in demeanor conspiratorially with the hosts, who are from big cities such as Tōkyō and Ōsaka. Media activate native speakers of TD to be authentic enough. Media promote stereotyped images of Tōhoku and TD with native speakers of TD. First, most guests, who are singers or actors, are middle-aged male and female in their 50s on average. Gender and age of guests themselves strengthen the stereotyped images of TD, i.e. unfeminine and middle-aged. Second, in the entertainment program, guests, who know what is expected of them, discuss embarrassing and unsophisticated experiences as TD speakers in Tōkyō. Their stance as hillbillies is emphasized through their talk. Third, guests as authentic TD speakers speak limited and patterned TD exaggeratedly just for mockery and parody. In the show, they identify themselves with and are identified by audiences with authentic TD speakers. In conclusion, this paper claims that the entertainment TV program, which was broadcast after the big earthquake in the eastern part of Japan in March 11, 2011, still reproduces negative stereotypes of TD conspiratorially with native speakers of TD and hosts.

### **Agnes Kuna**

*The function of first person deictic elements in doctor-patient relations* (Contribution to *The Pragmatics of Change in Therapy and Related Formats*, organized by Graf Eva-Maria [et al.]

In recent decades, several studies have focused on doctor-patient relationships and the dynamics of their evolution. Increasing attention has been devoted to the fact that the efficacy and outcome of a therapy are greatly determined by the nature of this relationship. Models of the healing relationship have also changed. Doctor- and illness-centered (patriarchal) medical relationships, with a long history of dominance in the field, are giving way to partnership-oriented, cooperative (patient- and relationship-centered) interactions (cf. Beach 2013). This trend reflects that hierarchies (based on prestige and knowledge) are diminishing and patients are getting more actively involved in the healing process. These processes entail changes to doctors' communication

as well. Doctor–patient relationships are always construed dynamically within particular situational contexts, shaped by the participants’ behaviour and linguistic activity. Among other factors, the doctor’s self-representation is fundamental to the process. The present paper aims to demonstrate the functioning of first person deictic elements in doctor-patient consultation, which is a typical linguistic expression of self-representation. The main questions of the survey are: 1) Which roles and patterns of first person deictic elements can be detected in doctors’ communication? 2) Do the examined linguistic representations play a role in the construal of the patriarchal or partner-like relationship between doctor and patient? The analysis is based on models of the healing relationship (Beach 2013) as well as a functional cognitive approach to pragmatics (Verschueren 1999). The empirical data of the study of first person deictic elements is supplied by participant observations undertaken in 2012. The communicative practice of four Hungarian, male general practitioners were monitored at more than 400 doctor–patient encounters in Budapest and in Pest county (Kuna–Kaló 2014). This paper offers an overview of the findings supported by 60 selected consultations (4 x 15 consultations on one day). A total of 1182 linguistic representations have been analysed against the background of the script of GP surgery (cf. Eysenck–Keane 1990). The investigations conclude that first person deictic elements display a variety of patterns and roles in medical communication, in close association with interpersonal and professional relations, empathy, and the work routine of general practitioners. First person singular forms typically foreground the doctor’s central role within the script of surgery, whereas the use of plural deictic elements tends to correlate with a partnership-oriented healing relationship. An added benefit of the project is that the analysis of doctors’ linguistic activity may offer insight into the correlation between burnout and self-representation.

#### Svetlana Kurtes

***(Mediated) public communication in post-conflict societies: Towards a better understanding of the culture-specificity of the Balkans*** (Contribution to *Interpreting and representing non-English language data in discourse studies*, organized by Zabielska Magdalena [et al.]

The paper reports on select findings of a follow-up study looking into the pragma-semantic structure of public communication and (official) daily interaction represented in mainstream electronic and print media in the countries formerly comprising Yugoslavia. The original investigation (Kurtes 2004) focused on instances of hate speech in public communication during the political crisis and war in the Balkans during the 1990s. More specifically, it looked into the semantics of hate speech and proposed a possible model of analysis in an attempt to disambiguate the phenomenon that was rather prevalent in the state-owned media in Serbia during the political crisis of the 1990s.

The follow-up investigation (i) puts under scrutiny the current situation, finding out if and how the language of public communication represented in the mainstream electronic and print media in the Balkans has changed in the last two decades and (ii) identifies possible emerging patterns triggered by the new political climate officially promoting the language of tolerance, political correctness and post-modern liberal values. The follow-up investigation focuses primarily on the situation in Serbia and Montenegro, two of the former Yugoslav republics which have recently become candidate countries for EU accession (European Commission 2013).

The aim of the paper is to contribute to the Panel ‘Interpreting and representing non-English language data in discourse studies’ by focusing on the issue of culture specificity of non-English linguistic data and idiosyncrasy of communities. More specifically, the chosen data will illustrate how, following the demise of the Communist ideology as the dominant socio-political paradigm of the region, some staple tokens of the period appear not only to have ‘survived’, but also to be able to re-conceptualise themselves semiotically and pragma-semantically. This particularly refers to the old ‘ideology-based’ form of address *comrade* (*drug*, m. / *drugarica*, f.), which appears to have secured a new lease of life in selected instances of public communication and media(tised) language in some ex-YU countries (Kurtes 2013).

### **Dennis Kurzon**

***Multi-voiced dialogue in opera and its addressees*** (Contribution to *Pragmatics in literary texts and other arts*, organized by Kurzon Dennis [et al.]

In a performance in a theatre or in an opera-house, there are at least two sets of communicative acts going on. The first is the dialogue on stage among the characters in the play or opera, while the second is the set of communicative acts occurring between what is taking place on the stage and the audience. The first set may be seen as a type of natural conversation, but there are cases in which this does not hold.

Dramatic soliloquies, such as Hamlet's in Shakespeare's tragedy and asides do not have addressees on stage, apart from the character, who is in effect speaking to him/herself. They are thoughts spoken out aloud, and therefore heard by the audience. The audience, then, is privy to the character's thoughts. In cinematic versions, this may be seen more clearly in cases where the actor does not speak but we hear his or her voice speaking the lines. We may add, too, the chorus in Greek and later European drama, in which the chorus speaks directly to the audience. A similar phenomenon occurs, too, on the operatic stage, but there we find not only arias sung by a single character and heard only by the audience, but also duets, trios and larger ensembles. These may be musical versions of a polylogue, in which several participants are holding a conversation. However, this situation may become more complex in cases where the singers are singing simultaneously, i.e. they are not, as it were, talking to each other. There are two major types of multi-voiced singing: firstly, when the singers are singing the same words concurrently or with slight overlapping, and secondly when the singers sing different texts.

Based on Goffman's distinction between ratified and non-ratified participants, and the several subcategories of these types of participants, the paper will explore the relationship between the polylogue on stage and the audience as a communicative act both when the message is clearly enunciated as in a soliloquy and when what is heard by the audience is far from being a clear message; it becomes an imbroglia - a point at which linguistic messages become aesthetic signs.

### **Marion Kwiatkowski**

***Pragmatic particles among adolescent speakers with a migrant background in rural areas: The case of Som in Swedish-language Ostrobothnia, Finland*** (Contribution to *Responsibility, migration, and integration*, organized by Östman Jan-Ola [et al.]

Pragmatic particles have been documented to be one element of language that is innovatively used among speakers with a migrant background or with a migrant network in bigger cities (cf. Svensson 2009, Wiese 2011). Pragmatic particles have a highly elusive meaning and therefore lend themselves for reinterpretation; their invariable form and structural mobility contribute to their salience in speech which makes them a preferred linguistic element for identity construction.

This contribution is concerned with the pragmatic particle *som*, a linguistic feature of the region of Ostrobothnia, Finland, and its use among adolescents with a migrant background. Data collected from adolescent speakers with a migrant background from Närpes, a small municipality in the countryside with a fairly long history of migration and a highly diverse demography, were compared to data obtained from speakers of all ages without a migrant background living in the wider area of Ostrobothnia.

Even though qualitative analysis paints a fairly similar picture of *som*'s usage among speakers with a migrant background compared to speakers without one, frequency counts reveal a less variable use of *som* among speakers with a migrant background: Whereas a fairly even distribution between *som* as an approximation and focus marker was found among speakers without a migrant background, informants with a migrant background show an overall preference for *som* as an approximation marker modifying the entire utterance in the structural position of a sentence adverbial.

The concept of responsibility offers a valid explanation for the informants' preference for approximative *som*: Vagueness has been characterised as a general feature of youth language. The use of approximation markers represents an effective strategy for reducing speaker commitment, or responsibility, to the truth value of the entirety or parts of the speaker's statement. Furthermore, the interview topic, namely the social and cultural relations between migrants and non-migrants, might have triggered increased hedging due to its predisposition of bringing about controversial statements.

On a theoretical level, I note that the traditional dichotomy established in linguistics of urban-innovative versus rural-conservative is no longer tenable. Due to increased media access and mobility, rural areas have become sites of linguistic contact, and with this, of linguistic innovation. As Britain (2012:25) argues, "while contact may well be most obviously and vividly felt and observed in cities, it is not confined sociologically or epistemologically to an urban context". For this reason, rural settings should be regarded as potential sites of linguistic innovation; this will in turn allow for further insights into the underlying mechanisms steering innovation.

*The enemy within us: Self-directed laughter in the 2015 refugee crisis* (Contribution to *Laughing at the 'other': Critical pragmatic insights into the humorous construction of opposing groups*, organized by Chovanec Jan [et al.]

Humour often plays with grand narratives and offers new unusual perspectives, doing it to the amusement of some and to the outrage of others. Using important texts for a society as a source for humour is bound to evoke strong emotions, because the joke assumes an attitude of self-criticism to which not everyone is willing to assign. Especially in the Internet both appreciation and criticism are expressed in ways that draw the arguing sides even more apart, rendering the conflict irreconcilable. It is in the crossroads of these voiced emotions where appealing insights into the relationship between individual utterances (micro-level) and society's stereotypes (macro-level) can be discovered and described. Investigating humorous texts and their public reception offers an entry point into the practices of othering between and within ethnic and/or social groups and the role of unlaughter in them.

In Estonia, the 2015 refugee crisis was met with much humour, most of which can be seen as insulting to the targets. As a reaction to the offensive humour about refugees, an extra twist to the already delicate situation was added in the 2015/2016 New Year's Eve programme Tujurikkuja ('Mood Spoiler'). The authors of the parodic video entitled "No country stands alone" offered a self-ironic take on the refugee crisis by pairing a patriotic song from 1990s with sharp criticism against xenophobic ideas in the present-day Estonian society. The focus of this presentation will be on the online reactions to this TV programme. During the heated debate, (re)definitions of humour were offered together with attacks on the creators of the humorous clip, thus displaying a reaction of unlaughter.

The study draws conclusions from the combined analysis of the humorous text itself, the internet comments discussing the show and the journalists' reaction to the controversial video in order to describe the diverse discursive realisations, effects, and functions of othering via humour in the complicated case when the target - the Other - is "the enemy from within". The results suggest that viewpoints become even more polarised in the discussion and narratives of cultural trauma find support even in moderated, censored and non-anonymous online settings.

\*This study was supported by the Estonian Ministry of Education and Research (IUT22-5), and by the European Union through the European Regional Development Fund (Centre of Excellence in Estonian Studies).

#### ***Humor as a discursive vehicle for political and social critique in Chinese society***

(Contribution to *Political humor as social action: verbal-visual attitudes towards politicians in late modernity*, organized by Van Hout Tom [et al.]

Queries into the dynamics of dominance and resistance in the discursive realm have been at the core of critical discourse studies and related disciplines examining the relation between discourse and power in political communication. These questions are particularly relevant in societies where authoritarian regimes are struggling to maintain their one-party-rule facing calls for democratization in a globalized world with citizens having increased access to multiple channels of expression. In these autocratic environments, the leadership usually exhibits a high metapragmatic awareness of the illocutionary force of language. While spreading its carefully designed ideology through official media channels and other propaganda mechanisms, the power base also controls articulation of alternative discourses, thus establishing ideological hegemony in the public sphere. This almost systematically tends to produce a cynical counter-discourse (Holbig, 2009) in a covert fashion through: humorous ‘hidden transcripts’ (Scott, 1990). The current paper offers several examples to illustrate how humor in China, from the Republican era to the present-day People’s Republic of China, has been functioning as a tool to incorporate subversive messages while all the same adhering to guidelines of political correctness. It describes various currents in Chinese society struggling for discursive power in the literary realm, daily conversations, and on the Chinese Internet as the anonymous arena par excellence for satire and parody. While reviewing the academic debate about the extent to which symbolic discursive practices constitute real power for political and social change, it also moves beyond the oppositional ‘info control/resistance’ paradigm, prevalent in Chinese media research, in its exploration of how online info is reconstituting Chinese society.

#### ***Age and stage of life categorizations used in accounting practices in social conflict online***

(Contribution to *The micro-analysis of online data (MOOD): Using discourse and conversation analytic methods to analyse online interactions*, organized by Meredith Joanne [et al.]

Conversation Analysis (CA) focuses on how participants achieve a common understanding in social interaction (Maynard 2013). A central point in CA research is that social norms are locally managed and negotiated in interaction in and through the interactional resources available and oriented by the participants (Schegloff 2007). In this paper, we focus on instances in which some interactional move is treated as an offense, and hence as accountable, by co-participants in written interaction in social media, leading to social conflict (McLaughlin, Cody & Rosenstein 1983). We analyze instances from different kinds of social media platforms, i.e. online discussion forums, news media discussion forums, and interaction on Facebook groups by using CA-inspired methods (Giles et al. 2015; Meredith & Potter 2014) and discuss methodological and analytical issues involved in understanding such negotiation and activities in different settings. Affordances of different media platforms make different kinds of identification of participants possible which provide participants with challenges and resources for accomplishing their interactional business. We include a method highly related to CA, membership categorization analysis (MCA) (Stokoe 2012), as we investigate how identity categories, namely age and stage of life categorizations, are used in accounting practices in social conflict online as a strategy and resource to negotiate social norms in online settings. In contrast to much research within for example sociolinguistics which views age as social fact (Chambers 2003), we show how age is used as a negotiable social category by participants. Further, we show that age categorization may achieve different purposes in the

interactional construction of social conflicts, for example age categorization may be treated as an offense or used to account for action viewed as an offense.

#### Robert Lawson

***Tough masculinity through the ages: A comparative analysis of the term ‘hard man’ in two British newspapers*** (Contribution to *Knowing me and knowing you – reference and identity markers in public discourse*, organized by Nevala Minna [et al.]

One of the most common cultural tropes in Scotland (and urban locations in the UK more generally) is that of the ‘hard man’, a term primarily associated with working-class male identities and a culture of excessive aggression, violence and toughness. But even though this term encodes a range of negative social orientations, including criminality and impulsiveness, such forms of ‘tough’ masculinity are also viewed as being socially-valued and desirable, particularly by young men (Skelton 1997; Lawson 2013). Thus, the term ‘hard man’ exists in a state of social tension - simultaneously a negative marker of social marginalization and a positive marker of a desirable working-class male identity. By functioning as a label of ‘primary potency’ (Allport 1986), ‘hard man’ can be used to differentiate between mainstream ‘law abiders’ and those potentially prepared to utilise violence (or the threat of violence) to achieve their social goals. Yet despite the complicated ways in which the ‘hard man’ appears to be orientated towards within contemporary society, there have been no attempts to understand its historical trajectory or its current usage patterns in public-facing texts, either within or outwith Scotland. In this talk, I present a longitudinal analysis of a corpus of news articles from two broadsheet newspapers published in the UK - *The Guardian* (with a UK-wide readership) and *The Scotsman* (with a primarily Scotland-only readership). Examining the period between 1850-2015, I outline the ways in which the term has been used in print media and compare its use among Scottish and non-Scottish newspaper outlets. In doing so, I consider the role of the broadcast media in (de)legitimizing public performances of masculinity, how particular evaluative stances are encoded in newspaper discourse, and the complex web of social meanings associated with the term.

#### Mariana Lazzaro-Salazar & Olga Zayts

***Does pragmatics matter? Migrant doctors' perceptions of conflict talk: The case of Chile and Hong Kong*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

The cultural diversity that characterises today's healthcare institutions poses the challenge of exploring an array of communicative scenarios in order to address culturally-sensitive issues that may help improve workplace performance. Partly due to the accelerated processes of globalisation and to the world financial crisis, professional mobility around the world among healthcare workers has been on increase in the last couple of decades (e.g. Horner and Weber, 2008; Harvey et al., 2004; El Mercurio Blogs, 14 March 2015). This paper examines the issue of professional mobility in the contexts of Chile and Hong Kong. In both countries professional mobility has been driven, on the one hand, by healthcare workers searching improved wages, better job opportunities and social security due to economic stability and growth of the host countries. On the other hand, professional mobility has been prompted by health care organizations actively developing recruitment strategies that aim to address the issue of inadequate supply of health professionals. The process of overseas relocation and adjustment is not without hurdles though. For example, both countries have introduced stringent requirements that include a licensing exam and a period of 're-training' or internship in order for foreign medical graduates to practice medicine. In the context of such current world-wide migration waves, cultural diversity is becoming increasingly more important in the workplace because it presents migrant doctors with the challenge of adjusting to the host culture and local workers with the challenge of embracing new foreign cultures. Because of the high stakes involved in medical practice, an important aspect of transitioning into a new culture is how doctors manage conflict situations through talk. Taking a discourse analytic perspective, in this paper we explore conflict talk among migrant and local healthcare workers. In Chile migrant healthcare professionals come predominantly from other Latin American countries; however, in spite of speaking the same language (i.e. Spanish) as local healthcare professionals, they belong to very different cultural groups. In Hong Kong migrant healthcare professionals originate from various countries around the world (e.g. in South East Asia, Europe, and Australia) and the cultural diversity is further exacerbated by linguistic diversity with the vast majority of the Hong Kong population speaking Cantonese as their first language. By drawing on autobiographical interviews and a survey on conflict talk in public healthcare institutions, this paper shows the levels of transitions undergone by foreign doctors in an exploration of the pragmatic aspects at play as doctors manage conflict talk, namely, the preference for direct and indirect talk. Reporting on an ongoing study carried out in both Chile and Hong Kong, the paper discusses how relevant direct and indirect talk are in intercultural communication and what impact they have on professional practice as perceived by migrant doctors.

***Linguistically diverse ad hoc mediated ED consultations (2): Communication patterns and medical consequences of interpreters' "inaccuracies"*** (Contribution to *The interpreter's role in healthcare conversations: A multimodal analysis of a multimodal reality*, organized by Van Vaerenbergh Leona [et al.]

**Background** [This paper is the second part of the presentation of the results of the research *Doctor patient communication via an ad hoc interpreter in the Emergency Department: what is lost in translation?*] Emergency medicine is a predominantly oral activity in which medical errors often result from poor communication. Due to the increasing diversity of patients in Emergency Departments (ED), especially in the light of the current refugee influx into Europe, emergency physicians have to take history from patients with whom they do not share a language. Sometimes, these patients bring along companions with some (often-limited) knowledge of the hospital's language to support the communication process. While these companions are often helpful, they may add additional sources of uncertainties to the communication process and hence of potential miscommunication. So far, the literature on language barriers in the ED has mainly focussed on health outcomes in the presence of language barriers, and the impact of interventions such as interpreting on these outcomes. This study aims to contribute to insights on the process of communication, by dissecting different levels of miscommunication and describing how they are interrelated.

#### Methods

We audio-recorded linguistically 16 multi party consultations in an ED and collected the corresponding

contextual information via ethnographic participant observation (including note taking and after action interviews with clinicians). The consultations were transcribed, translated, and multimodally analysed from a medical, interactional sociolinguistic and communication pattern perspective. This paper presents both the communication pattern and medical analysis. Analyses of patterns consist of determining which underlying voice is expressed in the consultations' dialogues, or, in other words according to Habermas and Mishler theories, how the voice of the Lifeworld (VoL) and the voice of Medicine (VoM) interact. Each utterance was coded as the VoM or the VoL separately by at two coders, who then compared their work in order to reach consensus on the divergently coded utterances. The medical impact of interpreters' mistranslations was assessed in a two-time procedure. First, the interpreters' utterances were coded as accurate or not. Inaccuracies were evaluated (omission, addition ...). Second, the clinical impact of inaccuracies was determined (0 insignificant to 2 high). The coders were two practicing physicians with experience in communication research. Both procedures have proved to be efficient in previous works.

**Findings** Analysis are still undergoing at the time to submit this abstract. Concerning communication patterns, a preliminary result is the absence of a structured communication in such ED consultations. Contrary to previous work where the VoL was shown to be blocked, ignored or taken into account in a meaning building process, ad hoc mediated consultations appear mainly oriented toward the VoM and very unstructured. In most consultations, the interpreter answered the doctor's questions without checking with the patient. The clinical impact of possibly incorrect answers is great. Interpreters rarely translated doctor explanations or expressions of empathy to patients thus preventing the known benefits of a strong doctor-patient relationship.

#### **Discussion**

From his analysis of the same data, Cox proposes a dynamic taxonomy that allows researchers to track communication problems within a linguistically complex multi-party ED consultation. Based on our own analysis, we will discuss and possibly enhance this taxonomy. Knowing in detail why and how miscommunication arises can help to produce tailor-made guidelines for clinical skills training on linguistically diverse doctor-patient consultations and other interventions.

### **Benoît Leclercq**

***Coercion: A case of saturation*** (Contribution to *Pragmatics and Constructions*, organized by Finkbeiner Rita [et al.]

This paper investigates the notion of coercion from the perspectives of Construction Grammar and Relevance Theory, and proposes a reanalysis of the process in terms of saturation. Construction grammarians have paid particular attention to cases of compositionality that involve a semantic incompatibility between a lexeme and the construction in which it is used, as in the sentences in (1) to (2). These examples are said to illustrate a process of coercion (Goldberg 1995:159, Michaelis 2004:2, Yoon 2012:2) whereby the semantics of each construction (X IS THE NEW Y in (1) and the WAY construction in (2)) is mapped onto that of the lexeme (referred to as the override principle, Michaelis 2004:25). This observation has essentially provided support for the construction status of argument structures. This status, however, is generally not recognized within the pragmatics literature. Instead of referring to coercion, for instance, relevance theorists tend to analyse the interpretation of Sampras and Houdinied in terms of 'free' pragmatic enrichment. The re-interpretation of the lexemes is argued to be pragmatically motivated by the need to arrive at an optimally relevant interpretation.

(1) Federer is the new Sampras. (Wilson, 2004:3)(2) He Houdinied his way out of the closet. (Wilson, 2004:4)

These two perspectives seem to provide contradictory analyses of the observed phenomenon of coercion. However, the aim of this paper is to question this apparent opposition and to argue that a better understanding of this notion can be arrived at by combining insights from the two frameworks. On the one hand, I will argue that it is necessary to treat coercion not as a systemic mechanism but as a context-dependant process in which speakers are involved (Lauwers and Willems, 2011:1224). At the same time, contra Ziegeler (2007), it will be shown that coercion is not a superfluous notion that can be better captured solely on the basis of pragmatic principles (González-García, 2011:1316). The construction status of argument structures has received empirical support (cf. Bencini and Goldberg, 2000:648). It is the semantics of these constructions that triggers coercion and the re-interpretation of the lexeme found in them.

Finally, I will argue that the process of coercion is in fact best described in terms of saturation (Recanati 1989:304, Carston 2009:50). The notion of saturation makes it possible to capture both the linguistic origin of the process involved (as argued in Construction Grammar) and the non-linguistic nature of the actual re-interpretation (as argued in Relevance Theory). In the sentences in (1) and (2), re-interpretation of the lexemes is first triggered by the semantics (and idiosyncratic properties) of the constructions used, but occurs in accordance with the principle of relevance.

**Kiri Lee**

***Choice of Japanese address terms in cross-cultural setting*** (Contribution to *Address Forms across cultures: A cross-cultural comparison of address terms in Indo-European, Uralic and Altaic languages*, organized by Bayyurt Yasemin [et al.]

This study examines the use of Japanese nominal address terms in cross-cultural setting, namely, how native Japanese speakers choose an address term when communicating in Japanese with Japanese-as-Second language (JSL) speakers, and vice versa. There have been many studies of address terms in various languages within the framework of “Power and Solidarity” proposed by Brown and Gilman (1960). However, its limitations have also been pointed out. Silverstein (2003) especially criticizes that this semantics only regards language as static and does not capture the dynamic nature of it. Following the ‘indexical order’ theory proposed by Silverstein (1976) and developed in Silverstein (2003) and Morford (1997), this study particularly focuses on links between address terms chosen by native/JSL Japanese speakers and JSL speakers’ language backgrounds, drawing the data from my interviews of 37 undergraduate students, both native and JSL speakers, studying in a university in Japan in the summer of 2013 and the fall of 2014. The ranges of address terms my participants chose fall within the ones predicted by the [-power, +solidarity] relationship (Lee and Cho 2013). However, the following strong tendencies were observed regarding language background of JSL speakers: the Japanese students are more comfortable using First-Name-only when addressing European students whereas they tend to use an address-suffix towards Asian students. Generally in Japanese, it is very awkward to address a person without any suffix, however, if it is more customary to use First-Name-only in a JSL student’s native language, Japanese students feel free to go along with it. When that is not done customary in a JSL student’s native language, such as Chinese, Korean and Thai, they prefer not to use First-Name-only. The JSL speakers’ native languages influence their choice of Japanese address terms as well. The Asian JSL speakers sometime combine their own address terms with the Japanese one, especially terms of endearment, and come up with a hybrid address term towards Japanese students. This shows that the selection of address term in the cross-cultural setting is heavily influenced by interlocutors’ language background, and thus, the use of address terms is not exclusively determined by the Power and Solidarity semantics.

**Keunyoung Lee**

***Impoliteness and identity in a Korean TV talk show*** (Contribution to *Multimodal (im)politeness*, organized by Brown Lucien [et al.]

Impoliteness has been a strong element entertaining audience in unscripted reality TV shows which made huge success in the TV entertainment business in the last decade (Culpeper & Holmes, 2013; Garcés-Conejos Blitvich, Bou-Franch & Lorenzo-Dus 2013). Impoliteness is entertaining especially in unscripted situations in TV shows because the public audience enjoys watching how the participants of the TV show, who usually care their public images on TV, react to impoliteness in the real situations as well as impoliteness itself performed on TV in the non-traditional and unexpected way. However, even with its overt effect as one of entertaining elements, there was not enough empirical analysis conducted on the nature of impoliteness in TV shows. This study presents an analysis of conflict situations caused by verbal aggression and impoliteness accompanied by multimodal elements (prosody, gesture, and facial expression etc.) in the Korean TV talk show ‘Radio Star’. The TV show ‘Radio Star’ is a late-night talk show originally produced for provoking laughter and the TV show became famous for its four-male hosts with their outspoken, rude, impolite and discourteous language toward the celebrity guests who are not expected by audience to be targets of impoliteness on the usual public TV. The present study investigates verbal and non-verbal strategies exhibited during the TV show especially both for causing and for reacting toward the conflict situations associated with impoliteness, and examine how participants in the TV show negotiate their identities to achieve their particular identities that they wish to claim on the public TV show with those verbal and multimodal components. The study finds that the salient impolite signals involve both verbal and nonverbal features and the targets of impoliteness on TV shows actively and intentionally negotiate their identities using either positive or negative reactions to impoliteness in contexts where they would take offense traditionally.

### **Cynthia Lee**

#### ***Teaching speech acts to Chinese learners of English: Design and implications***

(Contribution to *The interfaces between Pragmatics and Language Education*, organized by Lee Cynthia [et al.]

Accurate interpretation of a speaker's meaning of a speech act is part of pragmatic competence, an essential component of communicative competence, particularly for L2 learners. Many L2 learners with good grammatical competence, however, may fail in intercultural communication because they lack pragmatic competence. Pragmatic competence or ability refers an L2 learner's ability to interpret and respond to the intended meaning of what is said or written and actions that are performed in an appropriate way, taking into account of various social factors, social and cultural norms and choice of words. Over the past decade, teaching pragmatic competence in speech acts has become a growing area, aiming at enhancing pragmatic competence (in both sociopragmatic and pramalinguistic aspects) and self-confidence in managing the target language for intercultural and interpersonal communication. Drawing on the second language acquisition theories, conversation analysis method and empirical evidence, this presentation reports an intensive 12.5-hour course that adopted mixed pedagogies to teach three speech acts, namely requesting, refusing and complaining or expressing negative comments, to Chinese learners of English in an English-medium university in Hong Kong. The course aimed to explicitly raise the learners' awareness of how the three speech acts could be performed cognitively and linguistically in English, and provided opportunities to reflect on the similarities and differences in the use of speech acts in one's own and target cultures, practice them in written or oral interactions that involve different social and power relationships, and share success or failure in performing and interpreting the speech acts. To achieve the aims, the learners were asked to work on the discourse completion task, analyze the organization of conversations and perform role plays. The presentation will begin by describing the course design. Second, it will present the pedagogy juxtaposed with relevant course materials. Then, it will report the learners' comments and course evaluation results. Finally, it also reflect on the extent to which the learners could enhance their L2 pragmatic competence and awareness for effective use of English for communication across cultures.

### **Josephine Lee**

#### ***Scaling as an argumentative resource in TV debates*** (Contribution to

*Upgrading/Downgrading in Interaction*, organized by Prior Matthew [et al.]

In understanding how speakers manage issues of agreement/disagreement, alignment/disalignment, and affiliation/disaffiliation in interaction, recent conversation analytic research have examined the participants' employment of turn design (e.g., Drew & Walker, 2009), sequence organization (e.g., Reynolds, 2011), epistemic status and stance (e.g., Heritage, 2012; Raymond & Heritage, 2006; Stivers, Mondada, & Steensig, 2011), and nonvocal conduct (e.g., Stivers, 2008). The present study adds to this growing body of literature by centering on "scaling" (Bilmes, 1993) as the focal phenomenon. Of primary interest are the participants' scalar formulations in Korean argumentative interaction, and specifically the moment-by-moment sequential implications that scaling has for challenging the other interlocutor's argument.

The data comes from a weekly Korean talk show called "Non-Summit" wherein a panel of non-Korean men debate on controversial topics and Korean culture through the eyes of a foreigner. Other than the panel members, three Korean "chairmen" act as moderators, and a South Korean celebrity "guest" announces the topic of the week. Through upgrading practices and interactionally constructed scales, participants manage to disaffiliate with the prior turn while concurrently, maximizing preference for an ensuing, affiliative response. Scaling thereby demonstrates the participants' retrospective orientation to the properties of the utterance being challenged as well as the prospective trajectories of action that are consequentially demanded by the challenger (Goodwin, 2006). The presentation will elaborate on the practices through which participants employ scaling as a resource for organizing argumentative talk.

#### ***Pragmatics of first person pronouns in historical Chinese texts*** (Contribution to *The Diachronic Aspect of Politeness: Value and Form*, organized by Tanabe Kazuko [et al.]

Chinese pronominal forms have a long history. Inspired by Brown and Gilman (1960) and Hirose (2000), this paper aims to show how pragmatics can unravel the mysteries of various forms of pronouns in historical Chinese texts. The *Analects* 论语, also known as the *Analects of Confucius*, is a collection of sayings and ideas attributed to the Chinese philosopher Confucius and his contemporaries, traditionally believed to have been compiled and written by Confucius' followers. It is believed to have been written during the Warring States period (475 BC - BC), and it achieved its final form during the mid-Han dynasty (206 BC - 220 AD). Chinese grammarians have not been able to explain why there are four first person pronouns in *the Analects*. Lee (2012) shows that pragmatics is the key to the understanding the various forms of first person pronouns in *the Analects*: *zhen* 朕 is the royal face, *yu* 予 is the sacred face, *wo* 我 is the public face, and *wu* 吾 is the private face. In a similar way, this paper aims to examine the first person pronouns in *Shishuo Xinyu* 世说新语 (or *A New Account of the Tales of the World*) which has six forms of first person pronouns: *wo* 我, *wu* 吾, *yu* 予, *yu* 余, *zhen* 朕, and *shen* 身. This book was compiled and edited by Liu Yiqing 刘义庆 (403-444) during the Liu Song dynasty (420-479) of the Southern and Northern Dynasties (420-589). It contains some 1,130 historical stories and character sketches of some 600 literati, musicians, and painters who lived in the Han and Wei-Jin periods (200-400 AD). It is both a biographical source and a record of colloquial language. Literary historian Victor Mair as well as famous modern Chinese author Lu Xun both spoke highly of the book's merits. The findings of this paper will be compared with that of *the Analects* to determine how the use of first person pronouns develop over time as an account of the diachronic use of first person pronouns in historical Chinese.

#### ***Linguistic ideologies of subjectivity, sexuality, and power: Evidence from Ancient Chinese and Medieval Persian*** (Contribution to *On language users and their relations with others: Debating notions of the subject and intentions in pragmatics*, organized by Silva Daniel [et al.]

The notion of linguistic ideologies has become influential in linguistic anthropology (Silverstein 1979), but may also be fruitfully employed to uncover debatable tacit assumptions in linguistic theorizing. Thus, as is well known, H.P. Grice's influential theory of conversational implicature presumes that speakers are rational and cooperative; but it is less well known that it is based on a linguistic ideology of language as a kind of social contract between speakers tacitly assumed to be free and equal. Explicating Grice's tacit assumptions and

cultural codes, one might further suggest that his prototypical speaker is British, male, middle-class, and middle-aged. Thus explicated, Grice, though himself silent about the articulation of power in language, appears to assume very particular forms of social power as legitimate, if not as given. Philosophically, it may be argued that, both in its assumption of language usage as involving an underlying social contract, and in its assumption of language users as rational and autonomous, Grice's conception of subjectivity and intentionality might be qualified as 'Kantian' (cf. Leezenberg 2010). An entirely different philosophical conception of what speakers and their intentions are like can be found in Confucius *Lun Yu* or *Analects*. Not commonly known as a work of linguistic theorizing (nor, indeed, of 'philosophy' in the present-day academic sense), the *Analects* nonetheless presents a fascinating view of language in its famous doctrine of the 'correction of names' (*zheng ming*), according to which the correct naming of persons and their social roles is the first task of government. Rather than taking speakers as autonomous, this doctrine thus takes speakers' subjectivities and intentions as objects of government. Another dimension in which Grice's presumed conception of speaker's subjectivity and intentions may be more radically thematised is that of gender and sexuality. Grice's concept of conversation might seem 'victorian' in implying that speakers should avoid terms and topics that might offend or embarrass the hearer. Famously, however, Foucault (1978) has argued against the assumption of a Victorian repression of sexuality. Extending this line of thought, one can redirect one's attention to questions not of whether or not speakers are allowed to speak about sexuality, but rather where and to whom; put differently, the power involved in the modern constitution of a gendered subject with a sexual identity – and in the speaking about sexuality – is productive rather than repressive. Here, too, one can bring out the historical contingency and specificity of Grice's conception of subjectivity by exploring a genre of texts from a very different era. As an illustration, I will briefly discuss classical Persian poetry, which is, at times, sexually quite explicit, but does not impose clear or unambiguous norms of masculinity or femininity (cf. Najmabadi 2005). The upshot of these considerations is that speakers' subjectivities and intentions should not be taken as given or neutral with respect to relations of class and/or gender: rather, it may be argued that they are shaped and indeed constituted by relations of power. Put differently, and extending Silverstein, not only our conceptions of language but also our conceptions of speakers are part of linguistic ideologies that describe, shape, and legitimize particular ways of using language. Conversely, explicating these ideologies may be one way of contesting the legitimacy of such linguistic practices.

***Language use at a hospital ward – an ecological perspective on professional language proficiency*** (Contribution to *Multilingualism, Mobility, and Work*, organized by Moyer Melissa [et al.] )

In this paper, we will discuss a hospital ward as a language learning environment for immigrant nurses. The structures of Finnish labour market are rapidly changing due to globalization and ageing. Immigrants form a potential reserve for workforce, and healthcare is a field that already at present employs a large number of immigrants in Finland (Aalto et al. 2013) and is continuously seeking more workforce. Sufficient language skills are of primary importance in the field of healthcare, but at the same time, financial resources available for language teaching are restricted. In order to make language learning more efficient, more job-specific language needs and alternative models for language learning need to be identified. The aim of this paper is to explore the linguistic reality of nurses' working environment from the perspective of ecological language learning (see e.g. van Lier 2004), so that this information can be exploited to enhance community-supported learning of Finnish at work. The data come from three sources collected at the ward: 1) video-recorded authentic interactions (nurses interacting with patients, colleagues and physicians), 2) written reports concerning patients that the nurses need to provide, and 3) the "linguistic landscape" of the ward, including note boards, signs, leaflets, screens, and other forms of text visible at the ward. The data will be analysed in order to determine what kind of linguistic demands this working environment poses on the (immigrant) nurse. The nurses encounter a diversity of linguistic situations and texts from minimalistic notes to multiparty multiprofessional interaction. According to the second language speaking nurses, one of their biggest challenges is to be able to display professional identity in these different situations (Kela & Komppa 2011). In this paper, we will focus on two phenomena that represent the width of the linguistic reality at the ward. On the one hand, we will illustrate the density (abbreviations and ellipsis) of the written material; on the other hand, we will show the complexity of doctor's rounds as interactional situations. With authentic data excerpts from these two sources, we will show how language use at the ward requires very detailed and specific knowledge of the activities that are performed. The description of the interactional richness and complexity at the ward can be exploited to develop language teaching curricula to better meet the needs of working life. It will be argued that enhancing the linguistic

awareness at the workplace creates a space for situated professional language learning that is hard to achieve in language classroom.

#### ***Complaints about non-present third parties in performance appraisal interviews***

(Contribution to *Complaints in Institutional Settings: Accountability, Affect and Identity*, organized by Rhys Catrin S. [et al.]

In our presentation, we investigate complaints in the context of performance appraisal interviews. Performance appraisal interviews are dyadic manager-employee encounters that are arranged widely in workplaces. Usually they are held on a regular basis (e.g. once a year) and their purpose is to evaluate the employee's performance and set goals for the forthcoming period (Asmuss, 2008; Sandlund *et al.*, 2011). Often, questions about work satisfaction and collegial relations are also dealt with. While complaining is not an obligatory part of the encounter, complaints about co-workers, customers, as well as the organization in a general sense occur frequently in performance appraisal interviews. Our data corpus comprises video-recorded performance appraisal interviews in a variety of organizations in Denmark, Finland, and Sweden. In this presentation, we analyze a collection of complaint sequences where the employee presents a complaint about some non-present third party. Methodologically, we rely on conversation analysis. Our aim is to describe features and contingencies of complaints that are specific to the performance appraisal interview as a type of institutional encounter. We concentrate on three features of the complaints in our collection. Firstly, even though the complaint may in some cases be initiated solely by the employee, in many cases there are collaborative features in the sequences. That is, the employees' complaints are often responses to the managers' initiatives – e.g. questions – that make the complaint a relevant even if not a projected next action. Secondly, complaints are often embedded in other activities such as troubles telling or positive assessments of third parties (for similar findings in different institutional settings, see Ruusuvoori & Lindfors, 2009). Thus, complaining is often not presented as a main activity; instead the complaint may be, for example, presented as a reason for a troublesome situation of the employee. This has consequences for the response expected from the manager. An alternative for the manager is to respond to the main activity and disregard the complaint. This feature may be related to the delicacy of complaining as an activity, and the manager's obligation to remain 'objective' in collegial conflicts. Thirdly, the relationship between complaints and affiliation is not as clear-cut as in ordinary conversation. Earlier research shows that complaints project an affiliative response from the next speaker (e.g. Traverso, 2009). In performance appraisal interviews, the manager may also display affiliation with the complaint producer, but often she/he is more oriented towards problem solving and/or filing the complaint in order to deal with it later. Relatedly, the question of who is responsible for dealing with the problem that is complained about is highly relevant. Thus, the manager may commit her/himself to dealing with the problem or deliver advice to the employee with regard to how she/he should deal with it. Thus, there is a delicate balance between affiliating with the co-participant and a practical orientation that aims at a solution. All in all, our study shows that in complaint sequences participants of performance appraisal interviews fluctuate between displaying affect and furthering the main business of the encounter.

***Making kinship through similarity: Adoption talk in Peru and Spain*** (Contribution to *Discourse, interaction, new families and contemporary kinship processes*, organized by Poveda David [et al.]

In a recent article co-authored with Susan Frekko and Diana Marre, we argued that transnational adoption is very difficult to talk about in Spain, in part because adoption talk must mediate two contradictory understandings of talk and kinship: (1) a referentialist one in which adoption's undesirability must be first acknowledged and then masked and (2) a performative one in which talk can create a new world where transnational adoption is equivalent to and as valuable as traditional ways of creating families. In this paper, I extend our analysis to consider a recent campaign called "Adoption doesn't make me different" issued by Peru's government-run adoption office. The campaign's stated goal is to create a "culture of adoption," and to "create awareness in the Peruvian population to eradicate myths, stigma, and stereotypes that work against the integration of adopted youth." In this campaign, similar to what we observed in Spain, two competing language ideologies are present: a referentialist language ideology is present in which adoption's ostensible undesirability is disguised ("it doesn't make me different") and a performative one with the goal of creating a new culture of adoption. Of most interest in both the Spanish and the Peruvian case is how the referentialist ideology is deployed; similarities with native-born "biological children" are highlighted and the differences downplayed or even canceled, against professionals' recommendations in both instances. I advance our earlier analysis by demonstrating that both the Spanish and the Peruvian examples demonstrate a critical point about 'folk theories' of how kinship gets made: it is produced through similarity, affinity, 'matching,' and contiguity.

***Subordinate clauses and background information*** (Contribution to *Foreground and Background: The Conversational Tailoring of Content and Context*, organized by Chun Elaine [et al.]

Based on a video recording of conversational British English, this paper tests within the framework of Multimodal Discourse Analysis whether several different subordinate structures operating at the syntactic level of modification (e. g. Huddleston & Pullum 2002) all express background information. The subordinate constructions under study encompass the three most widespread syntactic types of finite clauses functioning as modifiers in our oral corpus of spontaneous interaction: adverbial clauses, restrictive relative clauses, and appositive relative clauses. Subordinate constructions have been described in linguistics as dependent structures elaborating on primary elements of discourse (Reinhart 1984; Tomlin 1985; Lambrecht 1996). However, the literature shows little consensus in weighing their informational input: while the information conveyed in subordinate structures is seen as serving grounding functions in discourse (Fleischman 1985), Cristofaro (2003) and Langacker (2008) signal that semantic and/or illocutionary subordination need not align with syntactic subordination, and that the notion of subordination is best understood in terms of dynamic conceptualisation. It has also been proposed that there may be a continuum of subordination even within one clause type (Tao & McCarthy 2001), and that certain subordinate clause types may not actually be best described as such, especially adverbials and appositive relative clauses (Depraetere 1996; Thompson 2002). This study therefore questions whether subordinate constructions all express the same absence of prominence in terms of informational content. Although their verbal characteristics have been deeply analysed, few studies have focused on the articulation of the different communicative modalities in their production or provided a qualified picture of their informational input. While some substantial work has focused on their syntactic (e. g. Lyttle 1974) or prosodic input (e. g. Couper-Kuhlen 1986), the development of analytical tools and schemes now facilitates an account of subordinate constructions as multimodal phenomena. Multimodal Discourse Analysis studies the way speakers use different channels, i.e. modalities (verbal, vocal, visual) in speech. Viewing language as integrating speech and gesture in an organised system enables to investigate the contribution of subordinate constructions on several levels in discourse, with a set of multimodal variables for the expression of foreground in discourse.

Beyond showing that subordinate constructions express different types of prominence, the results suggest that the creation of focalisation mainly relies on gestural cues in these constructions. Changes in the modal configuration throughout the sequence suggest modalities are dynamic and flexible resources for expressing background or foreground information in subordinate modifiers in function of their syntactic type.

#### Alfredo M. Lescano

*¿Qué es un "actor" en un conflicto social? Una propuesta semántica* (Contribution to *About subjectivity and otherness in language and discourse*, organized by Garcia Negroni Maria Marta [et al.] )

Cuando se intenta describir la configuración semántica de un conflicto social, uno de los problemas que se impone con más fuerza es el de las "identidades sociales", o más bien — para evitar toda sospecha esencialista — la cuestión de los "actores" del conflicto. Desde luego que no hablamos de los individuos de carne y hueso sino de entidades semánticas. En una óptica estrictamente semántica, aunque siguiendo ciertas teorizaciones de la conflictividad social provenientes de otros ámbitos (principalmente las de Laclau-Mouffe y de Chateauraynaud) los conflictos sociales son configuraciones inestables, ya que se constituyen como el blanco de operaciones discursivas antagónicas. Llamaremos a esta configuración el "espacio semántico" del conflicto y supondremos que los elementos que la componen son fundamentalmente esquemas de producción discursiva, artefactos delocutivos, que son instalados, puestos en producción, transformados, por los discursos que intervienen en el conflicto.

De modo que un actor de conflicto, a primera vista, podría ser identificado con un conjunto de estos esquemas, digamos, sus "posiciones". Pero esto llevaría, por supuesto, a un impase descriptivo. Un conflicto social no es la yuxtaposición de repertorios aislados de posiciones. Una posición existe en un conflicto en la medida en que es un punto de equilibrio para las diversas relaciones en las que entran los actores del conflicto (relaciones de divergencia, de convergencia, de dominación, etc.), relaciones no nominales sino topológicas, es decir, que tienen lugar por la ocupación de zonas de un espacio, más que por la indicación nominal de los términos de la relación (la respuesta a la pregunta "¿quién domina a quién en esta fase del conflicto?", por ejemplo, debe buscarse en la configuración del conflicto en dicha fase). Defenderemos así la idea que la descripción semántica de los actores de un conflicto social debe tomar en cuenta las posiciones de actor como el resultado concreto de intervenciones precisas (y no como la expresión de una ideología o algún otro a priori histórico), en tanto que cada posición es un artefacto delocutivo que construye/refuerza zonas dentro de un espacio inestable y que es el *locus* de puntos de equilibrio relacionales. Ilustraremos estas tesis a partir de conflictos sociales franceses contemporáneos.

#### Carsten Levisen

*Pragmatics in paradise: Keywords of place in postcolonial Vanuatu* (Contribution to *The*

*Pragmatics of Place: Colonial and Postcolonial Perspective*, organized by Levisen Carsten [et al.]

This paper explores conflicting conceptualizations of place embedded in postcolonial discourse. The case in point is “paradise talk” in Vanuatu, a postcolonial island nation in the South Pacific (Crowley 1990; Meyerhoff 2013; Vandeputte-Tavo 2013), where multiple discourses of “place” co-exist and co-emerge. The secularized Anglo-International concept of *paradise* is particularly salient in tourism discourse. In Bislama, the national creole of Vanuatu, the concept of *paradaes* is also gaining ground, partly in ways that resonate with tourism discourse, but also with a religious narrative of nation. The analysis aims to provide a portrait of the complex, multilayered semantics of *paradise/paradaes*, the associated cultural scripts, and the mythopoeia that is enabled by the two words. The study is based on fieldwork in Port Vila, Vanuatu and semantic consultations with young speakers of Bislama, as well as discourse studies of tourist talk and literature. The paper makes relies on analytical and conceptual tools from ethnopragmatics (Goddard 2006; Goddard and Ye 2015), postcolonial language studies (Errington 2008), and postcolonial semantics (Levisen and Jogie 2015; Levisen 2016a, 2016b, 2016c) An analysis will be provide for the cultural keyword *paradise/paradaes*, around which postcolonial discourses are organized, and around which partly conflicting cultural scripts revolve. The analysis shows that the meanings and scripts for English *paradise* (as an idealized cognitive models of an “idyllic place”) differ from Bislama *paradaes*, but that both words govern discourses of emotion, bodily sensation, social cognition and cultural imaginaries, related to “the ideal place”. As a metaphor, *paradaes/paradise* discourse fluctuates between experiences of reality, stories of ideality, and a new national mythopoeia which allows for a rhetoric of disruption, loss, and fall.

**Raluca Mihaela Levonian**

*Nationalism and national identity in populist discourse: A comparative study of two Romanian parties* (Contribution to *Personal and collective identities in populist discourse*, organized by Levonian Raluca Mihaela [et al.]

The evolution of political parties and leaders from various states indicates that, at present, populism is not an isolated phenomenon or a characteristic of extremist political actors. Strategies like the vilification of the political elites and the construction of an antagonism between the elites and 'the people' (e.g. Laclau 2005) are frequent in the discourse of many political parties, especially in the opposition. It is important to examine not

only what populism has in common across states, but also the diverse socio-political contexts in which it emerges and the specific features in the discourse of each populist formation. This study investigates the case of two Romanian political parties that, although recently formed, have gained access to the Parliament after the parliamentary elections in December 2016.

The party "The Popular Movement" and the Union "Save Romania" have both used extensively the new media in order to reach a wide group of electors and to mobilize them against the political elites. The corpus, totalizing approximately 35,000 words, consists in a selection of messages posted by the two parties on their webpages and on social networking sites, before and during the electoral campaign. The first research aim is to examine how the two parties construct their identities and legitimate their actions in relation with the other main parties and with 'the Romanian people'. A second aim is to assess whether populist strategies are employed in the discourse of the two parties. The methodological framework applied is that of critical discourse analysis, with a special focus on Van Leeuwen's theory on social actor representation and legitimation strategies (Van Leeuwen 2008, 2007).

While The Popular Movement recurs to a more nationalist form of populism, the Union Save Romania constructs a 'populism of the youth', linking the conflict between 'the people' and the elites to a conflict between generations. Both parties legitimate their actions through the appeal to the Romanian nation and the national identity, but the representations of the nation oscillate in their discourse. The restrictive understanding of the 'Romanian people' as those living within the actual state borders is sometimes substituted by an extensive conception of 'the people', which includes the numerous Romanians working and/or living abroad. The emergent portrait is that of a populist party that unites a people dispersed across the world and becomes their representative not only by voicing their demands, but also by assuring them that it saves and safeguards the country and the nation in their absence.

#### ***Chinese discourse markers for topic reorientation in clinical interviews*** (Contribution to *Functions of pragmatic markers: why should we care?*, organized by Crible Ludivine [et al.]

This paper investigates the use of Chinese discourse markers to remedy topical divergence in clinical interviews. Specifically, it examines how the frequently occurring Chinese discourse markers of *na* (so) and *jiu* (that is) are employed by clinical interviewers to reorient a derailed topic by right-hemisphere-damaged (RHD) interviewees.

Discourse markers are a type of pragmatic markers, which relate a discourse segment they introduce to the preceding discourse segment (Fraser, 1996). One of the four main categories of discourse markers in English distinguished by Fraser (1996) consists of "topic change markers", also called "topic management markers" (Fraser, 1999). These markers signal the departure of their following utterances from the ongoing topic. Similarly in Chinese, a class of "topic-related discourse markers" has also been identified (Ran, 2000). Fraser (2009) has investigated the functions of "topic orientation markers", a subgroup of topic management markers. Yet he mainly focuses on how those markers signify topic continuation. Thus how discourse markers signal an alteration of the topic remains largely unexamined. Ran (2000) roughly identifies topic-related discourse markers as topic-related expressions such as *shuo dao* (speaking of) and *wo yao jiang de shi* (what I want to talk about is), which function meta-linguistically. However, the use of topic related or topic management markers in Chinese has hardly been addressed purposefully so far.

This study draws on the data of about 15 hours of conversations between four interviewers (psychotherapists) and 30 RHD interviewees in the context of clinical interviews. Discourse markers are one of the main linguistic devices used by psychotherapists to deal with the often occurring non-on-topic talk by RHD patients in clinical interviews (Li, 2016). Yet it is observed that those topic-related Chinese expressions identified by Ran (2000) were seldom used. Instead, the conjunctions of *na* and *jiu*, which are not grammatically or semantically related to topic, were frequently employed to indicate rejection of topical divergence initiated by RHD interviewees. By use of *na* and *jiu*, the psychotherapists made a transition from the derailment back to the ongoing topic or a new interview topic. This study intends to account for how the use of the two discourse markers in clinical interviews not only maintains continuous conversational flow but, more importantly, the reorientation of conversational topic. This constitutes an additional function of topic management discourse markers, which adds up to the framework of discourse markers.

***Touching and toking— The role of interpersonal touch in conversational joking in Mandarin interaction*** (Contribution to *Activities in interaction*, organized by Gerhardt Cornelia [et al.])

Joking is a commonly seen activity in human interaction. Conversational joking (or “conversational humor”) refers to “various verbal chunks created spontaneously or repeated verbatim for the sake of amusing the recipient” (Dynel, 2009:1286). The recognition of joking requires participants’ capacity to frame the ongoing action as play and their shared understanding that the activity they are now engage in is play (Bateson, 1972). A variety of verbal and vocal practices have been documented to constitute and contextualize conversational joking, such as laughter (Archakis & Tsakona, 2005), lexical items and phrases (Dynel, 2009), puns (Norrick, 2003), and semantic and pragmatic features (Attardo, 1994, 2001). But the role of bodily-visual behavior in conversational joking has been understudied. This study investigates the role of a particular bodily-visual practice, i.e., interpersonal touch (IT), in the construction and contextualization of conversational joking in Mandarin face-to-face conversation. Adopting the methodology of Conversation Analysis, Interactional Linguistics, and Multimodal Analysis, this study examines 6 hours of everyday Mandarin Chinese face-to-face conversation. A cursory examination of the data shows that IT is used as a visual cue to contextualize conversational joking together with other vocal, verbal, and visual practices. The IT in conversational joking exhibit some recurrent formal features such as touching with whole palm with open hand palm down and extended contact time. The IT in the data tends to co-occurs with three types of conversational joking: teasing, joking about an absent other, and self-denigrating joking. IT often co-occurs with other vocal and visual practices, such as mutual gaze, laughter, and spatial-orientational change of the body in contextualizing conversational joking in Mandarin conversation.

## Christian Licoppe & Sylvaine Tuncer

***Viewing objects together at a distance. The organization of showings in video-mediated communication*** (Contribution to *Object-centered sequences: Recruiting objects and managing intersubjectivity in interaction*, organized by Tuncer Sylvaine [et al.])

We analyze sequences in which participants show one another a personal object in video-mediated (Skype) interpersonal conversations, for the purpose of its joint ‘viewing’. First, we show that such showing sequence unfold with a typical organization: Preface/ Collaborative positioning of the object/ Assessment. Second, we show how it is relevant to introduce a distinction between ‘informative showings’ which enact a recipient without relevant knowledge regarding the showable, and ‘evocative showings’, which enact instead a knowledgeable recipient. We also show how these epistemic orientations are consequential with respect to the organization of showing sequences. Finally, this systematic understanding of the organization of showing practices is used to account for the recurrent production of showing sequences involving personal objects (which index familiar and intimate territories) in video-mediated interpersonal conversations, and to show how such sequences can constitute a powerful resource to perform ‘intimacy-at-a-distance’.

## Maria Francisca Lier-DeVitto

***Live interpretation in the clinical setting: Facing symptomatic speech*** (Contribution to *On ‘interpretation’ in the context of language acquisition and in clinical settings: under the effects of speech errors and symptoms*, organized by Lier-DeVitto Maria Francisca [et al.])

Interpretation in clinical settings, though social in a quite particular sense, is sharply different from those which

take place in everyday interaction or in other specific communicative social contexts. Considering clinical settings in which language itself is at stake, it is necessary to discuss the clinicians' interpretative acts. Taking into account Speech Therapy, it must be stressed that the clinician must face speech disorders which cannot be identified either with ambiguous productions or casual odd utterances. The theoretical-clinical reflection which have been developed within the Language Clinic Project at PUCSP-Br, contrary to the blind trust on the application of any objective scientific tools in the diagnostic or the therapeutic instances, queries on theoretical and clinical grounds the homogeneity ideal in the domain of clinical practice (Lier-DeVitto, 2000, 2006). It is worth emphasizing that such a trend of thought cannot be identified with any pedagogic proposal, reeducation procedures are not at stake. Language Clinic follows Foucault's advertisement. He states that the clinic domain has to face the "the fantastic bond between knowledge with suffering" (op. cit. 1980/1994: IX). Keeping such a strong recommendation in mind, clinical practice is not allowed to be blind (or *deaf*) to the singular and unpredictable utterances, nor should it ignore the patients' judgments about their condition as a speaker. The therapist's interpretation is, no doubt, deeply affected by those two basic principles. Clinical dialogue is raised as the *locus* of possible changes and is conceived of as a dynamic movement propelled by the tense convergence of the conflicting non-symmetrical *live spoken chains*: the therapist's utterances and the patient's symptomatic speech. It is important to stress that, under such a theoretical framework, the *dialogue situation* cannot be taken as an intersubjective communication because mentioning "spoken chains" is to commit oneself with Saussure's theoretical proposal concerning *la langue*. Assuming that trend, it becomes logically necessary to admit that interpretation is not free from the equivocating effects of *la langue*, operating between and within the two conflicting spoken chains. The deep dissymmetry between the therapists' and the patients' dialogical contributions should not bar the dynamics of interpretation even when it sounds nonsensical and bizarre: clinical dialogues must flow. In this presentation, I aim at discussing and building up a notion interpretation in Speech Therapy clinical setting committed with a language theory (European structuralism) and with a specific notion of subject speaker which implies the hypothesis of the unconscious, introduced by Freud (1900) and later resumed and developed by Lacan.

### **Jan Lindström & Martina Huhtamaki**

***The basics of participation: Noun phrases in next-turn repeats in Swedish*** (Contribution to *The Pragmatics of the 'Noun Phrase' across Languages: an Emergent Unit in Interaction*, organized by Thompson Sandra [et al.]

In this paper we will analyze the formal properties and interactional relevance of Swedish noun phrases (NPs) in a pragmatically specific context, next-turn repeats in conversation. The interactional phenomenon in focus involves typically a sequence in which one speaker says something and the next speaker fully or partially repeats that verbal formulation. Interactional reasons for these repeats can have to do with a problem of hearing, understanding or expectation (e.g. surprise) or they can function as an understanding checks (produced to avoid a problem). Our collection of such next-turn repeats contains 146 cases, of which 122 have a phrasal, non-clausal form. The overwhelming majority of the phrasal repeats are noun phrases (69%), e.g. "– *Tänker ni skaffa barn? – Aj barn.*" '– Are you going to have children? – Oh children'. The data for this study are taken from audio and video recorded Finland Swedish conversations, mostly from everyday settings, but some institutional contexts, like interviews, are also included. In our analysis we characterize formal variations of the noun phrases in next-turn repeats: i) do they occur in a bare or expanded form?, ii) what kinds of syntactic relationships are targeted by the repeats (e.g., subject, prepositional phrase)?, iii) do the NPs constitute exact repeats of a prior turn or are they targeted as the key elements from a longer, possibly clausal prior turn? We also want to discuss the implications for the noun phrase as a unit in interaction of the fact that they are so ubiquitous in next-turn repeats. In addition, we will account for prosodic variations in the delivery of repeated (first-turn) and repeating (next-turn) NPs. Here, we will compare the pitch of the repeated turn and the repeating turn, in order to see if the same elements have the same prominence in the two turns. Our hypothesis is that prominences in the first turn will appear in the next turn, but that the next turn also can include prominences that are not in the first turn and that prominences may be stronger in the next turn than in the first turn. The results shed light on the category of NP from a new perspective. NPs are traditionally regarded central building blocks of Swedish grammar and especially of clauses, not least because they may take diverse functional roles as subjects and verb phrase complements and as constituents in prepositional phrases. In this study, NP repeats constitute short utterances in their own right, showing dialogic dependency on a preceding contribution. This points to the possibility that the NP is an elementary unit of participation, a unit which has a high referential relevance in meaning-making in real-time interaction and which, therefore, is a central vehicle for using talk to build intersubjectivity.

## Yang Liu

*The outside view: Constructing cultural differences in a Chinese talk show* (Contribution to *Producing ‘Foreigners’ in TV Entertainment Shows: Sequence, Categorization, and Multisemiotic Practices*, organized by Kasper Gabriele [et al.]

A number of studies have used Membership Categorization Analysis (Sacks, 1972; Fitzgerald & Housley, 2015; Hester & Eglin, 1999) and sequential Conversation Analysis (Schegloff, 2007) to investigate how participants from different national or linguistic backgrounds position themselves and each other as ‘insiders’ and ‘outsiders’ and construct cultural distinctiveness through categorization (Day, 1994, 1998, 2006; Fukuda, 2006; Hansen, 2005; Higgins, 2007, 2009; Mori, 2003; Nishizaka, 1995, 1999; Suzuki, 2009, Tranekjær, 2015). Building on this research, this study examines how participants “do being foreigners” (Nishizaka, 1995) through their interactional practices in a Chinese TV talk show. The program, “Qiang Qiang San Ren Xing” (锵锵三人行 :“Thump! Thump! Three People Walking”), features a Chinese host (H) and invited celebrity guests. Topics in the show range from societal issues to the celebrities’ personal lives. In the focal episode, the two invited guests are prominent media personalities, both foreign residents in China and fluent Chinese speakers: Julien Gaudfroy (J) from France and Kato Yoshikazu (K) from Japan. At the time of the show both had lived in China for over a decade and had been guests together on this show before.

The analysis will reveal how the participants build “cultural differences” through describing and assessing Chinese traditions, customs and social practices from an outsider’s perspective and in this way make the category of “foreigner” relevant and observable in the talk. To illustrate:

```

18 J: ni birushuo yang xiao baobao (.)
    you for example raise little baby
    +GAZE AT H -----#3
19 +yang xiao baobao ni zhidao
    raise little baby you know
20 jiushi xiang zhongguo de you haoduo
    just like China GEN have many
    +GAZE AT K -----#4
21 +naxie jia libianr a (.)
    those home inside MOD
    +LEFT HAND TO H, GAZE AT H -----#5
22 → +you henduo naxie bu kexue de chuantong
    have many those NEG science GEN tradition
    +GAZE DOWN
23 [huozhe shuo-]=
    Or say
    Take raising a baby for example, you know, many Chinese families have a lot of unscientific traditions regarding how
    to raise a baby, or...
24 K: [dui dui]=
    Right right
  
```

In line 22 Julien uses the description “unscientific traditions” (bu kexue de chuantong) to assess the social practice of “raising babies” (yang xiao baobao, line 18 & 19) in many “Chinese families” (line 20 & 21). Specifically, he formulates the category “Chinese family”, associates it with the category-bound predicate (CBP) “child raising traditions”, and categorizes the traditions as “unscientific”. The explicit formulations “Chinese” and “unscientific” make the contrasting categories (non-Chinese, scientific) inferentially available. In this way Chinese and non-Chinese families are constructed as mutually exclusive contrast categories regarding their child raising traditions. Further, Julien’s implicit crosscultural comparison can be heard as a “turn-generated” (Watson, 2015) categorization of himself as an outsider and specifically as someone from “the West”. This makes it possible to narrow the invoked category “non-Chinese” to “Western” and so get the contrast relation of Chinese versus Western familial child raising traditions. Julien selects both co-participants as addressed recipients by gaze, but the response comes from Kato, who strongly aligns himself with Julien’s categorization and thereby co-categorizes himself and Julien as members of the same team on the cultural issue at hand.

**Yaqiong Liu & Xiaoting Li**

***“V/ADJ (de) lai” construction, stance-taking and affiliation in Shanghai dialect***

***Conversation*** (Contribution to *Multimodality and diversity in Chinese interaction*, organized by Li Xiaoting [et al.]

“V/ADJ+(de)lai+ADJ.P/VP” is a typical Verb-Complement construction (VCC) in Shanghai dialect, and *de lai* or *lai* are the complement markers (Qian, 1997). This construction conveys two types of meanings: the manner in which the event described by the V/ADJ occurs, and the extent of the referent described by the V/ADJ (Li & Thompson, 1981:623-626). However, in natural conversation, the complement after *de lai* and *lai* are often omitted, and the VCC becomes truncated “V/ADJ+(de)lai” (Xu, Tang & You, 1988; Qian, 1997). So far, there has been very limited research on the interactional use of the Truncated Verb-Complement Construction (TVCC) in everyday Shanghai dialect conversation. Adopting the methodology of conversation analysis, interactional linguistics and multimodal analysis, this study explores 1) the interactional function of TVCC; and 2) how participants deploy the TVCC, prosody, and bodily-visual practices in achieving the interactional function in local sequential and situational environments in Shanghai dialect conversation. A cursory examination of 4.3 hours of everyday Shanghai dialect conversational data shows that the TVCC is usually used to display evaluative stance and affiliation in Shanghai dialect interaction. For example, TVCC may be used by the speaker to make assessments of a preceding or incipient referent in a telling. It may also be used by the recipient to display his/her affiliation with the prior speaker by making assessment of the referent in the prior speaker’s telling that is affiliative with the speaker’s conveyed stance. The TVCC is produced with particular prosodic and bodily-visual practices. Specifically, *lai* in TVCC is significantly lengthened with rising or level final pitch movement. The participants are observed to lift their head and produce a head nod while producing TVCC. This study shows that the different uses of the TVCC are constituted through multimodal resources including its sequential placement, prosodic features and concurrent bodily-visual features.

***Pretending ordinariness: Political speeches in a cultural context of conflicting demands***

(Contribution to *Constructing Ordinariness across Media Genres*, organized by Weizman Elda [et al.]

In the same way that doing ‘being ordinary’ is a task achieved through interactional practices (Sacks 1984), constituting a person’s own life as ‘epic’ is also a discursive task. While for most people the latter might be socially risky, in each society there are people who are “entitled to have their lives be an epic” (ibid.: 419). Political leaders are among those people, since their followers might expect a certain degree of non-ordinariness in order to allow a person to lead them. However, several theories of leadership emphasize the need for leaders to publicly display alignment and similarity with followers (e.g. Shamir et al. 1994). Thus, it might be demanded of political leaders to discursively constitute themselves and their lives as both ordinary and epic at the same time. Israeli PM Benjamin Netanyahu is such an example. An analysis of Netanyahu’s public talks in Hebrew, when addressing domestic audiences of different kinds, shows that he invests considerable discursive effort into giving the appearance of being ordinary, using various linguistic elements (use of first names and nick names, colloquial language and up-to-date slang), self-disclosure through stories and anecdotes that demonstrate his similarity to his audience, and references to a culture-specific lifestyle which he pretends to share with the audience. However, certain instances reveal his implied belief that his life is in fact epic (Kimhi 2001). This tension will be discussed on the background of changing and conflicting cultural demands (Katriel 1986) and the complexity of the concept of ‘being ordinary’ in Israel.

***Cyclicity in the grammaticalizations of the Spanish DMs lo mismo and igual*** (Contribution

to *Cyclicity in Semantic-Pragmatic Change*, organized by Hansen Maj-Britt Mosegaard [et al.]

This contribution aims at explaining the different grammaticalizations of *lo mismo* and *igual* as pragmatic and discourse markers. Until the 20<sup>th</sup> century these two markers followed similar paths of grammaticalization, what allows them to be interchangeable in many contexts in Present-Day Spanish. However, during the 20<sup>th</sup> century new meanings developed in both sides of the Atlantic: an epistemic meaning in oral, spontaneous Peninsular Spanish, and concessive and additive meanings in American Spanish. In this presentation, it will be argued that both markers are involved in an onomasiologic cycle (Hansen 2015), that is, “une même fonction (ou plusieurs fonctions apparentées) est (sont) renouvelée(s) à plusieurs reprises par des formes différentes, mais dont les sens primitifs se ressemblent” (Hansen 2015). Also, in the reanalysis of *igual* / *lo mismo* as additive DMs, a semasiological cycle seems to be involved, since *aeque* also fulfilled this same function in late Latin. This case study raises some questions, related to the origins of the new meaning and to its causes; to the simultaneity of the new pragmatic meaning, and finally, to their push-or-drag-chain role. In order to address these issues, different diachronic and synchronic corpora will be analyzed (CORDE, CORDIAM, CREA, the Val.Es.Co. 2.0 corpus, and also the Perseus Corpus and Patrologia Latina).

***Construction grammar, interaction and discourse units: A case study of Spanish pragmatic markers coming from sentences*** (Contribution to *From models of discourse units to interactional construction grammar*, organized by Pons Bordería Salvador [et al.]

From a sentential view, *yo qué sé* is an interrogative sentence (syntax) by means of which a speaker shows his ignorance about something. This explanation does not allow account for most uses, such as: (1) G: y han estado así diez años↑/ yo que sé // el tío/ aguantando... y parece ser que yaa- ya se han puesto de acuerdo↓ (Briz & Val.Es.Co. 2002, 166) (G: and he has been like this for ten years ↑/ don't know // the guy / putting up with // and it seems that they have already come to an agreement.↓) In (1) *yo qué sé* functions as a pragmatic marker mitigating what it has been just said (pragmatics), meaning developed from the semantic basis of ignorance (semantics); also, it is a construction fixed in the first person of singular (morphology) and it has a prosodic unit (phonology). This set of related features brought us to base our analysis on construction grammar applied to interaction (Fischer 2010; Gras 2010). Moreover, by examining the functions, we observed that they are linked

to a large extent with the position in relation to a specific discourse unit where the marker is hosted. Following the Val.Es.Co. model of discourse units (Val.Es.Co. 2003, 2014; Pons 2015), we notice that — When the marker is placed at final position of an act, it mitigates what it has been just said; and if it appears at final position of an intervention, it also expresses search of cooperation. — When it is placed at initial position of an act, it fulfils a formulative function, whereas if it is placed at initial position of an intervention, it shows a polite disagreement. Similar analysis was obtained in the pragmatic marker *no sé*. In conclusion, the study of *yo qué sé* and *no sé* —markers coming from sentences— demonstrates that the description of pragmatic markers used in conversations (more flexible position) would be more complete and accurate when basing our research on construction grammar and when taking into account the position in relation to the discourse unit.

#### Christopher Long, Saeko Fukushima & Rosina Marquez Reiter

*Non-Japanese impressions of service encounters in Japan: Omotenashi, kikubari and ritual/convention* (Contribution to *Ritual and ritualisation in interpersonal pragmatics*, organized by Kádár Daniel [et al.]

The importance of the foreign tourist industry to the Japanese economy is undeniable. David Atkinson, former analyst with Goldman Sacks, for example, claims that a lack of population growth, coupled with an unwillingness to accept immigrants, has forced Japan to rely increasing on income from foreign tourists (Brasor, 2015). In seeming agreement with this assessment, the Japanese government recently announced its plan to increase foreign tourists from its current 15 million to 30 million by the year 2030 (Nakagawa, 2015). The hosting of the 2020 summer Olympics can be seen as key to this plan. Among the estimated benefits are a roughly 200 million yen boost to the tourist industry and a 0.2~0.3% increase in Japan’s overall GDP (*Nippon Keizai Shimbun*, Jan. 1<sup>st</sup>, 2016). Alongside this predicted increase in foreign tourism, however, concerns have arisen regarding the readiness of Japanese businesses to accommodate non-Japanese consumers. In rural areas, in particular, a recent survey suggests that more than 75% of businesses are currently unprepared to accommodate foreign tourists (Japan Tourism Agency, 2016). A survey conducted in Sendai, the largest city in the northern region of Japan, further indicates less than half the businesses investigated were currently involved in any preparation to accommodate the predicted influx of non-Japanese customers (City of Sendai, 2014). In contrast to this seeming lack of preparedness, there appears to exist wide spread confidence in the quality of service offered by Japanese businesses. Following Japan’s much publicized bid to secure Tokyo as host of the 2020 Olympics, the concept of *omotenashi* (‘hospitality’) has secured its place in the minds of Japan and the world as representing the high quality of service associated with Japan. Behaviors seen by Japanese customers as expressing a high quality of service, however, may not be evaluated similarly by foreign tourists in

Japan. The goal of the current analysis is to consider how behaviors related to emic constructs relevant to service encounters in Japan are perceived by those who are not Japanese and are potentially interested in visiting Japan or have done so in the past. Focusing in particular on the constructs of *omotenashi* and *kikubari* (attentiveness) (Fukushima, 2015), the current analysis seeks to explain those behaviors in terms of ritual/convention (Kádár, 2013) within a social cognitive account of relational work (Long, 2016). To this end, analyses are presented of non-Japanese responses to an online article regarding the level of service in Japan (223 in total) (*Japan Today*, Oct. 10<sup>th</sup>, 2010). At the time of writing, analyses reveal two major trends. On the one hand, comments criticize the lack of flexibility of Japanese service (particularly with regards to requests for individualized service). On the other hand, the consistency of Japanese service is highly praised. The current analyses will discuss these findings in relation to the emic constructs *omotenashi* and *kikubari* and consider the implications of the findings for intercultural service encounters in Japan.

## Sabina Longhitano Piazza

*What is said, what is implicated and what can only be imagined* (Contribution to *Pragmatic Approaches to Literary Analysis*, organized by Chapman Siobhan [et al.]

Within the post Gricean pragmatics tradition there has recently been a growing interest in describing the cognitive effects of literary texts, including poetry and drama, in terms of the inferential processes involved, which I find a necessary and useful endeavor. Nonetheless I will argue, within the same ostensive-inferential tradition—Relevance Theory in particular—, that in the interpretation of prototypically literary texts (i) the process of interpretation is not solely an inferential one; (ii) the cognitive effects derived cannot be reduced to information with a propositional content (Longhitano 2014a and 2014b).

There seems to be an expressive modality of communication, which can be represented as a peculiar informative intention. The attribution of an expressive intention triggers a process of interpretation in which propositional meaning is not always relevant per se, whereas the text, considered as an artifact—a verbal ostensive one—triggers a process of creative imagination on one hand and of “opaque” appreciation of its shape on the other. The former process is based on a context of interpretation built by means of evocation of both propositional and non-propositional information, such as perceptions and emotions, as opposite to invocation of (sufficiently) stable propositional information, which can be processed by a truly inferential process and is represented as mutually manifest.

I will illustrate my point by analyzing the short story *The professor and the Siren* (1957), by the sicilian writer Giuseppe Tomasi di Lampedusa, complementing the current post Gricean and neogrician Pragmatics stylistics methods (Clark 2009; Chapman and Clark 2015)—which explain some of the effects of the text—with the idea

that an expressive text communicates the author's (and narrator's) intention to communicate ineffable experiences, which can only be retrieved in a creatively imaginative way.

***Evidential and epistemic strategies, stance and mind-style: The case of the police interview to Kipland Kinkel*** (Contribution to *Evidentiality: Discourse-Pragmatic Perspectives*, organized by Carretero Marta [et al.]

The present paper provides a comparative study of the discoursepragmatic functions of markers of evidentiality and epistemic modality as indexicals of speaker stance and mindstyle. These are analysed in the responses made by an allegedly schizophrenic underage criminal, KiplandKinkel, in a police interview after his arrest, and in the questions made by the police officer interviewing him. Our point of departure is that the concept of stance, which according to scholars englobes both markers of evidentiality and epistemic modality (Boye, 2012; Biber et al. 1999; Englebretson 2007; MarínArrese 2013), can also be analysed as expressing the speaker's mindstyle (Fowler 1986). We use a combination of Halliday and Matthiesen's (2004) classification of subjectivity markers into direct, indirect, explicit and implicit stance, and MarínArrese's classification of indirect markers of stance. Within this classification, we focus on the categories 'epistemic modals and adverbs' and 'verbs of mental state', in cooccurrence with negation. Results show that modality in Kinkel's discourse is of the indirect implicit type, and is expressed only by means of deontic and boulomaic verbs; this means that epistemic modality is absent, thus showing lack of epistemic commitment towards the information provided in the interview; this point, together with the cooccurrence of the other markers of stance, seems to reflect a mindstyle of a mentally ill person. In the case of the interviewer, he expresses modality by using epistemic, deontic, and boulomaic verbs, most of them in positive polarity. Regarding cognitive verbs and the indirect marking of stance, these are used by Kinkel mainly in negative polarity, in order to express lack of certainty regarding the reason for committing the crimes. The interviewer, instead, uses cognitive verbs less frequently and, usually, to refer to Kinkel in the form of acknowledgments and also to repeat what Kinkel has previously said.

***The profit of flexibilization: The management of the linguistic resources of Swiss health care workers*** (Contribution to *Global Transitions in Health Care*, organized by Zayts Olga [et al.]

Mobility is considered to be a central force that is shaping the global healthcare economy. In this service-based economy, the mobility of various healthcare workers is paralleled by the mobility of different patients ranging from medical tourists to medical refugees, to migrants. These movements of workers and patients raise new questions about the management of linguistic resources in the current political economy. Using ethnographic data from an ongoing study of the Swiss healthcare industry, this paper examines how a clinic at a hospital in

German-speaking Switzerland mobilizes the linguistic resources of its different workers, namely, the doctors, technicians, receptionists and secretaries. The paper also unpacks the discourses about language, and the role of language in medical care in particular, which are employed in order to legitimize and profit from this mobilization. To that end, this paper focuses on how, among others, a recent influx of French-speaking patients have reshuffled sociolinguistic hierarchies resulting in changes in the job responsibilities of workers and reconfiguring how the language part of their work is defined. The paper argues that this flexibilization of the linguistic resources of these workers is employed as a means of meeting the constantly changing and increasingly unpredictable demands of the linguistic market, while, at the same time, it allows the clinic to distinguish itself from the competition. The flexibilization of workers' linguistic resources appears to be a source of profit for the institution but, as we will show, it is not necessarily a source of profit for the workers themselves (Heller and Duchene 2016).

##### *A comparison of compliment responses on Facebook by Ecuadorian and Spanish men*

(Contribution to *Complimenting behaviour in social media*, organized by Das Anupam [et al.]

With the introduction of social media and subsequent high levels of participation in them, studies on compliments and responses in the context of social media are beginning to appear, many of which are based on observed behavior on Facebook. This paper aims to add to this body of work by offering a study of compliment responses on Facebook from a variational pragmatics perspective (Schneider and Barron, 2008). The focus is on regional variation between Ecuadorian (Quito) and Spanish (Andalusia) males, aged 18-25 (Placencia, 2011). The sample is an extract from a larger corpus of both Ecuadorian and Spanish males and females. I created a research Facebook profile, and made contact with people from the relevant groups and became their 'friend' so that I could study their profiles, with their consent, for complimenting behavior. Due to the fact that the males in my corpus tended to not receive or respond to as many compliments as females, I'm looking at all male-male compliments and responses in the corpus. This study builds on work in a face-to-face environment (Pomerantz, 1978; Holmes, 1986; Holmes, 1988), as well as studies available on compliment responses on social media (Cirillo, 2012) and Facebook (Eslami, Jabbari, and Kuo, 2015; Maíz-Arévalo, 2013; Placencia, Lower, and Powell, 2016). I analyze the full array of responses, from those rooted in face-to-face interactions, such as acceptance or gratitude, to those responses that have their basis in the affordances of the social media platform. The responses are analyzed from multiple aspects, including the most frequent type of response to a compliment, and the type of compliment that attracts the most responses.

***Elementary school children's oral argumentation competencies*** (Contribution to *Children's explaining and arguing in different conversational contexts*, organized by Heller Vivien [et al.]

The meaning of oral argumentation skills as an important competence for learning in general as well as a crucial everyday life competence has been stressed in recent years several times (e.g. Budke/Meyer 2015, Chinn 2006, Nussbaum 2008, Muller Mirza/ Perret-Clermont 2009). Most educational standards in (first) language teaching list oral argumentation skills already in elementary school, but there still is little empirical data on its acquisition by young school children (but see Anderson et al. 2001, Jadallah et al. 2011, Vogt 2002). Our talk will present first insights of a project on the acquisition of children's argumentation skills (age 7-12) as well as preliminary suggestions for different competence levels that are based on empirical data. Our corpus consists of 180 video recorded group discussions of pupils from the second, fourth and sixth grade that have been conducted without the presence of adults (peer talk). The data has been analyzed within the framework of Conversation Analysis (CA) (e.g. Sidnell/Stivers 2013), some aspects have also been analyzed quantitatively, e.g. different kinds of giving reason (opposition/proposition) and its lexical markers. We will first discuss some general issues regarding oral argumentation like its interactive dynamic (Andrews 2005, Spranz-Fogasy 2006), its learning potentials (Arendt 2015, Morek 2014, Zadunaisky Ehrlich/Blum-Kulka 2014, Stude 2014), and the problem of describing individual partial competencies within CA (Deppermann 2006). In a second part we will present our data and our first findings focusing different competence levels based on observations of aspects like the co-construction of arguments (Dausendschön-Gay/Gülich/Krafft 2015, Grundler 2015), the complexity of arguments and argumentative coherence (Grundler 2011), strategic sequences (Felton/Kuhn 2001) or relational work (Krelle 2014). We will end by addressing open questions about normative decisions regarding these levels and reflections on didactic consequences and implications for teaching and learning argumentative skills in school.
